# Purpose

Patient misidentification causes serious accidents in medical practice. Although facial image-based recognition systems have been used in many fields, they have not been used for patient recognition during examinations.

The purpose of this study is to evaluate a newly developed face mask-enabled face recognition system in a CT examination environment.

# Method

The facial recognition system used was PFAS with mask (CANON MEDTECH SUPPLY, Kawasaki, Japan).

- 142 patients  
(mean age 59+/-11 years, male/female ratio 59:41)

Cameras were installed to capture the patients.  
Recognition was possible in both of these situations.

- When they entered the CT room (walking).
- When they were positioned (supine).

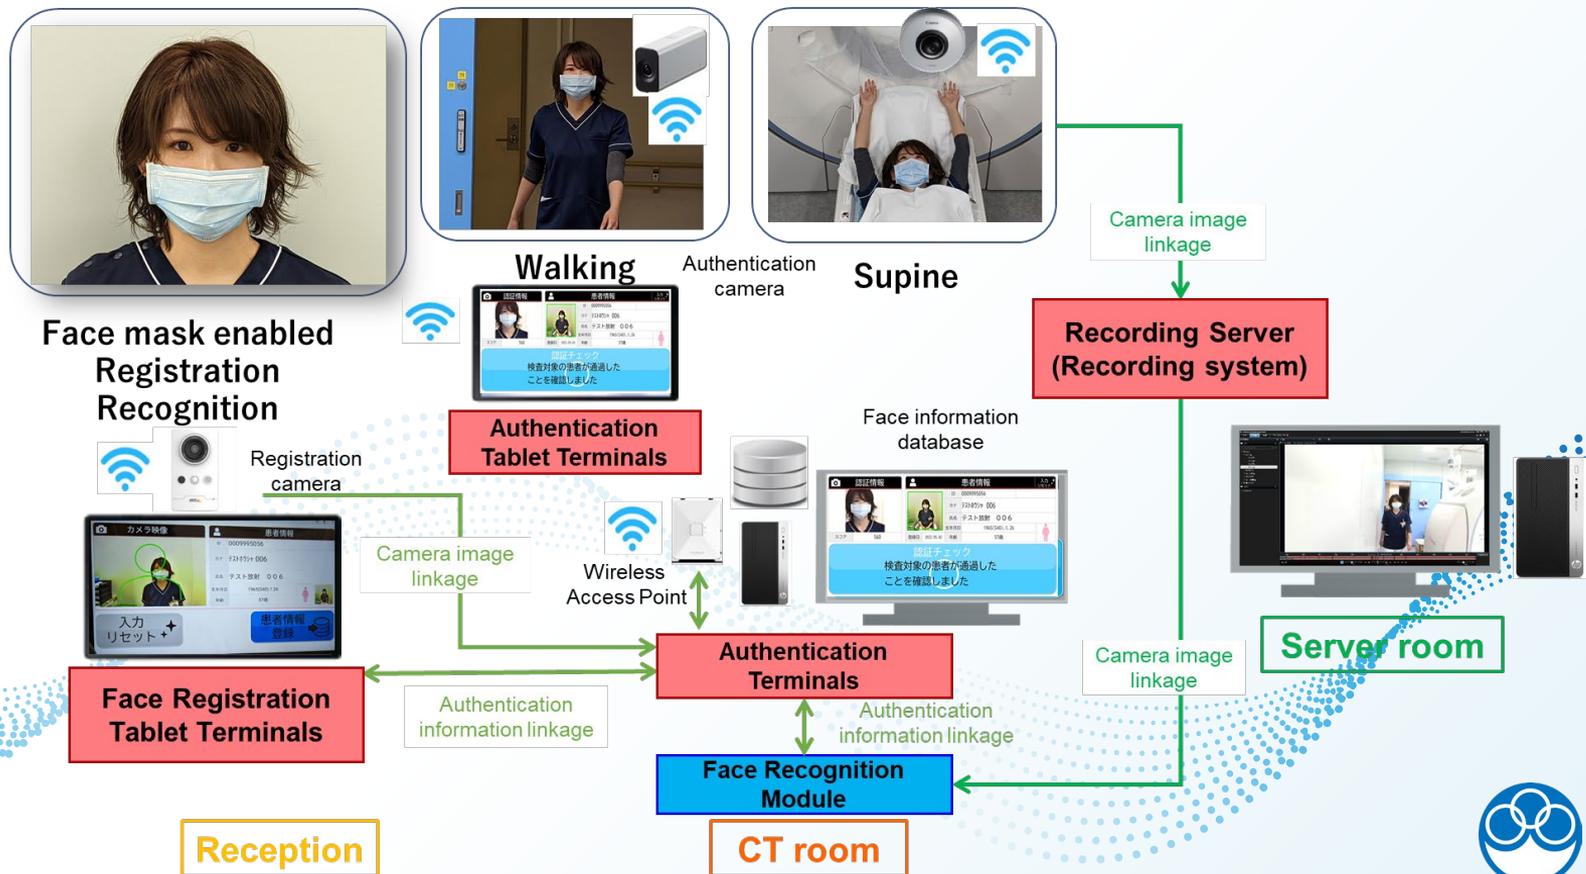

# Method

- The recognition task was performed with the face mask worn, and the success rate was calculated from the recognition score.
- A significant difference test was conducted using Welch's t test for the authentication scores obtained in the two situations.
- In this system, an authentication score of 550 or higher (max:1000) is considered as a successful authentication.

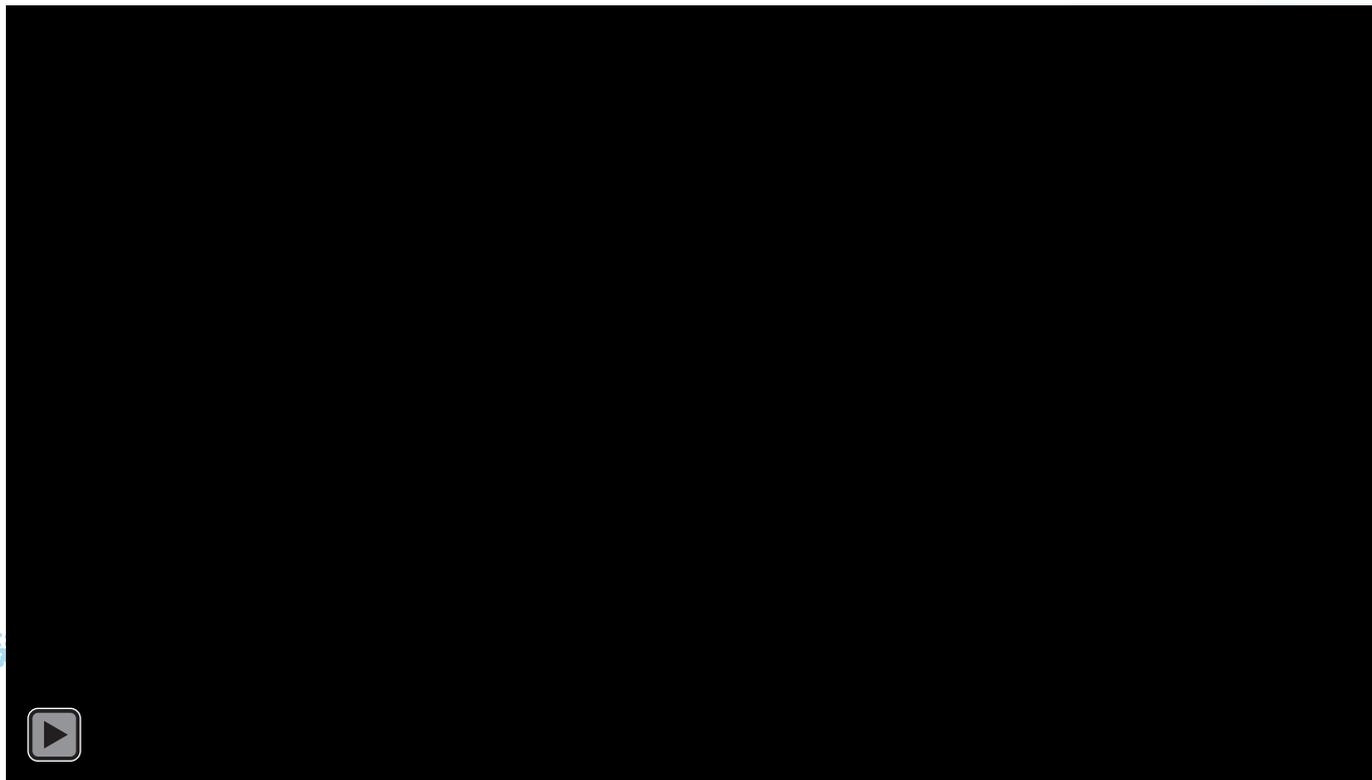

# Method - Information linkage -

# Method - Recognition flow-

# Result

- ✓ Of 142 patients, 136 were successfully authenticated, for a success rate of 96%.
- ✓ The reasons for the unsuccessful cases.
  - The patients were wearing hats too deeply.
  - 3 cases of overlapping with staff members.
  - 2 cases of unknown cause.
- ✓ Of the 136 patients, 113 (83%) were authenticated when entering the room (walking) and 23 (17%) when positioning (supine).

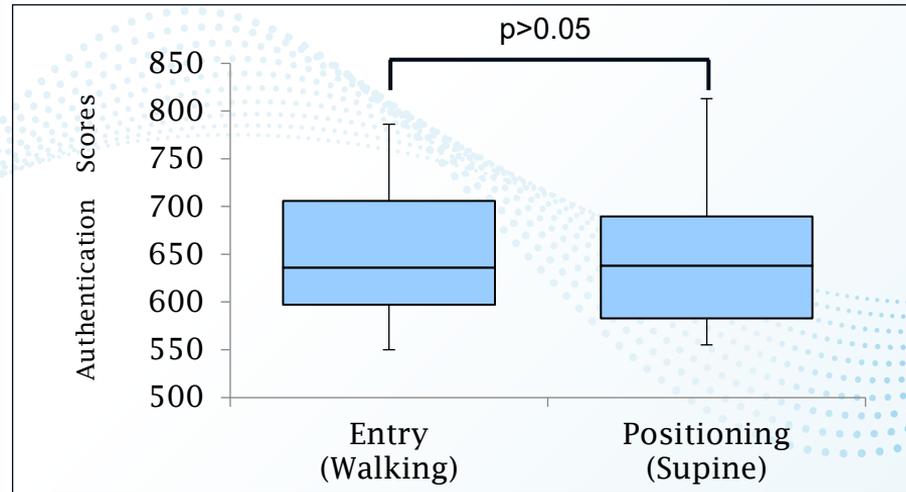

# Result

The mean authentication scores (mean +/- standard deviation) .

- Entry (walking) 648+/-66
- Positioning(supine) 643+/- 64

No significant difference ( $p>0.05$ ) between the two.

✓High authentication accuracy.

Two-way authentication provides more opportunities to recognize faces.

✓Efficient authentication flow.

Smooth face registration and stress-free face authentication.

✓Possibility of face recognition in hospitals.

Face recognition is possible in multiple situations.

➤ The system can be used in the clinical practice to prevent patient misidentification.

# Conclusion

- ✓ We confirmed that the accuracy of face recognition can be ensured even when the patient is wearing a face mask.
- ✓ We have realized the practical application of patient authentication using the face recognition system.
