

## Improving diagnostic confidence in pediatric intussusception

A multifaceted approach in a regional radiology practice

Eric Graham MD<sup>1,2</sup>, Julie Kaczmark MD<sup>1</sup>, Terri Lewis MD<sup>1</sup>, Abraham Weiss<sup>3</sup>, Dwayne Marsh<sup>1</sup>, Scott Cutler<sup>1</sup>, Jamie Crinion<sup>1</sup>

Inland Imaging - Spokane, WA<sup>1</sup>

Providence Sacred Heart Medical Center - Spokane, WA<sup>2</sup>

Washington State University - Elson S. Floyd College of Medicine<sup>3</sup>

## Purpose and background

#### **Purpose**

- Standardization of initial management of suspected intussusception
- Increase diagnostic confidence of sonographers and radiologists in pediatric exams, including intussusception

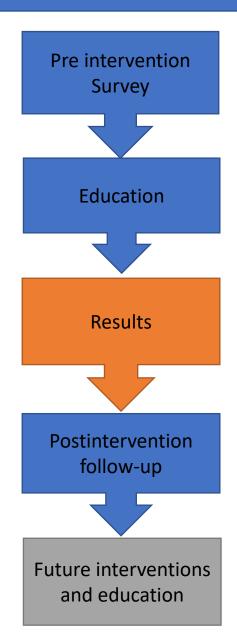

### **Background**

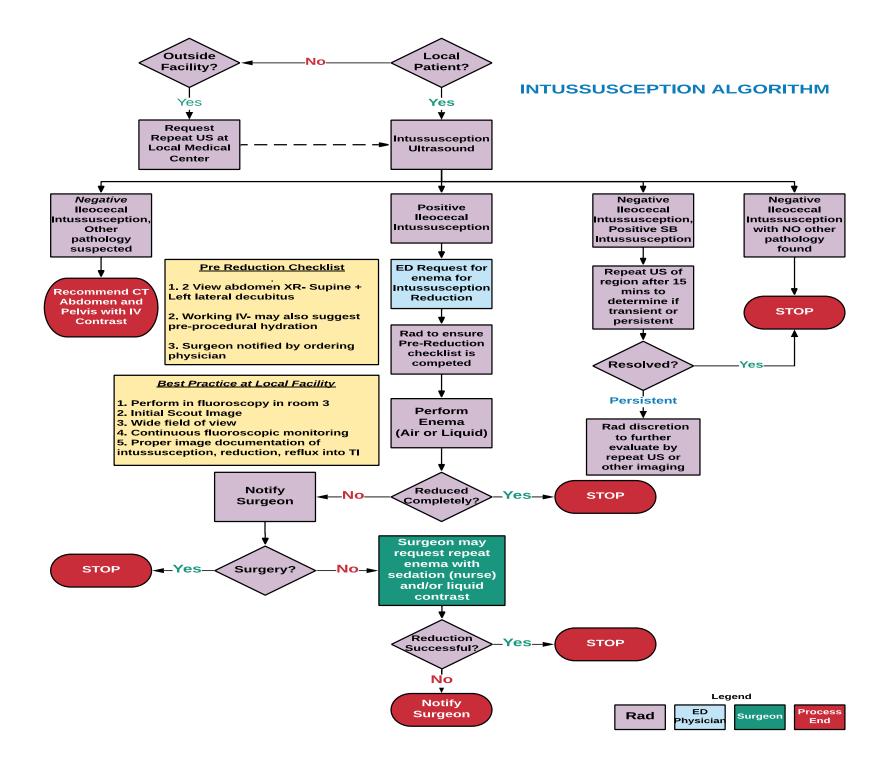

- Ileocolic intussusception is a common pediatric abdominal emergency typically diagnosed by ultrasound
- In our community practice, the exam is performed by a nonspecialized sonographer and may be interpreted by a pediatric or non-pediatric radiologist, depending on availability

### **Methods**

- Pre intervention survey including both radiologists and sonographers regarding exposure, knowledge, and confidence in imaging pediatric patients, including intussusception
- Case-based CME presentation for sonographers and radiologists through didactic slides and videos summarizing imaging techniques, common findings, and the new reporting templates and management algorithm

# Radiologist template

 In-house design for streamlined communication between sonographers and radiologists

EXAM DESCRIPTION:
ULTRASOUND ABDOMEN LIMITED FOR INTUSSUSCEPTION
CLINICAL INFORMATION:
Abdominal pain.
COMPARISON:
None.
PROCEDURE:
Grayscale imaging of the periphery of the abdomen was performed assessing for intussusception. Solid organs not interrogated.
FINDINGS:
Persistent intussusception [is/is not] identified.
Location: []
Diameter: []
Length: []
Simple free fluid: []
Complex free fluid: []
Small bowel appearance: []
Large bowel appearance: []
Other findings: []
IMPRESSION:
No ileocolic intussusception.
Criteria for ileocolic intussusception: Bowel-in-bowel appearance with diameter of 2.0 cm or greater. A smaller diameter likely represents incidental transient small bowel intussusception or other pathology.
Presence of significant free fluid and small bowel thickening suggest process other than intussusception.  Appendicitis or other pathology should be considered.
Colonic wall thickening and/or dilation cugacite process other than intercuscentian. Colitic or other nathology

should be considered

## Sonographer education

 Detailed instructions for the entire imaging process, from techniques to image collection and pathologic features

### Inland Imaging

## Radiologist education

 Narration of ileocolic and small bowel-small bowel intussusception with key findings

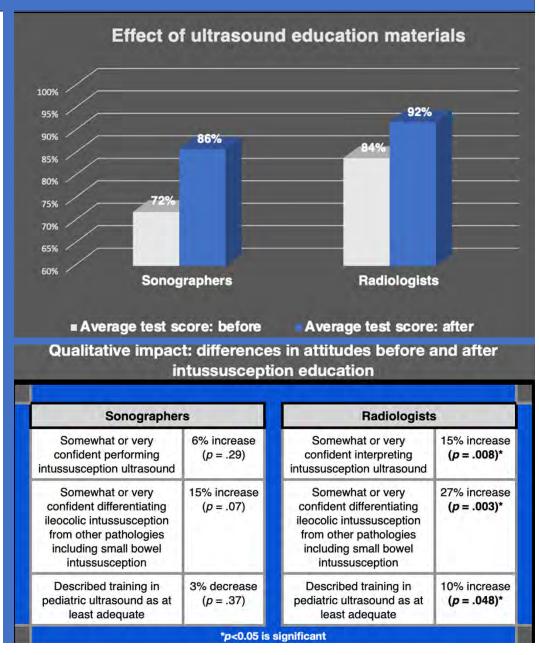

### Results

- Test scores improved following entire set of education materials (cranial, pylorus, intussusception, appendix)
- Radiologists reported significantly increased confidence in interpretation and felt training was adequate
- There was a lack of significant improvement in sonographers; this may be due to infrequent exposure to live cases and overall pediatric training
- Narrative feedback described an improved understanding of smallbowel-small bowel and ileocolic intussusception and common pitfalls

### Conclusion

- Internal CME with didactic and video-based instruction is an effective method for practice improvement
- Practice-wide confidence in diagnosis and management of ileocolic intussusception has increased
- Sonographers formed a pediatric study group in response to the survey results and are seeking additional hands-on opportunities in pediatric imaging
- Future
  - Quantitative comparisons of cases before and after education
  - New education interventions for other pathologies
