Lan-chau T. Kha, MD, MSc (*Abstract Co-Author*) Nothing to Disclose
Asutosh Sahu, MBBS, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

This educational exhibit will illustrate the cardiac and thoracic complications associated with new cancer agents such as immune checkpoint inhibitors (ICI). These treatments allow for substantial survival benefits in patients previously treated as palliative. However, treatment comes with an increased risk of cardiovascular and pulmonary side effects.
- Familiarize the reader with common cardiac and pulmonary complications resulting from cancer therapies with ICI, including immune myocarditis, pericardial diseases, pneumonitis, pulmonary embolism etc.
- To discuss the value of CT and MRI in identifying and differentiating between complications.
- To describe the range and overlap of critical imaging features based on specific clinical case scenarios.

**TABLE OF CONTENTS/OUTLINE**

- Background of cardiac and pulmonary toxicities:
- Epidemiology
- ICI drugs and common side effects
- Value of imaging with CT and MRI in the detection and monitoring of complications.
- Cardiac and thoracic side effects are illustrated by case examples.
- The role of radiologist in a multidisciplinary team:
- The importance of multidisciplinary collaboration in managing affected patients.

## CAEE-40 INTERSECTING VISTAS: CORONARY AND PULMONARY ARTERY FISTULAS IN CARDIAC CT IMAGING

Ali F. Tekin, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

This presentation aims to delineate various manifestations of a coronary artery - pulmonary artery fistulas (CPAFs) and assess their possible hemodynamic consequences. Additionally, it highlights the critical role of coronary CT angiography (CCTA) in identifying these uncommon vascular anomalies, illustrated through several CT imaging examples.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction to coronary artery - pulmonary artery fistulas Coronary artery - pulmonary artery fistulas (CPAFs) are rare vascular anomalies that create an abnormal connection between the coronary arteries and the pulmonary artery, bypassing the myocardial capillary network. 2. Coronary CT angiography (CCTA) Imaging Coronary CT angiography (CCTA) is a non-invasive, precise imaging technique crucial for diagnosing CPAFs. It requires a controlled heart rate, achieved through medications, and uses advanced imaging technologies to detail the fistula's characteristics. CCTA employs either prospective or retrospective ECG-triggered acquisition methods depending on the patient's heart rhythm stability. 4. ConclusionsIn conclusion, CCTA's role in diagnosing CPAFs has become more critical with its ability to detect these anomalies incidentally, emphasizing the need for radiologists to be proficient in using this technology for effective diagnosis and management.

## CAEE-41 ULTRASOUND IN CARDIOPULMONARY RESUSCITATION: HOW TO APPLY THE C.A.U.S.E PROTOCOL?

Izabela Camuri Firmino Carlos (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Point-of-care Ultrasound (POCUS) is a methods of evaluating patients at the bedside during cardiac arrest to enable an efficient response and the CAUSE (Cardiac Arrest Ultrasound Exam) protocol is a guide for the use of thoracic ultrasound in care for cardiac arrest in a non-shockable rhythm.- When applied correctly, the CAUSE protocol allows for the identification of potentially reversible causes, minimizing the time of cardiac arrest.- With the determination of a non-shockable rhythm through clinical history and monitoring, the use of ultrasound is indicated - through the subcostal, apical, pulmonary, and parasternal windows - which can provide an effective prognosis.- This review addresses techniques for identifying causes of cardiac arrest, such as pneumothorax, cardiac tamponade, pulmonary embolism, and hypovolemia.- The competence and training of the professional in using bedside ultrasound has the potential to increase clinical precision and significantly contribute to reducing morbidity and mortality in the emergency context.

**TABLE OF CONTENTS/OUTLINE**

- Introduction on using bedside ultrasound in the emergency context.- Evaluation of a literature review regarding the CAUSE protocol.- Discussion on the use of ultrasound during cardiac arrest with the aim of identifying potentially reversible causes.- Importance of mastering techniques for evaluating windows for a good prognosis.

## CAEE-42 BLOOD UNDER THE BRIDGE: IMAGE ASPECTS OF CORONARY ARTERY BYPASS GRAFT SURGERY AND STENTING

**Awards**
**Certificate of Merit**

Leonardo Rosolen Iunes, MD (*Abstract Co-Author*) Nothing to Disclose
Amanda Tenorio, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Coronary artery disease (CAD) is one of the main causes of death in the world and the management by means of coronary stenting and coronary artery bypass graft surgery (CABG) are well-established techniques.2. The assessment of coronary stents and myocardial revascularization plays a crucial role in post-procedural management and predicting patient clinical outcomes.3. Coronary CT angiography, a well-established technique in chronic CAD, offers a non-invasive and effective approach to this evaluation.4. This presentation aims to illustrate the role of CT angiography in assessing coronary stenting and CABG imaging, correlating them to conventional angiography, intravascular ultrasound, and optical coherence tomography.

**TABLE OF CONTENTS/OUTLINE**

1. Applied techniques of CABG and coronary stenting.2. Milestones in the evolution of percutaneous coronary intervention over the years.3. Techniques: CT angiography, conventional angiography, intravascular ultrasound, and optical coherence tomography - pros e cons.4. Coronary CT angiography protocols5. Coronary stenting:(a) Coronary anomalies(b) Restenosis and stent thrombosis(c) Coronary CT angiography-derived Fractional Flow Reserve testing (FFR-CT)(d) Artifacts: blooming and beam hardening(e) Complications6. CABG:(a) Types: arterial and venous(c) Complications7. Miscellaneous and other findings8. Sample cases of pearls, pitfalls, diagnostic difficulties, and mimics.9. Future directions: artificial intelligence10. Summary and take-home messages.

## CAEE-43 CT AND CMR IN AORTIC VALVE DIASESE: THE ULTIMATE GUIDE

**Awards**
**Certificate of Merit**

Javier Royuela (*Abstract Co-Author*) Nothing to Disclose
Prabhakar Rajiah, MD, FRCR (*Abstract Co-Author*) Nothing to Disclose
Antonio Luna, MD, PhD (*Abstract Co-Author*) Speaker, General Electric Company
Rob J. van der Geest, PhD (*Abstract Co-Author*) Nothing to Disclose
Pankaj Garg (*Abstract Co-Author*) Nothing to Disclose
Javier Sanchez, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Jordi Broncano, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. To evaluate the role of CMR in the evaluation of aortic valve disease, main sequences, protocol design and implementation in clinical practice. 2. To review the main CMR derived imaging biomarkers in aortic stenosis, aortic regurgitation, bicuspid aortic valve (BAV) as well as the repercussion in left side cardiac chambers and prognosis.

**TABLE OF CONTENTS/OUTLINE**

1. Aortic valve disease (AVD). Definition and epidemiology.2. Cardiac imaging in AVD. Role of CT and CMR2.1. CT acquisition and post-processing2.1.1. CMR Basic sequences: 2.1.2. Cine SSFP and SPGR2.1.3. 2D - Phase contrast imaging2.1.4. Late gadolinium enhancement2.2. Advanced sequences: 2.2.1. Accelerated cine SSFP/3D cine SSFP2.2.2. 4D flow imaging2.2.3. Parametric mapping2.3. CMR protocoling: From conventional to fast - MRI protocols3. Severity grading: 3.1. Aortic valve area3.2. AV calcification. Role in Low Flow Low Gradient aortic stenosis.3.3. Peak velocity and gradient3.4. Regurgitant volume and fraction3.5. Valve tracking and Conservation Mass Principle3.6. Assessment of multivalvular heart disease4. AVD related aortopathy5. Myocardial involvement in AVD (Valvular heart disease)6. AV tumor - like lesions7. AV neoplasms8. Multimodality imaging in AV disease and prognostic factors9. Conclusions

## CAEE-44 GAPS IN THE HEART: ATRIAL SEPTAL DEFECTS REVISITED

**Awards**
**Certificate of Merit**

Lorna Browne, MD, FRCR (*Abstract Co-Author*) Nothing to Disclose
Daniel Vargas, MD (*Abstract Co-Author*) Nothing to Disclose
Daniel Ocazionez-Trujillo, MD (*Abstract Co-Author*) Nothing to Disclose
Carlos S. Restrepo, MD (*Abstract Co-Author*) Nothing to Disclose
Camila Urzua Fresno, MD, MSc (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1) Understand the steps in the development of the interatrial septum and its relationship with the anatomic location of the different types of ASDs2) Name and identify the different types of morphologic and physiologic ASDs3) List the most common associated anomalies seen with the different types of ASD4) Describe the different modalities used to characterize ASDs, their advantages and disadvantages, and identify basic imaging protocols for CT and MR imaging of ASD5) Identify the relevant measurement, anatomical relations, and pertinent anomalies or lack thereof to include in the radiology report for pre-procedural assessment of ASDs, and the post-procedural / post-operative appearances of ASD closure.

**TABLE OF CONTENTS/OUTLINE**

Review of embryology, anatomy, and physiology of ASDASD classification and imaging findingsScanning parameters and recommendations for CT and CMRTroubleshooting and pitfallsPre-procedural / pre-operative assessmentPost-operative evaluationAssociated anomaliesFuture directions

## CAEE-45 DECODING THE MAP OF THE HEART: CMR PARAMETRIC MAPPING SEQUENCES FOR MYOCARDIAL TISSUE CHARACTERIZATION

Manuel Rafael Lopez De La Torre Carretero (*Abstract Co-Author*) Nothing to Disclose
Ana Ezponda, MD (*Abstract Co-Author*) Nothing to Disclose
Pablo Del Nido Recio (*Abstract Co-Author*) Nothing to Disclose
Carmen Mbongo, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To describe the fundamentals of parametric mapping methods in CMR and their clinical applications.To review and illustrate the role of T1 and T2 mapping in the characterization and assessment of different cardiomyopathies through different cases.

**TABLE OF CONTENTS/OUTLINE**

Cardiovascular magnetic resonance (CMR) is the gold standard imaging modality for myocardial tissue characterization. The development of native parametric mapping sequences has allowed a change from visual to quantitative evaluation of the myocardium. Absolute native T1 and T2 mapping values are particularly useful in detecting diffuse alterations (interstitial oedema or fibrosis), especially when the rest of the CMR protocol shows no significant findings.1. Brief review of technical aspects of sequence acquisition and imaging protocol.2. Tips for adequate interpretation of T1 and T2 parametric mapping sequences.3. Clinical applications. Although changes of T1 and T2 mapping values are not disease-specific, they indicate alteration in myocardial tissue composition and may serve as diagnostic and prognostic tools in the context of a specific clinical scenario.Acute myocardial injury- Acute coronary syndrome with obstructive coronary disease.- Troponin-positive non-obstructive coronary artery disease (TpNOCA). Infiltrative cardiac diseaseDiffuse global fibrosisCardiac massesParametric T1 and T2 mapping sequences increase the diagnostic capabilities of CMR by quantifying both focal and diffuse alterations in myocardial tissue. Changes in these parameters represent valuable biomarkers for making diagnosis, determining prognosis and monitoring therapy

## CAEE-46 BASICS OF NONINVASIVE FRACTIONAL FLOW RESERVE (FFR) CT, PLAQUE ANALYSIS AND PLAQUE QUANTIFICATION - CURRENT TRENDS IN CORONARY CT EVALUATION

Camila Urzua Fresno, MD, MSc (*Abstract Co-Author*) Nothing to Disclose
Daniel Vargas, MD (*Abstract Co-Author*) Nothing to Disclose
Ranish D. Khawaja, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Basics of FFR-CT analysis for the radiologists and cardiac imagers.- Role of FFR-CT can help improve diagnostic ability to assess for stenosis with most clinical impact.- Case examples to show-case various lesions identified on CT with their correlation on FFR-CT (easy to moderate level of complexity with interactive features).

**TABLE OF CONTENTS/OUTLINE**

- Discussion of the basic physiology and methodology of noninvasive fractional flow reserve (FFR-CT) technology.- Discussion of the role FFR-CT in evaluation of cardiac CT examinations in the current practice, and discuss the limitations.- Discussion of plaque burden, plaque morphology and plaque quantification using the CT data for characterization of plaque.- Showcase interactive CT-FFR cases and correlation with the CT-imaging to help navigate high-risk lesions, and complex cases.

## CAEE-48 RIGHT AT HEART: IMAGING INSIGHTS INTO THE TRICUSPID AND PULMONIC VALVES

**Awards**
**Certificate of Merit**

Katherine A. Kaproth-Joslin, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Lianne Mulvihill (*Abstract Co-Author*) Nothing to Disclose
John Piserchio, MD (*Abstract Co-Author*) Nothing to Disclose
Aaron Shang (*Abstract Co-Author*) Nothing to Disclose
Farhan Bajwa (*Abstract Co-Author*) Nothing to Disclose
Brian Nguyen, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1) Review the epidemiology of tricuspid and pulmonic valve disease, including congenital and acquired (both primary and secondary) causes. 2) Discuss the morbidity and mortality of right-sided valvular disease in recognition of its importance as an independent, often-overlooked clinical entity. 3) Provide an overview of structural and functional assessment of the normal tricuspid and pulmonic valves. 4) Discuss the relative advantages and disadvantages of echocardiography, CT, and cardiac MR for the purpose of right-heart valve evaluation. 5) Discuss the imaging findings associated with pulmonic and tricuspid regurgitation and stenosis. 6) Review interesting cases of right heart valve disease including: carcinoid syndrome, rheumatic disease, endocarditis, and Ebstein anomaly. 7) Review current treatment options for the tricuspid and pulmonic valves as well as post-treatment imaging findings.

**TABLE OF CONTENTS/OUTLINE**

1) Introduction and epidemiology of tricuspid and pulmonic valve disease2) Morbidity and mortality3) Congenital and acquired etiologies4) Normal structure and function 5) In situ anatomy with illustration 6) Normal appearance and planes on echocardiogram, CT, MR7) Advantages and disadvantages of echo, CT, MR 8) Quantification of normal function 9) Defining tricuspid and pulmonic regurgitation/stenosis10) Case review: Acquired causes e.g. Carcinoid syndrome, Endocarditis 11) Case review: Congenital causes e.g. Ebstein anomaly, Tetralogy of Fallot12) Brief overview of surgical and catheter-based interventions 13) Post treatment imaging appearances

## CAEE-49 READING THE SURGEON'S INTENT: DISCERNING INTENTIONAL FROM UN-INTENTIONAL IN THE POST-OPERATIVE COMPLEX CONGENITAL HEART DISEASE PATIENT

Sayedomid Ebrahimzadeh, MD (*Abstract Co-Author*) Nothing to Disclose
Jonathan A. Liu, MD (*Abstract Co-Author*) Nothing to Disclose
Hannah Ahn, MD (*Abstract Co-Author*) Nothing to Disclose
Shravan Sridhar, MD, MS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Imaging of the post-operative congenital heart disease patient can be difficult even for radiologists who routinely read these exams. Having a framework to recognize atypical but intended post-surgical changes ensures diagnostic accuracy and informs approach to detecting complications. Here, we present concepts underlying atypical appearances following congenital heart surgery including intentional post-surgical and physiologic changes that mimic pathology and address where an atypical appearance could be pathologic but still intentional (risk vs benefit dilemma), reviewing complications/pitfalls where appropriate.

**TABLE OF CONTENTS/OUTLINE**

1. Title, disclosure2. Abbreviations3. Overview4. Operations + timelinea. PA band in initial palliation vs branch PA stenosisb. Post-op appearance aortic atresia vs DKS anastomotic stenosisc. ASD in single vs BiV repaird. VSD in single vs BiV repaire. mBTT ligation vs occlusionf. RV-PA conduit stump vs pseudoaneurysmg. PDA maintenance vs abnormal patencyh. Fontan types atriopulmonary vs extracardiaci. Fontan fenestration vs baffle leakj. Unifocalization MAPCAs vs pulmonary veins5. Physiology and natural coursea. Absent Fontan conduit in 1.5V repair vs azygos/hemiazygos continuation of IVC vs BiV conversionb. Occluded hepatic-PA conduit + collaterals vs acute Fontan thrombosisc. RA baffle distension vs chamber dilationd. Transannular patch distension vs RVOT pseudo/aneurysm6. The surgeon's dilemma of risk vs benefita. Shunts with Qp:Qs < 1.5b. Pulmonic valve regurgitation, RV EDVI and RVHc. RPA band post-Fontan vs bilateral PA bands unrepaired TOFd. Aortic mycotic pseudoaneurysm7. Case summary8. Summary: Operative timeline9. References

## CAEE-5 IMAGING OF ADULT PRESENTATION OF UNTREATED CONGENITAL HEART DISEASE-EXPECT THE UNEXPECTED

Ameya J. Baxi, MBBS,DMRD (*Abstract Co-Author*) Nothing to Disclose
Daniel Vargas-Zapata, MD (*Abstract Co-Author*) Nothing to Disclose
Carlos S. Restrepo, MD (*Abstract Co-Author*) Nothing to Disclose
Vijay K. Aggarwal, MBBS (*Abstract Co-Author*) Nothing to Disclose
Dhruti Maisuri, MD, MBBS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Prevalence of congenital heart disease(CHD) in adults has increased and currently adults more than children have these malformations.2. Most common undiagnosed adult CHD includes bicuspid aortic valve, aortic coarctation, occult shunts (VSD, ASD, PFO, PDA) and uncomplicated tetralogy of Fallot.3. The spectrum of imaging findings of previously undiagnosed congenital heart disease in adults will be discussed.4. Multimodality imaging provides comprehensive assessment of morphology and function including flow analysis from the central to the more peripheral vasculature.5. Common pitfalls in evaluation of adult heart structure on CT/MRI will be reviewed.

**TABLE OF CONTENTS/OUTLINE**

Occasionally, radiologists are confronted with late presentation of undiagnosed or untreated congenital heart disease in the adult patient. Conditions like bicuspid aortic valve, coarctation, occult shunts, (ASD, VSD PDA) may represent up 10% -of all congenital cardiac anomalies. Rarely anomalous venous return, tetralogy of Fallot, congenitally corrected L-transposition of great vessels, Ebstein's anomaly, cor-triatrium may also be seen with late presentation in life. Functional assessment of the right heart represents an important aspect of imaging in ACHD patients. CT scan with excellent temporal and spatial resolution is an excellent imaging modality for assessing heart structure. MRI provides comprehensive functional information for both cardiac chambers and vasculature. It is important for the radiologists to be able to recognise common undiagnosed congenital heart disease in adult patient, even as an incidental finding.

## CAEE-50 CHALLENGING ANATOMIC AND PATHOLOGIC FEATURES FOR TAVR PROCESSING: PEARLS AND PITFALLS FROM THE 3D IMAGING LABORATORY

Frank J. Rybicki III, MD, PhD (*Abstract Co-Author*) Medical Director, Imagia Cybernetics Inc
Michael F. Morris, MD (*Abstract Co-Author*) Educator, Medtronic plc
Kimberly Hatch, ARRT, BA (*Abstract Co-Author*) Nothing to Disclose
Richard L. Hallett II, MD (*Presenter*) Consultant, Bracco Group

**TEACHING POINTS**

3D segmentation and post-processing of CT datasets is essential for safe and successful transcatheter aortic valve replacement (TAVR) procedural planning. High quality 3D Imaging Laboratory output contributes to shortened procedural times, improved patient safety, and supports excellent clinical outcomes.This presentation will: Review challenging anatomic, pathologic, and iatrogenic findings that may be encountered during 3D processing for TAVR planning. Provide practical processing techniques to overcome challenging and/or unexpected anatomy and generate highly accurate output for TAVR procedural planning. Examples include annular sizing, coronary anatomy, bicuspid aortic valve / aortic root / LVOT geometry, and challenging access considerations. Review processing pitfalls that may adversely impact processing output and procedural success.

**TABLE OF CONTENTS/OUTLINE**

A. Aortic valve / root / LVOT considerations: 1. Bicuspid aortic 2. Valve Valve in Valve (ViV) 3. Valve in TAVRB. Challenging annular configurations: 1. Subannular / LVOT calcification and alterationC. Coronary artery challenges: 1. coronary height, origin, and courseD. Access Considerations: 1. Aortic pathology 2. Iliofemoral segment pathology 3. Subclavian / carotid artery pathology 4. Direct access (aorta, LV apex)

## CAEE-51 HEMOPERICARDIUM: CASE BASED REVIEW OF POTENTIAL ETIOLOGIES AND KEY IMAGING FINDINGS

**Awards**
**Certificate of Merit**

Larry A. Latson JR, MS,MD (*Abstract Co-Author*) Nothing to Disclose
Geraldine T. Brusca-Augello, DO (*Abstract Co-Author*) Nothing to Disclose
Joanna G. Escalon, MD (*Abstract Co-Author*) Research Consultant, Vingroup
David Jones (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Hemopericardium is the accumulation of blood in the pericardial space. It often signals a life-threatening event and finding the source of bleeding is essential in expediting appropriate care. Furthermore, depending on the rate of accumulation, hemopericardium in and of itself can be fatal due to the development of cardiac tamponade. In order to quickly make this essential diagnosis, the radiologist must be familiar with the imaging findings of hemopericardium and tamponade and the potential causes.

**TABLE OF CONTENTS/OUTLINE**

1. Imaging findings of hemopericardium and tamponade. 2. Case-based review of the causes of hemopericardium including associated key imaging features and associated findings, including: (A) Acute vascular disease - i. ruptured aortic dissection, ii. ruptured myocardial infarction, (B) Iatrogenic - i. pacemaker perforation, ii. Mediport malposition, iii. Post-CABG; (C) Post-traumatic - i. cardiopulmonary resuscitation; (D) Other - i. pericarditis, ii. malignancy, iii. anti-coagulation therapy.

## CAEE-52 TIPS AND TRICKS TO AVOID PITFALLS IN INTERPRETATION OF CORONARY CT ANGIOGRAPHY

**Awards**
**Certificate of Merit**

Baskaran Sundaram, MD (*Abstract Co-Author*) Nothing to Disclose
Prabhakar Rajiah, MD, FRCR (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. To highlight key pitfalls that are encountered in coronary CTA interpretation 2. To illustrate the recognition of these pitfalls using representative case examples

**TABLE OF CONTENTS/OUTLINE**

1. False negative stenosis a) Non-calcific plaque not obvious in axial plane, e.g. left main- Use orthogonal, MIP, VR b) Plaque ignored as partial voluming (mid LAD, distal RCA)- Use orthogonal plane c) "Blind spots", LAD near diagonal, LCx near OM, RCA near PDA- Thin MIPs d) Small vessels- thin slice, sharp kernels e) Bypass graft landing zone, runoff f) Stent with distal contrast- Contrast attenuation in stent g) Subtle/absent stenosis- Evaluate regional wall motion/ perfusion defect 2. False positive stenosis a) Ghosting- Absent in another cardiac phase b) Misregistration - Confirm in another plane and phase c) Low attenuation in vessel without plaque - Confirm absence of plaque d) Low attenuation of beam hardening of calcified plaque e) Dense calcified plaques- Curved MPR 3. Overestimation of stenosis a) Using single cross sectional plane-Orthogonal views, cMPR b) Quantifying outer-to-outer diameters instead of inner-to-inner diameters- remodeling c) Using tiny distal vessel beyond bifurcation as reference d) Calcium blooming -wider window, sharper kernel, thinner slices, 100 keV VMI e) Poor contrast enhancement- Different windowing (e.g 700/250) f) Intense contrast enhancement- Different windowing (1000/200) 4. Underestimation of plaque a) Calcified plaque in contrast CT b) Motion 5. Strategies to avoid pitfalls a) Systematic review b) Multiple reconstruction techniques- MPR, cMPR, MIP, VR c) Multiple planes- Axial, orthogonal, longitudinal, cross-sectional

## CAEE-53 CT GUIDANCE FOR PERCUTANEOUS CORONARY ARTERY INTERVENTIONS

**Awards**
**Certificate of Merit**

Prabhakar Rajiah, MD, FRCR (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. To review the expanding role of CT in the guidance of percutaneous coronary interventions (PCI) 2. To discuss the role of CT in determining suitability for PCI 3. To highlight the utility of CT in cath lab resource optimization and real-time guidance

**TABLE OF CONTENTS/OUTLINE**

A. Need for PCI 1) Stenosis severity 2) Flow-limiting stenosis- FFRct/CTperfusion(CTP) B. Suitability for PCI 1) Focal lesion + FFRct < 0.8 2) FFRct virtual planner 3) FFRct virtual pullback C. Planning PCI 1) Risk-stratification- High-risk plaque increases MI, no-reflow 2) Coronary ostial origin- Atypical position needs different catheters 3) Anomalies- Change approach 4) Proximal lesion- deep cannulation obscures lesion 5) Optimal fluoroscopy angles for specific segments 6) Lesion length- Stent sizing 7) Extensive calcifications-need lithotripsy/atherectomy 8) Soft plaque at landing zone- dissection risk 9) Ostial lesions- Precise demarcation 10) Bifurcation lesions-Side branch demarcation, virtual FFRct, subtended myocardium 11) 3D calcium model- planning additional procedures 12) Wire simulator D. Real-time procedural guidance Fusion of 3D CT plaque map E. Planning complex multivessel CAD 1) CABGvsPCI, CT-SYNTAX 2) Lesion severity,length,focality 3) Landing zone, run off 4) Calcification 5) CTP- subtended myocardium, scar 6) LAD-D1 distance-sequential graft 7) RIMA,LIMA 8) Redo CABG- sternal relationships, aortic calcification F. Planning Chronic total occlusion 1) Poor outcome predictors- > 15 mm long, calcification > 5.5 mm / > 50 % of area, shrinkage, bend angle > 45° 2) Risk scores- JCO,CT RECTOR,KCCT G. Planning for redo revascularization 1) Repeat PCI- CTP for defect 2) PCI after CABG- CTA improves procedure planning

## CAEE-54 UTILITY OF CT IN TRANSCATHETER CLOSURE OF PARAVALVULAR LEAKS

**Awards**
**Certificate of Merit**

Prabhakar Rajiah, MD, FRCR (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. To review the etiology and pathophysiology of paravalvular leaks (PVL) 2. To understand the utility of CT in evaluating these patients 4. To illustrate the important CT measurements and clinical significance 5. To review the CT findings of common complications after PVL closure

**TABLE OF CONTENTS/OUTLINE**

Table of contents 1. Paravalvular leaks a) Etiology- Suture dehiscence, endocarditis, inflammation, degeneration b) Symptoms- CHF, hemolysis 2. Role of multimodality imaging in diagnosis and management a) Echo-limitations b) MRI- limitations c) CT 3. CT protocol- Retrospective ECG gating, delayed phase, non con 4. CT for diagnosis a) Diagnostic criteria b) Pitfalls- surgical material, metals, small c) Differentials-pseudoaneurysm, abscess 5. Management a) Indications for closure- symptoms, significant PVL b) Transcatheter vs surgical c) Transcatheter- high surgical risk, suitable anatomy 6. Devices for PVL closure- Vascular, ductal or septal occluder devices- Amplatzer vacular plug (I, II) 7. Access routes- Transeptal, transapical, retrograde arterial 8. Role of CT in planning PVL closure a) No acoustic shadows or artifacts b) Higher temporal resolution than 3D color doppler c) Characterization d) Most valuable in complex tract 9. CT parameters a) Location - Clockface position- Mitral anteromedial (10/11 o clock) or posterolateral (5/6 o clock) b) Size c) Shape d) Course e) Tract f) Fluoroscopic angles g) Contraindications- Infection, abscess, rupture 10. 3D printing a) Virtual device placement 11. Procedure technique - CT fluoro fusion 12. Follow-up protocol 13. Post-procedural CT- Normal appearances 14. Complications- Device migration, recurrent leak, infection, rupture 15. Conclusion

## CAEE-55 MYOCARDIUM IN DISARRAY: THE BASIC PHYSIQUES OF HYPERTROPHIC CARDIOMYOPATHY AND BEYOND

Jose A. Maldonado, MD (*Abstract Co-Author*) Nothing to Disclose
Ellis D. Mejias Febres, BS (*Abstract Co-Author*) Nothing to Disclose

Alejandro M. Linera Asencio, MD (*Abstract Co-Author*) Nothing to Disclose
Alejandro Acosta (*Abstract Co-Author*) Nothing to Disclose
Kevin Hornedo, BS (*Abstract Co-Author*) Nothing to Disclose
Santiago A. Saldana Mendez, MD, BS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

A. Review the pathophysiology and clinical picture of Hypertrophic Cardiomyopathy (HCM). B. Discuss HCM diagnosis and cardiac magnetic resonance imaging (MRI) findings C. Provide an overview of the different HCM morphologies including epidemiology, prognosis, and treatment implications. D. Examine late gadolinium enhancement (LGE) quantification analysis E. Highlight additional key imaging findings for optimal risk stratification for Sudden Cardiac Death (SCD).HCM is one of the leading causes of SCD among young people. The degree and pattern of left ventricular wall thickening have implications that impact the clinical course of patients with HCM. Our goal is to provide radiology trainees, radiologists, and clinicians an overview of the different phenotypes of HCM. We will do so by using cardiac MRI case examples, while highlighting the indispensable role of cardiac MRI in the assessment of HCM. We will also examine the pivotal role of LGE quantification analysis and other key imaging findings for optimal risk-stratification for SDC.

**TABLE OF CONTENTS/OUTLINE**

I. Introduction Objectives II. HCM A. Pathophysiology Clinical presentation B. Diagnosis C. Cardiac MRI Imaging findings III. Overview of HCM phenotypic presentations A. Prevalence, epidemiology, prognosis, and treatment B. MRI case examples IV. Examine LGE Quantification Analysis V. Risk-Stratification for SCD VI. Discuss the role of cardiac MRI VII. Conclusion

## CAEE-56 UNDERSTANDING EXERCISE CMR: A REVIEW OF ITS QUALITIES, METHODS AND CLINICAL APPLICATIONS

Ming-Yen Ng, BMBS, FRCR (*Abstract Co-Author*) Education Grant, General Electric Company;Education Grant, Bayer AG;Education Grant, Circle Cardiovascular Imaging Inc;Education Grant, TeraRecon, Inc;Education Grant, Arterys Inc;Speakers Bureau, Boehringer Ingelheim GmbH
Calvin Chin (*Abstract Co-Author*) Nothing to Disclose
Jeffrey Chit Wai Chan (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Understanding the (1) Roles of exercise CMR (Ex-CMR), its principles, and how Ex-CMR compares against other forms of stress tests. (2) Different types of Ex-CMR, their respective strengths and limitations. (3) How Ex-CMR is performed, challenges associated with acquiring images and safety considerations associated with exercise stress testing. (4) Clinical applications of Ex-CMR in terms of diagnosing coronary artery disease (CAD) and differentiating between dilated cardiomyopathy (DCM) and exercise-induced cardiac remodeling (EICR). (5) Interpreting the results of Ex-CMR using real case examples.

**TABLE OF CONTENTS/OUTLINE**

(1) Overview: An overview of Ex-CMR, including the principles behind it, the different forms of Ex-CMR and their respective strengths and limitations, and an evaluation of the strengths and limitations of Ex-CMR compared against other methods. (2) Performing the scan: the typical protocol for Ex-CMR is explained. We also explain the challenges in Ex-CMR in terms of achieving an adequate spatial-temporal resolution with free breathing sequence, with an example scan to illustrate the point. Safety considerations including contraindications to Ex-CMR and indications for test termination are overviewed. (3) Clinical applications: we review the clinical applications of Ex-CMR using 2 examples: diagnosing CAD and differentiating between DCM and EICR in athletes. (4) Case examples: we present 2 case examples to illustrate the aforementioned clinical applications of Ex-CMR with annotated and labeled scans and an explanation of how the scans are interpreted. (5) The future of Ex-CMR: a brief overview of the future developments related to Ex-CMR is presented.

## CAEE-57 LATE GADOLINIUM ENHANCEMENT FINDINGS IN HOSPITALIZED COVID-19 PATIENTS: A FOCUS ON THE POST-ACUTE PHASE

Cagdas Topel, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To demonstrate late gadolinium enhancement (LGE) findings in 12 patients who underwent cardiac magnetic resonance (CMR) during the peak phase of the COVID-19 pandemic

**TABLE OF CONTENTS/OUTLINE**

1. Introduction to cardiovascular impact of COVID-19 infection• Recent studies indicate that 26% to 60% of hospitalized COVID-19 survivors show CMR abnormalities, such as functional impairment, myocardial injuries, late gadolinium enhancement, or pericardial abnormalities.2. Literature review of the LGE findings in patients with COVID-19• A wide range of "myocarditis-like" or "ischemic-like" LGE patterns can be found.3. LGE features in different phases of myocardial injury• Presentation of cases with various LGE findings at different stages.4. Conclusions• A variety of LGE patterns were found in patients with a history of hospitalization due to COVID-19.• LGE can be observed after the acute phase of the disease, with normalized T1, T2 and extracellular volume (ECV) fraction.

## CAEE-58 MYOCARDIAL STRAIN - A PRACTICAL APROACH

Javier Alarcon Rodriguez, MD (*Abstract Co-Author*) Nothing to Disclose
Noelia Bravo Alcobendas, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

After reviewing this exhibit, the reader should: -Understand the concept of cardiac strain, its correlation with cardiac anatomy, and its significance in the pathophysiology of the cardiac cycle. - Comprehend the advantage provided by using cardiac strain over ejection fraction in the assessment of cardiac pathology. - Describing available techniques, their limitations, and the importance of strain assessment methods using MRI. -Be familiar with Fast-SENC sequences: Indications, technique application, postprocessing techniques. - Apply the acquired knowledge to real-life cases.

**TABLE OF CONTENTS/OUTLINE**

- Introduction - Pathophysiology - MRI techniques for strain assessment o Tagging o Feature tracking o Fast-SENC - Fast-SENC o Acquisition o Post-processing - Practical cases o Patients at risk of developing cardiotoxicity caused by anticancer treatment o Postinfectious heart failure: Chagas o Heart failure with normal FEVI parameters o Congenital cardiomyopathies o Other cardiac pathology - Conclusions

## CAEE-59 MALIGNANCY IN CONGENITAL HEART DISEASE

**Awards**
**Cum Laude**

Swati S. Mody, MD,MBBS (*Abstract Co-Author*) Nothing to Disclose
Aparna Joshi, MD (*Abstract Co-Author*) Nothing to Disclose
Michael Joynt (*Abstract Co-Author*) Nothing to Disclose

Jimmy C. Lu, MD (*Abstract Co-Author*) Nothing to Disclose
Tobias Else (*Abstract Co-Author*) Nothing to Disclose
Elizabeth Lee, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Cancer is more prevalent in patients with congenital heart disease (CHD) than the general population due to genetic and environmental risk factors including radiation exposure from imaging, genetic disorders, and alterations in physiology which promote tumorigenesis. 2. Cardiac hepatopathy increases the risk of hepatocellular carcinoma. Screening with US and alpha-fetoprotein levels in patients with single ventricle physiology, chronic heart failure and after Fontan palliation may help identify this complication. 3. Pheochromocytomas and paragangliomas develop in patients with cyanotic heart disease at higher rates than the general population and those with non-cyanotic CHD. 4. Genetic disorders can predispose to both CHD and tumors, for example Down syndrome (CHD risk and leukemia, testicular germ cell tumors). 5. Those patients receiving transplant for CHD are at elevated risk of various tumors including viral induced lymphomas as well as various solid organ tumors. 6. With increasing survival of patients into adulthood and the higher predisposition to cancer, adherence to screening is essential, although observational studies suggest lower screening rates in CHD patients.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction: Risk of tumors in CHD. 2. Factors which may contribute to increased risk of cancer in congenital heart disease: radiation exposure from diagnostic and therapeutic procedures, specific tumors related to CHD physiology (hepatocellular carcinoma, neuroendocrine tumors), genetic disorders predisposing to CHD and tumors, cancers which develop after cardiac transplant for congenital heart disease (lymphoma, solid organ tumors) 3. Screening for malignancy in CHD population

## CAEE-6 IMAGING REVIEW OF ACUTE CHEST PAIN WITH FOCUS ON CT AND MRI IN THE EMERGENCY SETTING

Thurl Cledera, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Acute chest pain is one of the most common complaints in the emergency department. Imaging with the help of proper clinical examination is a crucial component of evaluation in these patients. While ECG is mandatory in examinations for screening STEMI and NSTEMI, and chest radiography is a standard imaging examination, CT and/or MRI is valuable in the immediate detection or exclusion of a myriad of conditions presenting with acute chest pain. The appropriate choice of imaging test is affected by the suspected diagnosis and availability of the modality in question. This exhibit will present imaging modalities pertinent to acute chest pain and scenarios pertaining to acute coronary syndrome, cardiac, and noncardiac causes of chest pain. The objectives of this exhibit are: 1) To discuss current guidelines in assessing acute chest pain and how it intersects with the role of noninvasive imaging, 2) To review imaging features of cardiac and noncardiac causes of acute chest pain, and 3) To enable the radiologist to recommend appropriate imaging modalities and guide proper treatment

**TABLE OF CONTENTS/OUTLINE**

I. Introduction II. Acute Versus Stable Chest Pain III. Considerations in the Patient Presenting with Acute Chest Pain IV. Overview of Imaging Modalities A. Anatomic Testing B. Functional/Stress Testing V. Imaging Scenarios A. Acute Coronary Syndromes B. Myocardial Infarction with Nonobstructive Coronary Arteries (MINOCA) C. Prior CABG Surgery D. Suspected Myopericarditis E. Valvular Heart Disease F. Acute Aortic Syndrome G. Thromboembolism H. Noncardiac Causes VI. Teaching Points VII. Conclusion

## CAEE-60 PERICARDIAL PRIMER: AN IMAGING REVIEW OF ABNORMALITIES INVOLVING THE PERICARDIUM

Justin Sindoni, MD (*Abstract Co-Author*) Nothing to Disclose
Cristina Fuss, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Caroline Merriam, DO (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Describe normal pericardial anatomy and the expected appearance of the pericardium on CT and MRI.
- Review CT and MRI features of congenital, infectious, inflammatory, traumatic, and malignant pericardial abnormalities.
- For each pericardial abnormality, describe the associated clinical presentation, differential diagnoses, potential complications, and recommendations for next steps in management.Background: The pericardium is comprised of an inner visceral layer and an outer parietal layer, which create a potential space containing approximately 30-50mL of serous fluid. The pericardium surrounds the heart and great vessel origins, and normally measures less than 2mm in thickness. In addition to creating a physical barrier between the heart and lung pleura, the pericardium also regulates cardiac chamber pressures and optimizes cardiac motion. As a result, congenital and acquired pericardial abnormalities can be extremely detrimental to a patient's cardiovascular function. This exhibit will review the myriad of congenital, infectious, inflammatory, traumatic, and malignant abnormalities that can involve the pericardium. The goal of this exhibit is to expedite diagnosis and management of clinically significant pericardial pathologies seen on CT and MRI.

**TABLE OF CONTENTS/OUTLINE**

- Introduction
- Review of normal pericardial anatomy
- Discussion of expected appearance of the pericardium on CT and MRI
- Case-based review of pericardial pathologies, organized into the following broad categories:
- Congenital
- Infectious
- Inflammatory
- Traumatic
- Primary pericardial malignancy
- Pericardial metastasis

## CAEE-61 IMAGING OF CARDIAC DEVISE MIGRATION: A ROAD LESS TRAVELLED

**TEACHING POINTS**

To recognize various cardiac devices on radiological imaging. Discuss indication proper positioning of various cardiac device placement Detect malposition, complication, common pitfalls of device

**TABLE OF CONTENTS/OUTLINE**

In recent years, there is increase in the number of implanted cardiac devices. Device migration/complications associated with cardiac device can occur because of local erosion, excessive tension during deployment, inadvertent deployment, inappropriate device sizing or due to congenital or surgical/procedural defects. Multiple factors can contribute to delayed diagnosis of a migrated device, including lack of familiarity with the device, cognitive errors, radiographic technique. It may be challenging, but important to radiologist as how they appear on imaging, normal positions, complications. Radiologists must employ multiple strategies like comparing images with prior studies, reading recent relevant literature about interventional/surgical procedures implanted devices, and clinic notes. Radiologists play critical role in ensuring appropriate placement may be the first medical professionals to suggest unsuspected device migration. This review gives concise summary of various cardiac devices and complicationsAims/Objectives
- Introduction
- Pathology, role of imaging, imaging findings of malposition, complication, common pitfalls
- PICC line
- Pacemaker/ intracardiac defibrillator
- PCWP catheter
- ASD closure device
- Prosthetic aortic valve
- Prosthetic mitral valve
- Mitral valve clips
- TRANSCATHETER VALVES AND VALVE REPAIR
- Aortic stent
- Watchman device
- VENTRICULAR ASSIST DEVICES
- ECMO
- IMPLANTABLE LOOP RECORDER
- Miscellaneous
- Differential diagnosis
- Conclusion

## CAEE-62 CT CORONARY ANGIOGRAPHY FRACTIONAL FLOW RESERVE ($FFR_{CT}$) IN ASSESSMENT OF PATIENTS WITH CORONARY ARTERY DISEASE: A PRIMER FOR A RADIOLOGIST

Charit R. Tippareddy, MD (*Abstract Co-Author*) Nothing to Disclose
Amit Gupta, MD (*Abstract Co-Author*) Nothing to Disclose
Cody R. Johnson, MD (*Abstract Co-Author*) Nothing to Disclose
Syed Muhammad Awais Bukhari, MD (*Abstract Co-Author*) Nothing to Disclose
Benjamin Parker, MD, MS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1.To review how fractional flow is derived2.To review landmark clinical trials supporting the clinical usage of FFRCT3.To highlight clinical cases where FFRCT can influence management4.To highlight important limitations of FFRCT technology5.To discuss the future role and newer tools of non-invasive ischemia/plaque assessment

**TABLE OF CONTENTS/OUTLINE**

1) FFRCT: basics, workflow and reportinga. Computational flow dynamics and fractional flow reserve.b. FFRCT vs FFR Invasive -> pros and consc. Recommendations for interpretation of FFRCT results2) Literature supporting FFRCT in the clinical practicea. PRECISEb. TARGETc. FORECASTd. PLATFORMe. NXTf. DeFACTOg. DISCOVER-FLOW3) Clinical instances where FFRCT can augment diagnostic confidence and patient managementa. Borderline stenosis (50-70 %) on visual analysis.b. Isolated severe branch vessel disease.c. Heavily calcified coronary arteries.d. Tandem stenoses.e. Noninvasive preoperative clearance for coronary artery disease4) Limitations/Challenges of FFRCT analysis:a. Image Quality is central to study accuracy: Electrocardiographic (EKG) misregistration, Motion artifacts and increased noise precludes accurate assessment.b. Vessel Tortuosity, Stents and grafts.c. False positive results: Due to motion, suboptimal coronary vasodilatation and ventricular hypertrophy.d. False negative results: Due to motion, ultrashort segment plaque, manual segmentation error.e. Workflow and Reimbursement5) Future directionsa. Appropriate use of FFRCTb. Prediction of post-stenting FFRc. Plaque analysis

## CAEE-63 A PRACTICAL GUIDE TO IMPLEMENTATION OF PHOTON COUNTING DETECTOR CT (PCD-CT) IN CARDIAC IMAGING

**Awards**
**Certificate of Merit**

**TEACHING POINTS**

Explain unique technologic advantages of Photon Counting Detector CT (PCD-CT) that improve cardiac imaging Describe steps and provide key information for protocol development and optimization of imaging parameters specific to PCD scanners Discuss downstream challenges in image reconstruction, analysis and advanced post processing applications Demonstrate optimized cardiac imaging parameters through case review

**TABLE OF CONTENTS/OUTLINE**

Technologic advantages of PCD Ultra-high resolution (UHR) (0.2mm)- Small vessels, stents, plaques Multi energy (ME) (0.4mm) - High iodine signal, less artifacts, material characterization, k-edge Improved radiation dose efficiency Increased iodine contrast to noise ratio (CNR) Decreased noise Patient prep changes Protocol development Scan modes UHR (without ME)- Spiral (sequential-not preferred) Standard resolution with ME- Spiral with retrospective ECG gating, sequential, high-pitch helical Mode selection- indication, heart rate, heart rate variability, body habitus Tube potential selection Slice thickness/ interval Kernels- sharp vs smooth, body regular, body vascular, quantum regular Matrix- 512 vs 1024 Image types VMI- Single energy like (T3D) VMIs Virtual non-contrast Iodine map Virtual calcium removal Virtual non-iodine Auto post processing done at scanner increased efficiency Coronary calcium scoring Curved planar reformats of coronary arteries VR models of heart Downstream effects and challenges PACS - Image numbers, storage Advanced imaging 3D visualization FFRct 3D printing Plaque Analysis Artifacts- Noise in UHR mode, motion artifacts, artificial appearing images, edge enhancement Case review with optimized imaging parameters

## CAEE-64 30-MINUTE EXAM OF CARDIAC MAGNETIC RESONANCE IMAGING WITH DEEP LEARNING-BASED HIGHLY-ACCELERATED CARDIAC CINE AND SINGLE-SHOT MYOCARDIAL DELAYED ENHANCEMENT WITH DEEP LEARNING RECONSTRUCTION

Kunihiro Yoshioka, MD (*Abstract Co-Author*) Nothing to Disclose
Tsuyoshi Sugawara (*Abstract Co-Author*) Nothing to Disclose
Makoto Orii (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Society for Cardiovascular Magnetic Resonance offer a basic 30-min cardiac magnetic resonance (CMR) exam that answers many of the common clinical questions in cardiovascular practice (Figure 1). But in the real world, historic time slots of 60 min or longer hinder improved access to CMR. The total exam time can be reduced if high-quality 2D cine images can be collected post-contrast to minimize non-scanning time prior to myocardial delayed enhancement (MDE) imaging. Recent development of deep learning-based highly-accelerated cardiac cine (DL cine) has the potential to reduce scan time while preserving image quality (Figure 2). With the use of DL cine, 2D cine imaging can be performed after contrast injection during a waiting time for MDE imaging. Moreover, the diagnostic performance of DL cine pre- and post-contrast injection is expected to be comparable in terms of image quality and quantification of biventricular volume and function (Figure 3). Single-shot MDE (SSMDE) with deep learning reconstruction (DLR) could acquire each slice in a single heartbeat and allows for image acquisition of entire left ventricle in a few breath-holds (Figure 4). Several studies have reported that SSMDE with DLR provides similar diagnostic accuracy compared to conventional approach. Combined 2D DL cine and SSMDE with DLR, we could achieve a basic 30-min CMR exam with routine techniques that answers many of the common clinical questions (Figure 5).

**TABLE OF CONTENTS/OUTLINE**

Figure 1: Classical workflow of CMR. Figure 2: 2D DL cine. Figure 3: Comparison of pre- and post-contrast short-axis DL cine images of a patient with cardiac sarcoidosis. Figure 4: SSMDE with DLR. Figure 5: New 30-min workflow of CMR using DL cine and SSMDE with DLR.

## CAEE-65 THE IMPACT OF PHOTON-COUNTING DETECTOR CT IN ASSESSMENT OF CARDIAC DISEASE

Toshihide Itoh, PhD (*Abstract Co-Author*) Employee, Siemens AG

Masaya Kisohara, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. True semiconductors such as CdTe are energetically stable. Photons above the band gap form electron-hole pairs in semiconductors. CdTe is used in photon-counting detectors (PCD) and scintillators are used in energy-integrating detectors (EID).2. The unique structure of the photon-counting CT includes an application specific integrated circuit (ASIC), which counts the electrons converted from photons at each threshold value.3. PCD-CT can provide low-noise, high-resolution images and has excellent imaging performance, especially in the evaluation of coronary arteries.4. PCD-CT is capable to obtain spectral data with single pair of X-ray tube and detector, and dual energy analysis on high temporal resolution can be performed using dual-source PCD-CT (DS-PCD-CT)5. Cardiac extracellular volume (ECV) can now be realistically quantified by the iodine method thanks to the availability of high temporal resolution iodine values.

**TABLE OF CONTENTS/OUTLINE**

1. Physical properties of semiconductor which is used in PCD-CT and scintillator which is used in EID-CT.2. The principle of photon counting by ASIC and its features.3. Differences in the ability of EID-CT and PCD-CT to visualize stents after percutaneous coronary intervention.4. A case in which an iodine map obtained from DS-PCD-CT with high temporal resolution allowed the assessment of contrast failure and late iodine enhancement reflecting myocardial ischemia.5. Quantification of cardiac ECV by the Iodine method made possible by high temporal resolution using DS-PCD-CT.

## CAEE-66 INSIGHTS INTO LEFT VENTRICULAR HYPERTROPHY: CARDIAC MAGNETIC RESONANCE IN DIFFERENTIAL DIAGNOSIS

Andres Enriquez-Puga, MBChB, MSc (*Abstract Co-Author*) Nothing to Disclose
Maria M. Merideno Garcia, MBBCh (*Abstract Co-Author*) Nothing to Disclose
Javier Tejedor Toquero, MD (*Abstract Co-Author*) Nothing to Disclose

Mar Cespedes Mas (*Abstract Co-Author*) Nothing to Disclose
Victoria Esteban Izquierdo, MD (*Abstract Co-Author*) Nothing to Disclose
Jaime Lopez Martin, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To provide a thorough overview of the differential diagnosis of left ventricular hypertrophy (LVH) using cardiac magnetic resonance (CMR), with specific emphasis on achieving the following key learning objectives: - To comprehend the most valuable CMR sequences and their respective informative contributions. - To identify the various underlying diseases associated with the phenotypic expression of LVH.- To provide a succinct and pragmatic summary that facilitates clinical practice.

### TABLE OF CONTENTS/OUTLINE

- Objectives - Role of cardiac magnetic resonance in the assessment of LVH and the most useful sequences: 'steady state free precession' (SSFP) to study morphology and function, native T1 mapping for myocardial tissue characterization, and late gadolinium enhancement for evaluating fibrosis in various regional distributions. - Epidemiological data, clinical and therapeutic management, and CMR findings in the main diagnostic entities following LVH: hypertensive heart disease, hypertrophic cardiomyopathy, cardiac amyloidosis, Fabry disease, athlete's heart, aortic valve stenosis, and cardiac sarcoidosis. - Conclusions, summary of various diseases, and a table to aid in the clinical practice - References

## CAEE-67 STRATEGIES FOR BETTER IMAGING CORONARY STENTS AFTER PERCUTANEOUS CORONARY INTERVENTION (PCI) IN CORONARY CT ANGIOGRAPHY

Jianying Li, PhD (*Abstract Co-Author*) Employee, General Electric Company
Jianxin Guo (*Abstract Co-Author*) Nothing to Disclose
Tingting Qu (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1) Point out the limitations of displaying coronary stents in conventional coronary CT angiography (CCTA).2) Demonstrate the advantage of SSF2 in CCTA compared to standard algorithm without motion correction (STD) and with the first-generation snapshot freeze (SSF1).3)Demonstrate the strategies to improve the clarity of coronary stent display.

### TABLE OF CONTENTS/OUTLINE

1)Limitations of coronary stent display in CCTA• The high density of coronary stents in CT images naturally affects the observation of coronary artery within the stent.• The dual effects of motion artifacts and metal artifacts seriously affect the display of the stent and the in-stent lumen.• Artifacts caused by the stent in the coronary lumen may lead to misdiagnosis.2) Advantages of SSF2• SSF2 reduces both coronary motion artifacts and overall cardiac motion artifacts.• Reduce the motion artifacts of the stent and its surrounding tissues to enable clearer display of the stent. • Highly inclusive, provides excellent for patients with irregular heart rate and inability to hold their breath.3) Strategies• Iterative reconstruction or Deep learning reconstruction to reduce image noise.• Using high-resolution scanning protocol (high kVp, low mA, and small focal spot).• Using SSF2 reconstruction to reduce motion artifacts.

## CAEE-68 INFECTIVE ENDOCARDITIS: THE MANY FACES OF DEATH

### TEACHING POINTS

TP1: [Infective endocarditis (IE) can affect both native and prosthetic valves, leading to valvular (vegetations, leaflet perforation, and prosthetic dehiscence) or perivalvular complications (abscess, pseudoaneurysm, and fistula)]TP2: [Cardiac computed tomography angiography (CTA) is recommended by the European Society of Cardiology (ESC) guidelines to aid in the diagnosis and treatment planning of IE]TP3: [Electrocardiographic gating significantly increases the accuracy of CTA for the diagnosis of valvular or perivalvular complications]TP4: [CTA is particularly useful in patients with poor acoustic windows, complex cardiac anatomy, detection of distant lesions, preoperative assessment of coronary artery disease, and investigation of alternative diagnoses]

### TABLE OF CONTENTS/OUTLINE

I. IntroductionA. Overview of the role of CTA according to recent ESC guidelinesB. Significance of cardiac CTA in improving the accuracy for infective endocarditisII. MethodsA. Selection of confirmed cases of IE who underwent cardiac CTAB. CTA protocol descriptionIII. Results DiscussionA. Presentation of CTA images demonstrating valvular and paravalvular findings (extracardiac features were also briefly addressed)B. Definition, risk factors, clinical significance, and impact on patient management were reviewed for each complicationIV. Conclusion

## CAEE-69 TESTING THE WATERS: A COMPREHENSIVE REVIEW OF ENTITIES CAUSING MYOCARDIAL EDEMA WITH SYSTEMATIC AND CASE-BASED APPROACH

**Awards**
**Magna Cum Laude**

Emrah Duman, MD (*Abstract Co-Author*) Nothing to Disclose
Zehavit Kirshenboim (*Abstract Co-Author*) Nothing to Disclose
Timothy Wong (*Abstract Co-Author*) Nothing to Disclose
Chad Kosanovich (*Abstract Co-Author*) Nothing to Disclose
Omer Onder, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Myocardial edema is characterized by abnormal myocardial fluid accumulation due to impaired fluid homeostasis, triggered by a complex interplay of cellular, molecular, and hemodynamic factors. 2. It is a complex pathological phenomenon with diverse clinical manifestations, playing a pivotal role in the pathophysiology of various cardiovascular conditions such as ischemic, inflammatory, infiltrative, toxic, infectious, and autoimmune diseases. 3. Familiarity with diagnostic challenges/strategies, differential diagnoses of myocardial edema-associated conditions, and the implications of myocardial edema for risk stratification can enable radiologists to contribute significantly to patient management. This presentation will examine the role of cardiac MRI in characterizing myocardial edema through various case examples and a comprehensive review of existing literature.

**TABLE OF CONTENTS/OUTLINE**

A. Pathophysiological basis of myocardial edema B. Radiological evaluation - Image acquisition post-processing - Image interpretation: Pearls Pitfalls - Pattern-based approach: Focal, regional, patchy diffuse involvement C. Differential diagnosis clinical importance of myocardial edema with case examples - Myocardial ischemia/infarction - Post-arrest/post-surgical - Heart transplantation - Heart failure myocardial remodeling - Myocarditis - Stress-induced cardiomyopathy - Toxic/drug-induced cardiomyopathy - Hypertrophic cardiomyopathy - Dilated cardiomyopathy - Sarcoidosis - Amyloidosis - Rheumatologic diseases - Miscellaneous: Chronic kidney disease, sepsis, systemic pulmonary hypertension, myocardial contusion, other cardiomyopathies D. Summary conclusion

## CAEE-7 HEARTBREAK AND HEALING: UNDERSTANDING TAKOTSUBO SYNDROME

Udane Oiartzabal, MD (*Abstract Co-Author*) Nothing to Disclose
Virginia Diaz (*Abstract Co-Author*) Nothing to Disclose
Leire Ormaetxe Albeniz, MD (*Abstract Co-Author*) Nothing to Disclose

Patricia Rodriguez Ripalda, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Review the pathophysiology of Takotsubo syndrome.Identify the manifestations of Takotsubo syndrome on MRI, as well as its main differential diagnoses.

**TABLE OF CONTENTS/OUTLINE**

Takotsubo syndrome, also known as broken heart syndrome or stress cardiomyopathy, presents as an acquired cardiomyopathy causing transient and reversible systolic dysfunction without obstructive coronary artery disease. It is typically triggered by a stressful event and predominantly affects postmenopausal women. This syndrome shares clinical and electrocardiographic characteristics with acute coronary syndrome, initially making it difficult to distinguish between the two.During the initial diagnostic evaluation, echocardiography and cardiac catheterization typically reveal apical dyskinesia without significant evidence of coronary artery obstruction.Magnetic Resonance Imaging (MRI) plays a crucial role in diagnosing and monitoring these patients, providing an accurate assessment of global ventricular function, defining wall motion abnormalities, assessing myocardial edema and detecting complications.We present a case review highlighting the MRI features of Takotsubo cardiomyopathy and its complications, focusing on differentiating this condition from acute myocardial infarction and acute myocarditis. Although this condition generally follows a benign course with a good prognosis, its acute phase may involve complications, with heart failure being the most common.

## CAEE-72 EXTREMELY RARE ISOLATED ATRIAL LESIONS WITH SIMILAR DIFFUSE ATRIAL WALL THICKENING FROM COMPLETELY DIFFERENT ETIOLOGIES: IMAGING FINDINGS, MANAGEMENT, AND COMPLICATIONS

**Awards**
**Certificate of Merit**

Hajime Sakuma, MD, PhD (*Abstract Co-Author*) Research Grant, Eisai Co, Ltd;Research Grant, FUJIFILM Holdings Corporation;Research Grant, Guerbet SA;
Masafumi Takafuji, MD, PhD (*Abstract Co-Author*) Nothing to Disclose

Shintaro Yamaguchi (*Abstract Co-Author*) Nothing to Disclose
Masaki Ishida, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Suguru Araki (*Abstract Co-Author*) Nothing to Disclose
Miyuko Fujita (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. To discuss the clinical and imaging mimickers with diffuse atrial wall thickening but completely different etiologies. 2. To discuss the imaging findings and management strategies for isolated atrial lesions with diffuse atrial wall thickening. 3. To review the biopsy and pathologic findings isolated atrial lesions with diffuse atrial wall thickening. 4. To discuss the complications related to isolated atrial lesions with diffuse atrial wall thickening.

**TABLE OF CONTENTS/OUTLINE**

A) Differential diagnosis of clinical and imaging mimickers with diffuse atrial wall thickening but completely different etiologies: IgG4-related atrial cardiomyopathy, isolated atrial amyloidosis, atrial giant cell myocarditis. B) Typical imaging findings of isolated atrial lesions with diffuse atrial wall thickening: echocardiography, CT, cardiac MRI, FDG-PET/CT C) Clinical management of isolated atrial lesions with diffuse atrial wall thickening. D) Biopsy as a mandatory procedure for the final diagnosis in rare disease E) Complication of isolated atrial lesions with diffuse atrial wall thickening i. Atrial fibrillation ii. Atrial dysfunction iii. Atrial thrombus iv. Intramural atrial hemorrhagic dissection F) Case presentation: typical imaging findings, the course of treatment and the pathologic findings. i. IgG4-related atrial cardiomyopathy ii. isolated atrial amyloidosis iii. Atrial giant cell myocarditis

## CAEE-73 NAVIGATING ACROSS CORONARY ARTERIES: CT ANGIOGRAPHY CHARACTERIZATION OF CORONARY ATHEROSCLEROTIC PLAQUES ACCORDING TO THEIR CAD-RADS

Doris Licely Canche Aguilar, MD (*Abstract Co-Author*) Nothing to Disclose
Juan Manuel Pineda Cordoba, MD (*Abstract Co-Author*) Nothing to Disclose
Luis Enrique Nunez Castellanos (*Abstract Co-Author*) Nothing to Disclose
Diego Leonardo Meza Neri (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- To provide a pathophysiological overview of the formation of atherosclerotic coronary plaque and its cardiovascular impact on coronary heart disease.- Describe normal coronary anatomy.- Detail the specific radiological characteristics of a high-risk plaque to learn to recognize them.- Describe the pathophysiology of atherosclerotic plaque formation.- Learn to recognize the radiological features in healthy coronary arteries without atherosclerotic plaques and their significance.- Identify calcified and non-calcified coronary plaques through clinical cases.- Qualitatively assess the severity of coronary plaques.- Correctly interpret the CAD-RADS classification.- Understand the role of the radiologist in the interpretation of coronary CT angiography.- Describe the diagnostic and therapeutic conduct to follow according to the CAD-RADS classification.

**TABLE OF CONTENTS/OUTLINE**

1. Normal coronary anatomy in coronary CT angiography 1.1 Coronary segmentation2. Fundamentals of atherosclerotic plaque: What should the imaging specialist understand? 2.1 Epidemiology 2.2 Etiology 2.3 Main imaging characteristics of atherosclerotic plaques 2.4 Pathophysiology3. Principles and applications of coronary angiotomography in atheromatous plaque. 3.1 CAD-RADS implications and classification4. Radiological characterization of atherosclerotic plaque by AngioTAC according to CAD-RADS.4.1 High risk plaque 4.2 Low risk plaque 4.3 Diagnostic and therapeutic conduct according to CAD-RADS classification

## CAEE-74 UNUSUAL PERICARDIAL SPACES MIMICKING MEDIASTINAL TUMOR

Yo Won Choi, MD (*Abstract Co-Author*) Nothing to Disclose
Chang Guk Kim (*Abstract Co-Author*) Nothing to Disclose
Seung-Jin Yoo, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Review of the normal anatomy of the pericardial space 2. Review of the typical CT findings of the pericardial space. 3. Pericardial spaces mimicking mediastinal mass or lymphadenopathy. 4. How to differentiate mass-mimicking pericardial spaces from lymph nodes/mediastinal mass.

**TABLE OF CONTENTS/OUTLINE**

1. Normal anatomy of pericardial space 2. Review of typical CT findings of the pericardial space 3. Review of pericardial spaces mimicking mediastinal mass or lymph node. A. Sterno-pericardial ligament B. High-riding superior pericardial recess C. Pericardial diverticulum from superior pericardial recess 4. Differentiation between pericardial space with lymph nodes/mediastinal mass. 5. Summary

## CAEE-75 COMPREHENSIVE REVIEW OF NON-ATHEROSCLEROTIC CORONARY ARTERY DISEASES MIMICKING ACUTE CORONARY SYNDROME (ACS): ETIOPATHOGENESIS, IMAGING FINDINGS, AND DIFFERENTIAL DIAGNOSIS

Carlos S. Restrepo, MD (*Abstract Co-Author*) Nothing to Disclose
Sachin S. Saboo, MD, FRCR (*Abstract Co-Author*) Nothing to Disclose
Ameya J. Baxi, MBBS,DMRD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. To discuss non-atherosclerotic coronary artery disease (CAD) 2. To study the role of imaging in the diagnosis and evaluation of these conditions 3. To discuss imaging based differential diagnosis

**TABLE OF CONTENTS/OUTLINE**

Atherosclerotic CAD is the most common cause of ACS, however, non-atherosclerotic processes are also contribute to a substantial number of ACS events and as such require different diagnostic and therapeutic strategies. Non-obstructive conditions can also cause same symptoms as obstructive CAD. In the absence of obstructive CAD, increased awareness together with a high index of suspicion for other important causes of ACS is crucial to delineate the underlying etiology. Recognizing typical imaging manifestations with adequate clinical correlation is essential for timely and accurate diagnosis as well as optimized patient care. In this exhibit, we discuss the characteristic multimodality imaging findings and differential diagnosis of non-atherosclerotic causes of ACS. Aims/Objectives · Introduction · Taxonomy · Pathologic and cross-sectional imaging findings role of imaging § Malignant coronary artery origin anomalies § Coronary artery ectasia/Coronary artery aneurysms § Coronary artery dissection § Coronary artery fistula § Coronary artery embolism § Coronary artery vasospasm § Different types of Vasculitis § Myocardial bridging § Stress- induced cardiomyopathy · Differential diagnosis · Conclusion

## CAEE-76 IMAGING OF MITRAL VALVE PATHOLOGY: WHAT RADIOLOGIST SHOULD KNOW

Carlos S. Restrepo, MD (*Abstract Co-Author*) Nothing to Disclose
Sachin S. Saboo, MD, FRCR (*Abstract Co-Author*) Nothing to Disclose
Ameya J. Baxi, MBBS,DMRD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To discuss relevant Mitral Valva (MV) anatomy To review various congenital and acquired pathologies involving MV To increase imaging appearances differential diagnosis of congenital and acquired MV diseases

**TABLE OF CONTENTS/OUTLINE**

Knowledge of MV valve anatomy function is essential to understand diagnose pathology. MV complex consists of anterior posterior leaflets, fibrous annulus subvalvular apparatus, consisting of the chordae tendineae papillary muscles. Main manifestations of MV disease are regurgitation stenosis caused by spectrum of various pathologies. Echocardiography, CT, cardiac MR imaging are main modalities used for evaluation of MV pathologies, each with its own advantage and limitations. Cardiothoracic radiologist should be well versed with echocardiography, MDCT, and CMR, in order to optimize preprocedural patient selection, procedural planning, post-procedural assessment of MV including postoperative complications. Knowledge of natural history, clinical manifestations, salient imaging features is essential for accurate diagnosis guiding treatment. In this exhibit, we discuss characteristic multimodality imaging findings and differential diagnosis of normal and diseased MV. Aims/Objectives · Introduction · Anatomy · Pathology, role of imaging imaging findings Shone Complex , Mitral Annular Calcification, Mitral Annular Disjunction, Prolapse, MV rupture, Mitral Stenosis, Mitral Regurgitation, Endocarditis, Thrombosis, Tumors-Primary and Secondary, MV Devices § Miscellaneous · Role of imaging in preoperative and reintervention planning · Postprocedural postoperative complications · Differential diagnosis · Conclusion

## CAEE-77 IMAGING SPECTRUM OF CONOTRUNCAL ABNORMALITIES WITH MALALIGNMENT TYPE VENTRICULAR SEPTAL DEFECTS

Jerald Garvin S. Lim, MD (*Abstract Co-Author*) Nothing to Disclose
Julia Niemierko, MD (*Abstract Co-Author*) Nothing to Disclose

Franklin S. Lee, MD (*Abstract Co-Author*) Nothing to Disclose
Thurl Cledera, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Malalignment ventricular septal defects encompass a spectrum of anomalies characterized by the malalignment and absence of fusion between the outlet/conal septum and the ventricular septum. Malalignment defects are secondary to abnormalities in the elongation of the outflow tract during the different phases of cardiac looping. These defects have also been found to be associated with other cardiac anomalies, such as conotruncal abnormalities such as Tetralogy of Fallot, Transposition of the Great Arteries, Double Outlet Right Ventricle, and others. Knowledge of septal malalignment can help in determining the concordance of heart structures and outflow tracts. The objectives of this exhibit are: 1) Understand embryologic concepts behind the normal development of the outflow tract of the heart, 2) Use a systematic approach in identifying malalignment ventricular septal defects, and 3) Recognize key imaging features and anatomic landmarks in assessing these congenital defects

**TABLE OF CONTENTS/OUTLINE**

I. Introduction II. Embryology Review III. Characterizing Malalignment Ventricular Septal Defects IV. Imaging Modalities V. Conotruncal Abnormalities A. Tetralogy of Fallot B. Double Outlet Right and Left Ventricle C. Double Inlet Right and Left Ventricle D. Truncus Arteriosus E. Transposition of the Great Arteries VI. Considerations in Post-operative Imaging and Follow-up VII. Conclusion

## CAEE-8 JOURNEY INTO THE HEART: RADIOLOGICAL ASSESSMENT OF CARDIAC MASSES

Alba Lopez-Castello, MD (*Abstract Co-Author*) Nothing to Disclose
Samuel Pereiro Perez, MD (*Abstract Co-Author*) Nothing to Disclose
Maria Perez Costas, MD (*Abstract Co-Author*) Nothing to Disclose
Ana Robles Gomez, MD (*Abstract Co-Author*) Nothing to Disclose
Sabela Garcia Benito, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To review the most representative cases of cardiac masses in our center and summarize the clinical presentation and the most characteristic imaging findings.

**TABLE OF CONTENTS/OUTLINE**

- Cardiac masses are part of a broad and heterogeneous spectrum of pathology, with a clinical presentation that depends on both the nature of the mass (benign or malignant) and its location in the cardiac cavity (asymptomatic, ischemic events, arrhythmic, embolic, pericardial effusion, etc). - The initial imaging test when a cardiac mass is suspected is echocardiography (transthoracic or transesophageal), and depending on the findings and the patient's baseline condition, further evaluation with magnetic tesonance imaging or computed tomography may be considered, each with its specific protocols. -The location and imaging characteristics of the cardiac masses are essential for achieving an accurate diagnostic approach and for distinguishing between the main types of cardiac masses: non-neoplastic masses (intracavitary thrombus, vegetation, caseous calcification of the mitral annulus, pericardial cyst), primary benign tumors (myxoma, fibroelastoma, lipoma, hemangioma, rhabdomyoma, fibroma, etc.), malignant tumors (sarcoma, angiosarcoma, lymphoma, mesothelioma, etc.), and cardiac metastases.

## CAEE-9 CARDIAC CT APPLICATION OF SUPER RESOLUTION DEEP LEARNING RECONSTRUCTION

Yuji Kaga, RT (*Abstract Co-Author*) Nothing to Disclose
TOSHIKI KATO (*Abstract Co-Author*) Nothing to Disclose
Koichi Chida, PhD (*Abstract Co-Author*) Nothing to Disclose
Masahiro Sota (*Abstract Co-Author*) Nothing to Disclose
Yoshihiro Haga, PhD, RT (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Computed tomography (CT) images have evolved over time. Recently, deep learning technology has been used for reconfiguration techniques. In particular, Precise IQ Engine (PIQE) is a super-resolution image reconstruction technology that uses deep learning and Aquilion Precision's high-resolution data. This is Super Resolution Deep Learning Reconstruction (SR-DLR) developed by Canon Medical Systems. The use of PIQE for coronary CT angiography (CCTA) allows for more accurate diagnosis than previously possible. The purpose of this objective is to examine the use of PIQE for CCTA and the accuracy of stent lumen assessment.

**TABLE OF CONTENTS/OUTLINE**

1.To understand Precise IQ Engine(PIQE) using deep learning techniques2.To understand how it differs from other reconstruction methods (Iterative Dose Reduction 3D and advanced intelligent Clear-IQ Engine)3.To understand the importance of assessing the severity of in-stent stenosis on coronary CT angiography (CCTA)4. To evaluate the in-stent stenosis of < 3.0-mm stent diameter5. To understand the characteristics of coronary atherosclerotic plaque detected by CCTA (including positive remodeling, low-attenuation plaque, and mottled calcification)6. To understanding the application of PIQE to the cardiovascular field

## HOW TO REPORT A CT CORONARY ANGIOGRAM? - A STEP BY STEP GUIDE FOR THE NOVICE READER

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Srujana Ganti, MBChB, FRCR (*Abstract Co-Author*) Nothing to Disclose
Bimal Mayur Kumar Vora (*Abstract Co-Author*) Nothing to Disclose
Kang Ren Yong, MBBS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Understand how to report a CTCA study, in a step by step manner.

### TABLE OF CONTENTS/OUTLINE

CT Coronary Angiograms (CTCAs) are rapidly becoming entrenched as mainstream, routine examinations performed for the assessment of coronary artery disease, in various settings, including acute, inpatient and outpatient settings.This poster will take the novice CT Coronary Angiogram (CTCA) reader through the reading of the study in a step by step fashion, covering all crucial aspects, review areas and highlighting the importance of each of these. It will cover the factors that need to be considered in optimising the patient, such as patient education and nursing management, as well as the technical parameters to ensure the best possible images are obtained.It will outline, in a systematic fashion, how the scan should be reviewed, providing review checklists covering the cardiac findings as well as the extra-cardiac findings. Crucial factors in reporting and critical alert notification will be discussed with a sample report template included. A series of cases will also be provided, with annotations, to demonstrate both common and uncommon pathology so that the reader will not only obtain a sound framework to use as a basis to commence CTCA reporting but also gain an understanding of the pathologies encountered.

### TEACHING POINTS

Review cardiac sarcoidosis diagnostic criteria. Illustrate cardiac sarcoidosis imaging features in MRI, outlining the significance of late gadolinium enhancement (LGE). Highlight the prognostic implications of prompt diagnosis, emphasizing the importance of imaging in enhancing accuracy and predicting outcomes.

### TABLE OF CONTENTS/OUTLINE

Cardiac sarcoidosis, a potentially life-threatening manifestation of systemic sarcoidosis, presents diagnostic challenges due to its variable clinical presentations and limited biopsy yield. Early assessment and a multidisciplinary approach are crucial for improved outcomes, given the potential for sudden cardiac events.Diagnostic criteria have evolved, with current guidelines underscoring the importance of advanced imaging in its detection and evaluation. Cardiac MRI offers a multi-dimensional assessment, allowing detection of myocardial inflammation, characterizing tissue involvement, assessing cardiac function and guiding treatment. PET-CT identifies active inflammation, enabling risk stratification, follow-up post-ICD implantation, and targeted biopsies.The primary MRI finding is the presence of LGE, typically exhibiting a sub-epicardial and mid-wall pattern along the basal septum or inferolateral wall, indicating fibrosis. Additional features encompass myocardial edema, perfusion defects, and abnormal 18-FDG uptake.Imaging findings hold prognostic significance, with extensive LGE patterns and impaired left ventricular function predicting a high risk of adverse cardiac events.We gathered representative cases of cardiac sarcoidosis at our institution to highlight the hallmark findings that leads to accurate diagnosis.

## CLINICAL CORRELATION FOR LVAD IMAGING

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Lynne M. Hurwitz Koweek, MD (*Abstract Co-Author*) Departmental Research Grant, Siemens AG;Departmental Research Grant, HeartFlow, Inc;Departmental Research Grant, Verily Lifesciences LLC
Michael R. Harowicz, MD (*Abstract Co-Author*) Nothing to Disclose
Katherine A. Cheng, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Left ventricular devices (LVADs) are utilized as either destination therapy or bridge to cardiac transplant for patients with end-stage heart failure. Computed tomography (CT) has been a useful imaging modality to evaluate complications of LVAD devices. Knowledge of the clinical evaluation of patients with LVADs including altered flow dynamics and laboratory workup can be a useful tool for the radiologist. The purpose of this abstract is to review the normal appearance and configuration of LVADs and the various complications with their correlating clinical presentations.

### TABLE OF CONTENTS/OUTLINE

1. Review normal anatomy and configuration of LVADs2. Review the altered physiology of patients with LVADs3. Illustrate the complications that can arise with LVADs with their correlating clinical presentation

## HEART OF DARKNESS - INTRAMYOCARDIAL HEMORRHAGE AND MICROVASCULAR OBSTRUCTION: IMAGING FINDINGS AND PROGNOSTIC IMPLICATIONS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Kate Hanneman, MD, MPH (*Abstract Co-Author*) Speaker, Groupe Sanofi;Speaker, Amicus Therapeutics, Inc
Thomas Geyer, MD (*Abstract Co-Author*) Nothing to Disclose
Felipe S. Torres, MD, PhD (*Abstract Co-Author*) Research support, Altis Labs
Farah Cadour, MD, MS (*Abstract Co-Author*) Nothing to Disclose
Elsie Nguyen, MD, FRCPC (*Abstract Co-Author*) Nothing to Disclose
Rushali Gandhi, BSc (*Presenter*) Nothing to Disclose

### TEACHING POINTS

We discuss the pathophysiology of intramyocardial hemorrhage (IMH), demonstrate CMR imaging and prognostic features of IMH, and its connection with microvascular obstruction (MVO). CMR is the gold standard for detecting IMH and MVO. MVO, also known as "no-reflow", is related to severe microcirculatory alterations with obstructed microvasculature and can occur alone or concomitantly with IMH. IMH is a reperfusion injury, related to extravasation of erythrocytes through severely damaged endothelial walls. Both IMH and MVO are associated with worse prognosis following acute MI.

### TABLE OF CONTENTS/OUTLINE

IMH and MVO Pathophysiology and Evolution Post MI: Exact mechanism of microvascular injury and repair and temporal evolution of IMH and MVO are not well understood. These entities are early/subacute findings in the setting of acute MI, and typically resolve. Typical Imaging Features: MVO is identified as a subendocardial unenhanced region in the infarcted area due to lack of contrast within obstructed microvasculature. T2*-weighted sequences have higher sensitivity for demonstrating IMH. IMH can also appear as hypointense zone surrounded by myocardial edema (high T2 signal). Prognostic Value: The presence of IMH and MVO are strong predictors of adverse left ventricle remodelling and major adverse cardiovascular events after acute MI.

ANDREA SALAS (*Abstract Co-Author*) Nothing to Disclose
Moises Jimenez (*Abstract Co-Author*) Nothing to Disclose
LAURA TORRES (*Abstract Co-Author*) Nothing to Disclose
Claudia Mendoza, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

4D flow imaging represents an innovative technique that offers a comprehensive understanding of cardiovascular hemodynamics and related pathologies. This method provides functional cardiac information through the use of time-resolved four-dimensional cine sequences combined with 3D velocity encoding. The protocol enables the assessment of hemodynamic effects on vessel walls, myocardium, and flow pathways within the cardiovascular system. This imaging modality facilitates the evaluation of various cardiovascular pathologies, by analyzing multidirectional blood flow velocity data, providing valuable insights into conditions such as recurrent coarctation, aortic aneurysms, and valvular heart disease, contributing to the understanding of the natural history of cardiovascular disease. A notable example is the assessment of aortic dissection, where the technique identifies small fenestrations and characterizes flow dynamics between true and false lumens. This enhances patient risk assessment and treatment planning. In conclusion, 4D flow imaging emerges as a valuable tool for the comprehensive evaluation of cardiovascular hemodynamics and the precise diagnosis of associated pathologies. Its integration into clinical practice shows promise for optimizing patient management and treatment outcomes.

### TABLE OF CONTENTS/OUTLINE

Melika Shafeghat, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Pulmonary hypertension (PH) is a serious condition characterized by a gradual increase in mean pulmonary arterial pressure. The gold standard method to diagnose PH is right heart catheterization. However, heart catheterization is invasive and associated with a low, but not insignificant, risk of major complications, including fatality. Using noninvasive imaging modalities such as echocardiogram, chest CT, and cardiac MRI would be therefore more desirable as an alternative diagnostic method. While an echocardiogram is operator-dependent, and CT exposes the patient to ionizing radiation, MRI offers a comprehensive evaluation of cardiac anatomy, function, and focal and interstitial myocardial fibrosis without the risks associated with right heart catheterization or radiation exposure.

### TABLE OF CONTENTS/OUTLINE

1- What are the different types of PH, along with their WHO classification? 2- What are the etiologies of PH and its pathophysiology? 3 - What are the right heart catheterization findings as a gold standard method of diagnosis? 4- What are the noninvasive imaging modalities to diagnose PH? a. Echocardiogram findings in patients with PH along with pros and cons of echocardiogram to diagnose PH b. Chest CT findings in patients with PH and imaging features suggestive of PH b.1. Comparison of non-contrast chest CT vs. CT angiogram c. Cardiac MRI and 4D flow MRI imaging findings in patients with PH c.1. Comprehensive review of imaging sequences particularly CINE imaging, T1 mapping, delayed myocardial enhancement, 2D phase contrast, and 4D flow MRI

## COMPLICATIONS OF THE CARDIOVASCULAR SURGERY WHAT RADIOLOGISTS SHOULD KNOW?

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Iclal Ocak, MD (*Abstract Co-Author*) Nothing to Disclose
Furkan Ufuk, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Radiologists play a critical role in identifying early and late complications of cardiovascular surgery, which can improve patient outcomes.
- Familiarity with normal postoperative imaging appearances and common complications is essential.
- Key complications include infection, bleeding, edema, pseudoaneurysm and structural abnormalities.

### TABLE OF CONTENTS/OUTLINE

- Introduction
- Importance of imaging in cardiovascular surgery follow-up
- Role of the radiologist
- Normal Postoperative Appearances
- Typical imaging findings following different types of cardiovascular surgeries
- Early Complications
- Bleeding: Locations and imaging signs
- Infection: Diagnostic clues on imaging
- Graft Failure: Types and radiologic identification
- Late Complications
- Chronic graft occlusion
- Structural abnormalities: Valve malfunctions, aneurysm/pseudoaneurysm
- Advanced Imaging Techniques
- Use of CT, MRI, and ultrasound in the detection of complications
- Recent advances and their clinical applications
- Conclusion
- Summary of the radiologist’s role in managing post-surgical patients
- Future perspectives in imaging for cardiovascular surgery complications

## THE IMAGING APPEARANCE OF THORACIC AORTIC REPAIRS AND COMMON ASSOCIATED COMPLICATIONS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Cristina Fuss, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Ronald Gathagan, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Aortic repair remains a critical aspect of cardiovascular medicine, with traditional surgical approaches continuing to play a prevalent role in addressing thoracic aortic pathologies. However, the landscape of aortic repair has significantly evolved with the advent of endovascular techniques, and multiple methods are often integrated for broader anatomical coverage, bringing increasing complexity to aortic disease management.By understanding the expected appearances of key components in thoracic aortic repair, radiologists can effectively identify deviations indicative of complications. Adopting a structured approach can aid in navigating the complex appearance of these complications. Specifically, attention should be given to the status of the aortic valve, the aortic root (including the sinuses of Valsalva), the ascending aorta, and the aortic arch as all of these structures may be repaired individually or repaired as a unit.Additionally, attention should be given to the management of coronary arteries when necessary. Similarly, if the repair extends into the region of the aortic arch, there must be further consideration of the management of the arch vessels. By implementing a systematic approach, radiologists can effectively identify and describe the majority of repairs, even with the constant advent of novel techniques.

### TABLE OF CONTENTS/OUTLINE

1. Describe the normal anatomy of the thoracic aorta including the ascending aorta and the aortic arch.2. Provide a brief overview of common variant anatomy.3. Review the types of ascending aortic repair techniques and their appearance on diagnostic imaging.4. Discuss common complications associated with thoracic aortic repair.

### TEACHING POINTS

Although the majority of acute coronary events are the result of atherosclerotic lesions, some cases of myocardial infarction and sudden cardiac death may be related to non-atherosclerotic causes.The 2021 AHA Guideline for the Evaluation and Diagnosis of Chest Pain promotes the use of coronary computed tomography angiography (CCTA) as a diagnostic test in patients with an intermediate to high pretest probability of coronary artery disease (CAD), especially those younger than 65 years of age or when less obstructive CAD is suspected.CCTA provides information on intraluminal characteristics, and details of the coronary artery wall and surrounding tissue.

### TABLE OF CONTENTS/OUTLINE

IntroductionCAD is a diverse group of diseases with variable pathophysiology associated with myocardial infarction and sudden death, mostly in younger individuals. We review the imaging findings and the importance of the role of CCTA in the management of the major non-congenital causes of nonatherosclerotic CAD.MethodsNon-atherosclerotic CAD causes undergoing CCTA were retrospectively selected. Images were presented in the axial, sagittal, coronal, and curved multiplanar reconstruction planes. Conventional coronary angiography or 3D formatted images were added when available.Results DiscussionAmong other diagnoses, cases of dissection, thrombosis, coronary aneurysm, and extrinsic compression of the coronary arteries were included.An overview of CCTA findings and the role of imaging in the diagnostic process were provided.ConclusionThe increasing availability of CCTA and improvements in its technology have resulted in increased detection of nonatherosclerotic CADs, which was previously considered rare.

## STRESSED ON CALL? YOUR GUIDE TO RECOGNIZING CLASSIC CARDIAC SIGNS ON A CHEST RADIOGRAPH

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Nanditha Guruvaiah, MD (*Abstract Co-Author*) Nothing to Disclose
Namratha Guruvaiah Sridhara, MD, BSc (*Abstract Co-Author*) Nothing to Disclose
Janardhana Ponnatapura, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

A plain chest radiograph remains as the initial imaging modality of choice in evaluating patients with a history of cardiac pathology. A chest radiograph is convenient as it is easily accessible, low-cost, and a non-invasive diagnostic tool. A chest radiograph plays a key role in providing valuable information regarding underlying cardiac conditions. We aim to provide classic imaging signs of cardiac pathologies on a chest radiograph to boost the confidence and sharpen the skills of radiology residents and medical students. Since a chest radiograph is the initial imaging modality for patients with cardiac conditions, these classic signs can aid radiology residents and students to quickly recognize the underlying conditions and provide an accurate diagnosis for further patient management.

### TABLE OF CONTENTS/OUTLINE

Introduction to normal cardiac silhouetteChest radiograph signs of cardiac pathologies case-based learning:- Double density sign- Hoffman-Rigler sign- Walking man sign- Oreo cookie sign- Straight left heart sign- Wide carina sign- Water bottle sign- Continuous diaphragm sign- Small heart sign- Left atrial impression on the esophagus in barium swallow- Third mogul sign- Stag’s antlers sign / reverse mustache sign

Julia Alegria, MD (*Abstract Co-Author*) Nothing to Disclose
Christian P. Houbois, MD (*Abstract Co-Author*) Nothing to Disclose
Juan J. Urbina, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Purpose of this exhibit: 1. Explore the diverse phenotypic landscape of sarcomeric hypertrophic cardiomyopathy (HCM) within the era of modern precision medicine. 2. Delve into diagnostic challenges of the left ventricular hypertrophy (LVH) phenotypes. 3. Showcase the seamless integration of genetic testing with cardiac magnetic resonance (CMR) to precisely identify the etiology of LVH.

### TABLE OF CONTENTS/OUTLINE

1. Background: Epidemiology and Pathophysiology of HCM. 2. Genetic mutations involved in sarcomeric HCM. 3. Phenotypic spectrum of HCM -EARLY HCM a. Non-hypertrophic (crypts, mitral valve, and papillary abnormalities), b. Incipient LVH (LVH does not fulfill diagnostic criteria). ESTABLISHED HCM c. Symmetric (concentric) HCM, d. Asymmetric septal, e. Asymmetric apical, f. Focal HCM, g. Midventricular HCM, h. Masslike HCM, i. Noncontiguous HCM, j. Sigmoidal, k. Reverse curve. ADVANCED HCM l. HCM in the active-inflammatory phase ("Hot HCM"), m. HCM with left ventricular systolic dysfunction (LVSD), n. Dilated with extensive fibrosis HCM ("burned-out"). 4. HCM post septal reduction therapy: ablation-myomectomy and myosin inhibitors. 5. HCM phenocopies: the role of integrating genetic testing a. Storage and infiltrative cardiomyopathies i. Amyloidosis (mutant TTR), ii. Cardiac sarcoidosis, iii. Hemochromatosis, iv. Lysosomal storage disease: 1. Anderson-Fabry, 2. Hurler's syndrome. v. Glycogen storage disease: 1. Danon disease, 2. PRKAG2, Desminopathy, RASopathies, 3. Pompe's, vi. Mitochondrial (MELAS, MIDD), vii. Syndromic HCM: 1. Friedrich Ataxia, 2. Noonan, 3. Leopard. b. Other differential diagnosis i. Athlete's heart ii, Hypertensive cardiomyopathy iii, Aortic stenosis.

## OPTIMIZING RADIOLOGICAL APPROACH TO PREGNANCY-RELATED CARDIOVASCULAR DISEASES: STRATEGIES AND AWARENESS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Riccardo Marano, MD (*Abstract Co-Author*) Nothing to Disclose
Alessio Perazzolo, MD (*Abstract Co-Author*) Nothing to Disclose
Luigi Natale, MD (*Abstract Co-Author*) Nothing to Disclose
Giuseppe Rovere (*Abstract Co-Author*) Nothing to Disclose
Francesco Lauriero (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To enhance the awareness of radiologists in cardiovascular diseases (CVDs) during pregnancy. To highlight the role of imaging in diagnosing specific pregnancy-related CVDs. To illustrate strategies for minimizing radiation exposure and limiting the use of contrast agents when feasible.

### TABLE OF CONTENTS/OUTLINE

Background CVDs represent the primary cause of non-obstetric morbidity and mortality during or early after pregnancy in western countries. Timely diagnosis and effective management are crucial in mitigating these risks. Imaging plays a pivotal role in diagnosing some of the pregnancy-related CVDs, although radiation exposure and use of contrast agents should be minimized, adhering to the principle of as low as reasonably achievable (ALARA). If the disease occurs in late pregnancy, emergency cesarean delivery may be considered to prevent fetal exposure to radiation. Otherwise, magnetic resonance (MR) imaging is preferred over imaging examinations with ionizing radiation, particularly computed tomography (CT), whenever possible. Findings We present a series of illustrative cases focusing on the most common CVDs occurring in pregnant women, radiologists may run into their routine practice. We showcase different imaging techniques for each pathology, highlighting their distinct features and essential findings for accurate diagnosis. The discussed pathologies include pulmonary embolism (PE), sudden coronary artery dissection (SCAD), peripartum cardiomyopathy (PPCM), and aortic dissection. Conclusion Awareness of radiologists on pregnancy-related CVDs and radiation risks during gestation is crucial for optimizing imaging examination selection, diagnosis, and clinical management.

### TEACHING POINTS

Cardiovascular implantable electronic devices include a variety of technologies which are frequently visualized and assessed on chest radiography. Knowledge of the appropriate anatomical course and location of these devices is critical for radiologists in order to appropriately interpret chest radiographs and recognize device-related complications. An understanding of emerging devices and new approaches for their placement enables the radiologist to provide accurate information to the clinician, thus enhancing patient care. Furthermore, radiologists play a central role in identifying complications associated with hardware placement and on follow-up imaging evaluation of these devices. The goals of this exhibit are to help the learner: 1. Understand the radiographic anatomy pertinent to contemporary cardiac implantable devices and emerging techniques in device and lead placement 2. Identify common and critical complications associated with contemporary cardiac devices

### TABLE OF CONTENTS/OUTLINE

1. Introduction - Review radiographic anatomy as it relates to cardiac implantable conduction devices and leads 2. Overview of current electrophysiologic techniques and devices with emphasis on lead location on radiography 3. Discussion of radiographic features of common and critical complications associated with cardiac implantable devices 4. Conclusion

Camilla Vittoria Vita, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To overview inflammatory cardiomyopathy (I-CMP) in autoimmune rheumatic diseases (ARDs). To demonstrate the leading role of cardiac magnetic resonance (CMR) in detecting early cardiac inflammatory involvement in ARDs. To showcase imaging findings on multiparametric CMR approach of I-CMP in different ARDs.

### TABLE OF CONTENTS/OUTLINE

Introduction. Cardiac involvement is a common feature in ARDs. Traditional imaging varies in the diagnostic accuracy depending on pretest probability, type and severity of involvement. Conversely, CMR is the primary imaging tool for diagnosing I-CMP, offering unparalleled tissue characterization. The 2018 Lake Louise Criteria (LLC) enhanced its sensitivity, especially for early detection, leading to a rise in I-CMP incidence and revealing diverse CMR myocarditis patterns. Material and Methods. We showcase a series of CMR examination on ARDs patients with suspected myocarditis. Images were acquired following SCMR standard protocol (2020 update). Results. All patients met 2018 LLC criteria. Edema was not always evident in conventional T2-weighted images and distinct pattern of late gadolinium enhancement (LGE) were found. T1, T2 mapping, and ECV values were consistently elevated. Conclusions. Our aim is to emphasize the role of multiparametric mapping in detecting I-CMP in ARDs patients. Conventional T2-weighted images lack sensitivity for diffuse myocardial edema and different LGE patterns exist. Multiparametric mapping may overcome these limitations, providing quantitative maps of myocardial changes. Given the CMR sensitivity in I-CMP, even at early stages, a CMR screening for asymptomatic patients might increase ARDs-related I-CMP improving their prognosis.

Frandics P. Chan, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Kate Hanneman, MD, MPH (*Presenter*) Speaker, Groupe Sanofi;Speaker, Amicus Therapeutics, Inc

### TEACHING POINTS

1. Double aortic arch is the most frequent cause of a symptomatic congenital vascular ring as the trachea and esophagus are completely encircled; typically, the right arch is higher and more cephalic than the left arch2. Part of the double arch can be atretic and replaced by a fibrosis cord, which is difficult to detect on imaging due to lack of luminal contrast in the atretic segment3. Double arch with atretic segment can mimic right aortic arch variants, depending on the level of atresia; however, timely differentiation is critical to guide management4. Double aortic arch with atresia distal to the left subclavian artery can mimic right aortic arch with type 1 mirror image branching5. Double aortic arch with atresia between the left common carotid and left subclavian arteries can mimic right aortic arch with aberrant retroesophageal left subclavian artery6. Key imaging features to differentiate double aortic arch with an atretic segment from mimics include 1) presence of 4 symmetrical arch branches at an axial level just above the arch, 2) posterior direction of the proximal aspect of the first arch branch, 3) tethering or tenting of the posterior segment of the patent segment of the left arch, and 4) anteriorly-directed diverticular outpouching from the descending aorta.

### TABLE OF CONTENTS/OUTLINE

1. Review aortic arch anomalies and congenital vascular rings: epidemiology, embryology, clinical presentation, and management2. Demonstrate imaging findings in typical double aortic arches3. Illustrate variants of double aortic arches with atretic segments and right aortic arch mimics4. Identify key imaging features to differentiate double aortic arch with atretic segment from mimics

Rosaura Suazo Aguero, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Sarcoidosis is a systemic disease characterized by the formation of non-necrotizing granulomas. It presents with respiratory symptoms in up to 53% of patients, and cardiac granulomas are present in up to 46.9% of cases. Radiography and CT are the most common imaging modalities used in the evaluation of thoracic sarcoidosis. However, 18F FDG-PET/CT have been shown to be increasingly useful. Findings include symmetric hilar and mediastinal lymphadenopathy, pulmonary nodules, subpleural reticular markings, groundglass changes, and pulmonary fibrosis.Findings of pulmonary sarcoid should prompt the evaluation for cardiac sarcoid.With respect to cardiac sarcoidosis, MRI and 18F FDG-PET/CT are useful tools. On MRI, cardiac sarcoidosis is typically associated with patchy and multifocal late gadolinium enhancement in the septum and lateral wall. The mid-myocardium and epicardium are commonly affected, whereas the subendocardium is usually spared. On 18 F FDG-PET/CT, cardiac sarcoidosis appears as patchy focal FDG uptake.Myocardial perfusion imaging using SPECT-CT can also be useful in the diagnosis of cardiac sarcoidosis by identifying focal perfusion defects at rest. Fixed defects or those that demonstrate reverse redistribution following vasodilation can distinguish cardiac sarcoidosis from non-sarcoid cardiac pathologies.

### TABLE OF CONTENTS/OUTLINE

1. Introduction on sarcoidosis and its systemic manifestations2. Focus on pulmonary and cardiac sarcoidosis3. Imaging findings with a focus on chest CT, cardiac MRI, and 18F FDG-PET/CT4. Case examples of sequential multi-modality evaluation for pulmonary and cardiac sarcoidosis5. Advances and future prospects in the imaging of sarcoidosis

## MITRAL ANNULUS DISJUNCTION: A NOT SO RARE ENTITY. WHAT THE RADIOLOGIST NEEDS TO KNOW

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Ana Berasategui Criado, MD (*Abstract Co-Author*) Nothing to Disclose
Marina Arroyo Olmedo, MD (*Abstract Co-Author*) Nothing to Disclose
Victor Fernandez-Lobo (*Abstract Co-Author*) Nothing to Disclose
Celia Cantolla, MD (*Abstract Co-Author*) Nothing to Disclose
Sofia Bretos Azcona, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To familiarize the radiologist with Mitral Annular Disjunction (MAD), a little known and potentially fatal pathology, with the secondary objective that its knowledge will improve the detection and reporting rates within clinical practice.To review the role of imaging techniques in the diagnosis of this entity, especially cardiac magnetic resonance.

### TABLE OF CONTENTS/OUTLINE

MAD is an abnormal displacement of the mitral valve (MV) posterior leaflet onto the left atrial wall with separation between the MV attachment and the atrium MV junction. This entity has been associated with a progressive risk of malignant ventricular arrhythmias and sudden cardiac death, likely related to progressive mitral apparatus fibrosis. Therefore, recognition of this anomaly and its risk stratification are highly important. Its diagnosis is done by cardiac imaging. However, a reference imaging technique has not yet been established.MAD is commonly found in patients with mitral valve prolapse (MVP) or myxomatose MV disease but can also occur in the absence of mitral valve pathology. In either case it has been shown by multiple studies to be associated with life-threatening arrhythmic events.Transthoracic or transesophageal echocardiography and cardiac magnetic resonance (CMR) are useful noninvasive imaging tools for the diagnosis of MAD. It will manifest as an absence of myocardium during systole between the posterior mitral valve annulus and adjacent basal segments of the ventricular wall. CMR offers a detailed anatomic three-dimensional imaging that provides useful information for risk stratification and prognosis, being considered the gold standard.

## THE ROLE OF CORONARY COMPUTED TOMOGRAPHY ANGIOGRAPHY (CCTA) IN SPONTANEOUS CORONARY ARTERY DISSECTIONS (SCAD): WHAT RADIOLOGISTS NEED TO KNOW

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Silvia Duran Lojo, MD (*Abstract Co-Author*) Nothing to Disclose
Susana A. Otero Muinelo, MD (*Abstract Co-Author*) Nothing to Disclose
Carla Suarez Silva, MD (*Abstract Co-Author*) Nothing to Disclose
Blanca Perez Perez-Lafuente, MD (*Abstract Co-Author*) Nothing to Disclose
Maria Jose Martinez-Sapina Llanas, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The gold standard for the diagnosis of spontaneous coronary artery dissections (SCAD) is invasive coronariography angiography (ICA). Coronary computed tomography angiography (CCTA) can be the first diagnosis tool in haemodynamically stable patients and it´s very important in the follow-up. To present the role of CCTA in the diagnosis and follow-up of SCAD, with the different types of dissections and the differential diagnosis with other type of coronary occlusion. Also to describe the role of CCTA in the diagnosis of extracoronary arteriopathies related to SCAD.

### TABLE OF CONTENTS/OUTLINE

SCAD is a cause of myocardial infarction, and it accounts for at least 4% of all acute coronary syndromes. It is more common among young women and pregnant. The clinical presentation is variable, ranging from chest pain to cardiac death, most patients presenting with myocardial injury biomarkers increase. Fibromuscular dysplasia is the most common co-existing condition, also an association with connective diseases has also been reported. SCAD diagnosis is usually made by ICA, but CCTA can be the first diagnostic-tool in haemodynamically stable patients. Although dissection flap occurs in minority of cases, this is the easiest pattern to recognize on CCTA. Most often a stenosis or oclusion occurs and it´s challenging to distinguish between SCAD and other causes of vessel occlusion, so it´s important to observe other findings. Most patients are treated conservatively, unless they have ischaemia or haemodymically instability. Most patients are completely cured in 120 days and up to 30 % present a new SCAD. That is why the main role of CCTA is during follow-up period for assessment of dissection healing, 3/6 months after the SCAD event.

## MYOCARDIAL T1 MAPPING FOR CHARACTERIZING MYOCARDIAL DISEASES: STATE OF THE ART

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Priya Jagia, MD (*Abstract Co-Author*) Nothing to Disclose
Niraj N. Pandey, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Sanjeev Kumar, MBBS,MD (*Abstract Co-Author*) Nothing to Disclose
Vineeta Ojha, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. T1 mapping is a robust tool for evaluating myocardial diseases by quantifying changes in myocardial tissue composition.2. T1 mapping complements late gadolinium enhancement (LGE) imaging by detecting diffuse interstitial fibrosis, which LGE might miss.3. The utility of T1 mapping spans a diverse spectrum of cardiac conditions that influence both therapeutic strategies and clinical outcomes.After going through the exhibit, the reader will be able to explain the physics and principles behind T1 mapping, acquisition and interpretation, and applications of T1 and ECV mapping for diagnosis, prognostication, treatment and follow-up for various myocardial pathologies.

### TABLE OF CONTENTS/OUTLINE

1. Introduction2. Principles of T1 Mapping: Acquisition, post processing and interpretation3. Overview of T1 mapping indices and histological correlates: native T1, post contrast T1, and Extracellular Volume (ECV) Fraction4. Normal ranges5. T1-Mapping Techniquesa. Inversion Recovery-Based Techniquesb. Saturation Recovery-Based Techniquesc. Other techniques6. T1 Mapping in Ischemic Heart Diseasea. Acute Myocardial Infarctionb. Chronic Myocardial Infarction7. T1 Mapping in Non-Ischemic Cardiomyopathya. Non-Ischemic Dilated Cardiomyopathy (NIDCM)b. Takotsubo Cardiomyopathyc. Genetic Cardiomyopathies i. Hypertrophic Cardiomyopathy ii. Arrhythmogenic Right Ventricular Cardiomyopathy iii. Left Ventricular Noncompactiond. Post heart transplant e. Miscellaneous 8. Inflammatory Cardiomyopathiesa. Acute myocarditisb. Cardiac Sarcoidosis9. Infiltrative Cardiomyopathiesa. Cardiac Amyloidosisb. Anderson-Fabry Diseasec. Cardiac Siderosis10. Valvular Heart Disease11. Conclusions

Shibuki Matsui (*Abstract Co-Author*) Nothing to Disclose
Tatsuya Kawai, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Nobuo Kitera, RT, MSc (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Non-invasive quantification of the extracellular volume (ECV) is a method for the evaluation of focal and diffuse myocardial fibrosis, potentially obviating the need for invasive endomyocardial biopsy. 2. Quantification of ECV is an established method in MRI. However, quantification of ECV using CT (CT-ECV) is lower-cost, more accessible and faster than that of ECV using MRI (MR-ECV), and is also available even for patients where MRI is contraindicated. 3. Dual-source photon-counting detector CT (DS-PCD-CT) always provides spectral information. Moreover, this information can be obtained by ECG-gated scan mode and high-pitch spiral scan mode, which is unavailable with energy-integrating detector dual-source CT. 4. The new DS-PCD-CT option allow for more accurate CT-ECV quantification, which remains robust to variability of heart rate without the need for increased radiation dose.

### TABLE OF CONTENTS/OUTLINE

1. Utility of ECV for cardiac diseases 2. Non-invasive quantification of ECV-CT in comparison to ECV-MRI 3. Advantages of DS PCD-CT in cardiac imaging 4. Validation of the accuracy of data acquisition method specific to DS-PCD-CT 5. Advantages and disadvantages of CT-ECV and development with DS-PCD-CT

## SUPRA-AORTIC TENDON: AN ENIGMA ON CARDIAC IMAGING RESEMBLING AORTIC DISSECTION

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Satinder P. Singh, MD (*Abstract Co-Author*) Nothing to Disclose
Mostafa Abozeed, MD,PhD (*Abstract Co-Author*) Nothing to Disclose
Mohamed Ibrahim, MD (*Abstract Co-Author*) Nothing to Disclose
Inayat Grewal (*Abstract Co-Author*) Nothing to Disclose
Naga Sai Rasagna Mareddy, MBBS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

; Understand the embryological basis and origin of the supra-aortic tendon; Gain insight into the challenges of diagnosing this rare entity on cardiac imaging and become familiar with its mimics; Identify the clinical significance and limitations of conventional cardiac imaging modalities in assessing for this entity.; Describe the imaging features of supra-aortic tendon that help to distinguish it from type A aortic dissection

### TABLE OF CONTENTS/OUTLINE

; Overview of embryological development of supra-aortic tendon; Explanation of how to diagnose supra-aortic tendon on cardiac imaging:a) Understanding the limited role of echocardiogram and non-gated cardiac CTA to differentiate the two entities.b) Discussion of importance of gated Cardiac CT to better evaluate the aortic root.c) Discussion of impact of accurate diagnosis of this condition on patient management; Identification of specific imaging features found in patients with type A aortic dissection to better understand the similarities and differences in both conditions on imaging; Strategies for Radiologists who encounter similar cases in their practice.

## CARDIOPULMONARY COMPLICATIONS OF CANCER THERAPEUTICS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Anastasia Oikonomou, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Christian P. Houbois, MD (*Abstract Co-Author*) Nothing to Disclose
Issac Y. Yang, MD (*Abstract Co-Author*) Nothing to Disclose
Binita R. Chacko, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Lan-chau T. Kha, MD, MSc (*Abstract Co-Author*) Nothing to Disclose
Asutosh Sahu, MBBS, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

This educational exhibit will illustrate the cardiac and thoracic complications associated with new cancer agents such as immune checkpoint inhibitors (ICI). These treatments allow for substantial survival benefits in patients previously treated as palliative. However, treatment comes with an increased risk of cardiovascular and pulmonary side effects.
- Familiarize the reader with common cardiac and pulmonary complications resulting from cancer therapies with ICI, including immune myocarditis, pericardial diseases, pneumonitis, pulmonary embolism etc.
- To discuss the value of CT and MRI in identifying and differentiating between complications.
- To describe the range and overlap of critical imaging features based on specific clinical case scenarios.

### TABLE OF CONTENTS/OUTLINE

- Background of cardiac and pulmonary toxicities:
- Epidemiology
- ICI drugs and common side effects
- Value of imaging with CT and MRI in the detection and monitoring of complications.
- Cardiac and thoracic side effects are illustrated by case examples.
- The role of radiologist in a multidisciplinary team:
- The importance of multidisciplinary collaboration in managing affected patients.

## INTERSECTING VISTAS: CORONARY AND PULMONARY ARTERY FISTULAS IN CARDIAC CT IMAGING

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Ali F. Tekin, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

This presentation aims to delineate various manifestations of a coronary artery - pulmonary artery fistulas (CPAFs) and assess their possible hemodynamic consequences. Additionally, it highlights the critical role of coronary CT angiography (CCTA) in identifying these uncommon vascular anomalies, illustrated through several CT imaging examples.

### TABLE OF CONTENTS/OUTLINE

1. Introduction to coronary artery - pulmonary artery fistulas Coronary artery - pulmonary artery fistulas (CPAFs) are rare vascular anomalies that create an abnormal connection between the coronary arteries and the pulmonary artery, bypassing the myocardial capillary network. 2. Coronary CT angiography (CCTA) Imaging Coronary CT angiography (CCTA) is a non-invasive, precise imaging technique crucial for diagnosing CPAFs. It requires a controlled heart rate, achieved through medications, and uses advanced imaging technologies to detail the fistula's characteristics. CCTA employs either prospective or retrospective ECG-triggered acquisition methods depending on the patient's heart rhythm stability. 4. ConclusionsIn conclusion, CCTA's role in diagnosing CPAFs has become more critical with its ability to detect these anomalies incidentally, emphasizing the need for radiologists to be proficient in using this technology for effective diagnosis and management.

### TEACHING POINTS

- Point-of-care Ultrasound (POCUS) is a methods of evaluating patients at the bedside during cardiac arrest to enable an efficient response and the CAUSE (Cardiac Arrest Ultrasound Exam) protocol is a guide for the use of thoracic ultrasound in care for cardiac arrest in a non-shockable rhythm.- When applied correctly, the CAUSE protocol allows for the identification of potentially reversible causes, minimizing the time of cardiac arrest.- With the determination of a non-shockable rhythm through clinical history and monitoring, the use of ultrasound is indicated - through the subcostal, apical, pulmonary, and parasternal windows - which can provide an effective prognosis.- This review addresses techniques for identifying causes of cardiac arrest, such as pneumothorax, cardiac tamponade, pulmonary embolism, and hypovolemia.- The competence and training of the professional in using bedside ultrasound has the potential to increase clinical precision and significantly contribute to reducing morbidity and mortality in the emergency context.

### TABLE OF CONTENTS/OUTLINE

- Introduction on using bedside ultrasound in the emergency context.- Evaluation of a literature review regarding the CAUSE protocol.- Discussion on the use of ultrasound during cardiac arrest with the aim of identifying potentially reversible causes.- Importance of mastering techniques for evaluating windows for a good prognosis.

Amanda Tenorio, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Coronary artery disease (CAD) is one of the main causes of death in the world and the management by means of coronary stenting and coronary artery bypass graft surgery (CABG) are well-established techniques.2. The assessment of coronary stents and myocardial revascularization plays a crucial role in post-procedural management and predicting patient clinical outcomes.3. Coronary CT angiography, a well-established technique in chronic CAD, offers a non-invasive and effective approach to this evaluation.4. This presentation aims to illustrate the role of CT angiography in assessing coronary stenting and CABG imaging, correlating them to conventional angiography, intravascular ultrasound, and optical coherence tomography.

### TABLE OF CONTENTS/OUTLINE

1. Applied techniques of CABG and coronary stenting.2. Milestones in the evolution of percutaneous coronary intervention over the years.3. Techniques: CT angiography, conventional angiography, intravascular ultrasound, and optical coherence tomography - pros e cons.4. Coronary CT angiography protocols5. Coronary stenting:(a) Coronary anomalies(b) Restenosis and stent thrombosis(c) Coronary CT angiography-derived Fractional Flow Reserve testing (FFR-CT)(d) Artifacts: blooming and beam hardening(e) Complications6. CABG:(a) Types: arterial and venous(c) Complications7. Miscellaneous and other findings8. Sample cases of pearls, pitfalls, diagnostic difficulties, and mimics.9. Future directions: artificial intelligence10. Summary and take-home messages.

## DECODING THE MAP OF THE HEART: CMR PARAMETRIC MAPPING SEQUENCES FOR MYOCARDIAL TISSUE CHARACTERIZATION

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Manuel Rafael Lopez De La Torre Carretero (*Abstract Co-Author*) Nothing to Disclose
Ana Ezponda, MD (*Abstract Co-Author*) Nothing to Disclose
Pablo Del Nido Recio (*Abstract Co-Author*) Nothing to Disclose
Carmen Mbongo, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To describe the fundamentals of parametric mapping methods in CMR and their clinical applications.To review and illustrate the role of T1 and T2 mapping in the characterization and assessment of different cardiomyopathies through different cases.

### TABLE OF CONTENTS/OUTLINE

Cardiovascular magnetic resonance (CMR) is the gold standard imaging modality for myocardial tissue characterization. The development of native parametric mapping sequences has allowed a change from visual to quantitative evaluation of the myocardium. Absolute native T1 and T2 mapping values are particularly useful in detecting diffuse alterations (interstitial oedema or fibrosis), especially when the rest of the CMR protocol shows no significant findings.1. Brief review of technical aspects of sequence acquisition and imaging protocol.2. Tips for adequate interpretation of T1 and T2 parametric mapping sequences.3. Clinical applications. Although changes of T1 and T2 mapping values are not disease-specific, they indicate alteration in myocardial tissue composition and may serve as diagnostic and prognostic tools in the context of a specific clinical scenario.Acute myocardial injury- Acute coronary syndrome with obstructive coronary disease.- Troponin-positive non-obstructive coronary artery disease (TpNOCA). Infiltrative cardiac diseaseDiffuse global fibrosisCardiac massesParametric T1 and T2 mapping sequences increase the diagnostic capabilities of CMR by quantifying both focal and diffuse alterations in myocardial tissue. Changes in these parameters represent valuable biomarkers for making diagnosis, determining prognosis and monitoring therapy

## BASICS OF NONINVASIVE FRACTIONAL FLOW RESERVE (FFR) CT, PLAQUE ANALYSIS AND PLAQUE QUANTIFICATION - CURRENT TRENDS IN CORONARY CT EVALUATION

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Camila Urzua Fresno, MD, MSc (*Abstract Co-Author*) Nothing to Disclose
Daniel Vargas, MD (*Abstract Co-Author*) Nothing to Disclose
Ranish D. Khawaja, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Basics of FFR-CT analysis for the radiologists and cardiac imagers.- Role of FFR-CT can help improve diagnostic ability to assess for stenosis with most clinical impact.- Case examples to show-case various lesions identified on CT with their correlation on FFR-CT (easy to moderate level of complexity with interactive features).

### TABLE OF CONTENTS/OUTLINE

- Discussion of the basic physiology and methodology of noninvasive fractional flow reserve (FFR-CT) technology.- Discussion of the role FFR-CT in evaluation of cardiac CT examinations in the current practice, and discuss the limitations.- Discussion of plaque burden, plaque morphology and plaque quantification using the CT data for characterization of plaque.- Showcase interactive CT-FFR cases and correlation with the CT-imaging to help navigate high-risk lesions, and complex cases.

## READING THE SURGEON'S INTENT: DISCERNING INTENTIONAL FROM UN-INTENTIONAL IN THE POST-OPERATIVE COMPLEX CONGENITAL HEART DISEASE PATIENT

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Sayedomid Ebrahimzadeh, MD (*Abstract Co-Author*) Nothing to Disclose
Jonathan A. Liu, MD (*Abstract Co-Author*) Nothing to Disclose
Hannah Ahn, MD (*Abstract Co-Author*) Nothing to Disclose
Shravan Sridhar, MD, MS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Imaging of the post-operative congenital heart disease patient can be difficult even for radiologists who routinely read these exams. Having a framework to recognize atypical but intended post-surgical changes ensures diagnostic accuracy and informs approach to detecting complications. Here, we present concepts underlying atypical appearances following congenital heart surgery including intentional post-surgical and physiologic changes that mimic pathology and address where an atypical appearance could be pathologic but still intentional (risk vs benefit dilemma), reviewing complications/pitfalls where appropriate.

### TABLE OF CONTENTS/OUTLINE

1. Title, disclosure2. Abbreviations3. Overview4. Operations + timelinea. PA band in initial palliation vs branch PA stenosisb. Post-op appearance aortic atresia vs DKS anastomotic stenosisc. ASD in single vs BiV repaird. VSD in single vs BiV repaire. mBTT ligation vs occlusionf. RV-PA conduit stump vs pseudoaneurysmg. PDA maintenance vs abnormal patencyh. Fontan types atriopulmonary vs extracardiaci. Fontan fenestration vs baffle leakj. Unifocalization MAPCAs vs pulmonary veins5. Physiology and natural coursea. Absent Fontan conduit in 1.5V repair vs azygos/hemiazygos continuation of IVC vs BiV conversionb. Occluded hepatic-PA conduit + collaterals vs acute Fontan thrombosisc. RA baffle distension vs chamber dilationd. Transannular patch distension vs RVOT pseudo/aneurysm6. The surgeon’s dilemma of risk vs benefita. Shunts with Qp:Qs < 1.5b. ## IMAGING OF ADULT PRESENTATION OF UNTREATED CONGENITAL HEART DISEASE-EXPECT THE UNEXPECTED

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Ameya J. Baxi, MBBS,DMRD (*Abstract Co-Author*) Nothing to Disclose
Daniel Vargas-Zapata, MD (*Abstract Co-Author*) Nothing to Disclose
Carlos S. Restrepo, MD (*Abstract Co-Author*) Nothing to Disclose
Vijay K. Aggarwal, MBBS (*Abstract Co-Author*) Nothing to Disclose
Dhruti Maisuri, MD, MBBS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Prevalence of congenital heart disease(CHD) in adults has increased and currently adults more than children have these malformations.2. Most common undiagnosed adult CHD includes bicuspid aortic valve, aortic coarctation, occult shunts (VSD, ASD, PFO, PDA) and uncomplicated tetralogy of Fallot.3. The spectrum of imaging findings of previously undiagnosed congenital heart disease in adults will be discussed.4. Multimodality imaging provides comprehensive assessment of morphology and function including flow analysis from the central to the more peripheral vasculature.5. Common pitfalls in evaluation of adult heart structure on CT/MRI will be reviewed.

### TABLE OF CONTENTS/OUTLINE

Occasionally, radiologists are confronted with late presentation of undiagnosed or untreated congenital heart disease in the adult patient. Conditions like bicuspid aortic valve, coarctation, occult shunts, (ASD, VSD PDA) may represent up 10% -of all congenital cardiac anomalies. Rarely anomalous venous return, tetralogy of Fallot, congenitally corrected L-transposition of great vessels, Ebstein’s anomaly, cor-triatrium may also be seen with late presentation in life. Functional assessment of the right heart represents an important aspect of imaging in ACHD patients. CT scan with excellent temporal and spatial resolution is an excellent imaging modality for assessing heart structure. MRI provides comprehensive functional information for both cardiac chambers and vasculature. It is important for the radiologists to be able to recognise common undiagnosed congenital heart disease in adult patient, even as an incidental finding.

## CHALLENGING ANATOMIC AND PATHOLOGIC FEATURES FOR TAVR PROCESSING: PEARLS AND PITFALLS FROM THE 3D IMAGING LABORATORY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Frank J. Rybicki III, MD, PhD (*Abstract Co-Author*) Medical Director, Imagia Cybernetics Inc
Michael F. Morris, MD (*Abstract Co-Author*) Educator, Medtronic plc
Kimberly Hatch, ARRT, BA (*Abstract Co-Author*) Nothing to Disclose
Richard L. Hallett II, MD (*Presenter*) Consultant, Bracco Group

### TEACHING POINTS

3D segmentation and post-processing of CT datasets is essential for safe and successful transcatheter aortic valve replacement (TAVR) procedural planning. High quality 3D Imaging Laboratory output contributes to shortened procedural times, improved patient safety, and supports excellent clinical outcomes.This presentation will: Review challenging anatomic, pathologic, and iatrogenic findings that may be encountered during 3D processing for TAVR planning. Provide practical processing techniques to overcome challenging and/or unexpected anatomy and generate highly accurate output for TAVR procedural planning. Examples include annular sizing, coronary anatomy, bicuspid aortic valve / aortic root / LVOT geometry, and challenging access considerations. Review processing pitfalls that may adversely impact processing output and procedural success.

### TABLE OF CONTENTS/OUTLINE

A. Aortic valve / root / LVOT considerations: 1. Bicuspid aortic 2. Valve Valve in Valve (ViV) 3. Valve in TAVRB. Challenging annular configurations: 1. Subannular / LVOT calcification and alterationC. Coronary artery challenges: 1. coronary height, origin, and courseD. Access Considerations: 1. Aortic pathology 2. Iliofemoral segment pathology 3. Subclavian / carotid artery pathology 4. Direct access (aorta, LV apex)

## HEMOPERICARDIUM: CASE BASED REVIEW OF POTENTIAL ETIOLOGIES AND KEY IMAGING FINDINGS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Larry A. Latson JR, MS,MD (*Abstract Co-Author*) Nothing to Disclose
Geraldine T. Brusca-Augello, DO (*Abstract Co-Author*) Nothing to Disclose
Joanna G. Escalon, MD (*Abstract Co-Author*) Research Consultant, Vingroup
David Jones (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Hemopericardium is the accumulation of blood in the pericardial space. It often signals a life-threatening event and finding the source of bleeding is essential in expediting appropriate care. Furthermore, depending on the rate of accumulation, hemopericardium in and of itself can be fatal due to the development of cardiac tamponade. In order to quickly make this essential diagnosis, the radiologist must be familiar with the imaging findings of hemopericardium and tamponade and the potential causes.

### TABLE OF CONTENTS/OUTLINE

1. Imaging findings of hemopericardium and tamponade. 2. Case-based review of the causes of hemopericardium including associated key imaging features and associated findings, including: (A) Acute vascular disease - i. ruptured aortic dissection, ii. ruptured myocardial infarction, (B) Iatrogenic - i. pacemaker perforation, ii. Mediport malposition, iii. Post-CABG; (C) Post-traumatic - i. cardiopulmonary resuscitation; (D) Other - i. pericarditis, ii. malignancy, iii. anti-coagulation therapy.

# Abstract Archives of the RSNA, 2024

CAEE-52

## TIPS AND TRICKS TO AVOID PITFALLS IN INTERPRETATION OF CORONARY CT ANGIOGRAPHY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Baskaran Sundaram, MD (*Abstract Co-Author*) Nothing to Disclose
Prabhakar Rajiah, MD, FRCR (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. To highlight key pitfalls that are encountered in coronary CTA interpretation 2. To illustrate the recognition of these pitfalls using representative case examples

### TABLE OF CONTENTS/OUTLINE

1. False negative stenosis a) Non-calcific plaque not obvious in axial plane, e.g. left main- Use orthogonal, MIP, VR b) Plaque ignored as partial voluming (mid LAD, distal RCA)- Use orthogonal plane c) “Blind spots”, LAD near diagonal, LCx near OM, RCA near PDA- Thin MIPs d) Small vessels- thin slice, sharp kernels e) Bypass graft landing zone, runoff f) Stent with distal contrast- Contrast attenuation in stent g) Subtle/absent stenosis- Evaluate regional wall motion/ perfusion defect 2. False positive stenosis a) Ghosting- Absent in another cardiac phase b) Misregistration - Confirm in another plane and phase c) Low attenuation in vessel without plaque - Confirm absence of plaque d) Low attenuation of beam hardening of calcified plaque e) Dense calcified plaques- Curved MPR 3. Overestimation of stenosis a) Using single cross sectional plane-Orthogonal views, cMPR b) Quantifying outer-to-outer diameters instead of inner-to-inner diameters- remodeling c) Using tiny distal vessel beyond bifurcation as reference d) Calcium blooming -wider window, sharper kernel, thinner slices, 100 keV VMI e) Poor contrast enhancement- Different windowing (e.g 700/250) f) Intense contrast enhancement- Different windowing (1000/200) 4. Underestimation of plaque a) Calcified plaque in contrast CT b) Motion 5. Strategies to avoid pitfalls a) Systematic review b) Multiple reconstruction techniques- MPR, cMPR, MIP, VR c) Multiple planes- Axial, orthogonal, longitudinal, cross-sectional

Prabhakar Rajiah, MD, FRCR (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. To review the expanding role of CT in the guidance of percutaneous coronary interventions (PCI) 2. To discuss the role of CT in determining suitability for PCI 3. To highlight the utility of CT in cath lab resource optimization and real-time guidance

### TABLE OF CONTENTS/OUTLINE

A. Need for PCI 1) Stenosis severity 2) Flow-limiting stenosis- FFRct/CTperfusion(CTP) B. Suitability for PCI 1) Focal lesion + FFRct < 0.8 2) FFRct virtual planner 3) FFRct virtual pullback C. Planning PCI 1) Risk-stratification- High-risk plaque increases MI, no-reflow 2) Coronary ostial origin- Atypical position needs different catheters 3) Anomalies- Change approach 4) Proximal lesion- deep cannulation obscures lesion 5) Optimal fluoroscopy angles for specific segments 6) Lesion length- Stent sizing 7) Extensive calcifications-need lithotripsy/atherectomy 8) Soft plaque at landing zone- dissection risk 9) Ostial lesions- Precise demarcation 10) Bifurcation lesions-Side branch demarcation, virtual FFRct, subtended myocardium 11) 3D calcium model- planning additional procedures 12) Wire simulator D. Real-time procedural guidance Fusion of 3D CT plaque map E. Planning complex multivessel CAD 1) CABGvsPCI, CT-SYNTAX 2) Lesion severity,length,focality 3) Landing zone, run off 4) Calcification 5) CTP- subtended myocardium, scar 6) LAD-D1 distance-sequential graft 7) RIMA,LIMA 8) Redo CABG- sternal relationships, aortic calcification F. Planning Chronic total occlusion 1) Poor outcome predictors- > 15 mm long, calcification > 5.5 mm / > 50 % of area, shrinkage, bend angle > 45° 2) Risk scores- JCO,CT RECTOR,KCCT G. Planning for redo revascularization 1) Repeat PCI- CTP for defect 2) PCI after CABG- CTA improves procedure planning

## UTILITY OF CT IN TRANSCATHETER CLOSURE OF PARAVALVULAR LEAKS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Prabhakar Rajiah, MD, FRCR (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. To review the etiology and pathophysiology of paravalvular leaks (PVL) 2. To understand the utility of CT in evaluating these patients 4. To illustrate the important CT measurements and clinical significance 5. To review the CT findings of common complications after PVL closure

### TABLE OF CONTENTS/OUTLINE

Table of contents 1. Paravalvular leaks a) Etiology- Suture dehiscence, endocarditis, inflammation, degeneration b) Symptoms- CHF, hemolysis 2. Role of multimodality imaging in diagnosis and management a) Echo-limitations b) MRI- limitations c) CT 3. CT protocol- Retrospective ECG gating, delayed phase, non con 4. CT for diagnosis a) Diagnostic criteria b) Pitfalls- surgical material, metals, small c) Differentials-pseudoaneurysm, abscess 5. Management a) Indications for closure- symptoms, significant PVL b) Transcatheter vs surgical c) Transcatheter- high surgical risk, suitable anatomy 6. Devices for PVL closure- Vascular, ductal or septal occluder devices- Amplatzer vacular plug (I, II) 7. Access routes- Transeptal, transapical, retrograde arterial 8. Role of CT in planning PVL closure a) No acoustic shadows or artifacts b) Higher temporal resolution than 3D color doppler c) Characterization d) Most valuable in complex tract 9. CT parameters a) Location - Clockface position- Mitral anteromedial (10/11 o clock) or posterolateral (5/6 o clock) b) Size c) Shape d) Course e) Tract f) Fluoroscopic angles g) Contraindications- Infection, abscess, rupture 10. 3D printing a) Virtual device placement 11. Procedure technique - CT fluoro fusion 12. Follow-up protocol 13. Post-procedural CT- Normal appearances 14. Complications- Device migration, recurrent leak, infection, rupture 15. Conclusion

## MYOCARDIUM IN DISARRAY: THE BASIC PHYSIQUES OF HYPERTROPHIC CARDIOMYOPATHY AND BEYOND

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Jose A. Maldonado, MD (*Abstract Co-Author*) Nothing to Disclose
Ellis D. Mejias Febres, BS (*Abstract Co-Author*) Nothing to Disclose
Alejandro M. Linera Asencio, MD (*Abstract Co-Author*) Nothing to Disclose
Alejandro Acosta (*Abstract Co-Author*) Nothing to Disclose
Kevin Hornedo, BS (*Abstract Co-Author*) Nothing to Disclose
Santiago A. Saldana Mendez, MD, BS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

A. Review the pathophysiology and clinical picture of Hypertrophic Cardiomyopathy (HCM). B. Discuss HCM diagnosis and cardiac magnetic resonance imaging (MRI) findings C. Provide an overview of the different HCM morphologies including epidemiology, prognosis, and treatment implications. D. Examine late gadolinium enhancement (LGE) quantification analysis E. Highlight additional key imaging findings for optimal risk stratification for Sudden Cardiac Death (SCD).HCM is one of the leading causes of SCD among young people. The degree and pattern of left ventricular wall thickening have implications that impact the clinical course of patients with HCM. Our goal is to provide radiology trainees, radiologists, and clinicians an overview of the different phenotypes of HCM. We will do so by using cardiac MRI case examples, while highlighting the indispensable role of cardiac MRI in the assessment of HCM. We will also examine the pivotal role of LGE quantification analysis and other key imaging findings for optimal risk-stratification for SDC.

### TABLE OF CONTENTS/OUTLINE

I. Introduction Objectives II. HCM A. Pathophysiology Clinical presentation B. Diagnosis C. Cardiac MRI Imaging findings III. Overview of HCM phenotypic presentations A. Prevalence, epidemiology, prognosis, and treatment B. MRI case examples IV. Examine LGE Quantification Analysis V. Risk-Stratification for SCD VI. Discuss the role of cardiac MRI VII. Conclusion

## UNDERSTANDING EXERCISE CMR: A REVIEW OF ITS QUALITIES, METHODS AND CLINICAL APPLICATIONS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Ming-Yen Ng, BMBS, FRCR (*Abstract Co-Author*) Education Grant, General Electric Company;Education Grant, Bayer AG;Education Grant, Circle Cardiovascular Imaging Inc;Education Grant, TeraRecon, Inc;Education Grant, Arterys Inc;Speakers Bureau, Boehringer Ingelheim GmbH
Calvin Chin (*Abstract Co-Author*) Nothing to Disclose
Jeffrey Chit Wai Chan (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Understanding the (1) Roles of exercise CMR (Ex-CMR), its principles, and how Ex-CMR compares against other forms of stress tests. (2) Different types of Ex-CMR, their respective strengths and limitations. (3) How Ex-CMR is performed, challenges associated with acquiring images and safety considerations associated with exercise stress testing. (4) Clinical applications of Ex-CMR in terms of diagnosing coronary artery disease (CAD) and differentiating between dilated cardiomyopathy (DCM) and exercise-induced cardiac remodeling (EICR). (5) Interpreting the results of Ex-CMR using real case examples.

### TABLE OF CONTENTS/OUTLINE

(1) Overview: An overview of Ex-CMR, including the principles behind it, the different forms of Ex-CMR and their respective strengths and limitations, and an evaluation of the strengths and limitations of Ex-CMR compared against other methods. (2) Performing the scan: the typical protocol for Ex-CMR is explained. We also explain the challenges in Ex-CMR in terms of achieving an adequate spatial-temporal resolution with free breathing sequence, with an example scan to illustrate the point. Safety considerations including contraindications to Ex-CMR and indications for test termination are overviewed. (3) Clinical applications: we review the clinical applications of Ex-CMR using 2 examples: diagnosing CAD and differentiating between DCM and EICR in athletes. (4) Case examples: we present 2 case examples to illustrate the aforementioned clinical applications of Ex-CMR with annotated and labeled scans and an explanation of how the scans are interpreted. (5) The future of Ex-CMR: a brief overview of the future developments related to Ex-CMR is presented.

## LATE GADOLINIUM ENHANCEMENT FINDINGS IN HOSPITALIZED COVID-19 PATIENTS: A FOCUS ON THE POST-ACUTE PHASE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Maria Davo Jimenez, MD (*Abstract Co-Author*) Nothing to Disclose
Daniel Lee (*Abstract Co-Author*) Research Grant, Abbott Laboratories;Spouse, Employee, Takeda Pharmaceutical Company Limited
Daniel Kim, PhD (*Abstract Co-Author*) Nothing to Disclose
Suvai Gunasekaran, PhD (*Abstract Co-Author*) Nothing to Disclose
Golnoosh Ansari, MD (*Abstract Co-Author*) Nothing to Disclose
Brandon Benefield (*Abstract Co-Author*) Nothing to Disclose
Kevin Wojciechowski (*Abstract Co-Author*) Nothing to Disclose
Cagdas Topel, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To demonstrate late gadolinium enhancement (LGE) findings in 12 patients who underwent cardiac magnetic resonance (CMR) during the peak phase of the COVID-19 pandemic

### TABLE OF CONTENTS/OUTLINE

1. Introduction to cardiovascular impact of COVID-19 infection• Recent studies indicate that 26% to 60% of hospitalized COVID-19 survivors show CMR abnormalities, such as functional impairment, myocardial injuries, late gadolinium enhancement, or pericardial abnormalities.2. Literature review of the LGE findings in patients with COVID-19• A wide range of “myocarditis-like” or “ischemic-like” LGE patterns can be found.3. LGE features in different phases of myocardial injury• Presentation of cases with various LGE findings at different stages.4. Conclusions• A variety of LGE patterns were found in patients with a history of hospitalization due to COVID-19.• LGE can be observed after the acute phase of the disease, with normalized T1, T2 and extracellular volume (ECV) fraction.

Tobias Else (*Abstract Co-Author*) Nothing to Disclose
Elizabeth Lee, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Cancer is more prevalent in patients with congenital heart disease (CHD) than the general population due to genetic and environmental risk factors including radiation exposure from imaging, genetic disorders, and alterations in physiology which promote tumorigenesis. 2. Cardiac hepatopathy increases the risk of hepatocellular carcinoma. Screening with US and alpha-fetoprotein levels in patients with single ventricle physiology, chronic heart failure and after Fontan palliation may help identify this complication. 3. Pheochromocytomas and paragangliomas develop in patients with cyanotic heart disease at higher rates than the general population and those with non-cyanotic CHD. 4. Genetic disorders can predispose to both CHD and tumors, for example Down syndrome (CHD risk and leukemia, testicular germ cell tumors). 5. Those patients receiving transplant for CHD are at elevated risk of various tumors including viral induced lymphomas as well as various solid organ tumors. 6. With increasing survival of patients into adulthood and the higher predisposition to cancer, adherence to screening is essential, although observational studies suggest lower screening rates in CHD patients.

### TABLE OF CONTENTS/OUTLINE

1. Introduction: Risk of tumors in CHD. 2. Factors which may contribute to increased risk of cancer in congenital heart disease: radiation exposure from diagnostic and therapeutic procedures, specific tumors related to CHD physiology (hepatocellular carcinoma, neuroendocrine tumors), genetic disorders predisposing to CHD and tumors, cancers which develop after cardiac transplant for congenital heart disease (lymphoma, solid organ tumors) 3. Screening for malignancy in CHD population

## IMAGING REVIEW OF ACUTE CHEST PAIN WITH FOCUS ON CT AND MRI IN THE EMERGENCY SETTING

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Thurl Cledera, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Acute chest pain is one of the most common complaints in the emergency department. Imaging with the help of proper clinical examination is a crucial component of evaluation in these patients. While ECG is mandatory in examinations for screening STEMI and NSTEMI, and chest radiography is a standard imaging examination, CT and/or MRI is valuable in the immediate detection or exclusion of a myriad of conditions presenting with acute chest pain. The appropriate choice of imaging test is affected by the suspected diagnosis and availability of the modality in question. This exhibit will present imaging modalities pertinent to acute chest pain and scenarios pertaining to acute coronary syndrome, cardiac, and noncardiac causes of chest pain. The objectives of this exhibit are: 1) To discuss current guidelines in assessing acute chest pain and how it intersects with the role of noninvasive imaging, 2) To review imaging features of cardiac and noncardiac causes of acute chest pain, and 3) To enable the radiologist to recommend appropriate imaging modalities and guide proper treatment

### TABLE OF CONTENTS/OUTLINE

I. Introduction II. Acute Versus Stable Chest Pain III. Considerations in the Patient Presenting with Acute Chest Pain IV. Overview of Imaging Modalities A. Anatomic Testing B. Functional/Stress Testing V. Imaging Scenarios A. Acute Coronary Syndromes B. Myocardial Infarction with Nonobstructive Coronary Arteries (MINOCA) C. Prior CABG Surgery D. Suspected Myopericarditis E. Valvular Heart Disease F. Acute Aortic Syndrome G. Thromboembolism H. Noncardiac Causes VI. Teaching Points VII. Conclusion

## PERICARDIAL PRIMER: AN IMAGING REVIEW OF ABNORMALITIES INVOLVING THE PERICARDIUM

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Justin Sindoni, MD (*Abstract Co-Author*) Nothing to Disclose
Cristina Fuss, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Caroline Merriam, DO (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Describe normal pericardial anatomy and the expected appearance of the pericardium on CT and MRI.
- Review CT and MRI features of congenital, infectious, inflammatory, traumatic, and malignant pericardial abnormalities.
- For each pericardial abnormality, describe the associated clinical presentation, differential diagnoses, potential complications, and recommendations for next steps in management.Background: The pericardium is comprised of an inner visceral layer and an outer parietal layer, which create a potential space containing approximately 30-50mL of serous fluid. The pericardium surrounds the heart and great vessel origins, and normally measures less than 2mm in thickness. In addition to creating a physical barrier between the heart and lung pleura, the pericardium also regulates cardiac chamber pressures and optimizes cardiac motion. As a result, congenital and acquired pericardial abnormalities can be extremely detrimental to a patient's cardiovascular function. This exhibit will review the myriad of congenital, infectious, inflammatory, traumatic, and malignant abnormalities that can involve the pericardium. The goal of this exhibit is to expedite diagnosis and management of clinically significant pericardial pathologies seen on CT and MRI.

### TABLE OF CONTENTS/OUTLINE

- Introduction
- Review of normal pericardial anatomy
- Discussion of expected appearance of the pericardium on CT and MRI
- Case-based review of pericardial pathologies, organized into the following broad categories:
- Congenital
- Infectious
- Inflammatory
- Traumatic
- Primary pericardial malignancy
- Pericardial metastasis

Ameya J. Baxi, MBBS,DMRD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To recognize various cardiac devices on radiological imaging. Discuss indication proper positioning of various cardiac device placement Detect malposition, complication, common pitfalls of device

### TABLE OF CONTENTS/OUTLINE

In recent years, there is increase in the number of implanted cardiac devices. Device migration/complications associated with cardiac device can occur because of local erosion, excessive tension during deployment, inadvertent deployment, inappropriate device sizing or due to congenital or surgical/procedural defects. Multiple factors can contribute to delayed diagnosis of a migrated device, including lack of familiarity with the device, cognitive errors, radiographic technique. It may be challenging, but important to radiologist as how they appear on imaging, normal positions, complications. Radiologists must employ multiple strategies like comparing images with prior studies, reading recent relevant literature about interventional/surgical procedures implanted devices, and clinic notes. Radiologists play critical role in ensuring appropriate placement may be the first medical professionals to suggest unsuspected device migration. This review gives concise summary of various cardiac devices and complicationsAims/Objectives
- Introduction
- Pathology, role of imaging, imaging findings of malposition, complication, common pitfalls
- PICC line
- Pacemaker/ intracardiac defibrillator
- PCWP catheter
- ASD closure device
- Prosthetic aortic valve
- Prosthetic mitral valve
- Mitral valve clips
- TRANSCATHETER VALVES AND VALVE REPAIR
- Aortic stent
- Watchman device
- VENTRICULAR ASSIST DEVICES
- ECMO
- IMPLANTABLE LOOP RECORDER
- Miscellaneous
- Differential diagnosis
- Conclusion

## CT CORONARY ANGIOGRAPHY FRACTIONAL FLOW RESERVE ($FFR_{CT}$) IN ASSESSMENT OF PATIENTS WITH CORONARY ARTERY DISEASE: A PRIMER FOR A RADIOLOGIST

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Charit R. Tippareddy, MD (*Abstract Co-Author*) Nothing to Disclose
Amit Gupta, MD (*Abstract Co-Author*) Nothing to Disclose
Cody R. Johnson, MD (*Abstract Co-Author*) Nothing to Disclose
Syed Muhammad Awais Bukhari, MD (*Abstract Co-Author*) Nothing to Disclose
Benjamin Parker, MD, MS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1.To review how fractional flow is derived2.To review landmark clinical trials supporting the clinical usage of FFRCT3.To highlight clinical cases where FFRCT can influence management4.To highlight important limitations of FFRCT technology5.To discuss the future role and newer tools of non-invasive ischemia/plaque assessment

### TABLE OF CONTENTS/OUTLINE

1) FFRCT: basics, workflow and reportinga. Computational flow dynamics and fractional flow reserve.b. FFRCT vs FFR Invasive -> pros and consc. Recommendations for interpretation of FFRCT results2) Literature supporting FFRCT in the clinical practicea. PRECISEb. TARGETc. FORECASTd. PLATFORMe. NXTf. DeFACTOg. DISCOVER-FLOW3) Clinical instances where FFRCT can augment diagnostic confidence and patient managementa. Borderline stenosis (50-70 %) on visual analysis.b. Isolated severe branch vessel disease.c. Heavily calcified coronary arteries.d. Tandem stenoses.e. Noninvasive preoperative clearance for coronary artery disease4) Limitations/Challenges of FFRCT analysis:a. Image Quality is central to study accuracy: Electrocardiographic (EKG) misregistration, Motion artifacts and increased noise precludes accurate assessment.b. Vessel Tortuosity, Stents and grafts.c. False positive results: Due to motion, suboptimal coronary vasodilatation and ventricular hypertrophy.d. False negative results: Due to motion, ultrashort segment plaque, manual segmentation error.e. Workflow and Reimbursement5) Future directionsa. Appropriate use of FFRCTb. Prediction of post-stenting FFRc. Plaque analysis

## 30-MINUTE EXAM OF CARDIAC MAGNETIC RESONANCE IMAGING WITH DEEP LEARNING-BASED HIGHLY-ACCELERATED CARDIAC CINE AND SINGLE-SHOT MYOCARDIAL DELAYED ENHANCEMENT WITH DEEP LEARNING RECONSTRUCTION

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Kunihiro Yoshioka, MD (*Abstract Co-Author*) Nothing to Disclose
Tsuyoshi Sugawara (*Abstract Co-Author*) Nothing to Disclose
Makoto Orii (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Society for Cardiovascular Magnetic Resonance offer a basic 30-min cardiac magnetic resonance (CMR) exam that answers many of the common clinical questions in cardiovascular practice (Figure 1). But in the real world, historic time slots of 60 min or longer hinder improved access to CMR. The total exam time can be reduced if high-quality 2D cine images can be collected post-contrast to minimize non-scanning time prior to myocardial delayed enhancement (MDE) imaging. Recent development of deep learning-based highly-accelerated cardiac cine (DL cine) has the potential to reduce scan time while preserving image quality (Figure 2). With the use of DL cine, 2D cine imaging can be performed after contrast injection during a waiting time for MDE imaging. Moreover, the diagnostic performance of DL cine pre- and post-contrast injection is expected to be comparable in terms of image quality and quantification of biventricular volume and function (Figure 3). Single-shot MDE (SSMDE) with deep learning reconstruction (DLR) could acquire each slice in a single heartbeat and allows for image acquisition of entire left ventricle in a few breath-holds (Figure 4). Several studies have reported that SSMDE with DLR provides similar diagnostic accuracy compared to conventional approach. Combined 2D DL cine and SSMDE with DLR, we could achieve a basic 30-min CMR exam with routine techniques that answers many of the common clinical questions (Figure 5).

### TABLE OF CONTENTS/OUTLINE

Figure 1: Classical workflow of CMR. Figure 2: 2D DL cine. Figure 3: Comparison of pre- and post-contrast short-axis DL cine images of a patient with cardiac sarcoidosis. Figure 4: SSMDE with DLR. Figure 5: New 30-min workflow of CMR using DL cine and SSMDE with DLR.

Masaya Kisohara, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. True semiconductors such as CdTe are energetically stable. Photons above the band gap form electron-hole pairs in semiconductors. CdTe is used in photon-counting detectors (PCD) and scintillators are used in energy-integrating detectors (EID).2. The unique structure of the photon-counting CT includes an application specific integrated circuit (ASIC), which counts the electrons converted from photons at each threshold value.3. PCD-CT can provide low-noise, high-resolution images and has excellent imaging performance, especially in the evaluation of coronary arteries.4. PCD-CT is capable to obtain spectral data with single pair of X-ray tube and detector, and dual energy analysis on high temporal resolution can be performed using dual-source PCD-CT (DS-PCD-CT)5. Cardiac extracellular volume (ECV) can now be realistically quantified by the iodine method thanks to the availability of high temporal resolution iodine values.

### TABLE OF CONTENTS/OUTLINE

1. Physical properties of semiconductor which is used in PCD-CT and scintillator which is used in EID-CT.2. The principle of photon counting by ASIC and its features.3. Differences in the ability of EID-CT and PCD-CT to visualize stents after percutaneous coronary intervention.4. A case in which an iodine map obtained from DS-PCD-CT with high temporal resolution allowed the assessment of contrast failure and late iodine enhancement reflecting myocardial ischemia.5. Quantification of cardiac ECV by the Iodine method made possible by high temporal resolution using DS-PCD-CT.

### TEACHING POINTS

To provide a thorough overview of the differential diagnosis of left ventricular hypertrophy (LVH) using cardiac magnetic resonance (CMR), with specific emphasis on achieving the following key learning objectives: - To comprehend the most valuable CMR sequences and their respective informative contributions. - To identify the various underlying diseases associated with the phenotypic expression of LVH.- To provide a succinct and pragmatic summary that facilitates clinical practice.

### TABLE OF CONTENTS/OUTLINE

- Objectives - Role of cardiac magnetic resonance in the assessment of LVH and the most useful sequences: ‘steady state free precession’ (SSFP) to study morphology and function, native T1 mapping for myocardial tissue characterization, and late gadolinium enhancement for evaluating fibrosis in various regional distributions. - Epidemiological data, clinical and therapeutic management, and CMR findings in the main diagnostic entities following LVH: hypertensive heart disease, hypertrophic cardiomyopathy, cardiac amyloidosis, Fabry disease, athlete’s heart, aortic valve stenosis, and cardiac sarcoidosis. - Conclusions, summary of various diseases, and a table to aid in the clinical practice - References

## STRATEGIES FOR BETTER IMAGING CORONARY STENTS AFTER PERCUTANEOUS CORONARY INTERVENTION (PCI) IN CORONARY CT ANGIOGRAPHY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Jianying Li, PhD (*Abstract Co-Author*) Employee, General Electric Company
Jianxin Guo (*Abstract Co-Author*) Nothing to Disclose
Tingting Qu (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1) Point out the limitations of displaying coronary stents in conventional coronary CT angiography (CCTA).2) Demonstrate the advantage of SSF2 in CCTA compared to standard algorithm without motion correction (STD) and with the first-generation snapshot freeze (SSF1).3)Demonstrate the strategies to improve the clarity of coronary stent display.

### TABLE OF CONTENTS/OUTLINE

1)Limitations of coronary stent display in CCTA• The high density of coronary stents in CT images naturally affects the observation of coronary artery within the stent.• The dual effects of motion artifacts and metal artifacts seriously affect the display of the stent and the in-stent lumen.• Artifacts caused by the stent in the coronary lumen may lead to misdiagnosis.2) Advantages of SSF2• SSF2 reduces both coronary motion artifacts and overall cardiac motion artifacts.• Reduce the motion artifacts of the stent and its surrounding tissues to enable clearer display of the stent. • Highly inclusive, provides excellent for patients with irregular heart rate and inability to hold their breath.3) Strategies• Iterative reconstruction or Deep learning reconstruction to reduce image noise.• Using high-resolution scanning protocol (high kVp, low mA, and small focal spot).• Using SSF2 reconstruction to reduce motion artifacts.

Artur S. Santos SR, BMedSc (*Abstract Co-Author*) Nothing to Disclose
Ingrid Stefanie Sarmento Debaco (*Abstract Co-Author*) Nothing to Disclose
Vinicius C. Serra, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

TP1: [Infective endocarditis (IE) can affect both native and prosthetic valves, leading to valvular (vegetations, leaflet perforation, and prosthetic dehiscence) or perivalvular complications (abscess, pseudoaneurysm, and fistula)]TP2: [Cardiac computed tomography angiography (CTA) is recommended by the European Society of Cardiology (ESC) guidelines to aid in the diagnosis and treatment planning of IE]TP3: [Electrocardiographic gating significantly increases the accuracy of CTA for the diagnosis of valvular or perivalvular complications]TP4: [CTA is particularly useful in patients with poor acoustic windows, complex cardiac anatomy, detection of distant lesions, preoperative assessment of coronary artery disease, and investigation of alternative diagnoses]

### TABLE OF CONTENTS/OUTLINE

I. IntroductionA. Overview of the role of CTA according to recent ESC guidelinesB. Significance of cardiac CTA in improving the accuracy for infective endocarditisII. MethodsA. Selection of confirmed cases of IE who underwent cardiac CTAB. CTA protocol descriptionIII. Results DiscussionA. Presentation of CTA images demonstrating valvular and paravalvular findings (extracardiac features were also briefly addressed)B. Definition, risk factors, clinical significance, and impact on patient management were reviewed for each complicationIV. Conclusion

## TESTING THE WATERS: A COMPREHENSIVE REVIEW OF ENTITIES CAUSING MYOCARDIAL EDEMA WITH SYSTEMATIC AND CASE-BASED APPROACH

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Magna Cum Laude**

Emrah Duman, MD (*Abstract Co-Author*) Nothing to Disclose
Zehavit Kirshenboim (*Abstract Co-Author*) Nothing to Disclose
Timothy Wong (*Abstract Co-Author*) Nothing to Disclose
Chad Kosanovich (*Abstract Co-Author*) Nothing to Disclose
Omer Onder, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Myocardial edema is characterized by abnormal myocardial fluid accumulation due to impaired fluid homeostasis, triggered by a complex interplay of cellular, molecular, and hemodynamic factors. 2. It is a complex pathological phenomenon with diverse clinical manifestations, playing a pivotal role in the pathophysiology of various cardiovascular conditions such as ischemic, inflammatory, infiltrative, toxic, infectious, and autoimmune diseases. 3. Familiarity with diagnostic challenges/strategies, differential diagnoses of myocardial edema-associated conditions, and the implications of myocardial edema for risk stratification can enable radiologists to contribute significantly to patient management. This presentation will examine the role of cardiac MRI in characterizing myocardial edema through various case examples and a comprehensive review of existing literature.

### TABLE OF CONTENTS/OUTLINE

A. Pathophysiological basis of myocardial edema B. Radiological evaluation - Image acquisition post-processing - Image interpretation: Pearls Pitfalls - Pattern-based approach: Focal, regional, patchy diffuse involvement C. Differential diagnosis clinical importance of myocardial edema with case examples - Myocardial ischemia/infarction - Post-arrest/post-surgical - Heart transplantation - Heart failure myocardial remodeling - Myocarditis - Stress-induced cardiomyopathy - Toxic/drug-induced cardiomyopathy - Hypertrophic cardiomyopathy - Dilated cardiomyopathy - Sarcoidosis - Amyloidosis - Rheumatologic diseases - Miscellaneous: Chronic kidney disease, sepsis, systemic pulmonary hypertension, myocardial contusion, other cardiomyopathies D. Summary conclusion

Nicolas Perez, MD (*Abstract Co-Author*) Nothing to Disclose
Uxue Martinez Urabayen, MD (*Abstract Co-Author*) Nothing to Disclose
Patricia Rodriguez Ripalda, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Review the pathophysiology of Takotsubo syndrome.Identify the manifestations of Takotsubo syndrome on MRI, as well as its main differential diagnoses.

### TABLE OF CONTENTS/OUTLINE

Takotsubo syndrome, also known as broken heart syndrome or stress cardiomyopathy, presents as an acquired cardiomyopathy causing transient and reversible systolic dysfunction without obstructive coronary artery disease. It is typically triggered by a stressful event and predominantly affects postmenopausal women. This syndrome shares clinical and electrocardiographic characteristics with acute coronary syndrome, initially making it difficult to distinguish between the two.During the initial diagnostic evaluation, echocardiography and cardiac catheterization typically reveal apical dyskinesia without significant evidence of coronary artery obstruction.Magnetic Resonance Imaging (MRI) plays a crucial role in diagnosing and monitoring these patients, providing an accurate assessment of global ventricular function, defining wall motion abnormalities, assessing myocardial edema and detecting complications.We present a case review highlighting the MRI features of Takotsubo cardiomyopathy and its complications, focusing on differentiating this condition from acute myocardial infarction and acute myocarditis. Although this condition generally follows a benign course with a good prognosis, its acute phase may involve complications, with heart failure being the most common.

Masaki Ishida, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Suguru Araki (*Abstract Co-Author*) Nothing to Disclose
Miyuko Fujita (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. To discuss the clinical and imaging mimickers with diffuse atrial wall thickening but completely different etiologies. 2. To discuss the imaging findings and management strategies for isolated atrial lesions with diffuse atrial wall thickening. 3. To review the biopsy and pathologic findings isolated atrial lesions with diffuse atrial wall thickening. 4. To discuss the complications related to isolated atrial lesions with diffuse atrial wall thickening.

### TABLE OF CONTENTS/OUTLINE

A) Differential diagnosis of clinical and imaging mimickers with diffuse atrial wall thickening but completely different etiologies: IgG4-related atrial cardiomyopathy, isolated atrial amyloidosis, atrial giant cell myocarditis. B) Typical imaging findings of isolated atrial lesions with diffuse atrial wall thickening: echocardiography, CT, cardiac MRI, FDG-PET/CT C) Clinical management of isolated atrial lesions with diffuse atrial wall thickening. D) Biopsy as a mandatory procedure for the final diagnosis in rare disease E) Complication of isolated atrial lesions with diffuse atrial wall thickening i. Atrial fibrillation ii. Atrial dysfunction iii. Atrial thrombus iv. Intramural atrial hemorrhagic dissection F) Case presentation: typical imaging findings, the course of treatment and the pathologic findings. i. IgG4-related atrial cardiomyopathy ii. isolated atrial amyloidosis iii. Atrial giant cell myocarditis

## NAVIGATING ACROSS CORONARY ARTERIES: CT ANGIOGRAPHY CHARACTERIZATION OF CORONARY ATHEROSCLEROTIC PLAQUES ACCORDING TO THEIR CAD-RADS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Doris Licely Canche Aguilar, MD (*Abstract Co-Author*) Nothing to Disclose
Juan Manuel Pineda Cordoba, MD (*Abstract Co-Author*) Nothing to Disclose
Luis Enrique Nunez Castellanos (*Abstract Co-Author*) Nothing to Disclose
Diego Leonardo Meza Neri (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- To provide a pathophysiological overview of the formation of atherosclerotic coronary plaque and its cardiovascular impact on coronary heart disease.- Describe normal coronary anatomy.- Detail the specific radiological characteristics of a high-risk plaque to learn to recognize them.- Describe the pathophysiology of atherosclerotic plaque formation.- Learn to recognize the radiological features in healthy coronary arteries without atherosclerotic plaques and their significance.- Identify calcified and non-calcified coronary plaques through clinical cases.- Qualitatively assess the severity of coronary plaques.- Correctly interpret the CAD-RADS classification.- Understand the role of the radiologist in the interpretation of coronary CT angiography.- Describe the diagnostic and therapeutic conduct to follow according to the CAD-RADS classification.

### TABLE OF CONTENTS/OUTLINE

1. Normal coronary anatomy in coronary CT angiography 1.1 Coronary segmentation2. Fundamentals of atherosclerotic plaque: What should the imaging specialist understand? 2.1 Epidemiology 2.2 Etiology 2.3 Main imaging characteristics of atherosclerotic plaques 2.4 Pathophysiology3. Principles and applications of coronary angiotomography in atheromatous plaque. 3.1 CAD-RADS implications and classification4. Radiological characterization of atherosclerotic plaque by AngioTAC according to CAD-RADS.4.1 High risk plaque 4.2 Low risk plaque 4.3 Diagnostic and therapeutic conduct according to CAD-RADS classification

## COMPREHENSIVE REVIEW OF NON-ATHEROSCLEROTIC CORONARY ARTERY DISEASES MIMICKING ACUTE CORONARY SYNDROME (ACS): ETIOPATHOGENESIS, IMAGING FINDINGS, AND DIFFERENTIAL DIAGNOSIS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Carlos S. Restrepo, MD (*Abstract Co-Author*) Nothing to Disclose
Sachin S. Saboo, MD, FRCR (*Abstract Co-Author*) Nothing to Disclose
Ameya J. Baxi, MBBS,DMRD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. To discuss non-atherosclerotic coronary artery disease (CAD) 2. To study the role of imaging in the diagnosis and evaluation of these conditions 3. To discuss imaging based differential diagnosis

### TABLE OF CONTENTS/OUTLINE

Atherosclerotic CAD is the most common cause of ACS, however, non-atherosclerotic processes are also contribute to a substantial number of ACS events and as such require different diagnostic and therapeutic strategies. Non-obstructive conditions can also cause same symptoms as obstructive CAD. In the absence of obstructive CAD, increased awareness together with a high index of suspicion for other important causes of ACS is crucial to delineate the underlying etiology. Recognizing typical imaging manifestations with adequate clinical correlation is essential for timely and accurate diagnosis as well as optimized patient care. In this exhibit, we discuss the characteristic multimodality imaging findings and differential diagnosis of non-atherosclerotic causes of ACS. Aims/Objectives · Introduction · Taxonomy · Pathologic and cross-sectional imaging findings role of imaging § Malignant coronary artery origin anomalies § Coronary artery ectasia/Coronary artery aneurysms § Coronary artery dissection § Coronary artery fistula § Coronary artery embolism § Coronary artery vasospasm § Different types of Vasculitis § Myocardial bridging § Stress- induced cardiomyopathy · Differential diagnosis · Conclusion

## IMAGING OF MITRAL VALVE PATHOLOGY: WHAT RADIOLOGIST SHOULD KNOW

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Carlos S. Restrepo, MD (*Abstract Co-Author*) Nothing to Disclose
Sachin S. Saboo, MD, FRCR (*Abstract Co-Author*) Nothing to Disclose
Ameya J. Baxi, MBBS,DMRD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To discuss relevant Mitral Valva (MV) anatomy To review various congenital and acquired pathologies involving MV To increase imaging appearances differential diagnosis of congenital and acquired MV diseases

### TABLE OF CONTENTS/OUTLINE

Knowledge of MV valve anatomy function is essential to understand diagnose pathology. MV complex consists of anterior posterior leaflets, fibrous annulus subvalvular apparatus, consisting of the chordae tendineae papillary muscles. Main manifestations of MV disease are regurgitation stenosis caused by spectrum of various pathologies. Echocardiography, CT, cardiac MR imaging are main modalities used for evaluation of MV pathologies, each with its own advantage and limitations. Cardiothoracic radiologist should be well versed with echocardiography, MDCT, and CMR, in order to optimize preprocedural patient selection, procedural planning, post-procedural assessment of MV including postoperative complications. Knowledge of natural history, clinical manifestations, salient imaging features is essential for accurate diagnosis guiding treatment. In this exhibit, we discuss characteristic multimodality imaging findings and differential diagnosis of normal and diseased MV. Aims/Objectives · Introduction · Anatomy · Pathology, role of imaging imaging findings Shone Complex , Mitral Annular Calcification, Mitral Annular Disjunction, Prolapse, MV rupture, Mitral Stenosis, Mitral Regurgitation, Endocarditis, Thrombosis, Tumors-Primary and Secondary, MV Devices § Miscellaneous · Role of imaging in preoperative and reintervention planning · Postprocedural postoperative complications · Differential diagnosis · Conclusion

## IMAGING SPECTRUM OF CONOTRUNCAL ABNORMALITIES WITH MALALIGNMENT TYPE VENTRICULAR SEPTAL DEFECTS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Jerald Garvin S. Lim, MD (*Abstract Co-Author*) Nothing to Disclose
Julia Niemierko, MD (*Abstract Co-Author*) Nothing to Disclose
Franklin S. Lee, MD (*Abstract Co-Author*) Nothing to Disclose
Thurl Cledera, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Malalignment ventricular septal defects encompass a spectrum of anomalies characterized by the malalignment and absence of fusion between the outlet/conal septum and the ventricular septum. Malalignment defects are secondary to abnormalities in the elongation of the outflow tract during the different phases of cardiac looping. These defects have also been found to be associated with other cardiac anomalies, such as conotruncal abnormalities such as Tetralogy of Fallot, Transposition of the Great Arteries, Double Outlet Right Ventricle, and others. Knowledge of septal malalignment can help in determining the concordance of heart structures and outflow tracts. The objectives of this exhibit are: 1) Understand embryologic concepts behind the normal development of the outflow tract of the heart, 2) Use a systematic approach in identifying malalignment ventricular septal defects, and 3) Recognize key imaging features and anatomic landmarks in assessing these congenital defects

### TABLE OF CONTENTS/OUTLINE

I. Introduction II. Embryology Review III. Characterizing Malalignment Ventricular Septal Defects IV. Imaging Modalities V. Conotruncal Abnormalities A. Tetralogy of Fallot B. Double Outlet Right and Left Ventricle C. Double Inlet Right and Left Ventricle D. Truncus Arteriosus E. Transposition of the Great Arteries VI. Considerations in Post-operative Imaging and Follow-up VII. Conclusion

## JOURNEY INTO THE HEART: RADIOLOGICAL ASSESSMENT OF CARDIAC MASSES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Alba Lopez-Castello, MD (*Abstract Co-Author*) Nothing to Disclose
Samuel Pereiro Perez, MD (*Abstract Co-Author*) Nothing to Disclose
Maria Perez Costas, MD (*Abstract Co-Author*) Nothing to Disclose
Ana Robles Gomez, MD (*Abstract Co-Author*) Nothing to Disclose
Sabela Garcia Benito, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To review the most representative cases of cardiac masses in our center and summarize the clinical presentation and the most characteristic imaging findings.

### TABLE OF CONTENTS/OUTLINE

- Cardiac masses are part of a broad and heterogeneous spectrum of pathology, with a clinical presentation that depends on both the nature of the mass (benign or malignant) and its location in the cardiac cavity (asymptomatic, ischemic events, arrhythmic, embolic, pericardial effusion, etc). - The initial imaging test when a cardiac mass is suspected is echocardiography (transthoracic or transesophageal), and depending on the findings and the patient's baseline condition, further evaluation with magnetic tesonance imaging or computed tomography may be considered, each with its specific protocols. -The location and imaging characteristics of the cardiac masses are essential for achieving an accurate diagnostic approach and for distinguishing between the main types of cardiac masses: non-neoplastic masses (intracavitary thrombus, vegetation, caseous calcification of the mitral annulus, pericardial cyst), primary benign tumors (myxoma, fibroelastoma, lipoma, hemangioma, rhabdomyoma, fibroma, etc.), malignant tumors (sarcoma, angiosarcoma, lymphoma, mesothelioma, etc.), and cardiac metastases.

## CARDIAC CT APPLICATION OF SUPER RESOLUTION DEEP LEARNING RECONSTRUCTION

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Yuji Kaga, RT (*Abstract Co-Author*) Nothing to Disclose
TOSHIKI KATO (*Abstract Co-Author*) Nothing to Disclose
Koichi Chida, PhD (*Abstract Co-Author*) Nothing to Disclose
Masahiro Sota (*Abstract Co-Author*) Nothing to Disclose
Yoshihiro Haga, PhD, RT (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Computed tomography (CT) images have evolved over time. Recently, deep learning technology has been used for reconfiguration techniques. In particular, Precise IQ Engine (PIQE) is a super-resolution image reconstruction technology that uses deep learning and Aquilion Precision's high-resolution data. This is Super Resolution Deep Learning Reconstruction (SR-DLR) developed by Canon Medical Systems. The use of PIQE for coronary CT angiography (CCTA) allows for more accurate diagnosis than previously possible. The purpose of this objective is to examine the use of PIQE for CCTA and the accuracy of stent lumen assessment.

### TABLE OF CONTENTS/OUTLINE

1.To understand Precise IQ Engine(PIQE) using deep learning techniques2.To understand how it differs from other reconstruction methods (Iterative Dose Reduction 3D and advanced intelligent Clear-IQ Engine)3.To understand the importance of assessing the severity of in-stent stenosis on coronary CT angiography (CCTA)4. To evaluate the in-stent stenosis of < 3.0-mm stent diameter5. To understand the characteristics of coronary atherosclerotic plaque detected by CCTA (including positive remodeling, low-attenuation plaque, and mottled calcification)6. To understanding the application of PIQE to the cardiovascular field

## CHEE-10 IS BLOOD THICKER THAN TISSUE? A RADIOLOGIST'S GUIDE TO LIQUID BIOPSY IN LUNG CANCER

**Awards**
**Certificate of Merit**

Chiemezie Amadi, MD (*Abstract Co-Author*) Nothing to Disclose
Mohamed M. Sayyouh, MSc (*Abstract Co-Author*) Nothing to Disclose
Shotaro Naganawa, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Prachi P. Agarwal, MD (*Abstract Co-Author*) Nothing to Disclose
Jerald Garvin S. Lim, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• Introduce liquid biopsy, and its methods, as a non-invasive method for analyzing circulating analytes • Explain the current applications of liquid biopsy in guiding monitoring and treatment decisions in non-small cell lung cancer • Address challenges of liquid biopsy and its implementation in routine clinical practice • Enumerate some of the potential and future applications of liquid biopsy • Emphasize the multidisciplinary collaboration between oncologists, radiologists, and pathologists to leverage both liquid biopsy and imaging data effectively, ultimately improving patient outcomes and personalized treatment strategies.

### TABLE OF CONTENTS/OUTLINE

1. What is liquid biopsy and how is it done? 2. Common biomarkers and techniques utilized in liquid biopsy 3. Current application of liquid biopsy in non-small cell lung cancer 3.1. Tumor genotyping (e.g., KRAS, EGFR, other changes in molecular profile) 4. Advantages and disadvantages of liquid biopsy vs. percutaneous tissue biopsy. Can liquid biopsy replace tissue biopsy? 5. Current status of liquid biopsies and potential impact on radiology 6. Potential future applications of liquid biopsy 6.1. Enhance screening and early detection efforts in high-risk populations, as well as disease interception 6.2. Monitoring while on immunotherapy and targeted therapy 6.3. Identifying post-surgical patients that would benefit most from adjuvant therapy(ies) 6.4. Determining optimal duration of consolidation and adjuvant therapies 6.5. Early detection of disease progression prior to radiographic manifestation

## CHEE-100 POST-RADIOTHERAPY LUNG CHANGES, THE MAJOR MIMICKERS: NORMAL PATTERNS AND COMPLICATIONS

Camilo A. Caicedo Montano, MD (*Abstract Co-Author*) Nothing to Disclose
Maria Alejandra Amaya, MD (*Abstract Co-Author*) Nothing to Disclose
Felipe Aluja, MD, MEd (*Abstract Co-Author*) Nothing to Disclose
Omar Andres Pantoja Burbano, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

o It is necessary to clearly understand the approach to post-radiotherapy lung in diagnostic images, focusing on four fundamental aspects: previous studies, irradiated area, technique used, and elapsed time between treatment and the evaluated study.o The irradiated areas can acquire a wide variety of patterns on CT, especially in patients undergoing high-precision radiotherapy. Therefore, it is necessary to be familiar with them, as they often present findings similar to other pathologies.o The radiologist must recognize the key points to differentiate between radiotherapy patterns, infectious pathologies, or recurrenceo Post-radiotherapy complications must be promptly recognized and differentiated from usual changes.

### TABLE OF CONTENTS/OUTLINE

o Introduction.o Pathway for addressing expected findings in the post-radiotherapy lung.o Types of radiotherapy.o Acute and chronic post-radiotherapy changes in the lung.o Main patterns that can be visualized in the irradiated areas and their differential diagnoses.o Main complications.

## CHEE-101 INNOCENT-LIKE MIMICKERS: THE MEETING OF X-RAY WITH CINEMATIC AND 3D RENDERING TO REACH THE TRUTH

Omer Onder, MD (*Abstract Co-Author*) Nothing to Disclose
Zehavit Kirshenboim (*Abstract Co-Author*) Nothing to Disclose
Iclal Ocak, MD (*Abstract Co-Author*) Nothing to Disclose
Julian Fazi, MD (*Abstract Co-Author*) Nothing to Disclose
Emrah Duman, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

-Differentiate radiologist workflows and their impact on diagnostic accuracy in thoracic imaging.-An assessment of how findings that are difficult to detect or appear innocent on X-ray, a projection method, actually correspond to pathologies and how they are represented in high-quality 3D and cinematic rendering.-Detail the subtle presentations of thoracic pathologies and their propensity to mimic adjacent anatomical structures.-Highlight the need for careful scrutiny in regions commonly harboring lung masses and vascular anomalies.-Discuss the diagnostic challenges posed by the complex interplay of pneumothorax, effusion, and other thoracic conditions.-Address the pitfalls of anatomical superimposition in image interpretation.

**TABLE OF CONTENTS/OUTLINE**

•Trachea:-Identification of tracheal pathologies, often obscured or resembling adjacent structures.-Strategies for recognizing subtle tracheal anomalies in a busy clinical setting.•Lung:-The challenge of diagnosing lung pathologies that mimic the surrounding anatomy.•Cardiophrenic Region:-The cardiophrenic region as a potential site for pathology, complicated by its proximity to the heart and diaphragm.•Hilum:-The importance of meticulous examination to uncover hilar pathologies.•Pleura:-Pneumothorax and effusion as diagnostic challenges, with a focus on their masquerading aspects.-Techniques and pearls to differentiate these conditions from other pleural diseases.•Bones and Soft Tissues:-Superimpositions in thoracic imaging and their impact on the interpretation of bone and soft tissue anomalies.-Correcting misinterpretations of normal anatomical variants and pathological conditions.

## CHEE-102 PULMONARY FUNGAL DISEASE: A GUIDE FOR RESIDENTS

Reza Forghani, MD, PhD (*Abstract Co-Author*) Consultant, General Electric Company;Research Grant, General Electric Company;Research Grant, Intel Corporation;Research Grant, Toronto-Dominion Bank;Research Grant, McGill University Health Centre Foundation;President, Montreal Imaging Experts Inc
Amanda Acevedo (*Abstract Co-Author*) Nothing to Disclose

Joice C. Prodigios, MD (*Abstract Co-Author*) Nothing to Disclose
Juliana Barreto Caldas De Lima (*Abstract Co-Author*) Nothing to Disclose
Ian Griffin (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

; Delineate the radiologic signatures of common pulmonary fungal diseases, including aspergillosis, histoplasmosis, and cryptococcosis. ; Highlight the significance of immune status on the radiologic appearance of fungal infections. ; Discuss the importance of recognizing endemic regions in the imaging interpretation of fungal diseases.

**TABLE OF CONTENTS/OUTLINE**

● Introduction to Pulmonary Fungal Infections ○ Prevalence and Public Health Impact ○ Risk Factors and Patient Populations ● Imaging Hallmarks of Fungal Diseases ○ Aspergillosis: Nodules, Air Crescent Sign ○ Histoplasmosis: Calcifications, Lymphadenopathy ○ Cryptococcosis: Mass-like Lesions, "Soap Bubble" Lytic Bone Lesions ● Diagnostic Challenges ○ Overlap with Malignant and Non-infectious Pathologies ○ Case-based Approach to Differential Diagnosis ● Clinical and Imaging Correlation ○ Impact of HIV, Transplantation, and Immunosuppression on Disease Presentation ○ Imaging Protocols Tailored to Suspected Fungal Etiology ● Conclusion ○ Summary of Radiologic Criteria for Diagnosis ○ Role in Guiding Interventional Procedures

## CHEE-103 PURSUING THE UNUSUAL : IMAGING AND INTERVENTION STRATEGIES IN ATYPICAL SYSTEMIC VASCULAR SOURCES OF HAEMOPTYSIS

Amal Antony, MD (*Abstract Co-Author*) Nothing to Disclose
Vimal C. Mondy, MBBS,MD (*Abstract Co-Author*) Nothing to Disclose
Sai K. Deepalam JR, MD (*Abstract Co-Author*) Nothing to Disclose
Navya Paulson Mangali (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Imaging and endovascular interventions are pivotal in managing haemoptysis, a potentially life-threatening emergency. 2. Multidetector CT angiography (MDCTA) is the preferred imaging modality, allowing for a comprehensive evaluation of lung parenchyma, thoracic vasculature, and soft tissues. It enables precise identification of the source of hemoptysis, thereby aiding in the planning subsequent interventions. 3. In the majority of cases, hypertrophied bronchial arteries are responsible for haemoptysis, while atypical sources account for about five percent. Identifying these uncommon systemic vascular sources is crucial before planning intervention. 4. The role of endovascular intervention in the management of haemoptysis is increasing, offering a less invasive and effective alternative. The choice of endovascular treatment is tailored to the cause of haemoptysis. 5. Radiologists plays a central role in the multidisciplinary team, and should possess knowledge of the sources and mechanisms of haemoptysis, its imaging characteristics, and the available endovascular treatments.

**TABLE OF CONTENTS/OUTLINE**

1. Common source of haemoptysis: Orthoptic Bronchial Arteries 2. Uncommon systemic vascular sources of haemoptysis: 2.1 Ectopic Bronchial Arteries 2.2 Non-bronchial systemic collaterals 2.3 Atypical configurations of systemic arteries 2.4 Aneurysm/pseudoaneurysm of systemic arteries 2.5 Systemic supply in sequestration 2.6 Aortopulmonary Collateral Arteries 3. Role of Imaging: MDCTA 4. Endovascular treatment options

## CHEE-104 CHEST MRI: ANOTHER ALLY TO UNTANGLE ILD DIAGNOSIS AND FOLLOW-UP

Bruno Hochhegger, MD,PhD (*Abstract Co-Author*) Nothing to Disclose
Sandro B. da Silva, MD (*Abstract Co-Author*) Nothing to Disclose
Hiren Mehta, MD (*Abstract Co-Author*) Nothing to Disclose
Joice C. Prodigios, MD (*Abstract Co-Author*) Nothing to Disclose
Rosana S. Rodrigues, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Alysson Roncally Carvalho, MD,PhD (*Abstract Co-Author*) Nothing to Disclose
Ronak Kundalia (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Computed tomography (CT) is considered the gold standard imaging modality for interstitial lung disease (ILD); however, it is associated with a concerning amount of ionizing radiation exposure in patients with CT who require serial scans throughout their disease course. Magnetic resonance imaging (MRI) is emerging as a viable diagnostic modality for ILD that can accurately diagnose early stages of disease and trace its progression.

**TABLE OF CONTENTS/OUTLINE**

1. Main findings in MRI - honeycombing and traction bronchiectasis2. T2 CT MR Correlation3. T1 Times4. DELAYED enhancement5. Elastography

## CHEE-105 BEVACIZUMAB AND THORACIC RADIOTHERAPY: A DANGEROUS COMBINATION FOR RESPIRATORY TRACT FISTULAS

Bruno L. Moreira, MD (*Abstract Co-Author*) Nothing to Disclose
Augusto K. Medeiros, MD (*Abstract Co-Author*) Nothing to Disclose
Murilo d. Peixoto, MD (*Abstract Co-Author*) Nothing to Disclose
Pablo Rydz P. Santana, MD (*Abstract Co-Author*) Speaker, AstraZeneca PLC;Speaker, Boehringer Ingelheim GmbH
Camila P. Reifegerste, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Bevacizumab is a monoclonal antibody against the vascular endothelial growth factor (VEGF), which prevents the development of new blood vessels necessary for tumor growth. It has been used in the treatment of various neoplasms. In addition to its known adverse effects such as hypertension, proteinuria, thromboembolic and hemorrhagic events, recent reports highlight a rare but highly fatal complication: airway fistula. Reported types include tracheoesophageal, tracheomediastinal and bronchopleural fistulas. The mechanism behind these fistulas is not fully understood, but Bevacizumab's interference with angiogenesis may delay wound healing, predisposing the airways to fistula formation. Thus, any lesion in the airways could predispose to the formation of a fistula, and the main risk factor indicated in the literature for these lesions is a history of thoracic radiotherapy. This presentation will illustrate cases of airway fistula related to the combination of Bevacizumab and a history of thoracic radiotherapy, alerting radiologists to the possibility of this diagnosis. Despite its rarity, the high mortality rate associated with airway fistulas underscores the critical need for awareness, enabling early diagnosis and effective treatment.

**TABLE OF CONTENTS/OUTLINE**

Introduction to Bevacizumab and brief review of its mechanism of action/pharmacology; cases of airway fistula related to Bevacizumab + thoracic radiotherapy; discussion; conclusion.

## CHEE-106 VERTICAL VENOUS STRUCTURES OF THE LEFT VERTEX

Tatiana Arroyave, MEd (*Abstract Co-Author*) Nothing to Disclose
Manuela Restrepo, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. The right vertex of the mediastinum includes the most important vascular and lymphatic structures of the body. In unusual circumstances, these structures have developmental malformations that are incidentally recognized on imaging as vertical venous structures of the left vertex. It is essential to recognize because of its clinical and surgical importance.2. Persistent left superior vena cava (SVC) is the most common congenital anomaly seen in the thorax. In this case, the right SVC might be normal, small or absent. When the right SVC is also present, it is considered a duplicated vena cava. In unusual cases the brachiocephalic vein passes posterior or surrounding to the aorta. An atypical case of circumaortic SVC is presented.3. The anomalous supracardiac venous drainage is a congenital anomaly in which the pulmonary veins converge in one single vertical vein on the left vertex of the thorax, that drains to the systemic circulation, either to the SVC, brachiocephalic vein or the right atrium. 4. The anomalies of the thoracic duct are rare, and it is important to recognize the normal anatomy to identify when possible anomalies exist, including complete left sided course, cystic dilatation, duplications, plexiform variation and absence of the cisterna chyli.

**TABLE OF CONTENTS/OUTLINE**

Learning objectives. Normal anatomy. Duplicated and single left SVC. Circumaortic SVC. Abnormal supracardiac venous drainage. Thoracic duct reflux. Retroaortic innominate vein. Summary

## CHEE-107 BRIDGE OR DESTINATION: AN UPDATE ON VENTRICULAR ASSIST DEVICES

**Awards**
**Certificate of Merit**

Cristina Fuss, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Linda B. Haramati, MD, MS (*Abstract Co-Author*) Nothing to Disclose
Irene Dixe de Oliveira Santo, MD (*Abstract Co-Author*) Nothing to Disclose
Anna S. Bader, MD (*Abstract Co-Author*) Nothing to Disclose
Manroop Kaur, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Temporary ventricular assist devices (VAD) can be used in the acute setting supporting both the left and right ventricle.Long-term VADs are indicated for patients in the Class IV HF category, though cardiac transplant is the definitive treatment, assist devices can be used as a bridge to transplant, or destination therapy in those who do not qualify.Retrospective ECG gating through the entire cardiac cycle is recommended for optimal imaging of ventricular assist devices.Complications of VADs include malposition, hemopericardium, mediastinal hematoma, soft tissue hematoma, driveline infection/abscess, outflow graft thrombus, aortic stenosis, Heyde syndrome, bio-debris resulting in graft stenosis/occlusion.The purpose of this exhibit is to provide a review of the mechanics and appearances of traditional and newer ventricular support devices and illustrate common and uncommon complications through a multi-modality case-based review.

**TABLE OF CONTENTS/OUTLINE**

1. Cardiac anatomy and pathophysiology of heart failure. 2. Heart failure classification and indication for ventricular assist devices.3. CT protocols for appropriate evaluation of ventricular assist devices. 4. Appropriate placement of ventricular assist devices through a multi-modality case review with pitfalls in malpositioned devices.5. Case-based imaging review of acute and chronic complications from ventricular assist devices including acute renal failure, ischemic colitis, hematomas, driveline infection, LV/RV thrombus, aortic stenosis, outflow graft stenosis (thrombus and bio-debris), and twisting of the outflow graft. 6. Identification of thrombus versus bio-debris deposition in the outflow graft.

## CHEE-108 BETWEEN THE WALLS: INTRATHORACIC PSEUDOANEURYSM PATHOGENESIS AND IMAGING

Saurabh Agarwal, MD (*Abstract Co-Author*) Nothing to Disclose
Terrance T. Healey, MD (*Abstract Co-Author*) Nothing to Disclose
Brandon H. Koo, MD,BS (*Abstract Co-Author*) Nothing to Disclose
Samika S. Kanekar (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Provide a review of thoracic pseudoaneurysms and how to differentiate between other vascular pathologies.Discuss current imaging techniques used in diagnosis of pseudoaneurysm.Review common and rare pathologies of pseudoaneurysms using case-based examples, focusing on clinical disease courses, imaging features, treatment, prognosis, and complications.

**TABLE OF CONTENTS/OUTLINE**

1. Review of the Arterial Wall2. Pseudoaneurysm vs. True Aneurysm3. Imaging Techniques and Findings4. Case Based Review of Pseudoaneurysm Pathologies5. Treatment and Prognosis6. Complications of Thoracic PseudoaneurysmsOutlinePseudoaneurysms have a higher risk of rupture than true aneurysms due to greater instability. Identification of pseudoaneurysms are key to determining management and decreasing adverse events. We review a wide variety of etiologies of thoracic pseudoaneurysm, including inflammatory, iatrogenic, infectious, and traumatic causes.

## CHEE-109 PULMONARY NODULES IN MAGNETIC RESONANCE: WHERE WE CAN HELP?

Rosana S. Rodrigues, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Reza Forghani, MD, PhD (*Abstract Co-Author*) Consultant, General Electric Company;Research Grant, General Electric Company;Research Grant, Intel Corporation;Research Grant, Toronto-Dominion Bank;Research Grant, McGill University Health Centre Foundation;President, Montreal Imaging Experts Inc
Alysson Roncally Carvalho, MD,PhD (*Abstract Co-Author*) Nothing to Disclose

Kayla Davis (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Examine the indications for MRI in the evaluation of pulmonary nodules. Discuss the MRI characteristics of benign versus malignant pulmonary nodules. Understand the emerging role of MRI in lung cancer screening and surveillance.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction to pulmonary nodules: A. Prevalence and clinical significance. B. Current imaging modalities and limitations. 2. MRI and pulmonary nodule assessment: A. Technological advances in thoracic MRI. B. MRI protocol for nodule characterization. 3. Comparative analysis: A. MRI Versus CT: Sensitivity, Specificity, and Safety. B. Case examples illustrating diagnostic dilemmas resolved by MRI. 4. Conclusion: A. The future of MRI thoracic oncology. B. Recommendations for practice and research.

## CHEE-11 MULTIPLE LUNG CANCER: COMPREHENSIVE REVIEW AND REVIEW OF CURRENT MANAGEMENT STRATEGY

Hyun-ju Lee, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. To understand current staging system of multiple lung cancer 2. To review the results of CT based analysis for the differentiation between multiple primary cancers and intrapulmonary metastasis 3. To review prognostic CT findings in multiple lung cancer 4. To review the results of genetic analysis 5. To introduce current concepts of oligo-metastasis of lung cancers 6. To review current management strategies

**TABLE OF CONTENTS/OUTLINE**

1. Histologic features and current staging system of multiple lung cancer 2. CT analysis 2A. Differentiation between multiple primary cancers and intrapulmonary metastasis 2B. Prognostic CT findings in multiple lung cancer 3. Genetic analysis 3A. Results of chromosomal rearrangement studies 3B. Results of targeted sequencing analysis 3C. Results of oncogenic driver mutation studies 4. Current concepts of oligo-metastasis of lung cancers 5. Current management strategies 6. Future direction of research

## CHEE-110 DEMYSTIFYING TRAPPED LUNG:NOMENCLATURE, EMERGING CONCEPTS, IMAGING FINDINGS AND DIFFERENTIAL DIAGNOSIS THAT RADIOLOGIST SHOULD KNOW

Carlos S. Restrepo, MD (*Abstract Co-Author*) Nothing to Disclose
Rajeev Suri, MD, MBA (*Abstract Co-Author*) Nothing to Disclose
Ameya J. Baxi, MBBS,DMRD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To review nomenclature, etiopathogenesis and clinical features of trapped lungTo review radiographic and computed tomography imaging features of trapped lungTo review emerging concepts/recent literature update

**TABLE OF CONTENTS/OUTLINE**

The term 'trapped lung' is used when the lung in unable to expand secondary to defective healing of the pleural space leading to stiff pleura restricting expansion of the lung. The diagnosis requires documentation of chronicity absence of active inflammatory or malignant pleural process, bronchial obstruction, or severe underlying lung disease. Trapped lung is usually seen secondary to inadequately treated chronic parapneumonic effusion or empyema, post-cardiac injury syndrome, post-cardiac surgery, hepatic hydrothorax, uremia, radiation, hemothorax, and rheumatoid pleuritis. Due to its rarity, occasional case reports are published and limited radiology literature is available in regards to natural history, etiopathogenesis, radiological manifestations. A more accurate precise terminology of trapped lung is a need of time is proposed. Imaging plays a critical role in patient management and at times eliminates invasive diagnostic or therapeutic procedures. Following are discussed: Aims/objectives, Nomenclature, Pathogenesis and imaging features of trapped lung, Differential diagnosis, Review of literature, Management, Post treatment follow up, Teaching points, and Conclusionp class="MsoNormal">

## CHEE-111 EMPYEMA: INFECTION TO INTERVENTION - A PRIMER FOR THE RESIDENTS

Mariana Travieso Diffoot (*Abstract Co-Author*) Nothing to Disclose
Adrian Naoun (*Abstract Co-Author*) Nothing to Disclose
Babina Gosangi, MD, MPH (*Abstract Co-Author*) Nothing to Disclose

Manuel Garcia (*Abstract Co-Author*) Nothing to Disclose
Carol Sanchez Santana (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Ultrasound imaging can play an important role in the diagnosis, quantification, and staging of empyema. A sinusoid sign on ultrasound can predict lung expansion following empyema drainage. A positive sinusoid sign favors lung re-expansion after empyema drainage. Chest tube drainage output can be an indicator for response to antibiotic treatment. If output gradually decreases, it means the patient is responding to treatment. When the output is <100ml tube can be removed."Lung entrapment" is a reversible condition where the patient is symptomatic, with possible mediastinal shift to the opposite side, and surgical treatment like decortication offers immediate response. "Trapped lung" is irreversible, and an ex-vacuo pneumothorax can be present on imaging. Decortication is optional and performed for symptomatic relief.MRI imaging can help to differentiate empyema from necrotizing pneumonia.

**TABLE OF CONTENTS/OUTLINE**

Role of imaging in the diagnosis of empyema with a focus on quantification, staging, follow-up. Describe the imaging features of etiology of empyema: empyema from pneumonia, hematogenous spread, and infection spread from contiguous structures like osteomyelitis (bone infection), empyema following surgical procedures. Describe imaging features of complications of empyema: empyema necessitans, post-pyothorax lymphoma, fibrothorax. Describe imaging findings of treatment procedures for empyema: tube thoracostomy, thoracomyoplasty, pleural decortication, Clagett window, Eloesser flaps. Describe complications of treatment procedures including non-expanding lung-like formation of pleural rind, lung atelectasis, endobronchial obstruction, bronchopleural fistula.

## CHEE-112 ASSESSING USUAL AND UNUSUAL DEVICES COMPLICATIONS IN CARDIOTHORACIC RADIOLOGY - BE PREPARED FOR THE UNEXPECTED

Rodrigo Moreira Bello, MD (*Abstract Co-Author*) Nothing to Disclose
Otavio Augusto Ferreira Dalla Pria, MD (*Abstract Co-Author*) Nothing to Disclose
Carolina A. Heming, MD (*Abstract Co-Author*) Nothing to Disclose
Hanna R. Ferreira Dalla Pria, MD, MD (*Abstract Co-Author*) Nothing to Disclose
Sravani Mannuru, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Cardiothoracic devices represent an important aspect of evaluation in radiographs and tomography for trainees and experienced radiologists who critically assess their positioning and potential complications. However, although they are part of the daily routine, they also become challenging due to the multiple types of devices available, which increase yearly. It's essential to become familiar with and updated on these devices in order to identify what is expected and abnormal, especially regarding malfunctioning, malpositioning, and other potential complications.This exhibit aims: 1. To review the most used cardiothoracic devices, emphasizing the newest ones. 2. To illustrate cases of misposition, malfunctioning, and/or complications related to devices that appear in cardiothoracic radiology.

**TABLE OF CONTENTS/OUTLINE**

Section A- Introduction/Objectives: Brief review of relevant radiological concepts of cardiothoracic devices: 1. Pacemakers and Implantable cardioverter-defibrillators, 2. Loop recorders, 3. Valve replacement and repair, 4. Closure devices, 5. Vascular stents, surgery clips (CABG), 6. Left ventricular assist device, 7. Impella, 8. Intra-aortic balloon pump, 9. Pleural devices, 10. I Tracheal/bronchial, and II esophageal devices, 11. Vascular catheters, 12. And miscellaneous, such as hypoglossal nerve stimulator, embolization coils, and the antibiotic spacer. Section B - Case-based approach: Present/illustrate cases among the ones listed above with typical and unexpected complications, malpositioning, and malfunctioning of these devices.

## CHEE-113 CHEST BEDSIDE APPLICATIONS OF PORTABLE DYNAMIC DIGITAL RADIOGRAPHY (DDR): BRINGING THE DYNAMIC ACQUISITION TO THE PATIENTS' BED

Tatiana Lisnic (*Abstract Co-Author*) Nothing to Disclose
Marcello A. Orsi, MD (*Abstract Co-Author*) Nothing to Disclose
Giancarlo Oliva (*Abstract Co-Author*) Nothing to Disclose
Paolo F. Felisaz, MD (*Abstract Co-Author*) Nothing to Disclose
Maurizio Ce, MD,BA (*Abstract Co-Author*) Nothing to Disclose
Laura Macri (*Abstract Co-Author*) Nothing to Disclose
Francesca Lucrezia Rabaiotti (*Abstract Co-Author*) Nothing to Disclose
Michaela Cellina (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To learn applications of portable DDR for chest investigation at the patient's bedside.

**TABLE OF CONTENTS/OUTLINE**

DDR is a new high-resolution technique, that applies pulsed X-ray to acquire multi-frame fast-paced sequential acquisition of targeted anatomical areas, then reproduced in cine-loops.Different conditions may result in diaphragmatic dysfunction, including vascular disorders, post-traumatic abnormalities, infections, muscular and neuro-muscular diseases, and neoplasms. DDR provides functional, structural, and morphological information and shows the pattern of diaphragmatic motion over time in colored curves, quantifying the range of motion to support the diagnosis of diaphragmatic dysfunction. DDR allows the evaluation of lung motility and the presence of abnormal motion related to adhesions or post-surgical conditions, useful in diagnosing breathing abnormalities in lung cancer patients. Lung Ventilation can be assessed through automatic reconstructions of colored maps, which provide information on the changes in pixel density and related signal over time that can be used to identify regional differences in ventilation and to assess the effectiveness of different respiratory treatments in Intensive Care Units patients. Pulmonary perfusion abnormalities related to chronic and acute conditions can be investigated with DDR without the need for any contrast media, allowing the acquisition in patients with severe allergies or altered renal function. The acquisition of dynamic imaging at the patient's bed can also increase the X-ray sensitivity in detecting post-procedural complications, such as pneumothorax, that can be easily detected and followed up without moving the patient.

## CHEE-114 IMAGING AND CLINICAL FEATURES OF CYSTIC LUNG DISEASES: A PRACTICAL GUIDE FOR RADIOLOGISTS

Tassia R. Yamanari, MD (*Abstract Co-Author*) Nothing to Disclose
Guilherme Hipolito Bachion (*Abstract Co-Author*) Nothing to Disclose
Chang K. Chi, MD (*Abstract Co-Author*) Nothing to Disclose

Leonardo Rosolen Iunes, MD (*Abstract Co-Author*) Nothing to Disclose

Debora Mayumi Takamune, MD (*Abstract Co-Author*) Nothing to Disclose
Dario Nascimento Ferreira Alves, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Pulmonary cysts are a common finding in routine CT scans. Solitary/incidental cysts in asymptomatic individuals may represent part of the normal aging process. However, lung cysts can be a manifestation of an underlying disease and the diagnosis might be challenging. 1) Review the main imaging findings of cystic lung diseases (CLD). 2) Recognize the different causes of CLD based on their causes, location and distribution of the cysts, and associated findings. 3) Propose a practical and systematic approach to interpret the CLD based on the main imaging findings and clinical features. 4) Present helpful clues and key points to narrow down the differential diagnosis.

**TABLE OF CONTENTS/OUTLINE**

1) Introduction 2) Differential diagnosis of air-filled lung lesions 3)Histopathology of pulmonary cysts 4)Main causes of cystic lung disease 5)Solitary/localized cysts 6)Multiple/diffuse cysts not commonly associated with other pulmonary findings 7)Multiple/diffuse cysts associated with ground-glass opacities 8)Multiple/diffuse cysts associated with pulmonary nodules 9)Multiple/diffuse cysts associated with fibrotic changes 10)Conclusion/Take-home messages

## CHEE-115 PULMONARY SARCOIDOSIS: AN UPDATE FOR CT FINDINGS

**Awards**
**Certificate of Merit**

Lydia Chelala, MD (*Abstract Co-Author*) Nothing to Disclose
Iclal Ocak, MD (*Abstract Co-Author*) Nothing to Disclose
Erhan Akpinar, MD (*Abstract Co-Author*) Nothing to Disclose
Furkan Ufuk, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

• To review the typical and less common findings of pulmonary sarcoidosis on chest CT.• To describe the chest CT phenotypes of sarcoidosis and examines the pathophysiological insights gained from chest CT. • To review the role of chest CT in monitoring the sarcoidosis and in prognostication.

**TABLE OF CONTENTS/OUTLINE**

1. Non-fibrotic Subtypes a. Perilymphatic Micronodules Innumerable small nodules along the bronchovascular bundles, fissures, and subpleural regions. b. Large Peri-bronchovascular Nodules: Characterized by large nodules centered around the bronchovascular structures, potentially showing the "galaxy sign". c. Scattered Large Nodules Characterized by large nodules that are scattered and appear unrelated to the bronchovascular structures. d. Consolidation Lung consolidation which may suggest alveolar filling processes. e. Other rare conditions Air trapping, reversed halo sign, mass-like lesions, and ground-glass opacification. 2. Likely to be Fibrotic Subtypes a. Bronchocentric Reticulation without Cavitation Characterized by reticular patterns focused around the bronchovascular structures without evidence of cavitation. b. Bronchocentric Reticulation and Dense Parenchymal Opacification with Cavitation Characterized by bronchocentric reticulation accompanied by areas of dense opacification and cavitation. c. Large Bronchocentric Masses Characterized by large, dense, bronchocentric masses that mimic the appearance of progressive massive fibrosis. 3. Grey Zones and Unknowns: • Mosaic attenuation and interlobular septal thickening. • The link between specific CT appearances and with their clinical significance. Rare imaging findings of pulmonary sarcoidosis.

## CHEE-116 TIPS, TRICKS AND PEARLS IN THE RADIOLOGICAL DIAGNOSIS OF PLEURAL MESOTHELIOMA

Ainhoa Clemente Idoate, MD (*Abstract Co-Author*) Nothing to Disclose
Cristina Sanchez, MD (*Abstract Co-Author*) Nothing to Disclose
Helena Gomez Herrero (*Abstract Co-Author*) Nothing to Disclose
Elia Lecumberri, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To describe the optimal technical computed tomography (CT) acquisition in order to evaluate pleural thickening. Review the semiology of mesothelioma on CT. To illustrate the radiological findings associated with asbestos exposure that can provide clues in the diagnosis of pleural malignancy. To discuss the different interventional procedures available for diagnosis, focusing on those guided by imaging.

**TABLE OF CONTENTS/OUTLINE**

1. Chest CT scan studies with venous phase acquisition for better detection of pleural thickening in suspected malignant effusion. 2. Typical CT imaging findings in mesothelioma, considering subtle and more specific radiological signs. 3. Asbestosis and pleural plaques associated with asbestos exposure in the context of a pleural effusion suspicious for malignancy, along with recommendations for precise detection. 4. A review of various interventional techniques for diagnosing mesothelioma as reported in medical literature, including thoracentesis, blind pleural biopsy, image-guided pleural biopsy, and surgical procedures. 5. The importance of reviewing positron emission tomography (PET) studies before conducting image-guided biopsies to optimize results.

## CHEE-117 SILICOSIS AND SILICA EXPOSURE RELATED DISEASES: WHAT RADIOLOGISTS SHOULD KNOW

Eduardo Kaiser Ururahy Nunes Fonseca, MD (*Abstract Co-Author*) Nothing to Disclose
Leonardo G. Marcelino, MD (*Abstract Co-Author*) Nothing to Disclose
Jean Meneguetti (*Abstract Co-Author*) Nothing to Disclose
Marcio V. Sawamura, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Joao S. Pais, MD (*Abstract Co-Author*) Nothing to Disclose
Thiago De Gaultier Paulo, MD (*Abstract Co-Author*) Nothing to Disclose
Paulo E. Catarina, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

I. Review the epidemiology and clinical characteristics of silicosis, as well as the main diseases related to silica exposure. II. Illustrate the imaging findings of silicosis and diseases associated with silica exposure. III. Propose a diagnostic approach to the radiological findings of silicosis, considering its differential diagnoses, associated diseases and complications.

**TABLE OF CONTENTS/OUTLINE**

Silicosis overview:- Silicosis is the primary manifestation resulting from exposure to silica crystals. It entails irreversible diffuse interstitial lung disease.- Epidemiological data:-About 2.3 million Americans are exposed to inhalable silica particles.Other Associated Diseases: Silica exposure is strongly

associated to various diseases beyond silicosis (lung cancer, tuberculosis, chronic obstructive pulmonary disease (COPD)).Additionally, less prevalent ailments like autoimmune diseases (especially rheumatoid arthritis and systemic sclerosis), sarcoidosis, and vasculitis.Clinical Importance Understanding the presentation of pulmonary silicosis and its associated diseases is crucial.This knowledge aids radiologists and pulmonologists in early diagnosis and complication prevention.Purpose of Review: Provide a comprehensive understanding of silica exposure-related conditions

## CHEE-118 CYSTIC LUNG DISEASES: BLEND OF CLASSIC KNOWLEDGE AND CONTEMPORARY INSIGHTS

Felipe S. Torres, MD, PhD (*Abstract Co-Author*) Research support, Altis Labs
Micheal McInnis, MD (*Abstract Co-Author*) Speakers Bureau, Boehringer Ingelheim GmbH;Speakers Bureau, Bayer AG
Patrik Rogalla, MD, MBA (*Abstract Co-Author*) Institutional Research Grant, Canon Medical Systems Corporation;Institutional Research Grant, KA Imaging
Tae Bong Chung, MD (*Abstract Co-Author*) Nothing to Disclose
Jonatas Favero Prietto Dos Santos, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- A cyst appears as a circumscribed parenchymal low attenuating area, usually with thin and regular walls. - Solitary or few small thin-walled lung cysts incidentally detected on CT may be part of the normal aging process. - In scenarios involving young patients with multiple lung cysts, careful evaluation of cyst characteristics, distribution, and ancillary radiologic findings is paramount. - Cystic lung cancers are an underrecognized condition on CT, often missed at early stages. - Suspicious cyst features include thick or asymmetric walls, associated nodules, internal septations, and growth. - A change in the morphologic features of a cyst and surrounding tissues should raise suspicion for cancer.

### TABLE OF CONTENTS/OUTLINE

1) Review basic imaging concepts through examples, including the updated terminology from the new Fleischner Society glossary of terms for Thoracic Imaging. 2) Distinguish between non-pathological and pathological lung cysts, focusing on their clinical significance and associated findings that aid in diagnosing diffuse lung cystic diseases. 3) Overview of classical cystic lung pathologies. 4) Revisit congenital, infectious, and non-infectious abnormalities that may present with cysts. 5) Unveil the evolving landscape of cystic lung cancers, integrating recent updates from LUNG-RADS. 6) Through a blend of classic knowledge and contemporary insights, this exhibit endeavors to provide radiologists with a nuanced understanding of cystic lung diseases, enhancing diagnostic accuracy and patient care.

## CHEE-119 FINDING PNEUMO: ADVANCED PULMONARY FUNCTIONAL IMAGING METHODS

**Awards**
**Cum Laude**

Marcelo B. Amato, MD (*Abstract Co-Author*) Nothing to Disclose
Shotaro Naganawa, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Prachi P. Agarwal, MD (*Abstract Co-Author*) Nothing to Disclose

Mauricio S. Galizia, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• Traditional medical imaging methods, such as radiography, CT and MRI can depict structural spatial variation in the lungs but not function. Recently several imaging methods have been developed that are able to depict the local distribution of functional parameters, such as ventilation and perfusion. • Some techniques involve the application of software analysis to images obtained with standard hospital equipment. They include analysis of ventilation on fluoroscopic or CT images, as well as modeling airway flow with computational fluid dynamics methods. • Some techniques involve technical changes in standard imaging modalities, and they could be CT-based (e.g. dual-energy CT) or MRI-based (e.g. hyperpolarized gas MRI). • Some techniques involve the use of dedicated hardware, such as dynamic digital radiography and electrical impedance tomography. • We will describe several imaging methods capable of depicting lung function, such as ventilation and perfusion. Pros and cons of each method will be highlighted.

### TABLE OF CONTENTS/OUTLINE

• Nuclear-medicine methods: o Scintigraphy o SPECTPET • Radiography-based methods: o Dynamic digital radiography o X-Ray Velocimetry Lung Ventilation Analysis Software • CT-based methods: o Parametric response map o Xenon CTDual-energy CT o CT Lung Ventilation Analysis Software o Functional Respiratory Imaging • MRI-based methods: o Hyperpolarized gas MRI o Fluorinated gas MRI o Oxygen-enhanced MRI o Fourier-decomposition MRI o Phase-resolved functional lung MRI o Dynamic contrast-enhanced perfusion MRI o Contrast-enhanced MR angiography o Non-contrast MR angiography (arterial spin labelling) • Electrical Impedance Tomography

## CHEE-12 A COMPREHENSIVE VIEW OF ACUTE AORTIC SYNDROME THROUGH ANGIOTOMOGRAPHY

Magali Alvarez, MD (*Abstract Co-Author*) Nothing to Disclose
Andres Primavera (*Abstract Co-Author*) Nothing to Disclose
Ignacio Grimoldi, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To distinguish the pathologies included in acute aortic syndrome. To review the multiphase angiotomography protocol for the study of acute aortic syndrome, the frequent findings in each phase and for each entity on images. To explore the different existing classifications of aortic dissection. To characterize the imaging differences of the aortic dissection flap morphology according to the evolution of an acute to chronic state. To review the most frequent treatment techniques and their complications through cases. To recognize the typical findings of flow entry into the false lumen and its classification system. To detail the components that should not be missing in the follow-up aortic imaging report.

### TABLE OF CONTENTS/OUTLINE

1. Introduction to Acute Aortic Syndrome: distinct characteristics of aortic dissection, intramural hematoma and penetrating atherosclerotic ulcer. 2. Diagnosis CTA imaging: protocol and frequent findings in each phase. 3. Classification Systems, a) DeBakey system b) Stanford Classification System c) Society of Vascular Surgeons and the Society of Thoracic Surgeons (SVS/STS) classification system d) The European update of the Stanford classification: the type/entry/malperfusion (TEM) classification. 4. Common surgical procedures and their complications. 5. Follow-up CTA imaging and report. 6. Classification system for describing flow to the false lumen.

## CHEE-13 THROMBOTIC AND NON-THROMBOTIC PULMONARY EMBOLISM - IS IT REALLY A CHALLENGE FOR ROUTINE PRACTICE? AN ERROR-BASED LEARNING APPROACH

Philippe Khafagy (*Abstract Co-Author*) Consultant, Gleamer
Ernest Martinez Schargel, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Pulmonary artery artefacts (kinetic, beam hardening and flow artefacts specifically due to left-to-right shunt) can be resolved by adapted protocols such as using aorto-pulmonary injection timing. Density measurement of an embolus may be useful in determining its nature. Bilateral central ground glass opacities can refer to pulmonary edema, hemorrhage or infection (especially PCP) and can be the only finding in non-thrombotic PE such as fatty PE. Knowledge of anatomical distribution and morphology of lymph nodes is important to distinguish them from vascular lesions. MPR is useful for anatomical evaluation. Presence of an endovascular tumor invasion may help identify pulmonary tumor embolisms. Consolidation in septic emboli may present features similar to infarcts in the acute phase (before cavitation). MPR and minIP are essential to identify signs of chronic thromboembolic pulmonary hypertension. Sometimes pulmonary infarction may be nodular and difficult to recognize at first glance.

### TABLE OF CONTENTS/OUTLINE

Our 5 chosen cases will lead us to discuss the challenges encountered in routine practice for diagnosis of thrombotic and non-thrombotic PE. We will distinguish first readers' opinion from that of a second reader, which will provide tips to reach the right diagnosis. Each case will distinctly refer to a category of embolism, and will allow for an in-depth discussion of each of these categories. Case 1 : Shortness of breath and elevated D-Dimers. PE ? Case 2 : Elevated D-dimers and retrosternal pain. PE ? Case 3 : Follow-up CT of a patient known for signet ring cell adenocarcinoma Case 4 : Trauma and lumbar pain. Initially, no further context given Case 5 : Dyspnea of unknown origin, suspicious nodules on CT PET-CT

## CHEE-14 ULTRA-HIGH-RESOLUTION CT FINDINGS OF PRE-INVASIVE ADENOCARCINOMA AND MINIMALLY-INVASIVE ADENOCARCINOMA OF THE LUNG

Motoharu Hakozaki (*Abstract Co-Author*) Nothing to Disclose
Kenji Fujii (*Abstract Co-Author*) Employee, Canon Medical Systems Corporation
Kouji Hashimoto I (*Abstract Co-Author*) Nothing to Disclose
Hiroshi Chiba I (*Abstract Co-Author*) Nothing to Disclose
Hiroshi Moriya, MD, PhD (*Presenter*) Advisor, California Capital Equity, LLC;Research Grant, Canon Medical Systems Corporation

### TEACHING POINTS

With the spread of CT screening, the chances of small lung nodule and early lung cancer are increasing. Therefore, the following points are presented by comparing the ultra-high resolution CT (UHRCT) and pathological findings of resected specimens. 1. Classification of Lung Adenocarcinoma2. Pathological invasion criteria of lung adenocarcinoma 3. Spatial resolution of UHRCT4. UHRCT findings of of pre-invasive adenocarcinoma and minimally-invasive adenocarcinoma5. Comparison of UHRCT findings and pathological findings

### TABLE OF CONTENTS/OUTLINE

1. pre-invasive adenocarcinoma (AAH, AIS) and minimally-invasive adenocarcinoma (MIA) of the lung (confirmed by pathological diagnosis of resected specimens) were reviewed.2. The definition of "pathological non-invasion" is lepidic growth and the absence of reactive fibroblast growth factor, vascular / lymphatic vessel invasion, pleural invasion, and STATS. These are diagnoses by microscopic pathological findings, immunostaining, and genetic diagnosis, and are not directly reflected in the macroscopic image morphology.3. UHRCT is a CT that achieves high spatial resolution by reducing the detector size to 1/4. In the previous studies, bronchi with an inner diameter of 0.4 mm are delineated. By improving the resolution, it has become possible to display the intralobular structure. 4. AIS is mainly based on ground glass opacity, but there may be collapsed parts that have lost aeration inside. Ground glass opacity is a finding found in the lepidic extension, but also in the papillary extension. There are also invasive adenocarcinomas mainly composed of ground glass opacity. Some MIA presents solid nodules without aeration.

## CHEE-15 DIFFERENCES BY MORPHOLOGICAL PATTERN IN PROGRESSION OF PULMONARY FIBROSIS ON HRCT

Takahiko Nakazono, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Ken Yamaguchi, MD (*Abstract Co-Author*) Nothing to Disclose
Ryoko Egashira, MD, PhD (*Presenter*) Speakers Bureau, Boehringer Ingelheim GmbH;Speakers Bureau, AstraZeneca PLC;Speakers Bureau, Shionogi & Co, Ltd;Speakers Bureau, KYORIN Holdings, Inc;Speakers Bureau, DAIICHI SANKYO Group;Speakers Bureau, Bayer AG;Speakers Bureau, Otsuka Holdings Co, Ltd;

### TEACHING POINTS

The HRCT diagnosis of interstitial lung disease (ILD) is made by a combination of several non-specific findings.MDD is important because it provides a more practical diagnosis by reading the pathology from the images and combining it with the clinical background and histological diagnosis. Progressive pulmonary fibrosis (PPF) applies to ILDs other than IPF showing progressive clinical, functional or radiological fibrosis over a one-year period, in which the radiologist also has an important role to play in this decision. It is important to know where to focus on each morphological pattern, as the way fibrosis progresses differs according to the morphological pattern.

### TABLE OF CONTENTS/OUTLINE

Diagnostic approach to fibrotic ILD on HRCT. Summarize the current classification/guidelines of interstitial pneumonias/idiopathic pulmonary fibrosis/PPF. Presentation of the differences in the fibrotic progression by morphological patterns. In the UIP pattern, fibrosis results from abnormal alveolar epithelium "wound healing" after invisible injury, with alveolar collapse and collagen build-up causing volume loss and honeycombing. Small lesion accumulation makes detecting the increase of fibrosis on HRCT challenging. In NSIP/fibrosing OP, inflammation injures more extensive lung areas, transitioning to fibrosis and causing alveolar septa thickening and volume loss. This process, unlike UIP, is visible on HRCT, where ground-glass opacities evolve into reticulations. The newer PPFE pattern's pathogenesis remains unclear, but involves epithelial damage leading to lung collapse and induration, detectable on HRCT as volume reduction and collapsed sclerotic lesions, without prior inflammation.

## CHEE-16 DON'T GET LOST IN THE ILD MAZE: 4 STEPS TO APPROACH PATTERNS AND DIAGNOSIS

**Awards**
**Certificate of Merit**

Manuel Conde Blanco, MD (*Abstract Co-Author*) Nothing to Disclose
Sofia D. Gambetta I, MD, MD (*Abstract Co-Author*) Nothing to Disclose
JOSEFINA MEDINA (*Abstract Co-Author*) Nothing to Disclose
Joaquin Martinez Pereira, MD (*Abstract Co-Author*) Nothing to Disclose

Maria C. Ferrario, MD (*Abstract Co-Author*) Nothing to Disclose
Agustina Picarel, MD (*Abstract Co-Author*) Nothing to Disclose
Maria S. Fernandez Castillo Odena, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To provide a stepwise approach to identify pulmonary fibrosis and classifying into the most common specific patterns.To review the primary characteristic of usual interstitial pneumonia, nonspecific interstitial pneumonia and fibrotic hypersensitivity pneumonitis.To learn how to differentiate between idiopathic pulmonary fibrosis and its secondary causes.To recognize how to orientate our final diagnosis, using every tool from the imaging findings to the patient clinical history.

**TABLE OF CONTENTS/OUTLINE**

Step by step to guide pulmonary fibrosis : 1. Is it fibrotic pulmonary disease? 2. How is the distribution of the findings? 3. Which CT pattern predominates? 4. What to look for in the clinical history? Ancillary findings? Main characteristics of UIP pattern: Idiopathic Pulmonary Fibrosis: Differentiate with Probable UIP Main characteristics of UIP pattern: Secondary causes with ancillary findings: CT-ILDAsbestosisDrug InducedIgG4 Disease. Main characteristics of NSIP pattern and its probable causes with ancillary findings: CT-ILDInfectionsDrug toxicityMain characteristics of Fibrotic Hypersensitivity Pneumonitis: Inorganic Particulate Matter.Summarize the main differences between the three patterns

## CHEE-17 THE ROLE OF CHEST CT IN MONITORING CYSTIC FIBROSIS MODULATOR THERAPY

Laura Jimenez-Juan, MD (*Abstract Co-Author*) Nothing to Disclose
Matias F. Callejas, MD (*Abstract Co-Author*) Nothing to Disclose
Djeven P. Deva, MBBCh (*Abstract Co-Author*) Nothing to Disclose
Jose Miguel Castro Garcia, MD (*Abstract Co-Author*) Nothing to Disclose
Ji-Yeon Han, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Low-dose chest CT is used to assess cystic fibrosis patients initiating and undergoing cystic fibrosis transmembrane conductance regulator (CFTR) modulator therapy.- Reduction in bronchial wall thickening, mucous plugging, air trapping, and parenchymal abnormalities have been described in cystic fibrosis patients undergoing modulator therapy.- The extent and caliber of bronchiectasis remain stable in the vast majority of cases despite modulator therapy because bronchiectasis is, for the most part, an irreversible structural change.- CT quantification could be useful for predicting clinical outcomes, such as exacerbations and survival, but it has not yet been integrated into daily practice.

**TABLE OF CONTENTS/OUTLINE**

I. IntroductionII. Recent Advances in Modulator Therapy for Cystic FibrosisIII. Response of Structural Lung Changes to Modulator Therapy1. Thin-section CT Surveillance: Key Indicators in Daily Practice__Bronchiectasis__Bronchial Wall Thickening__Mucous Plugging__Mosaic Attenuation and Air Trapping__Atelectasis and Consolidation2. Effects on Lung Complications: Superimposed infections, ExacerbationIV. Change in Qualitative CT Scoring After Treatment__Currently available CT scoring system__Implementation in Pre- and Post-Treatment ImagingV. Proposal for Quantification in Monitoring Treatment ResponseVI. Conclusion

## CHEE-18 GLOSSARY OF TERMS USED IN LUNG CANCER DIAGNOSIS, STAGING AND TREATMENT

**Awards**
**Cum Laude**

Jo-Anne O. Shepard, MD (*Abstract Co-Author*) Editor with royalties, RELX
Susan K. Hobbs, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Katherine A. Kaproth-Joslin, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Abhishek Chaturvedi, MD (*Abstract Co-Author*) Nothing to Disclose
Karen Rodriguez, MD (*Abstract Co-Author*) Nothing to Disclose
Irene Chen (*Abstract Co-Author*) Nothing to Disclose
Maria Clara N. Lorca, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

This educational exhibit reviews the basic terms frequently used in the diagnosis, staging and treatment of lung tumor, making it a quick and reliable resource for radiologists participating in interdisciplinary conferences.This glossary of terms is an image rich, case-based guide designed to shape imaging interpretation in a way that creates concise but complete summaries, providing the necessary information needed to be conveyed to the different participants of interdisciplinary conferences.Briefly review the new proposed 9th TNM classification, including the new N guidelines. Discuss the expected imaging appearances of: The most common thoracic surgery approaches for lung cancer treatment: including segmentectomies, wedge resections, lobectomy and pneumonectomy. Compare and discuss the different CT-guided localization methods of pulmonary nodules, including fiducial and microcoil markers placement. Stereotactic ablative radiotherapy (SABR), aka stereotactic body radiotherapy (SBRT), chemotherapy, and immunotherapy. -Lung ablation therapy. Imaging pitfalls to be aware post precision therapy.

**TABLE OF CONTENTS/OUTLINE**

This education exhibit reviews different types of surgeries for lung cancer treatment and the expected radiological appearance post-therapy.Creates a checklist with all the necessary information the radiologist is expected to report when diagnosing and/or following lung cancer, as well as the most common post treatment findings.Depict the new subtypes of lung cancers, included in the 2021 WHO classification of the tumors of the lung, including SMARCA4 and bronchiolar adenoma.

## CHEE-19 PERICARDIAL AND PLEURAL TUMORS: CLASSIFYING THE CHEST'S UNWELCOME GUESTS

Maria Clara N. Lorca, MD (*Abstract Co-Author*) Nothing to Disclose
Aadya Chaturvedi (*Abstract Co-Author*) Nothing to Disclose
Katherine A. Kaproth-Joslin, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Irene Chen (*Abstract Co-Author*) Nothing to Disclose
Anna Kelly, MD (*Abstract Co-Author*) Nothing to Disclose
Steve Stephen, BS, MBA (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

This educational exhibit will: 1. Summarize the 2021 WHO Classification of both pericardial and pleural tumors 2. Highlight imaging characteristics of the different pleural and pericardial tumors

**TABLE OF CONTENTS/OUTLINE**

This exhibit aims to provide a comprehensive overview of pleural and pericardial tumors using biopsy-proven case examples. Cases will be systematically reviewed, utilizing the framework presented in the 2021 WHO guidelines and how the knowledge of histological tumor subtypes has become important in the clinical scenario of precision therapy treatment. Radiological findings of tumors will be presented alongside respective pathology correlates. Tumors to be covered include: Benign and preinvasive mesothelial tumors of the pleura, pleural mesothelioma in situ, localized mesotheliomas, malignant pleural mesotheliomas (MPM), aka diffuse mesotheliomas, benign and malignant primary tumors of the pericardium and metastases to the pleura and pericardium, pericardial angiosarcoma and others.References: 1. ## CHEE-2 REVISIONS IN THE TNM CLASSIFICATION FOR LUNG CANCER: A PRIMER FOR RADIOLOGISTS

Jose de Arimateia B. Araujo Filho, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Ana Isabella De Oliveira, MD (*Abstract Co-Author*) Nothing to Disclose
Debora Mayumi Takamune, MD (*Abstract Co-Author*) Nothing to Disclose
Hye J. Lee, MD (*Abstract Co-Author*) Nothing to Disclose
Roberto V. Torres, MD (*Abstract Co-Author*) Nothing to Disclose
Lucas d. Gomes de Farias, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Leonardo Rosolen Iunes, MD (*Abstract Co-Author*) Nothing to Disclose
Daniel L. Cardoso, MD (*Abstract Co-Author*) Nothing to Disclose
Maria Vitoria Ludwig, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

• The forthcoming 9th edition TNM classification (TNM-9) for lung cancer will introduce refined subcategories for nodal involvement and metastatic disease classification, addressing the need for improved precision in staging and treatment decisions. • The subcategorization of N2 into N2a and N2b resulted in new TN subsets, including T1N2a, assigned to stage IIB, which reflect changes in the prognosis prediction. • The subcategorization of M1c into M1c1 and M1c2 is also relevant to refine prognosis, even though it doesn’t imply a change of stage (both remain in stage IVB). • The clinical importance of these changes reinforces the necessity for precise evaluation and reporting of mediastinal nodal disease and distant metastases through comprehensive imaging, notably CT and PET-CT. • This presentation aims to review key concepts and revisions of TNM-9 in a practical approach tailored for radiologists and residents.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction: principles of cancer staging; 2. Lung cancer staging state-of-the-art: (a) Multimodality imaging (b) 8th edition of the TNM Classification; 3. IASLC Lung Cancer Staging Project: methods and guiding principles; 4. Revisions of the TNM Descriptors in the Forthcoming 9th edition of the TNM Classification: (a) N Descriptors (b) M Descriptors (c) Summary and practical approach; 5. Illustrative cases with multimodality imaging: a comparative review; 6. Future perspectives: liquid biopsy and artificial intelligence; 7. Take home messages

## CHEE-20 NONTUBERCULOUS MYCOBACTERIAL INFECTION: REVIEW OF CLINICAL AND IMAGING MANIFESTATIONS

Carlos S. Restrepo, MD (*Abstract Co-Author*) Nothing to Disclose
Felipe A. Sanchez, MD (*Abstract Co-Author*) Nothing to Disclose
Daniel Ocazionez-Trujillo, MD (*Abstract Co-Author*) Nothing to Disclose
Maria Patricia Puello Baron, Md (*Abstract Co-Author*) Nothing to Disclose
Markus Y. Wu, MD (*Abstract Co-Author*) Nothing to Disclose
Daniel Vargas, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Nontuberculous mycobacteria (NTM) are a group of ubiquitous, low grade pathogens that cause pulmonary infections in immunocompetent and immunocompromised people worldwide, with particularly high prevalence in the US and Japan.This exhibit will:a. Discuss the epidemiological and microbiological underpinnings on NTMb. Recognize the different clinical and imaging presentation of the two main forms of the disease.c. Review imaging features of less common types of presentation including scenarios with altered pulmonary parenchymal architecture, immunocompromised hosts, congenital heart disease, etc. As well as review common and rare complicationsd. Discuss the role of imaging in the pharmacologic and surgical management of these patients.

**TABLE OF CONTENTS/OUTLINE**

1. Epidemiology and Microbiological Background 2. Diagnosis 3. Imaging Findings a. Classic (Cavitary Form) b. Non-Classic (Bronchiectatic Form) c. Hypersensitivity Pneumonitis (Hot Tub Lung) d. Immunocompromised Host e. Other Predisposing Conditions (e.g. ILD, Cystic Fibrosis, Organ Transplant) f. Complications 4. Imaging Role in Treatment Strategies a. Pharmacologic Treatment Imaging Follow Up b. Pre-operative and Post-operative Evaluation 5. Role of Alternative Imaging Modalities (MRI, PETCT)

## CHEE-21 ACUTE THORACIC FINDINGS AND COMPLICATIONS RELATED TO CANCER TREATMENT

Tassia R. Yamanari, MD (*Abstract Co-Author*) Nothing to Disclose
Jose de Arimateia B. Araujo Filho, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Camila S. Franco, BMedSc (*Abstract Co-Author*) Nothing to Disclose

Fabiana Campos, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Review the most common modalities of local treatment of thoracic neoplasms.- Recognize the expected changes related to each modality of local treatment and the potential acute complications.- Review the imaging findings of the acute thoracic complications related to systemic cancer therapy.

**TABLE OF CONTENTS/OUTLINE**

Acute thoracic findings in oncology patients can be related to local or systemic therapy. It might vary from expected changes related to local treatment to acute complications that can be life threatening. Beyond that, these findings can be misinterpreted as tumor recurrence and compromise the appropriate treatment.The aim of this pictorial review is to present1. Expected acute imaging findings related to the most common local cancer treatment modalities in the chest, including surgery, ablation therapy and radiation therapy.2. A systematic review of the imaging findings of acute complications related to local and systemic cancer therapy, based on treatment modality and organ system (airways and lung, pleura, cardiovascular and mediastinum).

## CHEE-22 PERSPECTIVES IN PIXELS: THORACIC IMAGING'S VIEW ON RHEUMATOLOGICAL DISEASES

Bharat Aggarwal, MD (*Abstract Co-Author*) Nothing to Disclose
Prasandeep Rath, MBBS,MD (*Abstract Co-Author*) Nothing to Disclose
Amit K. Sahu, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Anandamoyee Dhar (*Abstract Co-Author*) Nothing to Disclose
Harshita Arora, MBBS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

• Role of CT in detecting and characterizing various thoracic manifestations in rheumatic diseases, including pulmonary involvement, pleural abnormalities, and mediastinal changes. • Overview of thoracic manifestations of common rheumatological conditions. • Use of follow-up CT scans for the monitoring of disease. • Highlight typical and atypical imaging findings for such conditions. • Case based approach to reinforce learning in this topic. • Emphasize role of imaging in early detection, disease severity assessment, and treatment guidance. • Discuss mimics of such conditions • Identification of associated complications such as infection, pulmonary embolism, and malignancy, which may occur concurrently or as a result of immunosuppressive therapy.

**TABLE OF CONTENTS/OUTLINE**

- Introduction: Overview of Thoracic Imaging in Rheumatological Disorders
- Role of CT in Detecting and Characterizing Thoracic Manifestations
- Thoracic Manifestations of Common Rheumatological Conditions: Rheumatoid Arthritis; Systemic Lupus Erythematosus; Systemic Sclerosis; Wegener's Granulomatosis; Dermatomyositis; Ankylosing Spondylitis
- Importance in Treatment Response Evaluation
- Adjustment of Therapeutic Strategies
- Case-Based Approach for Learning Reinforcement
- Mimics :Infectious Diseases; Malignancies; Idiopathic Interstitial Pneumonias
- Associated complications: Infection; Pulmonary Embolism; Malignancy

## CHEE-23 'WRECK'-REATIONAL DRUG INDUCED LUNG INJURY

Saurabh Agarwal, MD (*Abstract Co-Author*) Nothing to Disclose
Terrance T. Healey, MD (*Abstract Co-Author*) Nothing to Disclose
Samika S. Kanekar (*Abstract Co-Author*) Nothing to Disclose
Brandon H. Koo, MD,BS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The purpose of this educational exhibit is to: 1. Review current epidemiologic trends of recreational substance use 2. Discuss current chest imaging techniques and imaging findings of recreational drug induced lung injury 3. Review the pathophysiology and routes of lung injury and long-term damage caused by different recreational substances through representative cases 4. Discuss the complications, prognosis, and treatments of recreational substance induced lung injury and damage.

**TABLE OF CONTENTS/OUTLINE**

The majority of Americans now live in a state where recreational use of marijuana is legal, with usage trends mirroring increased accessibility; similar increased usage trends of e-cigarettes and vaping products have been noted nationwide. With more widespread use of recreational substances with the potential for substance induced lung injury, this exhibit aims to provide a timely review of key imaging features and patterns of both acute lung injury and long-term damage related to a myriad of substance use including marijuana, e-cigarettes/vaping, conventional tobacco products, talcosis, and crack cocaine.

## CHEE-24 TAKE A BREATH! PATTERNS OF POST-PRIMARY PULMONARY TUBERCULOSIS

Alair Arantes (*Abstract Co-Author*) Nothing to Disclose
Erica A. Naves, MD (*Abstract Co-Author*) Nothing to Disclose
Gabriel De Figueiredo Pereira, MD (*Abstract Co-Author*) Nothing to Disclose
Bruna Carvalho (*Abstract Co-Author*) Nothing to Disclose
Guilherme C. del Guerra, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The purpose of this exhibition is to delve into the characteristic CT findings that aid in the diagnosis and understanding of post-primary pulmonary tuberculosis, also known as reactivation tuberculosis or secondary tuberculosis. There are plenty of patterns that may be associated with post-primary pulmonary tuberculosis, such as lobar pneumonia, cavitations, tree-in-bud opacities, ground-glass opacities, centrilobular nodules, tuberculomas and/or pseudomasses. Demonstrating illustrative cases, this exhibition aims to assist radiologists in reporting chest CT scans in a post-primary pulmonary tuberculosis scenario.

**TABLE OF CONTENTS/OUTLINE**

This exhibition initiates with a summary of the relevance, worldwide prevalence and pathology of the post-primary pulmonary tuberculosis. The next slides present the types of presentation and expected findings of the post-primary pulmonary tuberculosis on chest CT, with illustrative cases of each main form of presentation, identifying the most important radiological finding on each image. The collection contains cases of miliary tuberculosis, tuberculomas/pseudotumors, lobar pneumonia, atypical forms, such as inferior and anterior involvement, and multi-drug resistant pulmonary tuberculosis findings, including bilateral cavitations. The potential signs of active disease are subsequently highlighted. The presentation ends with relevant take-home messages.

## CHEE-25 EXPLORING 68-GA-FAPI PET-CT IN LUNG CANCER: ADVANTAGES AND LIMITATIONS COMPARED TO 18-FDG PET-CT

Barboza (*Abstract Co-Author*) Nothing to Disclose
Gustavo B. Teles, MD (*Abstract Co-Author*) Nothing to Disclose

Eduardo Kaiser Ururahy Nunes Fonseca, MD (*Abstract Co-Author*) Nothing to Disclose
Ana Claudia Camargo (*Abstract Co-Author*) Nothing to Disclose
Lucas Daniel Pereira Lopes (*Abstract Co-Author*) Nothing to Disclose
Lilian Y. Yamaga (*Abstract Co-Author*) Nothing to Disclose
Nadjaneyre Casimiro, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Gallium-68-labeled Fibroblast Activation Protein Inhibitor (FAPI-PET) represents an exciting advancement in molecular imaging as it targets proteins directly involved in tumor microenvironment. This presentation will present and review the uses of this novel tracer, focusing on lung cancer: - Describe the diagnostic performance and limitations of the 68-Ga-FAPI PET-CT and 18-FDG PET-CT.- Demonstrate the application of the 68-Ga-FAPI PET-CT in oncology with didactic cases of lung cancer through cross-sectional imaging.- Discuss the role of 68-Ga-FAPI versus 18-FDG PET-CT imaging in staging lung cancer using a case-based approach.

**TABLE OF CONTENTS/OUTLINE**

- General concepts of the role of imaging in staging primary and metastatic lung cancer using both 18-FDG and 68-Ga-FAPIEffectiveness diagnostic performance.- Illustrative cases: Radiological features in false negative and false positive cases.- The main challenges and perspectives of implementing in routine clinical. - Conclusion / Take-home messages.

## CHEE-26 STERNUM SPOTLIGHT - EVERY (STERNUM) HAS HIS DAY

**Awards**
**Certificate of Merit**

Rodrigo C. Chate, MD (*Abstract Co-Author*) Nothing to Disclose
Durval D. Santos, MD (*Abstract Co-Author*) Nothing to Disclose
Eduardo Baptista, MD (*Abstract Co-Author*) Nothing to Disclose
Pedro Mecate Prada, MD (*Abstract Co-Author*) Nothing to Disclose

Murilo M. Silva, MD (*Abstract Co-Author*) Nothing to Disclose
Eduardo Kaiser Ururahy Nunes Fonseca, MD (*Abstract Co-Author*) Nothing to Disclose
Margrit Muller, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

This exhibit serves the following purposes:• Exploring the anatomy of the sternum and its diagnostic assessment through a comprehensive multimodality approach.• Discussing the spectrum of anatomical variants of the sternum, encompassing component disproportions, sternal foramina, xiphoid shape variations, and associated conditions such as pectus carinatum and pectus excavatum. • Analyzing mechanical and inflammatory conditions and their imaging manifestations, such as arthritis, mechanical overloads, spondyloarthropathy, and SAPHO syndrome. • Examining traumatic injuries involving the sternum, including sternoclavicular dislocations, as well as acute and chronic fractures. • Analyzing infectious diseases affecting the sternum, with a focus on septic arthritis, alongside discussion of rarer infections like sporotrichosis. • Identifying the expected image patterns of benign and malignant sternum tumors, notably enchondroma and chondrosarcoma. • Recognizing various post-operative sternum conditions, including pseudoarthrosis, acute mediastinitis, secondary osteomyelitis, and complications associated with sternal prostheses.

**TABLE OF CONTENTS/OUTLINE**

• Sternum anatomy. • Imaging modalities. • Sternal anatomical variations. • Mechanical and inflammatory pathologies. • Traumatic injuries. • Infectious diseases. • Tumors. • Post-operative complications.

## CHEE-27 BEYOND THE BELLY: IMAGING OF THORACIC MANIFESTATIONS OF OBSTETRIC AND GYNECOLOGIC DISEASE

**Awards**
**Certificate of Merit**

Aletta Ann Frazier, MD (*Abstract Co-Author*) Nothing to Disclose
Alan M. Ropp, MD (*Abstract Co-Author*) Nothing to Disclose
Thomas Battey, MD (*Abstract Co-Author*) Nothing to Disclose
Leah Smith (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

While the majority of obstetric and gynecologic disease presents in the abdominal cavity, many of these conditions can manifest in the thorax. Related imaging findings may be subtle, unexpected, or overlooked. Radiologists must consider these entities and familiarize themselves with the associated findings to enable prompt and accurate diagnosis and treatment. This case series presents a comprehensive review of obstetric and gynecologic diseases manifesting findings in thoracic imaging. After reviewing this exhibit, the learner will recognize thoracic imaging findings related to obstetric and gynecologic disease, understand optimal modalities and techniques for safely imaging pregnant patients, and define relevant recommendations for management and follow up of the presented imaging findings.

**TABLE OF CONTENTS/OUTLINE**

Cardiothoracic Complications of Pregnancy Emboli (thrombotic, amniotic fluid, and air) - Imaging protocols and other considerations in pregnant patients; Peripartum Cardiomyopathy; Eclampsia/Pre-Eclampsia; Pneumonia and Aspiration. Gynecologic Disease in the Thorax: Thoracic endometriosis syndromes (Catamenial Pneumothorax/Hemothorax, Hemoptysis, Pulmonary Endometrioma); Ovarian Hyperstimulation Syndrome; Benign Metastasizing Leiomyoma; Meigs Syndrome. Thoracic Patterns of Gynecologic Metastasis: Virchow's Node; Pleural/Diaphragmatic Metastases; Isolated Bilateral Axillary Metastases.

## CHEE-28 EXPLORING THE MANY FACES OF FAMILIAL PULMONARY FIBROSIS: RADIOLOGIC AND PATHOLOGIC FEATURES

Israel Missrie, MD (*Abstract Co-Author*) Speaker, F. Hoffmann-La Roche Ltd
Marcio V. Sawamura, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Camila S. Franco, BMedSc (*Abstract Co-Author*) Nothing to Disclose
Vinicius A. Cavalieri, MD (*Abstract Co-Author*) Nothing to Disclose
Diego Brigagao (*Abstract Co-Author*) Nothing to Disclose
Lais F. Pimentel, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Review the tomographic patterns of possible phenotypes found in familial pulmonary fibrosis using schematic illustrations and imaging studies.- Display a set of cases of familial pulmonary fibrosis exposing the heterogeneity of presentations.- Correlate imaging findings with pathological characteristics.

**TABLE OF CONTENTS/OUTLINE**

Familial pulmonary fibrosis (FPF) is defined as any fibrotic interstitial lung disease in at least two first or second-degree relatives in the family. Although it is not a consensual definition, it is highly accepted. It is known that several genetic mutations are associated with the presence of this entity, which results in a wide diversity of phenotypic, radiological and pathological characteristics, including overlap between them. Imaging plays a fundamental role in the investigation and suspicion of interstitial lung diseases. Therefore, we propose a systematic approach and review of the image characteristics found on computed tomography. This pictorial review will discuss:1. Introduction2. Pathogenesis and epidemiology3. Review of the main tomographic and anatomopathological patterns of familial interstitial fibrosis- Usual interstitial pneumonia- Cryptogenic organizing pneumonia- Undetermined fibrosis pattern- Non-specific interstitial pneumonia- Fibrotic hypersensitivity pneumonitis- Aspiration-related

## CHEE-29 NON-INFECTIOUS PULMONARY COMPLICATIONS IN HEMATOLOGICAL MALIGNANCY

Rishi Agrawal, MD (*Abstract Co-Author*) Speakers Bureau, Boehringer Ingelheim GmbH
Jeremy J. Erasmus, MD (*Abstract Co-Author*) Nothing to Disclose
Girish S. Shroff, MD (*Abstract Co-Author*) Nothing to Disclose
Mylene T. Truong, MD (*Abstract Co-Author*) Nothing to Disclose
Ioannis Vlahos, MBBS, FRCR (*Presenter*) Director, Grayscale Ltd;Co-owner, Grayscale Ltd;

**TEACHING POINTS**

Infection is the predominant cause of acute diffuse lung disease in hematological malignancy. However, 10-20% of presentations are due to alternative non-infectious etiologies. Familiarity with the radiological appearances, their timeline of evolution, and specific clinical scenarios when these occur aids diagnosis.

**TABLE OF CONTENTS/OUTLINE**

Cases from tertiary cancer center, with pathological/clinical correlation of common and rare conditions. Cases are categorized by clinical scenario/evolution timelines. Clinical indicators that should suggest non-infectious etiologies and radiology management recommendations are highlighted.To include:• Post Bone Marrow Transplantation (Edema, Hemorrhage, Idiopathic Pneumonia Syndrome) - timelines and differentiating features• Small Molecule Drug Toxicity (e.g. Bleomycin) - radiological/clinical risk factors• Novel therapy complications (CAR T-cell cytokine release syndrome, ATRA differentiation syndrome)• Transfusion Reactions (TACO, TRALI, FNHTR, etc.)• Secondary Alveolar Proteinosis• Pulmonary Interstitial Extramedullary Hematopoiesis• Leukemic Infiltration, Leukostasis, Leukemic Cell Lysis Pneumopathy

## CHEE-3 INTERSTITIAL LUNG ABNORMALITIES: WHEN RADIOLOGISTS SHOULD MAKE THIS CALL

Jessica Gemmell (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

; Elucidate the imaging features of interstitial lung abnormalities (ILA) that necessitate reporting on CT scans.; Provide a simple algorithm for the differential diagnosis of ILA, improving accuracy and efficiency.; Stress the significance of communication between radiologists and pulmonologists for ILA management.

**TABLE OF CONTENTS/OUTLINE**

● Overview of Interstitial Lung Abnormalities (ILA) ○ Definition and Epidemiological Relevance
○ Patterns of ILA on CT: Reticular, Nodular, Cystic, and Ground-Glass Opacities● Radiologic Approach to ILA
○ Criteria for Identification and Reporting of ILA ○ ILA versus Artefact: Ensuring Diagnostic Precision● Differential Diagnosis Simplified
○ Algorithmic Approach to Common and Uncommon Causes of ILA ○ Radiological Illustrations to Guide Pattern Recognition● Clinical Context and Management
○ When to Suggest Further Evaluation for ILA ○ Integrating Clinical Data in Radiological Interpretation● Conclusion
○ Summary of Best Practices for ILA Reporting ○ Call to Action for Standardization of Reporting Protocols

## CHEE-30 REVISITING THE LOWER RESPIRATORY TRACT: CORRELATION WITH BRONCHOSCOPY

Thiago Jose Pinheiro Lopes, MD (*Abstract Co-Author*) Nothing to Disclose
Debora Mayumi Takamune, MD (*Abstract Co-Author*) Nothing to Disclose
Ramon Borge Rizzi, MD (*Abstract Co-Author*) Nothing to Disclose

Jose de Arimateia B. Araujo Filho, MD, PhD (*Abstract Co-Author*) Nothing to Disclose

Leonardo Rosolen Iunes, MD (*Abstract Co-Author*) Nothing to Disclose
Rafael R. Santos Ferreira, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Chest CT is a non-invasive method capable of mapping and identifying lesions of the trachea and bronchi, as well as assisting in the biopsy and surgery planning of suspected findings. - Flexible bronchoscopy (FB) is the gold standard method for directly visualising the airways, allowing for many diagnostic and therapeutic interventions. - Virtual bronchoscopy (VB) is a technique for reconstructing three-dimensional images from CT scans, simulating a flexible bronchoscopy. - This presentation aims to illustrate the correlations between CT imaging findings and those obtained through FB and VB in diferent clinical setttings.

**TABLE OF CONTENTS/OUTLINE**

1) Background; 2) Techniques: Conventional CT, VB, FB (pros and cons); 3) Applications: a case-based review (- anatomical variants - inflammatory and infectious diseases - neoplasms - blood clots - foreign bodies - other findings - intervention mapping - surgical planning - post-surgical changes - miscellaneous); 4) Future directions: Artificial Intelligence for navigation planning; 5) Summary and take home messages;

## CHEE-31 INJURIES FROM EXTREME EXERCISE: LOTS OF PAIN, NO GAIN

**TEACHING POINTS**

-Demonstrate a variety of radiological findings of thoracic complications such as alveolar edema/hemorrhage and pulmonary fat embolism associated with different forms of strenuous physical exercise.-Explain the mechanisms of injury involved in exercise-induced pulmonary complications.-Illustrate these conditions based on cases from our radiology group.-Provide insights into the role of radiology in the early detection and proper management of exercise-induced pulmonary complications.

**TABLE OF CONTENTS/OUTLINE**

INTRODUCTION-Pathophysiological mechanism of pulmonary edema and hemorrhage caused by extreme physical exercise-Pathophysiological mechanism of pulmonary fat embolism caused by a long bone fracture during a extreme physical exercise-Pathophysiological mechanism of muscle injuries after weightlifting.CASE-BASED REVIEW-Pulmonary fat embolism following a long bone fracture sustained during a CrossFit session.-Alveolar edema/hemorrhage after cycling-Alveolar edema/hemorrhage after swimming-Pulmonary edema after running in high altitude-Muscle injuries after weightlifting.FINAL CONSIDERATIONSREFERENCES

## CHEE-32 OPTIMIZATION TECHNIQUES FOR RESCAN OF PROBLEMATIC CT PULMONARY ANGIOGRAMS

Eduardo J. Mortani Barbosa JR, MD, MBA (*Abstract Co-Author*) Research Consultant, FLUIDDA nv;Research Grant, Siemens AG
Achala Donuru, MD (*Abstract Co-Author*) Nothing to Disclose
Michael Colfer (*Abstract Co-Author*) Nothing to Disclose
Harold I. Litt, MD, PhD (*Abstract Co-Author*) Research Grant, Siemens AG;Research Grant, Koninklijke Philips NV
Yvonne Su, BA (*Abstract Co-Author*) Nothing to Disclose
Scott A. Simpson, DO, MEd (*Abstract Co-Author*) Nothing to Disclose
Julia C. Jacob, MD (*Abstract Co-Author*) Nothing to Disclose
Priscilla Stecher, MD (*Abstract Co-Author*) Nothing to Disclose
Arun C. Nachiappan, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Detect technical problems in nondiagnostic and low-quality CT pulmonary angiograms (CTPA). 2. Select which optimization technique to utilize for a potential rescan. 3. Compare pre- and post-intervention images to determine effectiveness of optimization techniques for rescan of problematic CTPA exams.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction/Background 2. Case-based review and demonstration of 13 technical problems in CTPA, with a comparison of the initial scan to the rescan performed with the optimization technique specific to each problem a) Transient interruption of contrast b) Bronchial artery inflow artifact c) Status post Fontan procedure d) Scan timing challenges - Parenchymal disease - Flow-related artifact - Tachycardia - ROI incorrectly placed on aorta e) Suboptimal contrast opacification f) Streak artifact from the SVC g) Pulmonary motion artifact h) Image noise i) Iodinated contrast anaphylaxis j) Concurrent technical problems 3. Conclusion

## CHEE-33 DECIPHERING ENIGMATIC CARDIOTHORACIC IMAGING IN END STAGE RENAL DISEASE (ESRD)

Ramya S. Gaddikeri, MD (*Abstract Co-Author*) Nothing to Disclose
Palmi N. Shah, MD (*Abstract Co-Author*) Research Grant, Abbott Laboratories
Emily M. Trudeau, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Unusual cardiothoracic imaging in ESRD can be diagnostic dilemmas. Metastatic pulmonary calcifications (MPC) with noncalcified centrilobular nodules: mimics infection. Hyperdense consolidations: simulate amiodarone toxicity. Positive bubble echo due to chronic central venous obstruction and contrast

shunting into the pulmonary veins. Miliary lung nodules in secondary pulmonary hemosiderosis from ESA: mimics miliary infection.Endplate erosion and vertebral collapse in Dialysis related spondyloarthropathy (DSA) mimics spondylodiscitis. Nodular pulmonary amyloidosis when non calcified /cavitating, mistaken for malignancy. Diffuse bone uptake on PET-CT secondary to ESA: confused for infiltrative processLarge IV contrast in ESRD patients can cause hyperdense fluid and muscles even after 24hrs, confused for hemorrhage. Post-transplant medication induced pneumonitis: mimics edema.

**TABLE OF CONTENTS/OUTLINE**

Imaging findings will be subcategorized with DD: Lungs/Pleura: Hyperdense consolidation, MPC, Secondary pulmonary hemosiderosis, pulmonary amyloidosis, Premature tracheal calcifications, hyperdense effusions from contrast staining, Chronic effusions and round atelectasis. Heart/Vessels: Premature Coronary calcifications and accelerated CAD, Coronary aneurysm (In PCKD), Uremic pleuro-pericarditis, Cardiac amyloidosis, venous collaterals shunting to pulmonary veins, pericardial calcifications. Bones/Soft tissueRenal osteodystrophy, Distal clavicle resorption, DSA, calciphylaxis, Post ESA diffuse FDG uptake in bones, brown tumor. Post-transplant complicationsInfections due to immune-compromised state, ex PJP pneumonia. Tacrolimus induced lung injury.

## CHEE-34 RETURN OF THE MAC: NON-TUBERCULOSIS MYCOBACTERIAL INFECTIONS

**Awards**
**Cum Laude**

Demetrios A. Raptis, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The classic manifestations of non-tuberculosis mycobacterial (NTM) infection in the chest have a unique clinical and radiographic presentation. These infectious processes can exist on a spectrum that can be life threatening or result in minor symptoms and require no treatment. The Runyon classification for non-tuberculosis in the current era has become more historical than clinically relevant, making the diagnosis challenging. We review a multi-disciplinary approach to making the diagnosis and directing treatment. While doing so we review a classification scheme for NTM infections and how imaging findings and clinical information can direct management.

**TABLE OF CONTENTS/OUTLINE**

• Review imaging findings of non-tuberculosis mycobacteria (NTM) infections with emphasis on the thorax • Develop/review a classification scheme based on the imaging findings • Discuss multi-disciplinary approach to making diagnosis (and differentiating from M. tuberculosis) and directing treatmentMycobacterial avium complex (MAC):• Classic - upper lobe predominant fibrocavitary/cavitary pattern • Disseminated disease - cavitary disease, necrotic lymphadenopathy, and hepatosplenomegaly• Lady Windemere Syndrome - bronchiectasis, centrilobular nodules• Hypersensitivity (aka hot tube lung) - subacute hypersensitivity pattern• MAC can be associated with other conditions:• Achalasia• CF• Immunodeficiency Not all mycobaceterial infections in the chest are caused by MAC. Discuss clinical presentation and overlapping imaging findings of other mycobacterial infections in the chest including:• Kansasii• Xenopus• Abscessus • Fortuitum

## CHEE-35 FIBROSING MEDIASTINITIS IN HISTOPLASMOSIS: WHAT THE RADIOLOGIST SHOULD KNOW

**Awards**
**Certificate of Merit**

Glenda Peres (*Abstract Co-Author*) Nothing to Disclose
Ferdinand D. Cabrera Filho, MD (*Abstract Co-Author*) Nothing to Disclose
Felipe C. Ribeiro, MD (*Abstract Co-Author*) Nothing to Disclose
Elissandra M. Lima, MD (*Abstract Co-Author*) Nothing to Disclose
LOUISE FATIMA GOMES DE ALMEIDA (*Abstract Co-Author*) Nothing to Disclose
Bruna Goncalves, MD (*Abstract Co-Author*) Nothing to Disclose
Daniella B. Parente, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Luiz Carlos Goncalves Motta (*Abstract Co-Author*) Nothing to Disclose
Eleonora Silva (*Abstract Co-Author*) Nothing to Disclose
Marina Da Silva, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

• Recognize the imaging modalities and protocols of choice for proper evaluation of mediastinal structures in patients with histoplasmosis.• Present the main forms and complications of fibrosing mediastinitis in histoplasmosis cases.• Show the other main differential diagnoses for fibrosing mediastinitis.

**TABLE OF CONTENTS/OUTLINE**

• INTRODUCTIONo General overview and definitions of histoplasmosis and fibrosing mediastinitis;o Prevalence, relevance, costs;o Review of mediastinal and pulmonary vascular anatomy;o Overview of physiopathology.• IMAGING TECHNIQUEo Imaging modalities of choice;o Computed tomography;o Angio tomography;o Magnetic resonance;o Perfusion/dual energy CT studies.• IMAGING INTERPRETATIONo Structured imaging analysis;o Main findings of thoracic histoplasmosis;o Airway, arterial, venous and pleural involvement in fibrosing mediastinitis;o What to include in the radiology report.• INTERACTIVE CASE-BASED DIDACTICSo Illustrative cases.• STRATEGIES TO OVERCOME THE CHALLENGING CASESo Imaging characteristics that help in the differential diagnosis;o Key clinical and laboratorial findings;o What to recommend in difficult scenarios.• IMPACT IN PATIENT MORBIDITYo Treatment options;o Post-surgery and follow-up evaluation;o Prognosis.

## CHEE-36 HYPERPOLARIZED XENON GAS LUNG MRI IN THE HEALTHY AND DISEASED LUNG

Mohamed A. Ebada, MD (*Abstract Co-Author*) Nothing to Disclose
Robert P. Thomen, PhD (*Abstract Co-Author*) Nothing to Disclose
Jeffrey R. Kunin, MD, MBA (*Abstract Co-Author*) Nothing to Disclose
Talissa A. Altes, MD (*Abstract Co-Author*) Speaker, Koninklijke Philips NV
Ummul Afia Shammi, PhD (*Abstract Co-Author*) Nothing to Disclose
Cody Thornburgh, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Hyperpolarized Xenon Gas (HXG) MRI is a relatively new-to-market FDA approved imaging agent to evaluate lung ventilation.2. Small airway diseases, like asthma, COPD, and Cystic Fibrosis, have MR ventilation features that increase confidence in diagnosis and assessment of disease severity.3. Xenon gas diffuses from the airways into the lung tissues and blood. HXG MRI allows simultaneously imaging of these various states of xenon gas, termed "dissolved phase imaging."4. Ongoing research of HXG MRI is revealing new applications for medical imaging, which may aid in the diagnosis of pulmonary hypertension and management of disease.

**TABLE OF CONTENTS/OUTLINE**

1. Background/Objectives2. Brief Review of Technique---a. Drug Preparation---b. MR Scanner Configuration---c. Data Analysis3. Ventilation Imaging Characteristics---a. Normal---b. Pathological disease states------i. COPD and Emphysema------ii. Asthma------iii. Cystic Fibrosis------iv. COVID-19------v. Interstitial Lung Diseases4. Dissolved Phase Imaging Characteristics---a. Normal---b. Pathological findings of Small Airway Diseases---c. Pathological findings of Pulmonary Hypertension5. Future Frontiers---a. RBC oscillation and pulmonary hypertension---b. Therapeutic agent monitoring

## CHEE-37 COMPLICATIONS OF THE PULMONARY SURGERY WHAT RADIOLOGISTS NEED TO KNOW?

Iclal Ocak, MD (*Abstract Co-Author*) Nothing to Disclose
Furkan Ufuk, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Radiologists are vital in detecting complications following pulmonary surgery, impacting patient management and outcomes.
- Recognizing imaging signs of common and critical complications ensures timely intervention.
- Key complications include infection, air leaks, and vascular complications.

**TABLE OF CONTENTS/OUTLINE**

- Introduction
- Role of imaging in the follow-up of pulmonary surgery
- Essential knowledge for radiologists
- Normal Postoperative Imaging
- Expected changes on imaging after common pulmonary surgeries
- Early Complications
- Pneumothorax: Identification and implications
- Hemorrhage: Expected vs. excessive bleeding
- Air Leaks: Manifestations and management
- Infectious Complications
- Empyema: Diagnostic imaging criteria
- Pneumonia: Distinguishing postoperative changes from infection
- Late Complications
- Bronchopleural fistula
- Lung torsion
- Lung hernia
- Pulmonary fibrosis and lung volume reduction
- Advanced Imaging Modalities
- Role of CT, X-ray, and MRI in detecting subtle complications
- The utility of imaging in guiding interventional procedures
- Conclusion
- Overview of critical findings for effective postoperative care
- Future directions in imaging technologies for pulmonary surgery

## CHEE-38 SMOKE SIGNALS: A JOURNEY THROUGH SMOKING RELATED PULMONARY PATHOLOGY

Sukrita Menon, MD (*Abstract Co-Author*) Nothing to Disclose
Ernest M. Scalzetti, MD (*Abstract Co-Author*) Nothing to Disclose
Harikrishnan Nandakumar, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Defining the spectrum of entities comprising Smoking Related-Interstitial Lung Diseases (SR- ILD). 2. Exploring the pathogenesis of SR- ILD. 3. Exploring various SR-ILDs including Respiratory bronchiolitis ILD (RB-ILD), Pulmonary Langerhans Cell Histiocytosis (PLCH), Desquamative Interstitial Pneumonitis (DIP), Idiopathic Pulmonary Fibrosis (IPF), and Combined Pulmonary Fibrosis with Emphysema (CPFE) by reviewing the clinical features, characteristic multimodality imaging findings, and pathologic findings. 4. Exploring Electronic Cigarette or Vaping Product Use-associated Lung Injury (EVALI) by reviewing the clinical features, characteristic multimodality imaging findings, and pathologic findings. 5. Discussion of potential imaging conundrums and confounders of each entity within the spectrum and defining specific features that could help direct imaging interpretation, diagnosis and clinical management of patients.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction to SR-ILDs: Definition and illustration of spectrum of entities. 2. Pathogenesis of SR-ILDs. 3. Exploring the cigarette smoking related entities: clinical features, characteristic multimodality imaging findings, and pathologic findings.a. RB-ILDb. PLCHc. DIPd. IPFe. CPFE. 4. Exploring the electronic cigarette smoking related patterns of injury: clinical features, characteristic multimodality imaging findings, and pathologic findings. a. Organizing Pneumonia. b. Diffuse alveolar damage. c. Diffuse alveolar hemorrhage. d. Mild nonspecific inflammation. e. Granulomatous pneumonitis. f. Exogenous lipoid pneumonia. g. Respiratory bronchiolitis. 5. Potential imaging conundrums and confounders.

## CHEE-39 EPIPERICARDIAL FAT NECROSIS (EFN): ILLUMINATING A HIDDEN CULPRIT IN CHEST PAIN

Danilo P. Bianco, MD (*Abstract Co-Author*) Nothing to Disclose
Eduardo Kaiser Ururahy Nunes Fonseca, MD (*Abstract Co-Author*) Nothing to Disclose
Lucas Daniel Pereira Lopes (*Abstract Co-Author*) Nothing to Disclose
Guilherme Swerts Pereira (*Abstract Co-Author*) Nothing to Disclose

Caio Nunes, MD (*Abstract Co-Author*) Nothing to Disclose
Rodrigo C. Chate, MD (*Abstract Co-Author*) Nothing to Disclose
Gustavo B. Teles, MD (*Abstract Co-Author*) Nothing to Disclose
Lara Quiche, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Epipericardial fat necrosis (EFN) often lurks in the shadows of differential diagnoses for chest pain. While clinicians and radiologists diligently explore common culprits such as pulmonary thromboembolism and acute coronary syndrome, EFN remains overlooked. Despite patients experiencing excruciating chest pain, both laboratory tests and electrocardiograms (ECGs) frequently yield normal results. In such cases, the diagnosis relies on imaging exams, usually chest CT scans.This presentation will shed light on ENF: we will discuss the pathophysiology, imaging findings (with focus on chest CT), associated findings, differential diagnosis and follow-up imaging findings.

**TABLE OF CONTENTS/OUTLINE**

- Epidemiology and clinical features- EFN findings on Chest CT- EFN findings on other imaging modalities (MRI, PET/CT)- Differential diagnosis that shouldn't be forgotten- Imaging follow-up findings after EFN

## CHEE-4 INDIRECT SIGNS OF PULMONARY EMBOLISM: SELF-ASSESSMENT AND REVIEW OF CONCEPTS

**Awards**
**Certificate of Merit**

Rodrigo C. Chate, MD (*Abstract Co-Author*) Nothing to Disclose
Lavinia Dias, MD (*Abstract Co-Author*) Nothing to Disclose
Pedro Paulo T. Torres, MD (*Abstract Co-Author*) Nothing to Disclose

Gilberto Szarf, MD, PhD (*Abstract Co-Author*) Speaker, F. Hoffmann-La Roche Ltd;Speaker, Amgen Inc;Speaker, Siemens AG
Gabriel Figueiredo, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Demonstrate that the diagnosis of pulmonary thromboembolism may not be suspected in the initial clinical evaluation, prompting non-targeted studies such as chest radiographs and non-contrast chest tomographies.- Demonstrate the wide range of clinical presentations and imaging findings related to pulmonary embolism.- Review the most common imaging findings of pulmonary embolism in non-targeted studies through self-assessment questions, expanding the radiologist's repertoire.- It is essential for radiologists to remain aware of indirect signs of PE in non-targeted studies (without contrast or without dedicated angiographic technique), in which this diagnosis may not have been initially suspected clinically.

**TABLE OF CONTENTS/OUTLINE**

INTRODUCTIONHighlight the variety of clinical presentations and imaging findings that may come to the radiologist's attention in the context of PE, summarizing the indirect signs to look for in non-directed studies.DIRECT SIGNSHighlight through different imaging studies what is considered a direct sign of PE.INDIRECT SIGNS• PULMONARY PARENCHYMA:Summarize the imaging features of pulmonary infarctions, differentiate from other conditions, discuss suspicion criteria, early signs, and progression.Explain the mosaic perfusion pattern, its appearance, differentials, and imaging representation.Demonstrate hyperperfusion edema in PE, its imaging aspects, and mechanism.• VASCULAR CALIBER VARIATIONS:Show how thrombi can alter vascular caliber in acute and chronic contexts, or how they can be detected in non-directed exams.• IODINE MAP:Demonstrate the imaging appearance of the iodine map and how it aids and suggests the diagnosis of PE.

## CHEE-40 A (W)HOLE-SOME APPROACH TO CYSTIC LUNG DISEASE

Yashant Aswani, MD (*Abstract Co-Author*) Nothing to Disclose
Ajith Varrior, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. To differentiate a true pulmonary cyst(s) from its mimics2. To learn the step-wise approach to narrow down the list of differential diagnoses and arrive at a specific diagnosis3. To discuss specific cystic lung diseases

**TABLE OF CONTENTS/OUTLINE**

1. What is cystic lung disease (air-filled structures versus fluid filled in rest of the body)? 2. Differentiation of true pulmonary cysts from cystic appearing lesions (cavity, bulla, pneumatocele, emphysema, honey combing, cystic bronchiectasis)3. Number of cysts: Are cysts solitary or localized versus multiple or diffuse?4. What is the distribution of cysts (upper lobe or lower lobe or subpleural)?5. Association with other pulmonary (nodules, ground glass) and extra-pulmonary findings (like renal tumors, plasma cell dyscrasia, autoimmune conditions)6. Algorithmic approach to cystic lung disease7. Discussion of specific entitiesLangerhans cell histiocytosis (LCH), Lymphangiomyomatosis (LAM), Lymphoid interstitial pneumonia (LIP), Birt Hogg Dube syndrome (BHD), amyloidosis, tracheobronchial papillomatosis, neurofibromatosis, cystic metastasis, congenital pulmonary airway malformation (CPAM) and bronchogenic cysts, Pneumocystis carini pneumonia (PCP) and desquamative interstitial pneumonia (DIP), cystic metastasis

## CHEE-41 IMAGING SPECTRUM OF PULMONARY HISTOPLASMOSIS

Marcela Rosa, MD (*Abstract Co-Author*) Nothing to Disclose
Pedro Paulo T. Torres, MD (*Abstract Co-Author*) Nothing to Disclose

Renato D. Teixeira, MD (*Abstract Co-Author*) Nothing to Disclose
Lara Quiche, MD (*Abstract Co-Author*) Nothing to Disclose
Caio Nunes, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Histoplasmosis stands as the most prevalent endemic fungal disease in the U.S., with significant incidence in Central and South America. While primarily targeting the lungs, it can disseminate systemically based on the patient’s immune status and the quantity of inhaled fungus.The disease poses a significant diagnostic challenge, given the limited availability and sensitivity of non-invasive tests. Consequently, imaging examinations are usually part of the diagnostic process. Histoplasmosis manifests in diverse patterns on chest X-rays and computed tomography scans, varying with the disease stage and

patient's immune response.It is paramount that radiologists remain cognizant of these potential findings. This presentation offers a didactic exploration of radiological findings across various clinical stages and forms of histoplasmosis, complemented by pertinent literature review.

**TABLE OF CONTENTS/OUTLINE**

Brief review of relevant epidemiology and pathophysiologyClinical presentations: acute pulmonary histoplasmosis X subacute pulmonary histoplasmosis X chronic pulmonary histoplasmosis X disseminated progressive histoplasmosis Different presentations on chest CT: calcified lung nodules, disseminated micronodular disease, solitary pulmonary nodule (histoplasmoma), heterogeneous consolidation with enlarged lymph nodes, isolated enlarged lymph nodes, fibrosing mediastinitis, central airway involvementDiscussion of 18-FDG PET/CT as a complementary imaging modality (flip-flop sign as a potential auxiliary finding to differentiate histoplasmosis from lung cancer)Relevant differential diagnosis Conclusion and take home messages

## CHEE-42 A CASE BASED REVIEW OF INHALATIONAL LUNG DISEASES: IMAGING FINDINGS AND CLINICAL FEATURES

Ryosuke Taiji, MD (*Abstract Co-Author*) Nothing to Disclose
Toshihiro Tanaka (*Abstract Co-Author*) Nothing to Disclose
Nagaaki Marugami (*Abstract Co-Author*) Nothing to Disclose
Dan Yamamoto, MD (*Abstract Co-Author*) Nothing to Disclose
Aya Yamada, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Inhalational lung diseases are caused by dust exposure, residential environment, smoking habits, pet keeping, and poisoning. These diseases occasionally show an upper lobe-predominant distribution with various imaging findings. Radiologists need to know more about each disease and obtain a detailed medical and exposure history.The purposes of this exhibit are: To depict typical imaging findings of inhalational lung diseasesTo discuss the clinical and radiological findings, and differential diagnosis

**TABLE OF CONTENTS/OUTLINE**

1. Hypersensitivity pneumonitis (HP) Nonfibrotic HP: Fungi (e.g. Summer-type and Humidifier lung) Bird fancier’s lung Hot tub lung (Mycobacterium avium) Fibrotic HP: Bird fancier’s lung 2. Occupational lung disease Dust and fume inhalation: Pneumoconiosis (e.g. Silica, Fume and Stainless-steel) Asbestos-related diseases: Pleural plaque Benign asbestos pleural effusion, Diffuse pleural thickening, Round atelectasis Malignant pleural mesothelioma 3. Smoking-related disease Emphysema Airspace enlargement with fibrosis (AEF) Respiratory bronchiolitis-associated interstitial lung disease (RB-ILD) Desquamative interstitial pneumonia (DIP) Langerhans cell histiocytosis (LCH) 4. Poisoning and miscellaneous Chemical inhalation (e.g. Disinfectant and Bleach) Burn injury and smoke inhalation Lipoid pneumonia (e.g. Petroleum and Toluene)

## CHEE-43 THORACIC IMAGING MANIFESTATIONS OF IGG-4 RELATED DISEASE

**Awards**
**Certificate of Merit**

Caroline Novis, MD (*Abstract Co-Author*) Nothing to Disclose
Marcio V. Sawamura, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Leticia Cardoso Ern, MD (*Abstract Co-Author*) Nothing to Disclose

Thiago Matheus Santos Rios, MD (*Abstract Co-Author*) Nothing to Disclose
Matheus Tonholo Ikedo, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

IgG4-related disease (IgG4-RD) is a systemic fibroinflammatory disorder with characteristic histologic findings (tumefactive lesions with IgG4-positive plasma cells and lymphocytic infiltration associated fibrosis), and may or may not coincide with elevated serum IgG4 levels. Diagnosis relies on histopathologic, serological, and radiological features. Chest involvement in IgG4-RD includes lymph node enlargements, pleuropulmonary involvement, and cardiovascular disease. Radiologists should consider IgG4-RD in their diagnoses due to significant diagnostic and prognostic value.1. Prototype the thoracic findings of IgG4-RD;2. Identify the key thoracic findings of IgG4-RD in cases with histopathological confirmation;3. Determine the importance of maintaining IgG4-RD as a differential diagnosis in the appropriate clinical-radiologic context.

**TABLE OF CONTENTS/OUTLINE**

1. Introductiona) Epidemiology, physiopathology and clinical aspects of the IgG4-RD.2. The recent diagnostic criteria of American College of Rheumatology/European League against Rheumatism (ACR/EULAR) for IgG4-RD probability - repercussions in clinical practice and recommendations3. IgG4-RD associated thoracic imaging features - Case-by-case discussion reviewa) Paravertebralb) Retromediastinal fibrosisc) Cardiac Interstitial diseased) Ground-glass opacitiesPeribronchovascular involvemente) Lymph node enlargementf) Pleural disease4. The mimics of IgG4-RD in thoracic manifestations - including vascular, pleural, mediastinal and airway involvement.5. Conclusions "take-home messages"

## CHEE-44 FROM SCAN TO INCISION: A COMPREHENSIVE GUIDE FOR RADIOLOGISTS TO EMPOWER SURGEONS IN IDEAL MANAGEMENT OF BLUNT TRAUMATIC AORTIC INJURY

Hamid Chalian, MD (*Abstract Co-Author*) Nothing to Disclose
Arash Azhideh, MD, MPH (*Abstract Co-Author*) Nothing to Disclose
Sara Haseli, MD (*Abstract Co-Author*) Nothing to Disclose
Sanaz Asadian, MD (*Abstract Co-Author*) Nothing to Disclose
Nastaran Hosseini (*Abstract Co-Author*) Nothing to Disclose
Seyedali Nabipoorashrafi, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Familiarize radiologists with the latest surgical classifications of blunt aortic injuries.Highlight the details surgeons need from radiologists for ideal management of different blunt traumatic aortic injuries.Review multimodality imaging features of blunt traumatic aortic injury.Review current recommendations and surgical managements for different blunt traumatic aortic injuries.Review Imaging pitfalls and mimics of blunt traumatic aortic injuries.

**TABLE OF CONTENTS/OUTLINE**

Review the anatomy and histology of aorta relevant to traumatic injuries.Updated grading and classification systems used by surgeons for blunt traumatic injuries.Role of multimodality imaging in detection and follow up of blunt traumatic injuries.Overview of imaging protocols ideal for detection of blunt traumatic injuries in emergency settings.Review of the definition, key imaging findings, and what surgeons need to know for:• minimal aortic injury• aortic laceration• pseudoaneurysm• intramural hematoma• aortic transectionExpected and unexpected imaging findings in post treatment imaging of

blunt traumatic aorta injuries.Review imaging pitfalls and mimics of blunt traumatic aortic injuries with emphasis on improving protocols for imaging the aorta.

## CHEE-45 THIS CHEST LOOKS ABNORMAL: SEQUEL OF INFANT AND CHILDHOOD DISORDERS

Lucian Beer, MD,PhD (*Abstract Co-Author*) Nothing to Disclose
Aida Korajac, MD (*Abstract Co-Author*) Nothing to Disclose
Ruxandra-Iulia Milos, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1) The diagnosis of developmental lung anomalies or infancy-acquired lung disorders later in adulthood can be challenging and often mistaken for something threatening. 2) The main categories can be divided in: diseases of the tracheobronchial system; diseases of the lung parenchyma, including congenital lung lesions, prematurity-related chronic lung disease, surfactant function disorders and post infectious abnormalities; and diseases of the vascular system. 3) Systematic approach and analysis of the imaging features on chest X-ray, CT and MRI are useful in facilitating the diagnosis.

### TABLE OF CONTENTS/OUTLINE

1) Diseases of the tracheobronchial system include primary ciliary dyskinesia, cystic fibrosis, alpha-1 antitrypsin deficiency, as well as the tracheobronchial branching abnormalities. 2) Congenital lung lesions most often encountered are the congenital pulmonary airway malformations (CPAMs), the bronchopulmonary sequestration (BPS), congenital lobar emphysema (CLE) and the bronchogenic cysts. 3) The prematurity-related chronic lung disease is related to the bronchopulmonary dysplasia (BPD) that often develops after mechanical ventilation in prematurely born infants with respiratory failure. 4) Disturbance of surfactant homeostasis can lead to development of pulmonary alveolar proteinosis and nonspecific interstitial pneumonia. 5) Postinfectious bronchiolitis obliterans or the hyperlucent lung syndrome is a rare complication of pulmonary infections in the childhood. 6) Vascular anomalies include interruption or absence of a main pulmonary artery, anomalous origin of the pulmonary arteries, anomalous pulmonary venous drainage, and pulmonary arteriovenous malformations.

## CHEE-46 PARENCHYMAL PULMONARY COMPLICATIONS IN PATIENTS WITH LUNG NEOPLASMS TREATED WITH RADIATION THERAPY

Santiago Carbullanca, MD (*Abstract Co-Author*) Nothing to Disclose
Angel Gayete Cara, MD, PhD (*Abstract Co-Author*) Nothing to Disclose

Flavio Zuccarino, MD (*Abstract Co-Author*) Nothing to Disclose
Jorge Ivan Martinez Cano, MD (*Abstract Co-Author*) Nothing to Disclose
Francesco Amorelli (*Abstract Co-Author*) Nothing to Disclose
Paulina Miranda, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The goal is to identify the different radiological patterns caused by radiation therapy in the lung parenchyma, along with their frequency and progression. It also aims to recognize the warning signs that help differentiate between expected post-radiation therapy changes and tumor recurrence.

### TABLE OF CONTENTS/OUTLINE

Radiation therapy provides local treatment for pulmonary neoplasms but can cause damage to surrounding tissues, particularly the lung parenchyma. Thus, distinguishing between post-radiation therapy changes and potential tumor recurrence or other non-radiation-induced pulmonary pathologies is crucial.In this work:- Classification: Post-radiation therapy changes are classified into early ( < 6 months) and late ( > 6 months). - Imaging Findings: We analyze the most common imaging findings: peri-bronchial consolidation, ground-glass opacities, and mass-like or scar patterns. - Complications: We evaluate potential complications. - Correlation: We correlate these findings with the radiation therapy plan, including duration, dose, and irradiated field. - Warning Signs: We highlight key warning signs indicating tumor recurrence or non-radiation-induced pathology, such as lesions outside the irradiated area, changes in lesion size after 12 months post-radiation therapy, or new-onset atelectasis.Radiation therapy is crucial in managing thoracic neoplastic lesions. Radiologists must understand post-treatment changes and potential complications, and be able to recognize warning signs of tumor recurrence or non-radiation-induced pathologies

## CHEE-47 ARTIFICIAL INTELLIGENCE APPLICATIONS IN LUNG CANCER: CURRENT STATUS AND FUTURE PERSPECTIVES

Vita Ida Gallone, MD (*Abstract Co-Author*) Nothing to Disclose
Gianluca Milanese, MD (*Abstract Co-Author*) Nothing to Disclose
Carlotta Zilioli, MD (*Abstract Co-Author*) Nothing to Disclose
Nicola Sverzellati, MD (*Abstract Co-Author*) Nothing to Disclose
Rebecca Mura, MD (*Abstract Co-Author*) Nothing to Disclose
Ludovica Leo (*Abstract Co-Author*) Nothing to Disclose
Cristina Marrocchio, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Have a comprehensive view of the possible applications of AI in lung cancer, from screening to prediction of treatment response2. Review the main AI techniques that can be used, including radiomics, machine learning, deep learning, and large language model3. Have detailed information and examples on the roles of AI in improving image quality, detecting lung cancer, assessing patients' comorbidities, and generating predictive models4. Be informed on current limitations and future developments in the field

### TABLE OF CONTENTS/OUTLINE

1. Main applications of artificial intelligence (AI) in lung cancer, from image acquisition to predictive models1. of 2. Review the basic knowledge of AI tools, including radiomics and machine learning, deep learning, large language models1. 3. Applications in lung cancer screening:• Risk prediction•

Nodule identification and classification• Comorbidities assessment• Report writing and communication with patients4. 1. Applications in providing clinically important information on the identified lesion:• Lesion characterization, e.g., histological type• Prediction models, including response to treatments and recurrence

## CHEE-48 CHEST WALL TUMORS, WHAT THE RADIOLOGIST NEEDS TO KNOW

Daniel Vargas, MD (*Abstract Co-Author*) Nothing to Disclose
Sofia Pividori (*Abstract Co-Author*) Nothing to Disclose
Marcos A. Mestas Nunez SR, MD (*Abstract Co-Author*) Nothing to Disclose
Gonzalo Dulcich SR, BMedSc (*Abstract Co-Author*) Nothing to Disclose
Aylen Gonzalez Gonzalez, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Chest wall neoplasms are uncommon entities that represent approximately 5% of all thoracic malignancies. Unfamiliarity with these lesions can pose a diagnostic dilemma. Radiologists must be acquainted with the imaging findings, differential diagnoses and complications of these neoplasms. With this exhibit we will:Review the typical imaging findings of chest wall neoplasms.Review the classification based on a wide range of tissues of origin.Discuss the usefulness of imaging methods to elucidate the origin and/or tissue composition of these lesions along with reviewing the evaluation for vascularization and local invasion.

### TABLE OF CONTENTS/OUTLINE

1. Introduction and Clinical characteristics2. Role of different modalities.3. Entities based on tissue originPrimary tumorsi. Cartilaginous and osseous tumors: 1. Fibrous dysplasia2. ## CHEE-49 BEYOND THE SMOKE: EXPLORING LUNG CANCER IN NON-SMOKERS

Efren J. Flores, MD (*Abstract Co-Author*) Speaker, WebMD LLC;Speaker, Consulting Medical Associates, Inc
Anand K. Narayan, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Maria D. Martin, MD (*Abstract Co-Author*) Nothing to Disclose
Farouk Dako, MD, MPH (*Abstract Co-Author*) Nothing to Disclose
Gabriel Camareno-Soto, BSc (*Abstract Co-Author*) Nothing to Disclose
Delmarie Rivera Rodriguez, BS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Roughly 10-20% of lung cancers (LC) arise in non-smokers, presenting unique risk factors and biological traits crucial for accurate diagnosis and management. Radiologists must cultivate a knowledge-based toolkit to discern distinctive imaging features, enhancing precision in diagnosis and management recommendations for LC in this patient cohort. Attendees will leave prepared to handle LC challenges in non-smokers, armed with insights into future epidemiological trends, new risk factors, and cutting-edge imaging. Thus, the purpose of this exhibit is to:1. Provide an overview of the epidemiology related to LC among non-smokers and pertinent risk factors, such as environmental exposures, and genetic risk factors. 2. Review the distinctive imaging features including variations in tumor location, morphology, and response to treatment. 3. Describe advancements in risk modeling, utilizing imaging technology and data science, to address LC in non-smokers.

### TABLE OF CONTENTS/OUTLINE

1. Introduction:a. LC trends in non-smokers b. Epidemiological risk factors for developing lung cancer in non-smokers c. Eligibility criteria for LC screening 2. Case based radiological patterns of LC in non-smokers: a.Variations in tumor location and morphology b.Imaging characteristics of different histological subtypes 3. Future directions for early detection, diagnosis and monitoring using imaging modalities a. Overview of new risk stratification models that incorporate exposures and genetics as risk factors for LC in non-smokers. b. Discuss the role of computed tomography, magnetic resonance imaging, and molecular imaging to aid in diagnosis of LC. 4. Conclusion

### TEACHING POINTS

A cyst is any circumscribed and well-defined air-containing structure in the lung parenchyma. Cystic lesions occur due to various mechanisms such as airway obstruction with distal airspace dilatation (a check-valve mechanism), necrosis of airway walls, or lung parenchymal destruction by proteases. Cysts typically contain air, although, in some cases, they may be filled with fluid.In this exhibit, we will present computed tomography images and the histology of patients with multiple cystic lesions to explore their pathogenesis. Some cystic lesions increase in size over time, and we will illustrate the progression of the cystic lesions.

### TABLE OF CONTENTS/OUTLINE

1, Rare cystic lung disease Langerhans cell histiocytosis, Birt-Hogg-Dubé syndrome, lymphoid interstitial pneumonia, lymphangioleiomyomatosis (Figure 1) 2, Cystic lesions in genetic diseases; Neurofibromatosis, Down syndrome 3, Cystic lesions in infectious disease; pneumocystis pneumonia 4, Cystic lesions in collagen vascular diseases; Sjögren syndrome (Figure 2), antineutrophilic cytoplasmic antibody-associated vasculitis (Figure 3) 5, Cystic lesions

in smokers; admixed emphysema and thick-walled large cysts as observed in combined pulmonary fibrosis and emphysema (Figure 4) 6, Others; cyst formation in multicentric Castleman's disease, benign metastasizing leiomyoma (Figure 5)

## CHEE-50 ROLE OF IMAGING IN DIAGNOSIS AND CHARACTERIZATION OF PROGRESSIVE FIBROTIC INTERSTITIAL LUNG DISEASE

Stephen Hobbs, MD (*Abstract Co-Author*) Author with royalties, Wolters Kluwer nv;Author with royalties, RELX
Jeffrey P. Kanne, MD (*Abstract Co-Author*) Research Consultant, PAREXEL International Corporation;
Sreeja Sanampudi, MD (*Abstract Co-Author*) Nothing to Disclose
Kiran Batra, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Interstitial lung disease (ILD) is a broad spectrum of pulmonary conditions that include idiopathic pulmonary fibrosis (IPF), connective tissue disease-ILD (CTD-ILD), hypersensitivity pneumonitis (HP), sarcoidosis, non-specific interstitial pneumonia (NSIP), amongst others. These non-IPF disease entities can present as fibrotic interstitial lung disease (F-ILD) or progressive F-ILD (also known as progressive pulmonary fibrosis (PPF)), which is disease progression despite adequate treatment. There is a growing prevalence of ILD and PPF, and clinicians face certain challenges regarding ambiguous categorization of disease, poor risk stratification, and lack of guidelines regarding the use of antifibrotic therapy. Diagnosis of PPF on high resolution computed tomography (HRCT) has recently been validated within a subset of criteria that can help identify a progressive phenotype in individuals with non-IPF ILD.

### TABLE OF CONTENTS/OUTLINE

• Define Progressive Fibrotic ILD and differentiate between Progressive fibrotic ILD and fibrotic ILD • Importance and role of imaging in diagnosing Progressive Fibrotic ILD • Schematic representation of the prevalence of the ILDs that may be associated with "Progressive Pulmonary Fibrosis (despite management)". • Describe the HRCT phenotypes and signs of progression. • Identify role of automated methods for identifying disease progression in the above setting.

## CHEE-51 THORACIC ULTRASOUND MADE SIMPLE: A COMPREHENSIVE GUIDE

Joaquin Martinez Pereira, MD (*Abstract Co-Author*) Nothing to Disclose
Agustina Picarel, MD (*Abstract Co-Author*) Nothing to Disclose
Pilar Navarro Azurmendi, MD (*Abstract Co-Author*) Nothing to Disclose
Maria C. Ferrario, MD (*Abstract Co-Author*) Nothing to Disclose

Juan Francisco Linan, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To review the essentials of thoracic anatomy in ultrasound.To approach the proper examination protocols and technique. To discuss the various clinical applications of thoracic ultrasound.Pleural effusion.Pneumothorax.Pulmonary consolidations.Empyema.Rib fracture.To highlight the advantages and disadvantages of thoracic ultrasound, in comparison with other modalities.To ensure the radiologist role and the unique ability of thoracic ultrasound to provide dynamic, real-time information, facilitating rapid decision-making in acute clinical situations.

### TABLE OF CONTENTS/OUTLINE

Introduction to thoracic ultrasound.Anatomy and examination Technique.Anatomical approachB-modeM-modeLinear and convex transducer.Clinical ApplicationsPleural effusion.Pneumothorax.Pulmonary consolidations.Empyema.Rib fracture.Comparison with other diagnostic modalities.Conclusion

## CHEE-52 EXPLORING IMMUNOSEROLOGY AND LUNG IMAGING IN RHEUMATIC DISORDERS: A RADIOLOGIST'S GUIDE

Omar Andres Pantoja Burbano, MD (*Abstract Co-Author*) Nothing to Disclose
Maria C. Perez Alvarado, MD (*Abstract Co-Author*) Nothing to Disclose
Felipe Aluja, MD, MEd (*Abstract Co-Author*) Nothing to Disclose
Andres F. Mejia Leon, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• Interpretation of immunoserological findings in the context of different rheumatic conditions, is key for radiologists' daily practice, to overcome diagnostic challenges and improve accuracy in clinical decision-making. • Correlating characteristic imaging findings associated with rheumatic lung manifestations and different seroinmunological markers can guide the interpretation of lung imaging studies. • A proper correlation between immunoserological profiles and lung imaging findings in different rheumatic disorders can improve clinical outcomes. • Is important to recognize common pitfalls in the interpretation of immunoserology and lung imaging in rheumatic disorders.

### TABLE OF CONTENTS/OUTLINE

- Introduction
- Chest CT manifestations and histopathologic patterns seen in rheumatic diseases.
- Chest findings, beyond the lung parenchyma.
- Main serologic tests based on HRCT or Histologic Pattern on biopsy, or both, in the context of the absence of a clear phenotype.
- Clues to identify pulmonary disease and suspect underlying rheumatic syndrome.
- Schematic representation of the most used serologic tests.
- Expected radiological appearance and common pitfalls.
- Take home points!

## CHEE-53 LUNG CANCER IN ASIA - A BURGEONING CRISIS

Srujana Ganti, MBChB, FRCR (*Abstract Co-Author*) Nothing to Disclose
Bimal Mayur Kumar Vora (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. 1.To raise awareness of the Lung cancer burden in Asia2. 2.Highlight how lung cancer in Asia is different to that in the West3. 3.Discuss lung cancer screening problems that are specific to the Asian continent4. 4.Discuss some potential solutions

**TABLE OF CONTENTS/OUTLINE**

Lung cancer is a one of the most lethal cancers worldwide. Lung cancer in Asia, specifically, makes up a significant proportion of the global burden and the tumour biology as well as risk factors are different to that in the west. The poster will give an overview of lung cancer and its subtypes.It will then discuss the disease burden in Asia, ephasising the magnitude of the problem. The various risk factors, in addition to tobacco will be reviewed. The differences in tumour biology of Lung cancer in Asia to the west will be discussed, highlighting how this would affect treatment and management of lung cancer. Lung cancer screening has the potential to improve the early detection of cancer and improve mortality. However, it comes at significant healthcare costs and a robust infrastructure is required to be in place. The poster will give an overview of some of the existing screening programmes in Asia and also some of the challenges that are faced. Some potential solutions will also be discussed.

## CHEE-54 REVIEW OF NAVIGATIONAL BRONCHOSCOPY PLANNING

Cristina Fuss, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Babina Gosangi, MD, MPH (*Abstract Co-Author*) Nothing to Disclose
Christopher P. Gange JR, MD (*Abstract Co-Author*) Stockholder, Pfizer Inc Stockholder, Bristol-Myers Squibb Company Research Consultant, Bayer AG Medical Advisory Board, AIxSCAN, Inc Shareholder, AIxSCAN, Inc
Colby Shreve (*Abstract Co-Author*) Nothing to Disclose
Mamta Gupta (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

•Identification of key anatomical structures relevant to bronchoscopy navigation.? •Recognition of anatomical variations and their impact on procedural success.? •Techniques for precise lesion localization using imaging landmarks.? •Importance of accurate targeting for successful biopsy or treatment.? •Utilization of imaging data to create virtual bronchoscopy maps.? •Assessment of potential risks based on imaging findings.? •Strategies for minimizing risks during bronchoscopy procedures.? •Case based discussion on challenging cases and decision-making processes.

**TABLE OF CONTENTS/OUTLINE**

• Overview of navigational bronchoscopy. • Role of imaging in procedural planning. •Discussion on optimal CT protocol Integration of Imaging with Navigational Systems and creation of virtual bronchoscopy maps from imaging data. •Assessment of procedural risks based on imaging. •Discussion of potential complications. •Review of case examples demonstrating planning.

## CHEE-55 AI-DRIVEN LUNG CANCER SCREENING PROGRAM: OPPORTUNITIES AND CHALLENGES

Amit Gupta, MD (*Abstract Co-Author*) Nothing to Disclose
Joshua Hunter, BS (*Abstract Co-Author*) Nothing to Disclose
Robert C. Gilkeson, MD (*Abstract Co-Author*) Research Consultant, Riverain Technologies, LLC;Research support, Koninklijke Philips NV;Research support, Siemens AG;Research support, General Electric Company;Consultant, HeartFlow, Inc
Cody R. Johnson, MD (*Abstract Co-Author*) Nothing to Disclose
Charit R. Tippareddy, MD (*Abstract Co-Author*) Nothing to Disclose
Syed Muhammad Awais Bukhari, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. To outline key statistics of lung cancer and review the current state of lung cancer screening in United States. 2. To learn about various currently available AI models and their role in lung cancer screening program 3. To understand the process of clinical deployment of AI technologies in lung cancer screening and the challenges involved.

**TABLE OF CONTENTS/OUTLINE**

1. Lung Cancer: Clinical and Epidemiological Considerations o Risk Factors o Disease Burden in the USA o Current State of Screening Programs 2. Low Dose Lung Cancer Screening: Rationale o Trials: NLCST and NELSON trial o Lung-RADS o USPSTF Recommendations 3. Utility of AI technologies in the Lung Cancer Screening Program o Role in Imaging Analysis > Deep CNN-based AI algorithms > NLP and Dashboards o Role in Histopathological Analysis e.g. diagnosis and staging of tumor o Role in Biomarker Quantification: e.g. PDL-1 status o Role in Radiogenomics: e.g. tumor mutation burden determination o Additional Applications § Quality control and image enhancement § Reduction of observation errors and false negatives § Efficiency and Workflow Optimizations 4. Clinical Deployment of AI Tools in Lung Cancer Program and Involved Challenges o End-to-end pipeline for the clinical deployment of AI tools in the Lung Cancer Program o Challenges § Issues with Generalizability and data bias § Ethical and Regulatory Considerations § Integration dilemmas into clinical practice 5. Future Directions o Prescreening risk assessment characterization o Generation of patient-centric CT report o Liquid biopsies o Virtual biopsy technique o AI-aided ultra-low dose PET/CTs o AI-aided ultrashort echo time MR scanners

## CHEE-56 BURNING OUT? TRY THE MRSA (MAKING REPORTING SEXY AGAIN) PILL WITH 50 MG AI AND 5 MG LLMS!

Mannudeep K. Kalra, MD (*Abstract Co-Author*) Research Grant, Siemens AG;Research Grant, Riverain Technologies, LLC;Research Grant, Coreline Inc
Shambo Guha Roy, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Lina Karout, MD (*Abstract Co-Author*) Nothing to Disclose
Subba R. Digumarthy, MD (*Abstract Co-Author*) Consultant, Merck & Co, Inc;Consultant, Pfizer Inc;Consultant, Bristol-Myers Squibb Company;Consultant, Novartis AG;Consultant, F. Hoffmann-La Roche Ltd;Consultant, Polaris;Consultant, Cascadian;Consultant, AbbVie Inc;Consultant, Gradalis, Inc;Consultant, Bayer AG;Consultant, Zai Lab Limited;Consultant, Biengen;Consultant, Riverain Technologies, LLC;Consultant, Resonance Health;Consultant, Annalise-AI Pty Ltd;Research Grant, Lunit Inc;Research Grant, General Electric Company;Research Grant, Qure.ai;Speaker, Siemens AG
Parisa Kaviani, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Understanding the etiology and characteristics of burnout in radiology 2. Knowledge of available quantitative AI tools for reducing onerous aspects of radiology reporting 3. Strategies for the substance of AI outputs with the style of LLMs for bringing joy and efficiency to radiology reporting. 4. Understanding the operating and breaking scenarios for different AI tools in thoracic imaging

**TABLE OF CONTENTS/OUTLINE**

1. Graphic summary of spiraling workload and burnout in radiology 2. Understanding the mundane, repetitive tasks in radiology reporting 3. Strengths and weakness of multi-vendor artificial intelligence (AI) tools for thoracic imaging 4. Where and how AI and large language models (LLMs) deliver the MRSA pill?

## CHEE-57 APPLICATIONS OF LARGE LANGUAGE MODELS IN CARDIOTHORACIC IMAGING: A PRIMER FOR RADIOLOGISTS AND CARDIOLOGISTS

Joshua Hunter, BS (*Abstract Co-Author*) Nothing to Disclose
Amit Gupta, MD (*Abstract Co-Author*) Nothing to Disclose
Cody R. Johnson, MD (*Abstract Co-Author*) Nothing to Disclose
Charit R. Tippareddy, MD (*Abstract Co-Author*) Nothing to Disclose
Robert C. Gilkeson, MD (*Abstract Co-Author*) Research Consultant, Riverain Technologies, LLC;Research support, Koninklijke Philips NV;Research support, Siemens AG;Research support, General Electric Company;Consultant, HeartFlow, Inc
Syed Muhammad Awais Bukhari, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. To understand various Large Language Models (LLMs) and their functionality 2. To review currently available LLMs in the cardiothoracic imaging space 3. To highlight the role and applicability of LLMs in cardiothoracic imaging

**TABLE OF CONTENTS/OUTLINE**

1. Large Language Models: A Primer o What are LLMs and their types? o Evolution of LLMs 2. LLMs in Radiology Workspace o RadBERT o ClinicalRadioBERT o Custom GPTs 3. Potential applications of LLMs in cardiothoracic imaging o Radiology reporting • Proofreading the reports • Potential time-saving with chest X-ray • Summarization of clinical history • Assisting with cardiac MRI reporting (structuring and adding guidelines) • Patient-centric reports and education (Simplifying the complex reports for patients) o Educational Applications • Instant Information Source • Evidence-based interactive learning • Case-based Exam Preparation • Quick Literature Review o Simplifying Complex Classifications e.g. Fleischner o Intelligent differential diagnosis o Information curation for lung cancer tumor board and ILD multidisciplinary discussions (combining Radiological, pathological, and Clinical information) o Assistance with Reporting to ACR for lung cancer screening program (Capture all the necessary elements to meet the ACR certification ) 4. Limitations of LLMs and mitigation tactics o Dependency on Training Data o Inaccurate Response Generation (Hallucination) o Poor complex reasoning o Probabilistic Nature (Stochasticity) o HIPAA Compliance o Bias o Radiologist Over-reliance o Operation costs 5. Future Directions o Need for robust radiology-specific LLMs o Multimodal medical LLMs o Seamless integration with EHR, RIS, and PACS

## CHEE-58 FEBRILE NEUTROPENIA: A PRACTICAL APPROACH

Alex Ha (*Abstract Co-Author*) Nothing to Disclose
Maya Vella, MD (*Abstract Co-Author*) Nothing to Disclose
Adam J. Yen, MD (*Abstract Co-Author*) Nothing to Disclose
Shravan Sridhar, MD, MS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Febrile neutropenia presents a challenging clinical dilemma and treatment success relies on early diagnosis and targeted antimicrobial therapy. Often, clinical teams look to radiologists to help narrow the differential diagnosis when a neutropenic patient’s thoracic CT contains findings concerning for infection. Here, we examine the role of imaging and CT-guided biopsy in the management of febrile neutropenia, present an approach wherein clinical information is paired with a CT pattern to help the radiologist make an educated guess as to the underlying causative agent, and specify where either clinical information or imaging appearance can serve more useful.

**TABLE OF CONTENTS/OUTLINE**

1. Introduce the problem2. Clinical presentation3. Initial workup (including imaging workup)4. Patternsa. Consolidation (±satellite nodules)b. Cavitary consolidationc. Nodulesd. GGOe. Halof. Reverse halog. Thoracic wall involvement5. Helpful clinical informationa. Time courseb. Antimicrobial responsec. Procalcitonind. B-D-Glucane. Galactomannanf. Serologiesg. BAL aspirate microscopyh. Cultures6. Less than 1 week from onseta. Consolidation/nodules - common bacteria i. Gram+ bacteria (MRSA, VRE) ii. Gram- (pseudomonas)b. GGO - mostly viral i. EBV, CMV, other viruses ii. PJP7. Consolidation/nodules + non-response to broad spectrum antibiotics - fungia. Candidab. Aspergillusc. Mucormycosisd. Tb8. Other organisms to consider - uncommon bacteriaa. Nocardiab. Actinomycesc. Tb9. Utility of biopsya. Fungal infectionb. Malignancyc. Non-diagnostic biopsyd. Platelet management10. Summary by imaging appearance11. Summary by helpful clinical information12. References

## CHEE-59 THE SMOKING GUN: SMOKING RELATED PULMONARY PARENCHYMAL DISEASE

Rocio Perez Johnston, MD (*Abstract Co-Author*) Nothing to Disclose
Carlyne Cool, MD (*Abstract Co-Author*) Nothing to Disclose

Daniel Vargas, MD (*Abstract Co-Author*) Nothing to Disclose
Tami J. Bang, MD (*Abstract Co-Author*) Nothing to Disclose
Gonzalo Dulcich SR, BMedSc (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Cigarette smoking continues to have a significant impact on the general population's health. The majority of morbidity and mortality from smoking is secondary to lung cancer, coronary artery disease, and chronic obstructive pulmonary disease (COPD). Additionally, a significant number of patients will develop diffuse parenchymal involvement related to smoking.Smoking related diffuse lung diseases comprise a heterogeneous group of disorders that can be classified into inflammatory (mostly chronic) and fibrotic entities. Despite their characteristic imaging findings with good pathologic correlation, they may overlap and it is not uncommon to see more than one entity in pathology. With this exhibit we will:- Review the imaging findings COPD related lung disease- Review clinical, imaging and pathological appearance of smoking related diffuse lung diseases- Highlight the spectrum of fibrotic findings related to smoking - Brief review of vaping and marijuana users associated lung injury

**TABLE OF CONTENTS/OUTLINE**

1) Overview2) Entitiesa) COPD relatedChronic Bronchitis EmphysemaVanishing lung syndromeb) Smoking related diffuse lung disease i) InflammatoryAcute eosinophilic pneumoniaRespiratory bronchiolitisDesquamative Interstitial PneumoniaPLCHII) FibroticIPFSmoking related fibrosis (SRIF - AEF)CPFE3) ILAs4) Vaping - Marijuana users injury 5) Conclusions

## CHEE-6 DIAGNOSTIC IMAGING OF ESOPHAGEAL FISTULAS: INDIRECT AND DIRECT SIGNS

**Awards**
**Certificate of Merit**

Linda B. Haramati, MD, MS (*Abstract Co-Author*) Nothing to Disclose
Ami N. Rubinowitz, MD (*Abstract Co-Author*) Nothing to Disclose
Babina Gosangi, MD, MPH (*Abstract Co-Author*) Nothing to Disclose
Mamta Gupta (*Abstract Co-Author*) Nothing to Disclose
Abhishek R. Keraliya, MD (*Abstract Co-Author*) Nothing to Disclose
Mihai O. Andreca, MD, BS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. The esophageal wall is inherently weak because it lacks a serosal layer which makes it vulnerable to perforation.2. Chest CT with oral contrast and upper GI fluoroscopy are the imaging modalities of choice to establish the diagnosis3. A tract/ communication between the esophagus and an adjacent structure like trachea, or left atrium, is a direct sign of fistula formation.4. Indirect signs of esophageal fistulas include the presence of esophageal contents (oral contrast or food) in unexpected locations (such as pleura), presence of stranding/ induration of the mediastinal fat with the esophageal wall in close proximity to an adjacent organ, and visualization of extraluminal gas with discontinuity of the esophageal wall.

**TABLE OF CONTENTS/OUTLINE**

1. Describe the anatomy of the esophagus with relationship to adjacent organs2. Imaging modalities for evaluation• Plain radiographs• Upper GI fluoroscopy• CT with oral contrast3. Signs of fistula on imaging• Direct signs- communication between the esophagus and an adjacent structure• Indirect signs- the presence of esophageal contents (oral contrast or food) in unexpected locations or extra-luminal gas4. Examples of various esophageal fistulas with a focus on imaging findings• Tracheoesophageal fistula• Bronchoesophageal fistula• Esophagopulmonary fistula• Atrio-esophageal fistula• Aorto-esophageal fistula• Pericardioesophageal fistula• Esophagopleural fistula• Esophagocutaneous fistula• Tumor-esophagus fistula

## CHEE-60 SIZE IS NOT ALL THAT MATTERS: EXPLORING THE MORPHOLOGICAL AND METABOLIC CHARACTERISTICS OF SOLITARY PULMONARY NODULES

**Awards**
**Certificate of Merit**

Maria G. Gracia Munoz, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The incidental encounter of solitary pulmonary nodules (SPNs) is highly common in the daily tasks of radiologists. The differential diagnosis of SPNs is extensive, and a significant percentage are malignant. Since timely detection of lung cancer has a crucial impact on patient prognosis, radiologists must be able to distinguish benign from malignant nodules with the highest possible precision and in early stages, while avoiding unnecessary follow-up studies and invasive diagnostic procedures. Ultimately, the determining factor regarding recommendations is the size, but taking into account the morphological and metabolic evaluation of the nodules can increase diagnostic accuracy in SPN assessment.

**TABLE OF CONTENTS/OUTLINE**

Definition. General Imaging RecommendationsMorphological Characteristics: Attenuation, Shape and Margins, Internal Characteristics (calcifications, fat attenuation, cavitation), Complex Findings (pleural retraction, air bronchogram, bubble-like lucencies, cystic airspace), Location and Enhancement.Metabolic Characteristics: PET/CT with FDG. Indications, Metabolism of Different Neoplasms, Limitations, Use of Other Radiopharmaceuticals.Recommendations on How to Measure Pulmonary Nodules according to the Fleischner Society (in QA format).Fleischner Society Guidelines for Management of Incidental Pulmonary Nodules (General Characteristics, Risk Estimation, and Description of Recommendations)

## CHEE-61 IMAGING FINDINGS OF RECURRENT NEOPLASTIC DISEASE ON SURVEILLANCE IMAGING OF THE CHEST

Cheng Ting Lin, MD (*Abstract Co-Author*) Nothing to Disclose
Preetham Bachina, BS (*Abstract Co-Author*) Nothing to Disclose

Karoly Viragh, MD (*Abstract Co-Author*) Nothing to Disclose
Sundus Lateef, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Silicosis is the oldest-recognized and most commonly diagnosed pneumoconiosis, historically associated with mining. In the last decade, there has been a surge of silicosis cases globally among stone countertop workers exposed to engineered stone (e.g. quartz) dusts. Silicosis has previously been uncommon among countertop workers, leading to delay in diagnosis, often due to difficulty differentiating imaging findings from sarcoidosis or atypical infection often favored as initial diagnoses. The goal of the current educational exhibit is to (1) raise awareness to the new silicosis epidemic, (2) depict the typical and atypical imaging features with clinicopathologic correlation when available, and (3) address important research questions. In addition to the rich imaging illustrations selected from one of the largest countertop manufacturer silicosis patient cohorts available in the USA, interactive (board-exam type) pointers will also be provided.

**TABLE OF CONTENTS/OUTLINE**

1. Silicosis - historical perspective;2. Silicosis - pathophysiology, clinical presentation, management;3. Imaging technique (brief review of the ILO and ICOERD systems);4. Imaging illustration: Parenchyma abnormalities (small and large nodular opacities, septal thickening, fibrosis, consolidations); Airway abnormalities; Pleural abnormalities (effusions, pseudoplaque); Mediastinal abnormalities (lymphadenopathy); Complications;5. Cases: Acute silicosis; Accelerated silicosis; Chronic simple silicosis; Chronic complicated silicosis with progressive massive fibrosis; Silicosis with pneumothorax; Superimposed infections (e.g. mycobacterium); Differential diagnosis cases (sarcoidosis, infections)

## CHEE-63 RADIOLOGIC APPROACH TO EVALUATING PERSISTENT CONSOLIDATIONS

Guadalupe Comadran (*Abstract Co-Author*) Nothing to Disclose
Gonzalo Dulcich SR, BMedSc (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Consolidation is a common imaging finding defined as an opacity that completely obscures the underlying bronchi and vessels. In most cases, it is evidence of a pathologic process primarily within the air spaces when alveolar air is replaced by fluid, pus, blood, cells, or other material. Patients with parenchymal consolidation may have an acute or subacute/chronic presentation. Despite this classification, there is no precise definition to differentiate them. Persistent consolidation represents opacity that is still present at follow-up examinations and does not resolve in the expected time and after initial treatment. In these cases, imaging findings along with specific clinical information can help narrow the differential and guide management.Review the typical imaging appearance of different causes of persistent consolidation on CTEmphasis on the importance of distribution and clinical information as diagnostic keys.Discuss an imaging and clinical based approach when encountering patients with persistent consolidation

Vitor D. Bichuette, MD (*Abstract Co-Author*) Nothing to Disclose
Lucas d. Gomes de Farias, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The purpose of this exhibit is: 1. To review usual and unusual cases related to the pulmonary vessels anomalies. 2. To correlate important findings with the anatomy, embryology, and pathophysiology, focusing on their clinical-radiological correlations. 3. To highlight their characteristics in order to familiarize radiologists, preventing unfavorable patient outcome. 4. To review CT and MRI protocols in the evaluation of patients with suspected pulmonary vessels anomalies.

**TABLE OF CONTENTS/OUTLINE**

1. Applied embryology and anatomy of pulmonary artery and veins. 2. Techniques: X-ray, CT and MRI - pros and cons 3. Pulmonary artery anomalies: (a) origination and course (conotruncal abnormalities, atresia, sling); (b) intrinsic pulmonary artery anatomy (proximal interruption of the pulmonary artery, hypoplasia, stenosis); (c) pulmonary termination (arteriovenous malformations); (d) anastomotic vessels (anomalous origin of the coronary artery from the pulmonary artery, patent ductus arteriosus). 4. Pulmonary veins anomalies: (a) Total anomalous pulmonary venous return (TAPVR). (b) Partial anomalous pulmonary venous return (PAPVR). & 7; Type I: Supracardiac & 7; Type II: Cardiac & 7; Type III: Infracardiac & 7; Type IV: Mixed 5. Sample cases of pearls, pitfalls, diagnostic difficulties, and mimics. 6. Future directions 7. Summary and take-home messages.

## CHEE-65 PNEUMONIA IN THE IMMUNOCOMPROMISED HOST

Mark M. Hammer, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Identify the types of immunocompromise encountered in different clinical settings and associate these with specific opportunistic organisms.2. Describe the patterns of mycobacterial disease seen in HIV patients at different levels of CD4 count.3. Describe the imaging appearance of viral and fungal infections in neutropenic patients.

**TABLE OF CONTENTS/OUTLINE**

1. Types of Immunocompromise: T-cell depletion, neutropenia, IgG deficiency, nonspecific2. Causes of pulmonary disease in immunocompromised patients: pulmonary edema, drug toxicity, radiation pneumonitis, malignancy, infection: community-acquired or opportunistic3. HIV infected patients: Tuberculosis, Pneumocystis, CMV pneumonia, Disseminated NTM, Kaposi's sarcoma4. Organ transplants: fungi, mycobacteria, Nocardia, PTLD5. Neutropenic patients: Aspergillus, Mucor6. Bone marrow transplant: fungi, CMV pneumonia, idiopathic pneumonia syndrome

## CHEE-66 HOW TO PERFORM CLINICALLY RELEVANT LUNG CANCER STAGING

Mark M. Hammer, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Clinically relevant staging goes beyond simple AJCC categories and should include clinically important local factors for the primary tumor.2. Understand which lymph node stations upstage a lung cancer.3. Understand how surgeons may need to modify their approach given abutment or invasion of various structures.

**TABLE OF CONTENTS/OUTLINE**

1. Overview of AJCC staging system for lung cancer2. Local factorsa. Proximity to central bronchi or arteries necessitating sleeve resection or arterioplastyb. For sublobar resection, identifying segmental anatomyc. Invasion of pericardium, focal versus disseminatedd. Invasion of pleura or mediastinal fat, and early pleural metastasese. Chest wall invasionf. Diaphragm invasion3. Lymph node staging: ipsilateral versus contralateral mediastinal nodes4. Evaluation of distant metastatic disease, and common mimics

## CHEE-68 PICTORIAL REVIEW OF THORACIC HEMATOMAS

Carlos S. Restrepo, MD (*Abstract Co-Author*) Nothing to Disclose
Emma C. Ferguson, MD (*Abstract Co-Author*) Nothing to Disclose
Daniel Ocazionez-Trujillo, MD (*Abstract Co-Author*) Nothing to Disclose
Erika G. Odisio, MD (*Abstract Co-Author*) Nothing to Disclose
Catalina Jaramillo, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1) Aortic Intramural hematoma is part of the aortic dissection spectrum and is diagnosed by crescentic hyperdensity of the aortic wall seen on unenhanced CT images. Additional findings associated with IMH include intramural blood pools and ulcer-like projections.2)A rare complication of Type A aortic dissection is the development of a pulmonary artery (PA) sheath hematoma, which can occur due to the shared adventitial layer between the ascending aorta and the PA, allowing dissection to extend between these vessels and possibly leading to PA lumen compromise.3)Pericardial hematomas can be secondary to blunt or penetrating chest trauma, post cardiac surgery and ventricular rupture. 4)Intramural hematomas of the esophagus can be spontaneous, emetogenic or iatrogenic in the setting of EGD. These hematomas vary in length and may obliterate the esophageal lumen.5)An extrapleural hematoma demonstrates the “fat sign” on CT, where thoracic soft tissues are pushed toward the ribs by intermediate/high density fluid in the extrapleural space. 6)Prevertebral hematoma usually indicates recent injury, as significant hematoma is uncommon after 2-3 weeks. Differential considerations for chronic prevertebral hematomas include infection or tumor.

**TABLE OF CONTENTS/OUTLINE**

1) Great Vessels: Intramural hematoma of the aorta, traumatic aortic injury, adventitial sheath hematoma of the pulmonary artery. 2) Pericardium: Pericardial hematoma. 3) Mediastinum: Spontaneous hematoma of the mediastinum. 4) Esophagus: Intramural Hematoma of the Esophagus. 5) Pleura: Pleural hematoma, extrapleural hematoma. 6) Thoracic Spine: Paravertebral hematoma 7) Chest Wall and soft tissues: Breast hematoma, intramuscular hematoma.

## CHEE-69 PRIMARY PULMONARY LYMPHOMA: WHAT THE RADIOLOGIST NEEDS TO KNOW

Maria Borba, MD (*Abstract Co-Author*) Nothing to Disclose
Joao Pedro C. Lino, MD (*Abstract Co-Author*) Nothing to Disclose
Gabriel Goncalves, MD (*Abstract Co-Author*) Nothing to Disclose
Mariana Abdo De Almeida (*Abstract Co-Author*) Nothing to Disclose
Lucas Rostom, MD (*Abstract Co-Author*) Nothing to Disclose
Adriano Magna, MD (*Abstract Co-Author*) Nothing to Disclose
Mauricio Kenji Ota (*Abstract Co-Author*) Nothing to Disclose
Bruna P. De Oliveira, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- The purpose of this presentation is to demonstrate and help the radiologist deal with the variety of imaging manifestation patterns of primary pulmonary lymphoma, highlighting a case of primary MALT pulmonary lymphoma, an extremely rare disease, but the most common primary pulmonary lymphoma.- This article shows the radiological variability of primary pulmonary lymphoma in patients treated at a reference hospital, focusing on the importance of diagnostic methods: which of them are most sensitive for early diagnosis of the disease, the role in guidance procedures and monitoring response to treatment.

**TABLE OF CONTENTS/OUTLINE**

-A compilation with the list of patients, epidemiological and clinical data, histopathological diagnosis, some microscopy images, some guided biopsy images, imaging patterns of diagnostic methods and their main role in the disease treatment line.- Examples of different imaging presentations of primary lung lymphoma, including an extremely rare case of primary MALT lung lymphoma, with details on how diagnostic methods are also important in assessing the evolution of response to treatment, providing resources to direct management and determine therapeutic success.

## CHEE-7 NOT ONLY LOW GRADE BUT ALSO THE ART OF SLOW TRADE: UNDERSTANDING ADENOCARCINOMA OF THE LUNG DEVELOPING FROM CYSTIC AND SUBSOLID NODULES

**Awards**
**Magna Cum Laude**

Iclal Ocak, MD (*Abstract Co-Author*) Nothing to Disclose
Emrah Duman, MD (*Abstract Co-Author*) Nothing to Disclose
Brittany Cody (*Abstract Co-Author*) Nothing to Disclose
Zehavit Kirshenboim (*Abstract Co-Author*) Nothing to Disclose
Omer Onder, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1- Subsolid and cystic nodules, as well as the resulting primary lung neoplasms, are notable for their slow-growing nature. However, they can sometimes be overlooked or misclassified as elements of infectious or inflammatory conditions. 2- Being aware of the possible imaging findings of these lesions and current recommendations regarding follow-up is crucial for patient management. With the introduction of new guidelines, such as Lung-RADS 2022, there has been a shift towards a more comprehensive approach that includes these types of nodules, thereby highlighting their clinical significance. 3- This educational exhibit aims to enhance awareness among radiologists regarding primary lung neoplasms that may originate from or potentially evolve from subsolid and/or cystic nodules via a variety of case examples, further enriched by the inclusion of histopathologic examination images obtained after surgical resections.

**TABLE OF CONTENTS/OUTLINE**

A. Introduction objectives B. Subsolid nodules - Nodule types and definitions -Adenocarcinoma spectrum - Lung-RADS 2022 recommendations - Pearls Pitfalls - Case examples important considerations C. Cystic nodules -Cystic lung cancer -Terminology and Lung-RADS 2022 recommendations -Pearls Pitfalls -Case examples important considerations D. Summary E. Conclusion

## CHEE-70 LUNG TRANSPLANT EVALUATION: COMPLICATIONS ON A TIMELINE

Markus Y. Wu, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Review history, indication/contraindication, and surgical techniques of lung transplantation.2. Highlight expected and unexpected imaging findings following lung transplantation.3. Present a concise imaging approach to evaluation of transplant- treatment-related complications

**TABLE OF CONTENTS/OUTLINE**

1. History and indications/contraindications.2. Donor selection.3. Surgical techniques.4. Postop imaging protocols.5. Complications on a timeline.6. Immediate complications including malpositioned lines, size mismatch, hyperacute rejection, and pulmonary torsion.7. Early complications including reperfusion injury and acute pleural complications.8. Intermediate complications including acute rejection, bronchial anastomotic complications, and infections.9. Primary late complications including bronchial stenosis, vascular complications, viral and fungal infection.10. Secondary late complications including chronic rejection, organizing pneumonia, PTLD, lung cancer.

## CHEE-71 IMAGING OF THE THORACIC AORTA: EVERYTHING YOU NEED TO KNOW

Robert C. Gilkeson, MD (*Abstract Co-Author*) Research Consultant, Riverain Technologies, LLC;Research support, Koninklijke Philips NV;Research support, Siemens AG;Research support, General Electric Company;Consultant, HeartFlow, Inc
Syed Muhammad Awais Bukhari, MD (*Abstract Co-Author*) Nothing to Disclose
Amit Gupta, MD (*Abstract Co-Author*) Nothing to Disclose
Joshua Hunter, BS (*Abstract Co-Author*) Nothing to Disclose
Omar Altabbakh, DO (*Abstract Co-Author*) Nothing to Disclose
Cody R. Johnson, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Discuss the importance of the thoracic aorta and summarize key points for radiologists using the latest multidisciplinary surgical and clinical guidelines. 2. Illustrate the proper technique for measuring the thoracic aorta in a reproducible way and discuss the normal size and cutoff for pathologic enlargement (e.g. dilated vs aneurysm). 3. Understand the radiologist's role in evaluating pathology of the aorta and recommended imaging surveillance. 4. Discuss acute aortic syndromes and how they should be approached with the latest nomenclature. 5. Review the operative management, post-operative complications, and post-operative surveillance of the aorta. 6. Demonstrate the clinical implementation of artificial intelligence in cardiovascular disease/imaging.

**TABLE OF CONTENTS/OUTLINE**

1. Embryology/Anatomy/Histology 2. Modalities for imaging the thoracic aorta 3. Defining normal size and correct measurement technique 4. Aneurysm Definition 5. Causes of thoracic aortic aneurysms a. Genetic (Ehlers-Danlos, Marfan’s, Loeys-Dietz) b. Congenital (bicuspid, Turner's, coarctation) c. Hypertension/Atherosclerosis d. Inflammatory aortitis 6. Recommended Screening/Surveillance 7. Acute aortic pathology a. Svensson classification b. Society of Vascular surgery reporting system c. Dissection d. Intramural Hematoma e. Penetrating Atherosclerotic Ulcer f. Atypical acute aortic pathologies 8. Operative Management of Aortic Pathology a. Post-operative aorta Complications b. Surveillance of post-operative aortic repairs 9. Artificial intelligence in Cardiovascular Imaging a. Clinical implementation of artificial intelligence into a PACs workflow

## CHEE-72 TRACHEOBRONCHIAL PAPILLOMATOSIS: WHAT RADIOLOGISTS NEED TO KNOW

Alexandre M. Silva, MD (*Abstract Co-Author*) Nothing to Disclose
Juliana A. Grill, MD (*Abstract Co-Author*) Nothing to Disclose
Tamires Morita, MD (*Abstract Co-Author*) Nothing to Disclose
Helen Ribeiro De Oliveira, MD (*Abstract Co-Author*) Nothing to Disclose
Brenda N. Lahlou, MD (*Abstract Co-Author*) Nothing to Disclose
Heytor Jose De Oliveira Cabral, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Review the etiology and the pathological mechanism of papillomatosis. Highlight the main organs affected in the respiratory system and their imaging characteristics. Emphasize pulmonary involvement and the risk of malignant transformation.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction.2. Etiological agent and forms of transmission.3. Pathological mechanism and histological features.4. Epidemiology and clinical findings.5. Tracheobronchial involvement.6. Pulmonary involvement and possible complications.7. Malignant transformation into squamous cell carcinoma.8. Therapeutic challenges.9. Take home message.

## CHEE-73 CYSTIC LUNG CANCER - A PICTORIAL REPRESENTATION OF MORPHOLOGICAL TYPES BASED ON CT, GROWTH PATTERNS AND FDG PET UTILIZATION

Thomas Taylor (*Abstract Co-Author*) Nothing to Disclose
Mohamed J. Thouseef, MD (*Abstract Co-Author*) Nothing to Disclose
Angela McKinnie (*Abstract Co-Author*) Nothing to Disclose
Chary Duraikannu, FRCR, MBBS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Morphological types: We outline four patterns of cystic lung malignancies, as described by Mascalchi et al: Type I - Cyst with exophytic solid component; Type II - Cyst with endophytic solid component; Type III - Cyst with wall thickening; Type IV - Multi-cystic lesion.2. Pathogenesis: prevailing theories include cyst formation via a check valve mechanism secondary to microscopic malignancy or growth along pre-existing bullae.3. Growth pattern: gradual replacement of cystic components by solid tissue observed during follow-up. 4. Histology: predominantly manifest as adenocarcinomas followed by squamous cell carcinoma. 5. Guidelines: current guidelines offer limited guidance on follow-up protocols. In our multidisciplinary meeting, we usually recommend an initial follow up period of 3 months for suspected cystic malignancy. PET imaging would be indicated if notable solid component.

**TABLE OF CONTENTS/OUTLINE**

Background: Lung cancer remains a significant public health concern and ranks as the leading cause of cancer-related mortality in the UK, making up 21% of all cancer deaths between 2017 and 2019. Despite established screening protocols and expedited diagnostic pathways, the diverse presentations of primary lung tumours pose challenges for timely recognition, often leading to diagnostic delays. Through a series of illustrative cases, we aim to showcase the morphological and growth pattern of cystic lung cancers.

## CHEE-74 EVOLVING LANDSCAPE OF CHEST WALL RECONSTRUCTION: A MULTIMODALITY IMAGING APPROACH

Achala Donuru, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Chest wall reconstruction is a complex surgical procedure aiming to restore anatomical and functional integrity after chest wall injury or resection.
- Various imaging modalities play crucial roles in different stages of chest wall reconstruction, each offering unique advantages.
- Pre-operative planning: Imaging helps assess the extent of the defect, guide implant selection and sizing, and identify potential complications.
- Intra-operative guidance: Imaging provides real-time visualization of anatomical structures, facilitating precise implant placement and minimizing complications.
- Post-operative assessment: Imaging monitors healing progress, detects complications like infection or implant failure, and guides further management decisions.

**TABLE OF CONTENTS/OUTLINE**

Introduction:
- Brief overview of chest wall reconstruction and its clinical significance.
- Importance of imaging in various stages of chest wall reconstruction. Pre-operative Imaging:
- Role of CT scans in defect characterization, implant planning, and surgical simulation.
- Advantages of MRI for soft tissue assessment and vascular mapping. Intra-operative Imaging:
- Utility of fluoroscopy and cone-beam CT for real-time guidance and accurate implant placement. Post-operative Imaging:
- Role of CT and MRI in evaluating healing progress, graft integration, and identifying complications.
- Potential applications of PET/CT for detecting early signs of infection or implant rejection. Multimodality Imaging Approach:
- Benefits of combining different imaging modalities for a comprehensive assessment throughout the reconstruction process.
- Examples of how each modality complements the others in different stages.

## CHEE-75 EXPLORING CAVITARY LUNG LESIONS: PERSPECTIVES ON DIFFERENTIAL DIAGNOSIS

Manuel Sebastian Paez Alvarez, MD (*Abstract Co-Author*) Nothing to Disclose
Esnelly F. Berrios Bonilla, MD (*Abstract Co-Author*) Nothing to Disclose
Javier Tejedor Toquero, MD (*Abstract Co-Author*) Nothing to Disclose
Andres Enriquez-Puga, MBChB, MSc (*Abstract Co-Author*) Nothing to Disclose

Maria M. Merideno Garcia, MBBCh (*Abstract Co-Author*) Nothing to Disclose
Elisabetta Ponte, MD (*Abstract Co-Author*) Nothing to Disclose
Jaime Lopez Martin, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The main objective of this study is to provide insights for proper characterization of cavitary lesions. To achieve this, we aim to fulfill the following three teaching points: firstly, ensuring that we are dealing with a true cavitary lesion and not a mimicker; secondly, once a cavitary lesion is confirmed, explaining how to evaluate it in 10 steps; and finally, elucidating the various entities that arise after cavitation, along with their respective clinical and imaging characteristics.

**TABLE OF CONTENTS/OUTLINE**

- Objectives. - Definition of cavitation and examples of imaging. - Mimickers of cavitation and their definition: cyst, cystic bronchiectasis, emphysema, and bullae. Imaging examples of each. - Evaluation of cavitation in ten steps: confirming the cavity, assessing wall characteristics, identifying intracavitary material, recognizing enhancing foci, evaluating pleural communication, observing surrounding changes and ancillary findings, correlating with history and clinical presentation, assessing temporal evolution, determining the location of the cavity, and determining the number of cavities (solitary vs multiple). - Detailed presentation and explanation of the different entities following the semiological finding of cavitation, illustrating several cases of each: cancer, rheumatoid arthritis, vasculitis, infections (aspergillus, tuberculosis), septic emboli, etc. - Conclusions. - References.

## CHEE-76 THE PE PUZZLE: IDENTIFYING AND DIFFERENTIATING MIMICS ON CTPA

Daniel Ocazionez-Trujillo, MD (*Abstract Co-Author*) Nothing to Disclose
Carlos S. Restrepo, MD (*Abstract Co-Author*) Nothing to Disclose
Emma C. Ferguson, MD (*Abstract Co-Author*) Nothing to Disclose
Cihan Duran, MD (*Abstract Co-Author*) Nothing to Disclose
Catalina Jaramillo, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

• Clues to distinguish mixing artifacts from true PE include poorly defined margins, attenuation >78 HU, unilateral lesions, and lesions that do not alter vessel caliber.• Distinguishing whether the defect occurs within the vessel lumen is crucial, as adjacent lymphadenopathy and endobronchial mucous plugging potentially create PE-like lesions.• Metastatic leiomyoma can extend to involve the right sided heart chambers and pulmonary arteries.• Primary sarcoma of the pulmonary artery generally demonstrates enhancement, luminal expansion and loss of the wall contours “eclipse sign”, that distinguishes it from real PE.

**TABLE OF CONTENTS/OUTLINE**

CT Pulmonary Angiography (CTPA) is the study of choice for the evaluation of Pulmonary Embolism (PE), yet its interpretation is filled with challenges. This exhibit aims to clarify the technical and pathologic conditions that mimic PE on CTPA.Artifactsa) Cardiac and respiratory motion artifactb) Pulmonary artery mixing “smoke” artifact from slow flow and ipsilateral parenchymal abnormalities such as bronchiectasisc) Contrast bolus interruptiond) Pulmonary artery devicesPseudo-defects due to pathology at nearby anatomic structuresa) Hilar lymphadenopathyb) Endobronchial aspirationc) Pulmonary Vein ThrombosisTumorala) Direct tumoral invasion from bronchogenic carcinomab) Tumoral metastasis from renal cell carcinoma and uterine leiomyomac)

Primary sarcoma of the pulmonary arteryMimickers of Chronic PEa) Thrombosis in situ secondary to chronic pulmonary hypertensionb) Pulmonary artery sheath hematoma in the setting of aortic dissectionc) Pulmonary artery thickening as a manifestation of vasculitis

## CHEE-77 THE ATOLL WITHIN: A DEEP DIVE INTO THE REVERSE HALO SIGN IN CHEST CT

Iclal Ocak, MD (*Abstract Co-Author*) Nothing to Disclose
Furkan Ufuk, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• Define the reverse halo sign and its diagnostic relevance in chest CT imaging. • Review the various etiologies associated with the reverse halo sign, emphasizing the differentiation between infectious, neoplastic, and inflammatory causes. • Illustrate the significance of integrating clinical history and other diagnostic tools to accurately interpret the reverse halo sign.

### TABLE OF CONTENTS/OUTLINE

1. Introduction to the Reverse Halo Sign Definition and visual characteristics Historical context and significance in radiology 2. Etiological Spectrum a) Idiopathic Organizing Pneumonia: The most common cause, involves inflammation and scarring of the small airways and alveoli. b) Fungal Infections: Various fungal infections can cause the reverse halo sign, including mucormycosis and aspergillosis. c) Bacterial Pneumonia: Certain bacterial infections, including tuberculosis and atypical mycobacterial infections, can sometimes manifest with this sign. d) Viral Infections: Viral pneumonias, such as those caused by influenza, COVID-19, can occasionally show a reverse halo sign. e) Pulmonary Infarction: Pulmonary embolism can result in a reverse halo sign due to hemorrhagic infarction. f) Malignancies: Rare, such as adenocarcinomas of the lung or lymphomatoid granulomatosis might present with a reverse halo sign. g) Autoimmune Diseases: Diseases like granulomatosis with polyangiitis and rheumatoid arthritis can sometimes show this pattern. h) Sarcoidosis: Although less common, sarcoidosis can occasionally present with a reverse halo sign. i) Treatment related: Drug or radiation induced pneumonitis. 3. Conclusion • Summary of key points • Future directions in research and imaging techniques

## CHEE-78 CATCH A RIDE ON THE TRAM TRACKS: IMAGING REVIEW AND DIFFERENTIAL DIAGNOSIS OF BRONCHIECTASIS

**Awards**
**Certificate of Merit**

Leah Traube, MD (*Abstract Co-Author*) Nothing to Disclose
Alan Gao, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Bronchiectasis is a common condition characterized by irreversible dilatation of the bronchi. It results from a wide range of infectious, inflammatory, neoplastic, and congenital disease processes. Recurrent infections and hemoptysis are the most common complications, both of which contribute substantially to morbidity and mortality. Imaging plays a key role in the initial diagnosis of bronchiectasis, evaluation for progression, and detection of complications. This exhibit will review the imaging features of bronchiectasis and highlight disease-specific differences in anatomic distribution, imaging appearance, and clinical features, which can aid in narrowing the differential diagnosis or in certain cases provide a confident diagnosis.

### TABLE OF CONTENTS/OUTLINE

1. Introduction (Definition, Pathophysiology, CXR/CT Findings, Mimics) 2. Case Examples: a. Focal (Bronchial Atresia, Carcinoid, Endobronchial Metastases, Aspirated Foreign Body) b. Central (ABPA, Cystic Fibrosis, Ciliary Dyskinesia, Mounier-Kuhn, Williams-Campbell) c. Upper Lobe (Cystic Fibrosis, Sarcoidosis, Silicosis, Berylliosis, Prior TB, Fibrotic HP) d. Lower Lobe (Infectious, Aspiration, Fibrotic ILD, Alpha-1 Antitrypsin Deficiency, Hypogammaglobulinemia) e. Right Middle Lobe and Lingula (Atypical Mycobacterium) f. Variable (Radiation Fibrosis, Bronchiolitis Obliterans) 3. Complications (Infection, Hemoptysis)

## CHEE-79 CT MANIFESTATIONS OF HIV-ASSOCIATED PULMONARY INFECTIONS IN THE ERA OF ANTIRETROVIRAL THERAPY

**Awards**
**Magna Cum Laude**

David C. Kraft, MD (*Abstract Co-Author*) Nothing to Disclose
Muhammad Naeem, MD, MBBS (*Abstract Co-Author*) Nothing to Disclose

Michael A. Beal, MD (*Abstract Co-Author*) Nothing to Disclose
Joshua Volin, MD (*Abstract Co-Author*) Nothing to Disclose
Timothy Arleo, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Since the discovery of human immunodeficiency virus (HIV), the imaging findings of the numerous opportunistic infections have been extensively described. However, the high variability of imaging findings and multitude of opportunistic infections may be difficult to differentiate and present a diagnostic challenge. The purpose of this abstract is to present a comprehensive overview of the pulmonary infections seen in immunocompromised patients, as well as propose a pattern-based approach for differentiating pulmonary pathology. Teaching points include the following: 1. Define AIDS defining illness and review the relationship between CD4 levels and opportunistic infection 2. Review the imaging patterns and differential diagnoses of pulmonary infections among immunocompromised patients 3. Discuss non-infectious pulmonary pathology that is characteristic among immunocompromised patients and differentiate it from infectious processes

### TABLE OF CONTENTS/OUTLINE

1. Overview pulmonary infections in immunocompromised patients by CD4 and infection type 2. Review AIDs-defining illnesses 3. Present a CT pattern-based approach to pulmonary pathology, including the following imaging patterns: consolidation, cavitation, cyst, peribronchovascular opacity, halo/reverse halo, nodule/septal line, and ground glass 4. Differentiate imaging mimickers (for example, differentiate pneumatocele/blebs from a cavity or cyst) 5. Discuss non-infectious pulmonary pathology in immunocompromised patients, including immune reconstitution inflammatory syndrome and infection-associated pulmonary malignancy

## CHEE-8 A PICTORIAL REVIEW: ANTERIOR MEDIASTINAL MASSES - ESSENTIAL KNOWLEDGE FOR RADIOLOGISTS

Nagaaki Marugami (*Abstract Co-Author*) Nothing to Disclose
Ryosuke Taiji, MD (*Abstract Co-Author*) Nothing to Disclose
Toshihiro Tanaka (*Abstract Co-Author*) Nothing to Disclose
Aya Yamada, MD (*Abstract Co-Author*) Nothing to Disclose
Dan Yamamoto, MD (*Abstract Co-Author*) Nothing to Disclose
Masatoshi Ikeno (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Anterior mediastinal masses have various etiologies, such as neoplastic or non-neoplastic pathology. These masses are located in the anterior mediastinum and originate from the thymus or other adjacent organs. Radiologists should be familiar with imaging findings and clinical courses.This exhibit aims to:Depict typical imaging findings of Anterior mediastinal massesDiscuss the clinical and radiological findings, and differential diagnosis

### TABLE OF CONTENTS/OUTLINE

Thymic epithelial tumor Thymoma Thymic carcinoma l Mediastinal lymphoma Non-Hodgkin lymphoma Thymic MALT lymphoma Primary mediastinal (thymic) large B-cell lymphoma T-cell lymphoblastic lymphoma Classical Hodgkin lymphoma (CHL) Nodular sclerosis CHL Mixed cellularity CHL l Anterior mediastinal germ cell tumor Mature teratoma Immature teratoma Mixed germ cell tumor l Thymic neuroendocrine tumor (TNETs) Carcinoid l Mediastinal goiter l Thymic cyst l Thymic hyperplasia

## CHEE-80 THE NIGHTMARE NEIGHBOR NEXT DOOR; SHARED SHEATH HEMATOMAS AND MIMICS

Satinder P. Singh, MD (*Abstract Co-Author*) Nothing to Disclose
Inayat Grewal (*Abstract Co-Author*) Nothing to Disclose
Scott A. Grumley, MD (*Abstract Co-Author*) Nothing to Disclose
Donald G. Benson JR, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Mostafa Abozeed, MD,PhD (*Abstract Co-Author*) Nothing to Disclose
Naga Sai Rasagna Mareddy, MBBS (*Abstract Co-Author*) Nothing to Disclose
Mohamed Ibrahim, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• Shared sheath pulmonary artery hematoma is a rare and underreported complication of Stanford type A aortic dissection. • Identify imaging features of acute type A aortic dissection and possible mimics. • Understanding the embryological development and anatomical relationship between the aorta and pulmonary arteries.

### TABLE OF CONTENTS/OUTLINE

• Embryological Development and Anatomical Relationship: - Overview of embryological development leading to the formation of the heart tube and aorticopulmonary septum. - Discussion of the anatomical relationship between the aorta and pulmonary arteries, including the presence of shared structures like the common aortopulmonary adventitia. - Highlighting how understanding embryology and anatomy enhances comprehension of pathological processes like aortic dissection. • Clinical Implications and Historical Descriptions: - Overview of clinical implications associated with acute type A aortic dissection, including potential complications and prognostic factors. - Historical descriptions of aortic dissection and its complications, including the concept of acquired aortopulmonary fistula. • Imaging protocol and features: o Discuss the imaging protocol in suspected acute chest pain scenario o Discuss the imaging features of shared sheath hematoma and its potential mimics o Discuss variety of acute dissection imaging findings and its mimics

## CHEE-81 EFFECTS OF RADIATION THERAPY IN THORACIC ONCOLOGY REVISITED

Elena Garcia Garrigos, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Marina Sirera Matilla, MD (*Abstract Co-Author*) Nothing to Disclose
Eloisa Feliu, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
David Ferrandez Ferrandez (*Abstract Co-Author*) Nothing to Disclose
Juan Arenas-Jimenez, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Both radiation and medical therapies for thoracic malignancies have evolved with combination and sequential strategies being an alternative to many tumors of the chest, mainly lung and breast cancer. Our goals are: To show how radiation therapy affects tumoral and non-tumoral tissues and how imaging can show those effects, with special emphasis on their chronology. To describe how radiation therapy has evolved from classic methods into more precise multiple beam stereotactic techniques thus expanding its indications and leading to more complex manifestations. To depict imaging findings related to radiation therapy, its associated complications and the effect of combining medical therapies such as immunotherapy with radiotherapy.

### TABLE OF CONTENTS/OUTLINE

1. Definition of radiation therapy types and their effects on tumoral and non-tumoral tissues 2. Differences between conventional radiotherapy and new techniques and indications. 3. Frequent effects of radiotherapy in the lungs, mediastinum, pleura and chest wall and their chronology. 4. Specific complications of radiotherapy and their differential diagnosis. 5. Radiological presentation of uncommon radiation therapy-related conditions: abscopal effect, delayed organizing pneumonia, radiation recall pneumonitis, radiation induced neoplasms. 6. Clues for diagnosing tumor recurrence in radiated lesions 7. Discussion of evidences about relationship of preexisting radiological interstitial lung abnormalities and immunotherapy with lung complications after radiation therapy. 8. Conclusions.

## CHEE-82 VASCULAR TUMORS IN THE THORAX: IMAGING CHARACTERISTICS, BIOPSY, AND MANAGEMENT OF ASSOCIATED COMPLICATIONS

**Awards**
**Certificate of Merit**

Abhishek Chaturvedi, MD (*Abstract Co-Author*) Nothing to Disclose
Swati P. Deshmane, MBBS (*Abstract Co-Author*) Nothing to Disclose
Andrew C. Clark, DO (*Abstract Co-Author*) Nothing to Disclose
Adam Dykie, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Vascular tumors of the thorax have complex imaging findings; however, there also may be difficulty distinguishing them from other benign or malignant lesions. Vascular lesions can be present in the major vessels, mediastinum, lung parenchyma, or soft tissues and osseous structures of the chest wall. Cross sectional imaging with CT/MR and PET is essential in workup, although additional studies and biopsy may be needed for diagnosis. Deciding whether to biopsy, which technique to use, and which lesion to biopsy depends on various factors. Complications of image-guided biopsy and management of these complications should be considered, particularly given the increased concern for bleeding.

**TABLE OF CONTENTS/OUTLINE**

This exhibit will provide background on vascular tumors including their subcategories and locations within the chest. Imaging characteristics of different vascular lesions on modalities such as CT, MRI, and PET will be reviewed, including techniques such as pre- and post-contrast imaging. Considerations for biopsy, such as malignant versus benign features, location, concern for bleeding, and treatment planning will then be discussed. Different methods for tissue sampling will be reviewed along with basic biopsy technique for vascular lesions. Biopsy may include ultrasound-guided, CT-guided, excisional, or intraluminal approaches. Complications of biopsy and their management will be discussed. Finally, conclusions will be drawn on the workup of vascular thoracic tumors through imaging characterization and biopsy.

## CHEE-83 HIDDEN IN FIBROSIS: APPROACH TO DIAGNOSIS AND PITFALLS OF LUNG CANCER IN PATIENTS WITH FIBROTIC INTERSTITIAL LUNG DISEASE

**Awards**
**Certificate of Merit**

Jaewon Jung (*Abstract Co-Author*) Nothing to Disclose
Brett M. Elicker, MD (*Abstract Co-Author*) Nothing to Disclose
Jae Ho Sohn, MD, MS (*Abstract Co-Author*) Nothing to Disclose
Shravan Sridhar, MD, MS (*Abstract Co-Author*) Nothing to Disclose
Tician Schnitzler, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Interstitial lung disease (ILD) patients are known to have elevated risk for lung cancer with odds ratio ranging from 3.5-7.3. Lung cancer in ILD is often difficult to detect due to significant background reticulation and potential superimposed acute exacerbation that may obscure malignancy. However, accurate detection of lung cancer has important implications for clinical management and potential lung transplant candidacy. The purpose of this exhibit is to review the epidemiology of lung cancer in ILD patients, present a case-based approach to diagnosing lung cancer in patients with ILD, and review pitfalls of imaging ILD patients who also have lung cancer including cases in which lung cancer was initially missed.

**TABLE OF CONTENTS/OUTLINE**

1. Title 2. Table of contents 3. Overview 4. Demographics and epidemiology 5. Pathogenesis 6. Histopathology of lung cancer in ILD vs normal lung 7. CT diagnosis a. Inconsistent with lung cancer i. Infection/inflammation 1. Acute exacerbation 2. Aspiration 3. Mycetoma ii. Manifestation of ILD 1. NSIP-OP 2. PPFE 3. PMF iii. Iatrogenic 1. Bronch bite hematoma b. Consistent with lung cancer i. Characteristic CT features nodules ii. Characteristic CT features lymphadenopathy/(asymmetric) iii. Time course iv. Evolution on CT 8. When suspicious finding identified 9. Tissue sampling 10. Utility of CT lung biopsy 11. CT lung biopsy complications 12. Confirming the diagnosis a. Confirmed i. Staging ii. Implication on transplant candidacy b. Non-malignant result i. Non-malignant vs non-diagnostic ii. Accept vs reject result iii. Utility of repeat CT lung biopsy 13. Case overview 14. Cases 15. Challenging cases and pitfalls 16. Summary 17. References

## CHEE-84 UNDERSTANDING CYSTIC LUNG LESIONS IN SMOKERS WITH INTERSTITIAL LUNG DISEASE: RADIOLOGIC-PATHOLOGIC CORRELATION

**Awards**
**Cum Laude**

Almudena I. Urena Vacas, MD (*Abstract Co-Author*) Nothing to Disclose
LETICIA GRACIA Saenz (*Abstract Co-Author*) Nothing to Disclose
Svetlana Shalygina (*Abstract Co-Author*) Nothing to Disclose
CRISTINA ALENDA Gonzalez (*Abstract Co-Author*) Nothing to Disclose
Juan Arenas-Jimenez, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Due to destructive, fibrotic and remodeling mechanisms, we can find a varied constellation of aerated lung lesions in chest CT scans of smoker patients that pose a diagnostic challenge for both the radiologists and pathologists. Radiologic terminology used for cystic lung lesions is complex and sometimes confusing, and the same applies to their pathologic correlation, with different names for similar findings. In this setting, the goals of this exhibit are to make an approach to these lesions trying to allow the reader: 1. To differentiate among the pathologic findings that characterize each type of aerated lung lesion in smokers. 2. To define the clue radiological findings and the diagnostic meaning of each subtype of cystic lung lesions in smokers. 3. To avoid pitfalls when interpreting aerated lung lesions in CT of smoker patients.

**TABLE OF CONTENTS/OUTLINE**

1.Pathologic descriptions of airspaces enlargement and cystic lesions associated to fibrosis in the lungs of smokers: centrilobular and paraseptal emphysema, emphysema with fibrosis, smoking related interstitial fibrosis, airspace enlargement with fibrosis, smoking-related diffuse cystic lung disease and honeycombing. 2. Radiologic description of cystic lung lesions described in smokers and their meaning: emphysema, thin-walled cysts, thick-walled cysts, traction emphysema, cysts associated to desquamative interstitial pneumonia, smoking-related cysts and honeycombing cysts. 3. Pitfalls when interpreting cystic lesions. 4.Conclusions and quiz: how do I call this cyst?

## CHEE-85 CLEARING THE AIR: STATE OF THE ART IMAGING OF INTRALUMINAL AIRWAY OCCLUSIONS AND MUCUS PLUGGING

Prachi P. Agarwal, MD (*Abstract Co-Author*) Nothing to Disclose
Luis A. del Carpio Bellido Vargas, MD (*Abstract Co-Author*) Nothing to Disclose
Njira L. Lugogo (*Abstract Co-Author*) Nothing to Disclose
Wassim Labaki, MD (*Abstract Co-Author*) Nothing to Disclose
Chiemezie Amadi, MD (*Abstract Co-Author*) Nothing to Disclose
Elizabeth Lee, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. There is a spectrum of etiologies and imaging appearance of filling defects in the airways. 2. Mucous plugs are a common finding on CT and although often dismissed, are associated with adverse outcomes in specific patient populations. 3. Understanding the importance of mucus plugging in muco-obstructive diseases and asthma is important for all radiologists. 4. Apart from mucus plugging, segmental and subsegmental intraluminal airway occlusions can be due to myriad conditions including infection, foreign bodies and neoplasms. 5. If high density is identified in airway occlusions specific entities including broncholiths and foreign bodies should be considered. 6. Opportunities and challenges relating to the evolving role of advanced imaging techniques in airways disease include air trapping quantification using parametric response mapping, airway wall thickness quantification and mucous plug quantification. These can provide prognostic information and may help quantify treatment response.

**TABLE OF CONTENTS/OUTLINE**

1. Spectrum of intraluminal airway occlusions including: Muco-obstructive diseases (COPD, cystic fibrosis, primary ciliary dyskinesia, and non-cystic fibrosis bronchiectasis), asthma, allergic bronchopulmonary aspergillosis, obstruction leading to distal mucus plugging (neoplasms, bronchial atresia) and other etiologies (Diffuse: endobronchial infection, blood, plastic bronchitis, aspiration; Focal: foreign body, broncholiths, tumors) 2. Prognostic significance and current evidence related to mucus plugging in muco-obstructive diseases and asthma. 3. New techniques for quantification of airway wall thickening, mucus impaction and air trapping

## CHEE-86 NON-TUBERCULOUS MYCOBACTERIA (NTM): RADIOLOGICAL INSIGHTS FOR A CHALLENGING DIAGNOSIS

Amanda Acevedo (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Identify imaging characteristics of non-tuberculous mycobacteria (NTM) infections across different patient populations.2. Understand the importance of differential diagnosis in imaging to distinguish NTM from other pulmonary conditions, including tuberculosis.3. Recognize the role of radiologists in the multidisciplinary management of NTM, emphasizing early detection and monitoring treatment response.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction to Non-tuberculous Mycobacteria a. Definition and Epidemiology b. Clinical Significance2. Imaging Features of NTM Infection a. Pulmonary NTM: Key Findings on Chest X-ray and CT b. Extra-pulmonary NTM: Diagnostic Challenges3. Differential Diagnosis a. Differentiating NTM from Tuberculosis and Other Lung Pathologies b. Role of Imaging in Guiding Biopsy and Further Testing4. Case Studies and Imaging Gallery a. Representative cases highlighting diagnostic features and pitfalls5. Conclusion a. Summary of Radiologist's Role in NTM Detection and Management6. PDF Upload Supplementary material includes detailed imaging studies, expanded case discussions, and a comprehensive review of NTM treatment protocols. This content aims to enhance understanding and provide a visual guide to assist radiologists in diagnosing and managing NTM infections effectively.

## CHEE-87 THORACIC FISTULAS - A MULTIFACETED CHALLENGE

Vinay V. Kandula, MBBS (*Abstract Co-Author*) Nothing to Disclose
Achala Donuru, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Early diagnosis and management of thoracic fistulas is critical for improving patient outcomes.
- Understanding the different causes (infection vs. malignancy) guides treatment decisions.
- Multimodality imaging, particularly MDCT, is essential for accurate diagnosis and fistula characterization.
- Management strategies involve addressing the underlying cause and potential fistula closure techniques.

**TABLE OF CONTENTS/OUTLINE**

Diagnosis: Clinical suspicion is paramount, considering symptoms like cough, dyspnea, chest pain, recurrent infections, and nutritional issues.Imaging: CT scan with intravenous contrast is the mainstay for detailed fistula characterization, demonstrating the fistula tract and adjacent structures.Bronchoscopy: Valuable for evaluating airway fistulas, allowing visualization of the internal opening and potential foreign body removal.Esophagram: Useful for identifying esophageal fistulas, demonstrating contrast extravasation from the esophagus.Angiography: May be necessary for definitive diagnosis of vascular fistulas, depicting abnormal blood flow patterns.Management: The approach depends on fistula type and severity. Conservative management with antibiotics and nutritional support might be attempted for small fistulas. Endoscopic closure using stents or glue may be suitable for specific fistulas. Surgical repair is often definitive therapy, particularly for complex or large fistulas.

## CHEE-88 WHAT YOU CAN LEARN FROM FALSE-NEGATIVE STUDIES IN AN ACADEMIC LUNG CANCER SCREENING PROGRAM

**Awards**
**Certificate of Merit**

Suzanne Byrne, MD (*Abstract Co-Author*) Nothing to Disclose
Ariadne DeSimone, MD, MPH (*Abstract Co-Author*) Nothing to Disclose
Kathryn Schulz, MD (*Abstract Co-Author*) Nothing to Disclose
Mark M. Hammer, MD (*Abstract Co-Author*) Nothing to Disclose
Silvia Arora, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. The most common causes of errors in diagnostic radiology are underreading, satisfaction of search, faculty reasoning, and location.2. Missed lung cancers tend to be paramediastinal or perihilar in location, therefore a radiologist should be aware of these blind spots, incorporate these locations into their search pattern, and consider integration of computer-aided detection software and AI algorithms.3. Missed lung cancers tend to be endobronchial lesions, therefore a radiologist should ensure comprehensive evaluation of the tracheobronchial tree on every examination.

**TABLE OF CONTENTS/OUTLINE**

• Review types/causes of diagnostic errors in radiology• Review proposed methods to decrease errors in radiology• Highlight peer learning opportunity of monthly lung cancer screening (LCS) program conference and in learning from diagnostic errors • Define 'false-negative studies' within a LCS program• Review cases of missed lung cancers within a LCS program and discuss potential reasons for the 'false negative'• Review cases of interval lung cancers within a LCS program• Review cases of slow-growing ground-glass or part-solid or cystic nodules within a LCS program

## CHEE-89 NEW TERMINOLOGY IN ILD: PROGRESIVE PULMONARY FIBROSIS (PPF)

Santiago Martinez-Jimenez, MD (*Abstract Co-Author*) Support, Reed Elsevier
Aura Ramirez, MD (*Abstract Co-Author*) Nothing to Disclose
Javier Leonardo Galindo Pedraza (*Abstract Co-Author*) Nothing to Disclose
Jorge Carrillo, MD (*Abstract Co-Author*) Nothing to Disclose
Ana M. Alvarado, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The term progressive pulmonary fibrosis (PPF), refers to progression in fibrosing interstitial lung diseases (ILDs) other than idiopathic pulmonary fibrosis (IPF). PPF is not a disease, but rather a behavior that different subtypes of fibrosing ILDs may develop overtime. A significant proportion of ILDs show progression, being more common in fibrosing hypersensitivity pneumonitis follow by ILDs associated with systemic autoimmune diseases and sarcoidosis. In patients with a pre-existing ILD, PPF is defined as prove of progression within the previous 12 months, with at least two of the following three criteria: worsening respiratory symptoms, physiological and radiological evidence of disease progression. Radiological findings of disease progression include: Increased extent or severity of traction bronchiectasis and bronchiolectasis, new ground-glass opacity with traction bronchiectasis, new fine reticulation, increased extent or coarseness of reticular abnormality, new or increased honeycombing and increased lobar volume loss. Progression of fibrosis is typically assessed visually. Semiquantitative assessment of the percentage of lung volume containing fibrotic feature may be a predictor of mortality.The assessment of ILDs needs a multidisciplinary approach including clinical, functional, imaging, and histopathological data to integrate a clinical probability for an accurate diagnosis and to assess the likelihood of progression.

**TABLE OF CONTENTS/OUTLINE**

Introduction; Epidemiology; Physiopathology of pulmonary fibrosis; Definition criteria of PPF; Imaging approach to PPF; Differential diagnosis; Clinical Considerations: Treatment, Prognosis, and the role of imaging.

## CHEE-9 NOVEL APPROACH FOR COMPREHENSIVE PERIOPERATIVE ASSESSMENT OF RESPIRATORY MALIGNANCY VIA ULTRA-LOW-DOSE LUNG CT UTILIZING AG FILTER AND DEEP LEARNING RECONSTRUCTION

Hirofumi Uehara, PhD (*Abstract Co-Author*) Nothing to Disclose
Yasuyuki Ichinohe (*Abstract Co-Author*) Nothing to Disclose
Koichi Osuda, RT (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

In the current local treatment of respiratory malignancies, there are cases in which multiple CT examinations are required to prevent complications caused by intervention procedures.It includes (1)coil marking + Video-Assisted Thoracoscopic Surgery (VATS) partial resection for small lung cancer and (2)lung Radiofrequency Ablation.Ultra-low-dose lung CT examination combined with Ag filter and Deep Learning image Reconstruction (DLR) significantly reduce radiation dose, and reliably provides image quality sufficient for preoperative and postoperative assessment.We summarize the potential benefits of incorporating ultra-low-dose CT imaging into clinical practice in the management of respiratory malignancies.

**TABLE OF CONTENTS/OUTLINE**

High-definition thin-section CT is performed for initial diagnostic assessment, judging surgical indication, and the detailed scan data allowed to simulate bronchoscopic coil-marking technique.Ultra-low-dose CT using Ag filter have been taken for confirm the marking-site immediately before surgery.In addition, it is used to assess the complications such as pneumothorax and hemothorax after surgery and for early pneumonia.We emphasize the importance of reducing radiation exposure while maintaining both diagnostic accuracy and intervention technique safety, and propose comprehensive approach for supporting respiratory malignancy treatment using appropriate scan protocol.

## CHEE-90 STAY CURRENT WITH LUNG-RADS® V2022: A QUESTION-BASED REVIEW

Lavinia Dias, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Lung cancer, characterized by high morbidity and mortality rates, ranks among the most prevalent cancers, with smoking as its primary risk factor. The U.S. Preventive Services Task Force advises annual low-dose computed tomography (LDCT) screening for individuals aged 50 to 80 years with a 20-pack-year smoking history or who quit within the last 15 years. To standardize terminology and management guidelines, the American College of Radiology developed the Lung CT Screening Reporting and Data System (Lung-RADS®), recently updated in 2022. Early diagnosis is imperative for facilitating curative treatment and improving patient survival. Lung cancer screening with low-dose CT has demonstrated a 20% reduction in mortality compared to unscreened patients. Given the ongoing scientific advancements, radiologists must stay abreast of updates to identify suspicious lesions and determine appropriate management.

**TABLE OF CONTENTS/OUTLINE**

Interactive Case-Based Learning Image characteristics according to Lung-RADS® v.2022 will be demonstrated, accompanied by respective recommendations, through an interactive question and answer format (quiz):-Atypical Pulmonary Cysts-Juxtapleural Nodules-Airway Nodules-Infectious or Inflammatory FindingsGeneral Summary: A comprehensive overview of LungRADS v2022 categories and concepts based on cases and illustrations

## CHEE-91 USING IMAGING BIOMARKERS FOR COMPREHENSIVE LUNG PATHOLOGY DIAGNOSIS

Vinay V. Kandula, MBBS (*Abstract Co-Author*) Nothing to Disclose
Achala Donuru, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Differentiating between benign, infectious, and malignant lung pathologies remains a diagnostic challenge. This presentation explores the power of imaging biomarkers identified on CT, PET, MRI, and PET/MRI in guiding radiologists towards a confident diagnosis.By leveraging the expanding repertoire of imaging biomarkers, radiologists can enhance diagnostic accuracy across a spectrum of lung pathologies, ultimately leading to optimal patient management.

**TABLE OF CONTENTS/OUTLINE**

CT Biomarkers for Pinpointing Pathology• Malignancy: Size and spiculation, attenuation, calcification• Infection: Consolidation, cavitation• Benign Conditions: Honeycombing, cyst characteristicsPET Scan Biomarkers for Metabolic ActivityMalignancy: Increased FDG uptake on PET/CT signifies hypermetabolic activity, a hallmark of lung cancer. Some infections and inflammatory processes can also show FDG avidity, requiring correlation with CT findings.MRI Biomarkers for Soft Tissue CharacterizationMalignancy: While not a first-line modality, MRI can offer valuable insights by differentiating between tumors and benign lesions based on signal intensity on T1 and T2 weighted images. Restricted diffusion on diffusion-weighted MRI can suggest malignancy.PET/MRI Scan BiomarkersParticularly beneficial for patients with contraindications to CT scans due to radiation concerns or kidney issues with contrast agents.Emerging Biomarkers and Advanced Techniques• Dotatate PET scans: Can be helpful in diagnosing lung carcinoid tumors.• Hyperpolarized gas MRI offers unique insights into gas exchange, alveolar integrity, and ventilation defects.• Dual tracer PET • Beyond FDG: Choline analogs, amino acid tracers

## CHEE-92 THE SNIFF TEST: HOW WE DO IT

Rachna Madan, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Mark M. Hammer, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Review of prior anatomic imaging is helpful to focus the sniff exam and interpret the results.2. Adequate deep, rapid sniff maneuver is key to providing definitive diagnosis of paralysis.3. If paralysis is not present, review of anatomic imaging can provide the diagnosis for mimics.

**TABLE OF CONTENTS/OUTLINE**

1. Review the differential diagnosis for an elevated hemidiaphragm2. Review causes of diaphragm paralysis.3. Review sniff test: patient positioning, fluoroscopy technique, and the sniff maneuver.4. Interpreting the sniff test results, i.e. paradoxical motion.5. Mimics: eventration, hernia, lung volume loss.

## CHEE-93 AUTOMATIC PULMONARY ARTERIOVENOUS SEPARATION IN NON-CONTRAST CT BY USING STATE-OF-THE-ART IMAGE PROCESSING TECHNOLOGY

Shuuji Ishikawa (*Abstract Co-Author*) Nothing to Disclose
Masayuki Kamoshita (*Abstract Co-Author*) Nothing to Disclose
Hideki Yashiro, MD (*Abstract Co-Author*) Nothing to Disclose
KITARO IRWAN BIN MOHD AZLAN (*Abstract Co-Author*) Nothing to Disclose
Akihiro Saitou (*Abstract Co-Author*) Nothing to Disclose
Wataru Fujishiro, RT (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

•Importance of understanding pulmonary arteriovenous anatomy before pulmonary segmentectomy •Visualization of pulmonary arteries (PA) and pulmonary veins (PV) by 3D-CT images •Benefits of non-contrast CT for the separation of PA and PV •Accuracy of automatic pulmonary arteriovenous separation by non-contrast CT and contrast CT •Optimal reconstruction parameters for automatic separation by non-contrast CT

**TABLE OF CONTENTS/OUTLINE**

1. Pulmonary arteriovenous anatomy and critical anatomical variants 2. Explanation of the conventional methods and the novel method for 3D-CT images of pulmonary arteriovenous separation 3. Benefits: a) Does not require contrast media b) Eliminate artifacts c) Reduce radiation dose 4. Comparison of non-contrast and contrast 3D-CT images of pulmonary arteriovenous Outline: 3D-CT images of the pulmonary arteriovenous helps perform safe navigation during video-assisted thoracic surgery (VATS), which anatomically involves variety of blood vessels. Conventionally, 3D-CT images are reconstructed from contrast-enhanced CT data using a workstation semi-automatically. However, some patients are allergic to contrast media, have impaired renal function, or are receiving biguanides, and extreme caution must be exercised when performing contrast CT in these patients. We present a method to reconstruct 3D images of PA and PV automatically separated from non-contrast CT data by using state-of-the-art image processing technology. This method allows 3D-CT images of the pulmonary arteriovenous to be reconstructed without contrast, with low radiation, and high accuracy. 3D images of the pulmonary arteriovenous with non-contrast CT useful in VATS just as contrast-enhanced CT.

## CHEE-94 THORACIC MRI FOR THE CHARACTERIZATION OF MEDIASTINAL ANTERIOR MASSES

Caroline Caramella (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Mediastinal anterior masses (MAM) represent an uncommon finding on CT. Whether there are clinical symptoms suggesting myasthenia or not, it is of the utmost importance to differentiate thymic hyperplasia from thymic epithelial tumours (thymoma or thymic carcinoma) and to rull out other diagnosis such as benign thymic cysts or other types of tumours (germinal-cell tumors, lymphoma, paraganglioma, ?). It will completely change the treatment strategy (surgery vs chemotherapy or withholding). In addition to FDG-PET-CT, MRI enables better identification of the tissue composition (cystic, presence of fat, ..). It also is useful in the surgical planning of mediastinal tumours by giving precious information on the cardio-vascular structures that can be involved in the mass, and on the possible presence of metastasis, especially in the pleura. Thoracic MRI is however rarely used in this context, due to

misconception of its poor performances in lung imaging. We will present a simple MR protocol that enables MAM characterization and work-up, and give tips for dealing with a fortuitously discovered (or not) MMA.

**TABLE OF CONTENTS/OUTLINE**

Table of content: - Thoracic MRI protocol - Different anterior mediastinal tumour types Reasoning algorithm

## CHEE-95 COMPLICATIONS UNRAVELED: A RADIOLOGIST'S GUIDE TO POST-LUNG TRANSPLANT IMAGING

Elena Julian Gomez, MD (*Abstract Co-Author*) Nothing to Disclose
Victor Fernandez Lobo (*Abstract Co-Author*) Nothing to Disclose
Marta Barrios Lopez, MD (*Abstract Co-Author*) Nothing to Disclose
Celia Cantolla Nates (*Abstract Co-Author*) Nothing to Disclose
Ana Berasategui Criado, MD (*Abstract Co-Author*) Nothing to Disclose
Maria J. Galante I, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Lung transplantation is a very complex life-saving treatment for patients with end-stage lung disease. The radiologist represents an important part of the process, from the presurgical imaging to postoperative control. Postsurgical imaging can be challenging since a wide spectrum of postoperative complications can appear. This work shows a comprehensive overview of post-transplant imaging from presurgical imaging to complications through a radiological perspective, hoping to serve as a guide for radiologists and clinicians involved in this complex procedure. With a systematic review of common and more rare post-transplant complications including rejection, haemorrage, airway complications, etc. , this educational poster highlights the highly important role of radiological imaging in early detection, and accurate diagnosis that may lead to a prompt intervention if needed.The main objectives are: - To review the main types of pulmonary transplants and surgical techniques. - To discuss pretransplant imaging- To suggests imaging protocols for the assesmento of complications- By knowing the main surgical techniques, predict the normal postsurgical changes. - To describe the main immediate, early, intermediate and late complications of this surgery- To provide images that can illustrate these complications

**TABLE OF CONTENTS/OUTLINE**

1) Indications of lung transplant2) Contraindications3) Types of pulmonary transplants4) Surgical techniques5) Imaging pre-surgical assesment6) Immediate Complications7) Intermediate Complications8) Late Complications

## CHEE-96 RADIOLOGICAL PERSPECTIVES OF LUNG DISEASE IN IDIOPATHIC INFLAMMATORY MYOPATHIES

Carlos Arteaga (*Abstract Co-Author*) Nothing to Disclose
Javier Leonardo Galindo Pedraza (*Abstract Co-Author*) Nothing to Disclose
Jorge Carrillo, MD (*Abstract Co-Author*) Nothing to Disclose
Jenny Londono (*Abstract Co-Author*) Nothing to Disclose
Santiago Martinez-Jimenez, MD (*Abstract Co-Author*) Support, Reed Elsevier
Ana M. Alvarado, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Idiopathic inflammatory myopathies (IIM) include a heterogeneous group of systemic autoimmune diseases characterized by varying degree of skeletal muscle inflammation and extramuscular manifestations. The main subtypes of IIM are dermatomyositis, polymyositis, clinically amyopathic dermatomyositis, antisynthetase syndrome, overlap syndrome, inclusion body myositis, and immune mediated necrotizing myopathy. Pulmonary involvement in the form of interstitial lung disease (ILD) is the most common extramuscular manifestation of IIM, contributing to an estimated 50% excess mortality. In up to 20% of cases, ILD precedes muscular symptoms, challenging early IIM diagnosis due to its unpredictable onset.The diversity within IIM clinical phenotypes is due to various autoantibodies, which include: myositis-specific autoantibodies (MSAs) and myositis-associated autoantibodies (MAAs). Some MSAs are associated with increased risk of ILD, such as Anti-synthetase autoantibodies, particularly Anti-Jo1 (up to 90%). Non-specific interstitial pneumonia is the most common HRCT finding in this grup. Myositis-associated rapidly progressive ILD is related with anti-MDA-5, which comes with increased mortality (up to 50%). Organizing pneumonia is the main HRCT pattern. Anti-Pl-7 and anti-Pl-12 are associated with higher incidence of ILD in the absence of clinical myositis.Other pulmonary manifestations of MII include: opportunistic infections, pulmonary hypertension, aspiration pneumonia, neoplasia and drug-induced pneumonitis.

**TABLE OF CONTENTS/OUTLINE**

Definition; Classification; Clinical presentation; HRCT patterns; Other pulmonary manifestations of MII.

## CHEE-97 LUNGS EXPOSED: A RADIOLOGICAL APPROACH TO OCCUPATIONAL LUNG DISEASES

Marie Bambrick, MBBCh (*Abstract Co-Author*) Nothing to Disclose
Micheal McInnis, MD (*Abstract Co-Author*) Speakers Bureau, Boehringer Ingelheim GmbH;Speakers Bureau, Bayer AG
Jimin Lee (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Occupational lung diseases often manifest over decades, challenging clinicians to identify the disease.- Progressive massive fibrosis has become increasingly common in recent years due to the popularity of artificial stones.- Chrysotile asbestos was still used and imported into the United States until the Environmental Protection Agency banned the material in March 2024.- Inhaled hard metal dust can result in giant cell interstitial lung disease or desquamative interstitial pneumonia.- Occupational lung diseases have characteristic appearances on high-resolution computed tomography and chest radiographs.- Mesothelioma most commonly arises from the pleura and presents with nodular pleural thickening.

**TABLE OF CONTENTS/OUTLINE**

- Overview of various occupational lung diseases (pneumoconioses, occupational asthma, hypersensitivity pneumonitis) and their clinical presentations- Review of causative agents and environments for occupational lung diseases in the modern era- Overview of clinical and radiologic approach to diagnosing occupational lung diseases- Review of hallmark imaging abnormalities on computed tomography and radiographs through sample patient cases

## CHEE-98 THE MYRIAD FACES OF NON THROMBOTIC PULMONARY EMBOLISM

Rachna Madan, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Mark M. Hammer, MD (*Abstract Co-Author*) Nothing to Disclose
Anupama Ramachandran, MD (*Presenter*) Siemens AG

**TEACHING POINTS**

To review the spectrum of imaging manifestations of non-thrombotic pulmonary artery embolism (NTPE).

**TABLE OF CONTENTS/OUTLINE**

•NTPE represents embolization of nonthrombotic material, such as tumoral cells (or other cells types), organisms, gas or foreign material, into the pulmonary circulation.•In addition to causing occlusion of pulmonary micro- or macro-circulation, NTPE are often accompanied by endothelial and/or parenchymal injury, with an inflammatory reaction both in the systemic and pulmonary circulation.•Hence on imaging, NTPE maybe associated with a constellation of vascular and parenchymal imaging findings depending on the underlying etiology.•The etiologies can be grouped in 4 categories as follows:o Neoplastic entities: Pulmonary artery sarcoma, pulmonary tumor embolism, intravascular leiomyomatosis.o Inflammatory entities: Pulmonary arterial IgG4-related disease, Takayasu arteritis, Behcet diseaseo Iatrogenic entities: Pulmonary embolization of intravascular device (central venous catheter fragment, fractured pacemaker lead), coils from thoracic duct, cement embolization, air embolism, FDG hot clot artifact.o Miscellaneous entities: Septic embolism, fat embolism.•In this educational exhibit, we discuss the etiology and the spectrum of imaging findings of NTPE.

## CHEE-99 EXPLORING THE FRONTIER OF THORACIC RADIOLOGY: THE POWER OF RADIOMICS UNVEILED

Lavinia Dias, MD (*Abstract Co-Author*) Nothing to Disclose
Marcos R. Queiroz, MD, MBA (*Abstract Co-Author*) Nothing to Disclose

CHEE-10

## IS BLOOD THICKER THAN TISSUE? A RADIOLOGIST'S GUIDE TO LIQUID BIOPSY IN LUNG CANCER

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Chiemezie Amadi, MD (*Abstract Co-Author*) Nothing to Disclose
Mohamed M. Sayyouh, MSc (*Abstract Co-Author*) Nothing to Disclose
Shotaro Naganawa, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Prachi P. Agarwal, MD (*Abstract Co-Author*) Nothing to Disclose
Jerald Garvin S. Lim, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• Introduce liquid biopsy, and its methods, as a non-invasive method for analyzing circulating analytes • Explain the current applications of liquid biopsy in guiding monitoring and treatment decisions in non-small cell lung cancer • Address challenges of liquid biopsy and its implementation in routine clinical practice • Enumerate some of the potential and future applications of liquid biopsy • Emphasize the multidisciplinary collaboration between oncologists, radiologists, and pathologists to leverage both liquid biopsy and imaging data effectively, ultimately improving patient outcomes and personalized treatment strategies.

### TABLE OF CONTENTS/OUTLINE

1. What is liquid biopsy and how is it done? 2. Common biomarkers and techniques utilized in liquid biopsy 3. Current application of liquid biopsy in non-small cell lung cancer 3.1. Tumor genotyping (e.g., KRAS, EGFR, other changes in molecular profile) 4. Advantages and disadvantages of liquid biopsy vs. percutaneous tissue biopsy. Can liquid biopsy replace tissue biopsy? 5. Current status of liquid biopsies and potential impact on radiology 6. Potential future applications of liquid biopsy 6.1. Enhance screening and early detection efforts in high-risk populations, as well as disease interception 6.2. Monitoring while on immunotherapy and targeted therapy 6.3. Identifying post-surgical patients that would benefit most from adjuvant therapy(ies) 6.4. Determining optimal duration of consolidation and adjuvant therapies 6.5. Early detection of disease progression prior to radiographic manifestation

## POST-RADIOTHERAPY LUNG CHANGES, THE MAJOR MIMICKERS: NORMAL PATTERNS AND COMPLICATIONS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Camilo A. Caicedo Montano, MD (*Abstract Co-Author*) Nothing to Disclose
Maria Alejandra Amaya, MD (*Abstract Co-Author*) Nothing to Disclose
Felipe Aluja, MD, MEd (*Abstract Co-Author*) Nothing to Disclose
Omar Andres Pantoja Burbano, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

o It is necessary to clearly understand the approach to post-radiotherapy lung in diagnostic images, focusing on four fundamental aspects: previous studies, irradiated area, technique used, and elapsed time between treatment and the evaluated study.o The irradiated areas can acquire a wide variety of patterns on CT, especially in patients undergoing high-precision radiotherapy. Therefore, it is necessary to be familiar with them, as they often present findings similar to other pathologies.o The radiologist must recognize the key points to differentiate between radiotherapy patterns, infectious pathologies, or recurrenceo Post-radiotherapy complications must be promptly recognized and differentiated from usual changes.

### TABLE OF CONTENTS/OUTLINE

o Introduction.o Pathway for addressing expected findings in the post-radiotherapy lung.o Types of radiotherapy.o Acute and chronic post-radiotherapy changes in the lung.o Main patterns that can be visualized in the irradiated areas and their differential diagnoses.o Main complications.

### TEACHING POINTS

-Differentiate radiologist workflows and their impact on diagnostic accuracy in thoracic imaging.-An assessment of how findings that are difficult to detect or appear innocent on X-ray, a projection method, actually correspond to pathologies and how they are represented in high-quality 3D and cinematic rendering.-Detail the subtle presentations of thoracic pathologies and their propensity to mimic adjacent anatomical structures.-Highlight the need for careful scrutiny in regions commonly harboring lung masses and vascular anomalies.-Discuss the diagnostic challenges posed by the complex interplay of pneumothorax, effusion, and other thoracic conditions.-Address the pitfalls of anatomical superimposition in image interpretation.

### TABLE OF CONTENTS/OUTLINE

•Trachea:-Identification of tracheal pathologies, often obscured or resembling adjacent structures.-Strategies for recognizing subtle tracheal anomalies in a busy clinical setting.•Lung:-The challenge of diagnosing lung pathologies that mimic the surrounding anatomy.•Cardiophrenic Region:-The cardiophrenic region as a potential site for pathology, complicated by its proximity to the heart and diaphragm.•Hilum:-The importance of meticulous examination to uncover hilar pathologies.•Pleura:-Pneumothorax and effusion as diagnostic challenges, with a focus on their masquerading aspects.-Techniques and pearls to differentiate these conditions from other pleural diseases.•Bones and Soft Tissues:-Superimpositions in thoracic imaging and their impact on the interpretation of bone and soft tissue anomalies.-Correcting misinterpretations of normal anatomical variants and pathological conditions.

## PURSUING THE UNUSUAL : IMAGING AND INTERVENTION STRATEGIES IN ATYPICAL SYSTEMIC VASCULAR SOURCES OF HAEMOPTYSIS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Amal Antony, MD (*Abstract Co-Author*) Nothing to Disclose
Vimal C. Mondy, MBBS,MD (*Abstract Co-Author*) Nothing to Disclose
Sai K. Deepalam JR, MD (*Abstract Co-Author*) Nothing to Disclose
Navya Paulson Mangali (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Imaging and endovascular interventions are pivotal in managing haemoptysis, a potentially life-threatening emergency. 2. Multidetector CT angiography (MDCTA) is the preferred imaging modality, allowing for a comprehensive evaluation of lung parenchyma, thoracic vasculature, and soft tissues. It enables precise identification of the source of hemoptysis, thereby aiding in the planning subsequent interventions. 3. In the majority of cases, hypertrophied bronchial arteries are responsible for haemoptysis, while atypical sources account for about five percent. Identifying these uncommon systemic vascular sources is crucial before planning intervention. 4. The role of endovascular intervention in the management of haemoptysis is increasing, offering a less invasive and effective alternative. The choice of endovascular treatment is tailored to the cause of haemoptysis. 5. Radiologists plays a central role in the multidisciplinary team, and should possess knowledge of the sources and mechanisms of haemoptysis, its imaging characteristics, and the available endovascular treatments.

### TABLE OF CONTENTS/OUTLINE

1. Common source of haemoptysis: Orthoptic Bronchial Arteries 2. Uncommon systemic vascular sources of haemoptysis: 2.1 Ectopic Bronchial Arteries 2.2 Non-bronchial systemic collaterals 2.3 Atypical configurations of systemic arteries 2.4 Aneurysm/pseudoaneurysm of systemic arteries 2.5 Systemic supply in sequestration 2.6 Aortopulmonary Collateral Arteries 3. Role of Imaging: MDCTA 4. Endovascular treatment options

Alysson Roncally Carvalho, MD,PhD (*Abstract Co-Author*) Nothing to Disclose
Ronak Kundalia (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Computed tomography (CT) is considered the gold standard imaging modality for interstitial lung disease (ILD); however, it is associated with a concerning amount of ionizing radiation exposure in patients with CT who require serial scans throughout their disease course. Magnetic resonance imaging (MRI) is emerging as a viable diagnostic modality for ILD that can accurately diagnose early stages of disease and trace its progression.

### TABLE OF CONTENTS/OUTLINE

1. Main findings in MRI - honeycombing and traction bronchiectasis2. T2 CT MR Correlation3. T1 Times4. DELAYED enhancement5. Elastography

Camila P. Reifegerste, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Bevacizumab is a monoclonal antibody against the vascular endothelial growth factor (VEGF), which prevents the development of new blood vessels necessary for tumor growth. It has been used in the treatment of various neoplasms. In addition to its known adverse effects such as hypertension, proteinuria, thromboembolic and hemorrhagic events, recent reports highlight a rare but highly fatal complication: airway fistula. Reported types include tracheoesophageal, tracheomediastinal and bronchopleural fistulas. The mechanism behind these fistulas is not fully understood, but Bevacizumab's interference with angiogenesis may delay wound healing, predisposing the airways to fistula formation. Thus, any lesion in the airways could predispose to the formation of a fistula, and the main risk factor indicated in the literature for these lesions is a history of thoracic radiotherapy. This presentation will illustrate cases of airway fistula related to the combination of Bevacizumab and a history of thoracic radiotherapy, alerting radiologists to the possibility of this diagnosis. Despite its rarity, the high mortality rate associated with airway fistulas underscores the critical need for awareness, enabling early diagnosis and effective treatment.

### TABLE OF CONTENTS/OUTLINE

Introduction to Bevacizumab and brief review of its mechanism of action/pharmacology; cases of airway fistula related to Bevacizumab + thoracic radiotherapy; discussion; conclusion.

## VERTICAL VENOUS STRUCTURES OF THE LEFT VERTEX

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Tatiana Arroyave, MEd (*Abstract Co-Author*) Nothing to Disclose
Manuela Restrepo, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. The right vertex of the mediastinum includes the most important vascular and lymphatic structures of the body. In unusual circumstances, these structures have developmental malformations that are incidentally recognized on imaging as vertical venous structures of the left vertex. It is essential to recognize because of its clinical and surgical importance.2. Persistent left superior vena cava (SVC) is the most common congenital anomaly seen in the thorax. In this case, the right SVC might be normal, small or absent. When the right SVC is also present, it is considered a duplicated vena cava. In unusual cases the brachiocephalic vein passes posterior or surrounding to the aorta. An atypical case of circumaortic SVC is presented.3. The anomalous supracardiac venous drainage is a congenital anomaly in which the pulmonary veins converge in one single vertical vein on the left vertex of the thorax, that drains to the systemic circulation, either to the SVC, brachiocephalic vein or the right atrium. 4. The anomalies of the thoracic duct are rare, and it is important to recognize the normal anatomy to identify when possible anomalies exist, including complete left sided course, cystic dilatation, duplications, plexiform variation and absence of the cisterna chyli.

### TABLE OF CONTENTS/OUTLINE

Learning objectives. Normal anatomy. Duplicated and single left SVC. Circumaortic SVC. Abnormal supracardiac venous drainage. Thoracic duct reflux. Retroaortic innominate vein. Summary

Irene Dixe de Oliveira Santo, MD (*Abstract Co-Author*) Nothing to Disclose
Anna S. Bader, MD (*Abstract Co-Author*) Nothing to Disclose
Manroop Kaur, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Temporary ventricular assist devices (VAD) can be used in the acute setting supporting both the left and right ventricle.Long-term VADs are indicated for patients in the Class IV HF category, though cardiac transplant is the definitive treatment, assist devices can be used as a bridge to transplant, or destination therapy in those who do not qualify.Retrospective ECG gating through the entire cardiac cycle is recommended for optimal imaging of ventricular assist devices.Complications of VADs include malposition, hemopericardium, mediastinal hematoma, soft tissue hematoma, driveline infection/abscess, outflow graft thrombus, aortic stenosis, Heyde syndrome, bio-debris resulting in graft stenosis/occlusion.The purpose of this exhibit is to provide a review of the mechanics and appearances of traditional and newer ventricular support devices and illustrate common and uncommon complications through a multi-modality case-based review.

### TABLE OF CONTENTS/OUTLINE

1. Cardiac anatomy and pathophysiology of heart failure. 2. Heart failure classification and indication for ventricular assist devices.3. CT protocols for appropriate evaluation of ventricular assist devices. 4. Appropriate placement of ventricular assist devices through a multi-modality case review with pitfalls in malpositioned devices.5. Case-based imaging review of acute and chronic complications from ventricular assist devices including acute renal failure, ischemic colitis, hematomas, driveline infection, LV/RV thrombus, aortic stenosis, outflow graft stenosis (thrombus and bio-debris), and twisting of the outflow graft. 6. Identification of thrombus versus bio-debris deposition in the outflow graft.

CHEE-110

## DEMYSTIFYING TRAPPED LUNG:NOMENCLATURE, EMERGING CONCEPTS, IMAGING FINDINGS AND DIFFERENTIAL DIAGNOSIS THAT RADIOLOGIST SHOULD KNOW

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Carlos S. Restrepo, MD (*Abstract Co-Author*) Nothing to Disclose
Rajeev Suri, MD, MBA (*Abstract Co-Author*) Nothing to Disclose
Ameya J. Baxi, MBBS,DMRD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To review nomenclature, etiopathogenesis and clinical features of trapped lungTo review radiographic and computed tomography imaging features of trapped lungTo review emerging concepts/recent literature update

### TABLE OF CONTENTS/OUTLINE

The term 'trapped lung' is used when the lung in unable to expand secondary to defective healing of the pleural space leading to stiff pleura restricting expansion of the lung. The diagnosis requires documentation of chronicity absence of active inflammatory or malignant pleural process, bronchial obstruction, or severe underlying lung disease. Trapped lung is usually seen secondary to inadequately treated chronic parapneumonic effusion or empyema, post-cardiac injury syndrome, post-cardiac surgery, hepatic hydrothorax, uremia, radiation, hemothorax, and rheumatoid pleuritis. Due to its rarity, occasional case reports are published and limited radiology literature is available in regards to natural history, etiopathogenesis, radiological manifestations. A more accurate precise terminology of trapped lung is a need of time is proposed. Imaging plays a critical role in patient management and at times eliminates invasive diagnostic or therapeutic procedures. Following are discussed: Aims/objectives, Nomenclature, Pathogenesis and imaging features of trapped lung, Differential diagnosis, Review of literature, Management, Post treatment follow up, Teaching points, and Conclusionp class="MsoNormal">

## EMPYEMA: INFECTION TO INTERVENTION - A PRIMER FOR THE RESIDENTS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Mariana Travieso Diffoot (*Abstract Co-Author*) Nothing to Disclose
Adrian Naoun (*Abstract Co-Author*) Nothing to Disclose
Babina Gosangi, MD, MPH (*Abstract Co-Author*) Nothing to Disclose
Manuel Garcia (*Abstract Co-Author*) Nothing to Disclose
Carol Sanchez Santana (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Ultrasound imaging can play an important role in the diagnosis, quantification, and staging of empyema. A sinusoid sign on ultrasound can predict lung expansion following empyema drainage. A positive sinusoid sign favors lung re-expansion after empyema drainage. Chest tube drainage output can be an indicator for response to antibiotic treatment. If output gradually decreases, it means the patient is responding to treatment. When the output is <100ml tube can be removed.“Lung entrapment” is a reversible condition where the patient is symptomatic, with possible mediastinal shift to the opposite side, and surgical treatment like decortication offers immediate response. “Trapped lung” is irreversible, and an ex-vacuo pneumothorax can be present on imaging. Decortication is optional and performed for symptomatic relief.MRI imaging can help to differentiate empyema from necrotizing pneumonia.

### TABLE OF CONTENTS/OUTLINE

Role of imaging in the diagnosis of empyema with a focus on quantification, staging, follow-up. Describe the imaging features of etiology of empyema: empyema from pneumonia, hematogenous spread, and infection spread from contiguous structures like osteomyelitis (bone infection), empyema following surgical procedures. Describe imaging features of complications of empyema: empyema necessitans, post-pyothorax lymphoma, fibrothorax. Describe imaging findings of treatment procedures for empyema: tube thoracostomy, thoracomyoplasty, pleural decortication, Clagett window, Eloesser flaps. Describe complications of treatment procedures including non-expanding lung-like formation of pleural rind, lung atelectasis, endobronchial obstruction, bronchopleural fistula.

Hanna R. Ferreira Dalla Pria, MD, MD (*Abstract Co-Author*) Nothing to Disclose
Sravani Mannuru, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Cardiothoracic devices represent an important aspect of evaluation in radiographs and tomography for trainees and experienced radiologists who critically assess their positioning and potential complications. However, although they are part of the daily routine, they also become challenging due to the multiple types of devices available, which increase yearly. It’s essential to become familiar with and updated on these devices in order to identify what is expected and abnormal, especially regarding malfunctioning, malpositioning, and other potential complications.This exhibit aims: 1. To review the most used cardiothoracic devices, emphasizing the newest ones. 2. To illustrate cases of misposition, malfunctioning, and/or complications related to devices that appear in cardiothoracic radiology.

### TABLE OF CONTENTS/OUTLINE

Section A- Introduction/Objectives: Brief review of relevant radiological concepts of cardiothoracic devices: 1. Pacemakers and Implantable cardioverter-defibrillators, 2. Loop recorders, 3. Valve replacement and repair, 4. Closure devices, 5. Vascular stents, surgery clips (CABG), 6. Left ventricular assist device, 7. Impella, 8. Intra-aortic balloon pump, 9. Pleural devices, 10. I Tracheal/bronchial, and II esophageal devices, 11. Vascular catheters, 12. And miscellaneous, such as hypoglossal nerve stimulator, embolization coils, and the antibiotic spacer. Section B - Case-based approach: Present/illustrate cases among the ones listed above with typical and unexpected complications, malpositioning, and malfunctioning of these devices.

Laura Macri (*Abstract Co-Author*) Nothing to Disclose
Francesca Lucrezia Rabaiotti (*Abstract Co-Author*) Nothing to Disclose
Michaela Cellina (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To learn applications of portable DDR for chest investigation at the patient’s bedside.

### TABLE OF CONTENTS/OUTLINE

DDR is a new high-resolution technique, that applies pulsed X-ray to acquire multi-frame fast-paced sequential acquisition of targeted anatomical areas, then reproduced in cine-loops.Different conditions may result in diaphragmatic dysfunction, including vascular disorders, post-traumatic abnormalities, infections, muscular and neuro-muscular diseases, and neoplasms. DDR provides functional, structural, and morphological information and shows the pattern of diaphragmatic motion over time in colored curves, quantifying the range of motion to support the diagnosis of diaphragmatic dysfunction. DDR allows the evaluation of lung motility and the presence of abnormal motion related to adhesions or post-surgical conditions, useful in diagnosing breathing abnormalities in lung cancer patients. Lung Ventilation can be assessed through automatic reconstructions of colored maps, which provide information on the changes in pixel density and related signal over time that can be used to identify regional differences in ventilation and to assess the effectiveness of different respiratory treatments in Intensive Care Units patients. Pulmonary perfusion abnormalities related to chronic and acute conditions can be investigated with DDR without the need for any contrast media, allowing the acquisition in patients with severe allergies or altered renal function. The acquisition of dynamic imaging at the patient’s bed can also increase the X-ray sensitivity in detecting post-procedural complications, such as pneumothorax, that can be easily detected and followed up without moving the patient.

### TEACHING POINTS

Pulmonary cysts are a common finding in routine CT scans. Solitary/incidental cysts in asymptomatic individuals may represent part of the normal aging process. However, lung cysts can be a manifestation of an underlying disease and the diagnosis might be challenging. 1) Review the main imaging findings of cystic lung diseases (CLD). 2) Recognize the different causes of CLD based on their causes, location and distribution of the cysts, and associated findings. 3) Propose a practical and systematic approach to interpret the CLD based on the main imaging findings and clinical features. 4) Present helpful clues and key points to narrow down the differential diagnosis.

### TABLE OF CONTENTS/OUTLINE

1) Introduction 2) Differential diagnosis of air-filled lung lesions 3)Histopathology of pulmonary cysts 4)Main causes of cystic lung disease 5)Solitary/localized cysts 6)Multiple/diffuse cysts not commonly associated with other pulmonary findings 7)Multiple/diffuse cysts associated with ground-glass opacities 8)Multiple/diffuse cysts associated with pulmonary nodules 9)Multiple/diffuse cysts associated with fibrotic changes 10)Conclusion/Take-home messages

## PULMONARY SARCOIDOSIS: AN UPDATE FOR CT FINDINGS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Lydia Chelala, MD (*Abstract Co-Author*) Nothing to Disclose
Iclal Ocak, MD (*Abstract Co-Author*) Nothing to Disclose
Erhan Akpinar, MD (*Abstract Co-Author*) Nothing to Disclose
Furkan Ufuk, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• To review the typical and less common findings of pulmonary sarcoidosis on chest CT.• To describe the chest CT phenotypes of sarcoidosis and examines the pathophysiological insights gained from chest CT. • To review the role of chest CT in monitoring the sarcoidosis and in prognostication.

### TABLE OF CONTENTS/OUTLINE

1. Non-fibrotic Subtypes a. Perilymphatic Micronodules Innumerable small nodules along the bronchovascular bundles, fissures, and subpleural regions. b. Large Peri-bronchovascular Nodules: Characterized by large nodules centered around the bronchovascular structures, potentially showing the "galaxy sign". c. Scattered Large Nodules Characterized by large nodules that are scattered and appear unrelated to the bronchovascular structures. d. Consolidation Lung consolidation which may suggest alveolar filling processes. e. Other rare conditions Air trapping, reversed halo sign, mass-like lesions, and ground-glass opacification. 2. Likely to be Fibrotic Subtypes a. Bronchocentric Reticulation without Cavitation Characterized by reticular patterns focused around the bronchovascular structures without evidence of cavitation. b. Bronchocentric Reticulation and Dense Parenchymal Opacification with Cavitation Characterized by bronchocentric reticulation accompanied by areas of dense opacification and cavitation. c. Large Bronchocentric Masses Characterized by large, dense, bronchocentric masses that mimic the appearance of progressive massive fibrosis. 3. Grey Zones and Unknowns: • Mosaic attenuation and interlobular septal thickening. • The link between specific CT appearances and with their clinical significance. Rare imaging findings of pulmonary sarcoidosis.

### TEACHING POINTS

To describe the optimal technical computed tomography (CT) acquisition in order to evaluate pleural thickening. Review the semiology of mesothelioma on CT. To illustrate the radiological findings associated with asbestos exposure that can provide clues in the diagnosis of pleural malignancy. To discuss the different interventional procedures available for diagnosis, focusing on those guided by imaging.

### TABLE OF CONTENTS/OUTLINE

1. Chest CT scan studies with venous phase acquisition for better detection of pleural thickening in suspected malignant effusion. 2. Typical CT imaging findings in mesothelioma, considering subtle and more specific radiological signs. 3. Asbestosis and pleural plaques associated with asbestos exposure in the context of a pleural effusion suspicious for malignancy, along with recommendations for precise detection. 4. A review of various interventional techniques for diagnosing mesothelioma as reported in medical literature, including thoracentesis, blind pleural biopsy, image-guided pleural biopsy, and surgical procedures. 5. The importance of reviewing positron emission tomography (PET) studies before conducting image-guided biopsies to optimize results.

Paulo E. Catarina, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

I. Review the epidemiology and clinical characteristics of silicosis, as well as the main diseases related to silica exposure. II. Illustrate the imaging findings of silicosis and diseases associated with silica exposure. III. Propose a diagnostic approach to the radiological findings of silicosis, considering its differential diagnoses, associated diseases and complications.

### TABLE OF CONTENTS/OUTLINE

Silicosis overview:- Silicosis is the primary manifestation resulting from exposure to silica crystals. It entails irreversible diffuse interstitial lung disease.- Epidemiological data:-About 2.3 million Americans are exposed to inhalable silica particles.Other Associated Diseases: Silica exposure is strongly associated to various diseases beyond silicosis (lung cancer, tuberculosis, chronic obstructive pulmonary disease (COPD)).Additionally, less prevalent ailments like autoimmune diseases (especially rheumatoid arthritis and systemic sclerosis), sarcoidosis, and vasculitis.Clinical Importance Understanding the presentation of pulmonary silicosis and its associated diseases is crucial.This knowledge aids radiologists and pulmonologists in early diagnosis and complication prevention.Purpose of Review: Provide a comprehensive understanding of silica exposure-related conditions

## CYSTIC LUNG DISEASES: BLEND OF CLASSIC KNOWLEDGE AND CONTEMPORARY INSIGHTS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Felipe S. Torres, MD, PhD (*Abstract Co-Author*) Research support, Altis Labs
Micheal McInnis, MD (*Abstract Co-Author*) Speakers Bureau, Boehringer Ingelheim GmbH;Speakers Bureau, Bayer AG
Patrik Rogalla, MD, MBA (*Abstract Co-Author*) Institutional Research Grant, Canon Medical Systems Corporation;Institutional Research Grant, KA Imaging
Tae Bong Chung, MD (*Abstract Co-Author*) Nothing to Disclose
Jonatas Favero Prietto Dos Santos, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- A cyst appears as a circumscribed parenchymal low attenuating area, usually with thin and regular walls. - Solitary or few small thin-walled lung cysts incidentally detected on CT may be part of the normal aging process. - In scenarios involving young patients with multiple lung cysts, careful evaluation of cyst characteristics, distribution, and ancillary radiologic findings is paramount. - Cystic lung cancers are an underrecognized condition on CT, often missed at early stages. - Suspicious cyst features include thick or asymmetric walls, associated nodules, internal septations, and growth. - A change in the morphologic features of a cyst and surrounding tissues should raise suspicion for cancer.

### TABLE OF CONTENTS/OUTLINE

1) Review basic imaging concepts through examples, including the updated terminology from the new Fleischner Society glossary of terms for Thoracic Imaging. 2) Distinguish between non-pathological and pathological lung cysts, focusing on their clinical significance and associated findings that aid in diagnosing diffuse lung cystic diseases. 3) Overview of classical cystic lung pathologies. 4) Revisit congenital, infectious, and non-infectious abnormalities that may present with cysts. 5) Unveil the evolving landscape of cystic lung cancers, integrating recent updates from LUNG-RADS. 6) Through a blend of classic knowledge and contemporary insights, this exhibit endeavors to provide radiologists with a nuanced understanding of cystic lung diseases, enhancing diagnostic accuracy and patient care.

### TEACHING POINTS

• Traditional medical imaging methods, such as radiography, CT and MRI can depict structural spatial variation in the lungs but not function. Recently several imaging methods have been developed that are able to depict the local distribution of functional parameters, such as ventilation and perfusion. • Some techniques involve the application of software analysis to images obtained with standard hospital equipment. They include analysis of ventilation on fluoroscopic or CT images, as well as modeling airway flow with computational fluid dynamics methods. • Some techniques involve technical changes in standard imaging modalities, and they could be CT-based (e.g. dual-energy CT) or MRI-based (e.g. hyperpolarized gas MRI). • Some techniques involve the use of dedicated hardware, such as dynamic digital radiography and electrical impedance tomography. • We will describe several imaging methods capable of depicting lung function, such as ventilation and perfusion. Pros and cons of each method will be highlighted.

### TABLE OF CONTENTS/OUTLINE

• Nuclear-medicine methods: o Scintigraphy o SPECTPET • Radiography-based methods: o Dynamic digital radiography o X-Ray Velocimetry Lung Ventilation Analysis Software • CT-based methods: o Parametric response map o Xenon CTDual-energy CT o CT Lung Ventilation Analysis Software o Functional Respiratory Imaging • MRI-based methods: o Hyperpolarized gas MRI o Fluorinated gas MRI o Oxygen-enhanced MRI o Fourier-decomposition MRI o Phase-resolved functional lung MRI o Dynamic contrast-enhanced perfusion MRI o Contrast-enhanced MR angiography o Non-contrast MR angiography (arterial spin labelling) • Electrical Impedance Tomography

## A COMPREHENSIVE VIEW OF ACUTE AORTIC SYNDROME THROUGH ANGIOTOMOGRAPHY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Magali Alvarez, MD (*Abstract Co-Author*) Nothing to Disclose
Andres Primavera (*Abstract Co-Author*) Nothing to Disclose
Ignacio Grimoldi, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To distinguish the pathologies included in acute aortic syndrome. To review the multiphase angiotomography protocol for the study of acute aortic syndrome, the frequent findings in each phase and for each entity on images. To explore the different existing classifications of aortic dissection. To characterize the imaging differences of the aortic dissection flap morphology according to the evolution of an acute to chronic state. To review the most frequent treatment techniques and their complications through cases. To recognize the typical findings of flow entry into the false lumen and its classification system. To detail the components that should not be missing in the follow-up aortic imaging report.

### TABLE OF CONTENTS/OUTLINE

1. Introduction to Acute Aortic Syndrome: distinct characteristics of aortic dissection, intramural hematoma and penetrating atherosclerotic ulcer. 2. Diagnosis CTA imaging: protocol and frequent findings in each phase. 3. Classification Systems, a) DeBakey system b) Stanford Classification System c) Society of Vascular Surgeons and the Society of Thoracic Surgeons (SVS/STS) classification system d) The European update of the Stanford classification: the type/entry/malperfusion (TEM) classification. 4. Common surgical procedures and their complications. 5. Follow-up CTA imaging and report. 6. Classification system for describing flow to the false lumen.

## THROMBOTIC AND NON-THROMBOTIC PULMONARY EMBOLISM - IS IT REALLY A CHALLENGE FOR ROUTINE PRACTICE? AN ERROR-BASED LEARNING APPROACH

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Philippe Khafagy (*Abstract Co-Author*) Consultant, Gleamer
Ernest Martinez Schargel, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Pulmonary artery artefacts (kinetic, beam hardening and flow artefacts specifically due to left-to-right shunt) can be resolved by adapted protocols such as using aorto-pulmonary injection timing. Density measurement of an embolus may be useful in determining its nature. Bilateral central ground glass opacities can refer to pulmonary edema, hemorrhage or infection (especially PCP) and can be the only finding in non-thrombotic PE such as fatty PE. Knowledge of anatomical distribution and morphology of lymph nodes is important to distinguish them from vascular lesions. MPR is useful for anatomical evaluation. Presence of an endovascular tumor invasion may help identify pulmonary tumor embolisms. Consolidation in septic emboli may present features similar to infarcts in the acute phase (before cavitation). MPR and minIP are essential to identify signs of chronic thromboembolic pulmonary hypertension. Sometimes pulmonary infarction may be nodular and difficult to recognize at first glance.

### TABLE OF CONTENTS/OUTLINE

Our 5 chosen cases will lead us to discuss the challenges encountered in routine practice for diagnosis of thrombotic and non-thrombotic PE. We will distinguish first readers' opinion from that of a second reader, which will provide tips to reach the right diagnosis. Each case will distinctly refer to a category of embolism, and will allow for an in-depth discussion of each of these categories. Case 1 : Shortness of breath and elevated D-Dimers. PE ? Case 2 : Elevated D-dimers and retrosternal pain. PE ? Case 3 : Follow-up CT of a patient known for signet ring cell adenocarcinoma Case 4 : Trauma and lumbar pain. Initially, no further context given Case 5 : Dyspnea of unknown origin, suspicious nodules on CT PET-CT

## ULTRA-HIGH-RESOLUTION CT FINDINGS OF PRE-INVASIVE ADENOCARCINOMA AND MINIMALLY-INVASIVE ADENOCARCINOMA OF THE LUNG

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Motoharu Hakozaki (*Abstract Co-Author*) Nothing to Disclose
Kenji Fujii (*Abstract Co-Author*) Employee, Canon Medical Systems Corporation
Kouji Hashimoto I (*Abstract Co-Author*) Nothing to Disclose
Hiroshi Chiba I (*Abstract Co-Author*) Nothing to Disclose
Hiroshi Moriya, MD, PhD (*Presenter*) Advisor, California Capital Equity, LLC;Research Grant, Canon Medical Systems Corporation

### TEACHING POINTS

With the spread of CT screening, the chances of small lung nodule and early lung cancer are increasing. Therefore, the following points are presented by comparing the ultra-high resolution CT (UHRCT) and pathological findings of resected specimens. 1. Classification of Lung Adenocarcinoma2. Pathological invasion criteria of lung adenocarcinoma 3. Spatial resolution of UHRCT4. UHRCT findings of of pre-invasive adenocarcinoma and minimally-invasive adenocarcinoma5. Comparison of UHRCT findings and pathological findings

### TABLE OF CONTENTS/OUTLINE

1. pre-invasive adenocarcinoma (AAH, AIS) and minimally-invasive adenocarcinoma (MIA) of the lung (confirmed by pathological diagnosis of resected specimens) were reviewed.2. The definition of "pathological non-invasion" is lepidic growth and the absence of reactive fibroblast growth factor, vascular / lymphatic vessel invasion, pleural invasion, and STATS. These are diagnoses by microscopic pathological findings, immunostaining, and genetic diagnosis, and are not directly reflected in the macroscopic image morphology.3. UHRCT is a CT that achieves high spatial resolution by reducing the detector size to 1/4. In the previous studies, bronchi with an inner diameter of 0.4 mm are delineated. By improving the resolution, it has become possible to display the intralobular structure. 4. AIS is mainly based on ground glass opacity, but there may be collapsed parts that have lost aeration inside. Ground glass opacity is a finding found in the lepidic extension, but also in the papillary extension. There are also invasive adenocarcinomas mainly composed of ground glass opacity. Some MIA presents solid nodules without aeration.

## DIFFERENCES BY MORPHOLOGICAL PATTERN IN PROGRESSION OF PULMONARY FIBROSIS ON HRCT

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Takahiko Nakazono, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Ken Yamaguchi, MD (*Abstract Co-Author*) Nothing to Disclose
Ryoko Egashira, MD, PhD (*Presenter*) Speakers Bureau, Boehringer Ingelheim GmbH;Speakers Bureau, AstraZeneca PLC;Speakers Bureau, Shionogi & Co, Ltd;Speakers Bureau, KYORIN Holdings, Inc;Speakers Bureau, DAIICHI SANKYO Group;Speakers Bureau, Bayer AG;Speakers Bureau, Otsuka Holdings Co, Ltd;

### TEACHING POINTS

The HRCT diagnosis of interstitial lung disease (ILD) is made by a combination of several non-specific findings.MDD is important because it provides a more practical diagnosis by reading the pathology from the images and combining it with the clinical background and histological diagnosis. Progressive pulmonary fibrosis (PPF) applies to ILDs other than IPF showing progressive clinical, functional or radiological fibrosis over a one-year period, in which the radiologist also has an important role to play in this decision. It is important to know where to focus on each morphological pattern, as the way fibrosis progresses differs according to the morphological pattern.

### TABLE OF CONTENTS/OUTLINE

Diagnostic approach to fibrotic ILD on HRCT. Summarize the current classification/guidelines of interstitial pneumonias/idiopathic pulmonary fibrosis/PPF. Presentation of the differences in the fibrotic progression by morphological patterns. In the UIP pattern, fibrosis results from abnormal alveolar epithelium "wound healing" after invisible injury, with alveolar collapse and collagen build-up causing volume loss and honeycombing. Small lesion accumulation makes detecting the increase of fibrosis on HRCT challenging. In NSIP/fibrosing OP, inflammation injures more extensive lung areas, transitioning to fibrosis and causing alveolar septa thickening and volume loss. This process, unlike UIP, is visible on HRCT, where ground-glass opacities evolve into reticulations. The newer PPFE pattern's pathogenesis remains unclear, but involves epithelial damage leading to lung collapse and induration, detectable on HRCT as volume reduction and collapsed sclerotic lesions, without prior inflammation.

## THE ROLE OF CHEST CT IN MONITORING CYSTIC FIBROSIS MODULATOR THERAPY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Laura Jimenez-Juan, MD (*Abstract Co-Author*) Nothing to Disclose
Matias F. Callejas, MD (*Abstract Co-Author*) Nothing to Disclose
Djeven P. Deva, MBBCh (*Abstract Co-Author*) Nothing to Disclose
Jose Miguel Castro Garcia, MD (*Abstract Co-Author*) Nothing to Disclose
Ji-Yeon Han, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Low-dose chest CT is used to assess cystic fibrosis patients initiating and undergoing cystic fibrosis transmembrane conductance regulator (CFTR) modulator therapy.- Reduction in bronchial wall thickening, mucous plugging, air trapping, and parenchymal abnormalities have been described in cystic fibrosis patients undergoing modulator therapy.- The extent and caliber of bronchiectasis remain stable in the vast majority of cases despite modulator therapy because bronchiectasis is, for the most part, an irreversible structural change.- CT quantification could be useful for predicting clinical outcomes, such as exacerbations and survival, but it has not yet been integrated into daily practice.

Maria Clara N. Lorca, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

This educational exhibit reviews the basic terms frequently used in the diagnosis, staging and treatment of lung tumor, making it a quick and reliable resource for radiologists participating in interdisciplinary conferences.This glossary of terms is an image rich, case-based guide designed to shape imaging interpretation in a way that creates concise but complete summaries, providing the necessary information needed to be conveyed to the different participants of interdisciplinary conferences.Briefly review the new proposed 9th TNM classification, including the new N guidelines. Discuss the expected imaging appearances of: The most common thoracic surgery approaches for lung cancer treatment: including segmentectomies, wedge resections, lobectomy and pneumonectomy. Compare and discuss the different CT-guided localization methods of pulmonary nodules, including fiducial and microcoil markers placement. Stereotactic ablative radiotherapy (SABR), aka stereotactic body radiotherapy (SBRT), chemotherapy, and immunotherapy. -Lung ablation therapy. Imaging pitfalls to be aware post precision therapy.

### TABLE OF CONTENTS/OUTLINE

This education exhibit reviews different types of surgeries for lung cancer treatment and the expected radiological appearance post-therapy.Creates a checklist with all the necessary information the radiologist is expected to report when diagnosing and/or following lung cancer, as well as the most common post treatment findings.Depict the new subtypes of lung cancers, included in the 2021 WHO classification of the tumors of the lung, including SMARCA4 and bronchiolar adenoma.

### TEACHING POINTS

This educational exhibit will: 1. Summarize the 2021 WHO Classification of both pericardial and pleural tumors 2. Highlight imaging characteristics of the different pleural and pericardial tumors

### TABLE OF CONTENTS/OUTLINE

This exhibit aims to provide a comprehensive overview of pleural and pericardial tumors using biopsy-proven case examples. Cases will be systematically reviewed, utilizing the framework presented in the 2021 WHO guidelines and how the knowledge of histological tumor subtypes has become important in the clinical scenario of precision therapy treatment. Radiological findings of tumors will be presented alongside respective pathology correlates. Tumors to be covered include: Benign and preinvasive mesothelial tumors of the pleura, pleural mesothelioma in situ, localized mesotheliomas, malignant pleural mesotheliomas (MPM), aka diffuse mesotheliomas, benign and malignant primary tumors of the pericardium and metastases to the pleura and pericardium, pericardial angiosarcoma and others.References: 1. Maria Vitoria Ludwig, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• The forthcoming 9th edition TNM classification (TNM-9) for lung cancer will introduce refined subcategories for nodal involvement and metastatic disease classification, addressing the need for improved precision in staging and treatment decisions. • The subcategorization of N2 into N2a and N2b resulted in new TN subsets, including T1N2a, assigned to stage IIB, which reflect changes in the prognosis prediction. • The subcategorization of M1c into M1c1 and M1c2 is also relevant to refine prognosis, even though it doesn’t imply a change of stage (both remain in stage IVB). • The clinical importance of these changes reinforces the necessity for precise evaluation and reporting of mediastinal nodal disease and distant metastases through comprehensive imaging, notably CT and PET-CT. • This presentation aims to review key concepts and revisions of TNM-9 in a practical approach tailored for radiologists and residents.

### TABLE OF CONTENTS/OUTLINE

1. Introduction: principles of cancer staging; 2. Lung cancer staging state-of-the-art: (a) Multimodality imaging (b) 8th edition of the TNM Classification; 3. IASLC Lung Cancer Staging Project: methods and guiding principles; 4. Revisions of the TNM Descriptors in the Forthcoming 9th edition of the TNM Classification: (a) N Descriptors (b) M Descriptors (c) Summary and practical approach; 5. Illustrative cases with multimodality imaging: a comparative review; 6. Future perspectives: liquid biopsy and artificial intelligence; 7. Take home messages

### TEACHING POINTS

Nontuberculous mycobacteria (NTM) are a group of ubiquitous, low grade pathogens that cause pulmonary infections in immunocompetent and immunocompromised people worldwide, with particularly high prevalence in the US and Japan.This exhibit will:a. Discuss the epidemiological and microbiological underpinnings on NTMb. Recognize the different clinical and imaging presentation of the two main forms of the disease.c. Review imaging features of less common types of presentation including scenarios with altered pulmonary parenchymal architecture, immunocompromised hosts, congenital heart disease, etc. As well as review common and rare complicationsd. Discuss the role of imaging in the pharmacologic and surgical management of these patients.

### TABLE OF CONTENTS/OUTLINE

1. Epidemiology and Microbiological Background 2. Diagnosis 3. Imaging Findings a. Classic (Cavitary Form) b. Non-Classic (Bronchiectatic Form) c. Hypersensitivity Pneumonitis (Hot Tub Lung) d. Immunocompromised Host e. Other Predisposing Conditions (e.g. ILD, Cystic Fibrosis, Organ Transplant) f. Complications 4. Imaging Role in Treatment Strategies a. Pharmacologic Treatment Imaging Follow Up b. Pre-operative and Post-operative Evaluation 5. Role of Alternative Imaging Modalities (MRI, PETCT)

### TEACHING POINTS

- Review the most common modalities of local treatment of thoracic neoplasms.- Recognize the expected changes related to each modality of local treatment and the potential acute complications.- Review the imaging findings of the acute thoracic complications related to systemic cancer therapy.

### TABLE OF CONTENTS/OUTLINE

Acute thoracic findings in oncology patients can be related to local or systemic therapy. It might vary from expected changes related to local treatment to acute complications that can be life threatening. Beyond that, these findings can be misinterpreted as tumor recurrence and compromise the appropriate treatment.The aim of this pictorial review is to present1. Expected acute imaging findings related to the most common local cancer treatment modalities in the chest, including surgery, ablation therapy and radiation therapy.2. A systematic review of the imaging findings of acute complications related to local and systemic cancer therapy, based on treatment modality and organ system (airways and lung, pleura, cardiovascular and mediastinum).

### TEACHING POINTS

The purpose of this educational exhibit is to: 1. Review current epidemiologic trends of recreational substance use 2. Discuss current chest imaging techniques and imaging findings of recreational drug induced lung injury 3. Review the pathophysiology and routes of lung injury and long-term damage caused by different recreational substances through representative cases 4. Discuss the complications, prognosis, and treatments of recreational substance induced lung injury and damage.

### TABLE OF CONTENTS/OUTLINE

The majority of Americans now live in a state where recreational use of marijuana is legal, with usage trends mirroring increased accessibility; similar increased usage trends of e-cigarettes and vaping products have been noted nationwide. With more widespread use of recreational substances with the potential for substance induced lung injury, this exhibit aims to provide a timely review of key imaging features and patterns of both acute lung injury and long-term damage related to a myriad of substance use including marijuana, e-cigarettes/vaping, conventional tobacco products, talcosis, and crack cocaine.

Gabriel De Figueiredo Pereira, MD (*Abstract Co-Author*) Nothing to Disclose
Bruna Carvalho (*Abstract Co-Author*) Nothing to Disclose
Guilherme C. del Guerra, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The purpose of this exhibition is to delve into the characteristic CT findings that aid in the diagnosis and understanding of post-primary pulmonary tuberculosis, also known as reactivation tuberculosis or secondary tuberculosis. There are plenty of patterns that may be associated with post-primary pulmonary tuberculosis, such as lobar pneumonia, cavitations, tree-in-bud opacities, ground-glass opacities, centrilobular nodules, tuberculomas and/or pseudomasses. Demonstrating illustrative cases, this exhibition aims to assist radiologists in reporting chest CT scans in a post-primary pulmonary tuberculosis scenario.

### TABLE OF CONTENTS/OUTLINE

This exhibition initiates with a summary of the relevance, worldwide prevalence and pathology of the post-primary pulmonary tuberculosis. The next slides present the types of presentation and expected findings of the post-primary pulmonary tuberculosis on chest CT, with illustrative cases of each main form of presentation, identifying the most important radiological finding on each image. The collection contains cases of miliary tuberculosis, tuberculomas/pseudotumors, lobar pneumonia, atypical forms, such as inferior and anterior involvement, and multi-drug resistant pulmonary tuberculosis findings, including bilateral cavitations. The potential signs of active disease are subsequently highlighted. The presentation ends with relevant take-home messages.

### TEACHING POINTS

Gallium-68-labeled Fibroblast Activation Protein Inhibitor (FAPI-PET) represents an exciting advancement in molecular imaging as it targets proteins directly involved in tumor microenvironment. This presentation will present and review the uses of this novel tracer, focusing on lung cancer: - Describe the diagnostic performance and limitations of the 68-Ga-FAPI PET-CT and 18-FDG PET-CT.- Demonstrate the application of the 68-Ga-FAPI PET-CT in oncology with didactic cases of lung cancer through cross-sectional imaging.- Discuss the role of 68-Ga-FAPI versus 18-FDG PET-CT imaging in staging lung cancer using a case-based approach.

### TABLE OF CONTENTS/OUTLINE

- General concepts of the role of imaging in staging primary and metastatic lung cancer using both 18-FDG and 68-Ga-FAPIEffectiveness diagnostic performance.- Illustrative cases: Radiological features in false negative and false positive cases.- The main challenges and perspectives of implementing in routine clinical. - Conclusion / Take-home messages.

### TEACHING POINTS

This exhibit serves the following purposes:• Exploring the anatomy of the sternum and its diagnostic assessment through a comprehensive multimodality approach.• Discussing the spectrum of anatomical variants of the sternum, encompassing component disproportions, sternal foramina, xiphoid shape variations, and associated conditions such as pectus carinatum and pectus excavatum. • Analyzing mechanical and inflammatory conditions and their imaging manifestations, such as arthritis, mechanical overloads, spondyloarthropathy, and SAPHO syndrome. • Examining traumatic injuries involving the sternum, including sternoclavicular dislocations, as well as acute and chronic fractures. • Analyzing infectious diseases affecting the sternum, with a focus on septic arthritis, alongside discussion of rarer infections like sporotrichosis. • Identifying the expected image patterns of benign and malignant sternum tumors, notably enchondroma and chondrosarcoma. • Recognizing various post-operative sternum conditions, including pseudoarthrosis, acute mediastinitis, secondary osteomyelitis, and complications associated with sternal prostheses.

### TABLE OF CONTENTS/OUTLINE

• Sternum anatomy. • Imaging modalities. • Sternal anatomical variations. • Mechanical and inflammatory pathologies. • Traumatic injuries. • Infectious diseases. • Tumors. • Post-operative complications.

## BEYOND THE BELLY: IMAGING OF THORACIC MANIFESTATIONS OF OBSTETRIC AND GYNECOLOGIC DISEASE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Aletta Ann Frazier, MD (*Abstract Co-Author*) Nothing to Disclose
Alan M. Ropp, MD (*Abstract Co-Author*) Nothing to Disclose
Thomas Battey, MD (*Abstract Co-Author*) Nothing to Disclose
Leah Smith (*Presenter*) Nothing to Disclose

### TEACHING POINTS

While the majority of obstetric and gynecologic disease presents in the abdominal cavity, many of these conditions can manifest in the thorax. Related imaging findings may be subtle, unexpected, or overlooked. Radiologists must consider these entities and familiarize themselves with the associated findings to enable prompt and accurate diagnosis and treatment. This case series presents a comprehensive review of obstetric and gynecologic diseases manifesting findings in thoracic imaging. After reviewing this exhibit, the learner will recognize thoracic imaging findings related to obstetric and gynecologic disease, understand optimal modalities and techniques for safely imaging pregnant patients, and define relevant recommendations for management and follow up of the presented imaging findings.

### TABLE OF CONTENTS/OUTLINE

Cardiothoracic Complications of Pregnancy Emboli (thrombotic, amniotic fluid, and air) - Imaging protocols and other considerations in pregnant patients; Peripartum Cardiomyopathy; Eclampsia/Pre-Eclampsia; Pneumonia and Aspiration. Gynecologic Disease in the Thorax: Thoracic endometriosis syndromes (Catamenial Pneumothorax/Hemothorax, Hemoptysis, Pulmonary Endometrioma); Ovarian Hyperstimulation Syndrome; Benign Metastasizing Leiomyoma; Meigs Syndrome. Thoracic Patterns of Gynecologic Metastasis: Virchow's Node; Pleural/Diaphragmatic Metastases; Isolated Bilateral Axillary Metastases.

Vinicius A. Cavalieri, MD (*Abstract Co-Author*) Nothing to Disclose
Diego Brigagao (*Abstract Co-Author*) Nothing to Disclose
Lais F. Pimentel, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Review the tomographic patterns of possible phenotypes found in familial pulmonary fibrosis using schematic illustrations and imaging studies.- Display a set of cases of familial pulmonary fibrosis exposing the heterogeneity of presentations.- Correlate imaging findings with pathological characteristics.

### TABLE OF CONTENTS/OUTLINE

Familial pulmonary fibrosis (FPF) is defined as any fibrotic interstitial lung disease in at least two first or second-degree relatives in the family. Although it is not a consensual definition, it is highly accepted. It is known that several genetic mutations are associated with the presence of this entity, which results in a wide diversity of phenotypic, radiological and pathological characteristics, including overlap between them. Imaging plays a fundamental role in the investigation and suspicion of interstitial lung diseases. Therefore, we propose a systematic approach and review of the image characteristics found on computed tomography. This pictorial review will discuss:1. Introduction2. Pathogenesis and epidemiology3. Review of the main tomographic and anatomopathological patterns of familial interstitial fibrosis- Usual interstitial pneumonia- Cryptogenic organizing pneumonia- Undetermined fibrosis pattern- Non-specific interstitial pneumonia- Fibrotic hypersensitivity pneumonitis- Aspiration-related

Mylene T. Truong, MD (*Abstract Co-Author*) Nothing to Disclose
Ioannis Vlahos, MBBS, FRCR (*Presenter*) Director, Grayscale Ltd;Co-owner, Grayscale Ltd;

### TEACHING POINTS

Infection is the predominant cause of acute diffuse lung disease in hematological malignancy. However, 10-20% of presentations are due to alternative non-infectious etiologies. Familiarity with the radiological appearances, their timeline of evolution, and specific clinical scenarios when these occur aids diagnosis.

### TABLE OF CONTENTS/OUTLINE

Cases from tertiary cancer center, with pathological/clinical correlation of common and rare conditions. Cases are categorized by clinical scenario/evolution timelines. Clinical indicators that should suggest non-infectious etiologies and radiology management recommendations are highlighted.To include:• Post Bone Marrow Transplantation (Edema, Hemorrhage, Idiopathic Pneumonia Syndrome) - timelines and differentiating features• Small Molecule Drug Toxicity (e.g. Bleomycin) - radiological/clinical risk factors• Novel therapy complications (CAR T-cell cytokine release syndrome, ATRA differentiation syndrome)• Transfusion Reactions (TACO, TRALI, FNHTR, etc.)• Secondary Alveolar Proteinosis• Pulmonary Interstitial Extramedullary Hematopoiesis• Leukemic Infiltration, Leukostasis, Leukemic Cell Lysis Pneumopathy

Jessica Gemmell (*Presenter*) Nothing to Disclose

### TEACHING POINTS

; Elucidate the imaging features of interstitial lung abnormalities (ILA) that necessitate reporting on CT scans.; Provide a simple algorithm for the differential diagnosis of ILA, improving accuracy and efficiency.; Stress the significance of communication between radiologists and pulmonologists for ILA management.

### TABLE OF CONTENTS/OUTLINE

● Overview of Interstitial Lung Abnormalities (ILA) ○ Definition and Epidemiological Relevance
○ Patterns of ILA on CT: Reticular, Nodular, Cystic, and Ground-Glass Opacities● Radiologic Approach to ILA
○ Criteria for Identification and Reporting of ILA ○ ILA versus Artefact: Ensuring Diagnostic Precision● Differential Diagnosis Simplified
○ Algorithmic Approach to Common and Uncommon Causes of ILA ○ Radiological Illustrations to Guide Pattern Recognition● Clinical Context and Management
○ When to Suggest Further Evaluation for ILA ○ Integrating Clinical Data in Radiological Interpretation● Conclusion
○ Summary of Best Practices for ILA Reporting ○ Call to Action for Standardization of Reporting Protocols

Leonardo Rosolen Iunes, MD (*Abstract Co-Author*) Nothing to Disclose
Rafael R. Santos Ferreira, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Chest CT is a non-invasive method capable of mapping and identifying lesions of the trachea and bronchi, as well as assisting in the biopsy and surgery planning of suspected findings. - Flexible bronchoscopy (FB) is the gold standard method for directly visualising the airways, allowing for many diagnostic and therapeutic interventions. - Virtual bronchoscopy (VB) is a technique for reconstructing three-dimensional images from CT scans, simulating a flexible bronchoscopy. - This presentation aims to illustrate the correlations between CT imaging findings and those obtained through FB and VB in diferent clinical setttings.

### TABLE OF CONTENTS/OUTLINE

1) Background; 2) Techniques: Conventional CT, VB, FB (pros and cons); 3) Applications: a case-based review (- anatomical variants - inflammatory and infectious diseases - neoplasms - blood clots - foreign bodies - other findings - intervention mapping - surgical planning - post-surgical changes - miscellaneous); 4) Future directions: Artificial Intelligence for navigation planning; 5) Summary and take home messages;

## DECIPHERING ENIGMATIC CARDIOTHORACIC IMAGING IN END STAGE RENAL DISEASE (ESRD)

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Ramya S. Gaddikeri, MD (*Abstract Co-Author*) Nothing to Disclose
Palmi N. Shah, MD (*Abstract Co-Author*) Research Grant, Abbott Laboratories
Emily M. Trudeau, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Unusual cardiothoracic imaging in ESRD can be diagnostic dilemmas. Metastatic pulmonary calcifications (MPC) with noncalcified centrilobular nodules: mimics infection. Hyperdense consolidations: simulate amiodarone toxicity. Positive bubble echo due to chronic central venous obstruction and contrast shunting into the pulmonary veins. Miliary lung nodules in secondary pulmonary hemosiderosis from ESA: mimics miliary infection.Endplate erosion and vertebral collapse in Dialysis related spondyloarthropathy (DSA) mimics spondylodiscitis. Nodular pulmonary amyloidosis when non calcified /cavitating, mistaken for malignancy. Diffuse bone uptake on PET-CT secondary to ESA: confused for infiltrative processLarge IV contrast in ESRD patients can cause hyperdense fluid and muscles even after 24hrs, confused for hemorrhage. Post-transplant medication induced pneumonitis: mimics edema.

### TABLE OF CONTENTS/OUTLINE

Imaging findings will be subcategorized with DD: Lungs/Pleura: Hyperdense consolidation, MPC, Secondary pulmonary hemosiderosis, pulmonary amyloidosis, Premature tracheal calcifications, hyperdense effusions from contrast staining, Chronic effusions and round atelectasis. Heart/Vessels: Premature Coronary calcifications and accelerated CAD, Coronary aneurysm (In PCKD), Uremic pleuro-pericarditis, Cardiac amyloidosis, venous collaterals shunting to pulmonary veins, pericardial calcifications. Bones/Soft tissueRenal osteodystrophy, Distal clavicle resorption, DSA, calciphylaxis, Post ESA diffuse FDG uptake in bones, brown tumor. Post-transplant complicationsInfections due to immune-compromised state, ex PJP pneumonia. Tacrolimus induced lung injury.

## RETURN OF THE MAC: NON-TUBERCULOSIS MYCOBACTERIAL INFECTIONS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Cum Laude**

Demetrios A. Raptis, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The classic manifestations of non-tuberculosis mycobacterial (NTM) infection in the chest have a unique clinical and radiographic presentation. These infectious processes can exist on a spectrum that can be life threatening or result in minor symptoms and require no treatment. The Runyon classification for non-tuberculosis in the current era has become more historical than clinically relevant, making the diagnosis challenging. We review a multi-disciplinary approach to making the diagnosis and directing treatment. While doing so we review a classification scheme for NTM infections and how imaging findings and clinical information can direct management.

### TABLE OF CONTENTS/OUTLINE

• Review imaging findings of non-tuberculosis mycobacteria (NTM) infections with emphasis on the thorax • Develop/review a classification scheme based on the imaging findings • Discuss multi-disciplinary approach to making diagnosis (and differentiating from M. tuberculosis) and directing treatmentMycobacterial avium complex (MAC):• Classic - upper lobe predominant fibrocavitary/cavitary pattern • Disseminated disease - cavitary disease, necrotic lymphadenopathy, and hepatosplenomegaly• Lady Windemere Syndrome - bronchiectasis, centrilobular nodules• Hypersensitivity (aka hot tube lung) - subacute hypersensitivity pattern• MAC can be associated with other conditions:• Achalasia• CF• Immunodeficiency Not all mycobaceterial infections in the chest are caused by MAC. Discuss clinical presentation and overlapping imaging findings of other mycobacterial infections in the chest including:• Kansasii• Xenopus• Abscessus • Fortuitum

Talissa A. Altes, MD (*Abstract Co-Author*) Speaker, Koninklijke Philips NV
Ummul Afia Shammi, PhD (*Abstract Co-Author*) Nothing to Disclose
Cody Thornburgh, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Hyperpolarized Xenon Gas (HXG) MRI is a relatively new-to-market FDA approved imaging agent to evaluate lung ventilation.2. Small airway diseases, like asthma, COPD, and Cystic Fibrosis, have MR ventilation features that increase confidence in diagnosis and assessment of disease severity.3. Xenon gas diffuses from the airways into the lung tissues and blood. HXG MRI allows simultaneously imaging of these various states of xenon gas, termed “dissolved phase imaging.”4. Ongoing research of HXG MRI is revealing new applications for medical imaging, which may aid in the diagnosis of pulmonary hypertension and management of disease.

### TABLE OF CONTENTS/OUTLINE

1. Background/Objectives2. Brief Review of Technique---a. Drug Preparation---b. MR Scanner Configuration---c. Data Analysis3. Ventilation Imaging Characteristics---a. Normal---b. Pathological disease states------i. COPD and Emphysema------ii. Asthma------iii. Cystic Fibrosis------iv. COVID-19------v. Interstitial Lung Diseases4. Dissolved Phase Imaging Characteristics---a. Normal---b. Pathological findings of Small Airway Diseases---c. Pathological findings of Pulmonary Hypertension5. Future Frontiers---a. RBC oscillation and pulmonary hypertension---b. Therapeutic agent monitoring

## COMPLICATIONS OF THE PULMONARY SURGERY WHAT RADIOLOGISTS NEED TO KNOW?

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Iclal Ocak, MD (*Abstract Co-Author*) Nothing to Disclose
Furkan Ufuk, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Radiologists are vital in detecting complications following pulmonary surgery, impacting patient management and outcomes.
- Recognizing imaging signs of common and critical complications ensures timely intervention.
- Key complications include infection, air leaks, and vascular complications.

### TABLE OF CONTENTS/OUTLINE

- Introduction
- Role of imaging in the follow-up of pulmonary surgery
- Essential knowledge for radiologists
- Normal Postoperative Imaging
- Expected changes on imaging after common pulmonary surgeries
- Early Complications
- Pneumothorax: Identification and implications
- Hemorrhage: Expected vs. excessive bleeding
- Air Leaks: Manifestations and management
- Infectious Complications
- Empyema: Diagnostic imaging criteria
- Pneumonia: Distinguishing postoperative changes from infection
- Late Complications
- Bronchopleural fistula
- Lung torsion
- Lung hernia
- Pulmonary fibrosis and lung volume reduction
- Advanced Imaging Modalities
- Role of CT, X-ray, and MRI in detecting subtle complications
- The utility of imaging in guiding interventional procedures
- Conclusion
- Overview of critical findings for effective postoperative care
- Future directions in imaging technologies for pulmonary surgery

Lara Quiche, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Epipericardial fat necrosis (EFN) often lurks in the shadows of differential diagnoses for chest pain. While clinicians and radiologists diligently explore common culprits such as pulmonary thromboembolism and acute coronary syndrome, EFN remains overlooked. Despite patients experiencing excruciating chest pain, both laboratory tests and electrocardiograms (ECGs) frequently yield normal results. In such cases, the diagnosis relies on imaging exams, usually chest CT scans.This presentation will shed light on ENF: we will discuss the pathophysiology, imaging findings (with focus on chest CT), associated findings, differential diagnosis and follow-up imaging findings.

### TABLE OF CONTENTS/OUTLINE

- Epidemiology and clinical features- EFN findings on Chest CT- EFN findings on other imaging modalities (MRI, PET/CT)- Differential diagnosis that shouldn't be forgotten- Imaging follow-up findings after EFN

### TEACHING POINTS

- Demonstrate that the diagnosis of pulmonary thromboembolism may not be suspected in the initial clinical evaluation, prompting non-targeted studies such as chest radiographs and non-contrast chest tomographies.- Demonstrate the wide range of clinical presentations and imaging findings related to pulmonary embolism.- Review the most common imaging findings of pulmonary embolism in non-targeted studies through self-assessment questions, expanding the radiologist's repertoire.- It is essential for radiologists to remain aware of indirect signs of PE in non-targeted studies (without contrast or without dedicated angiographic technique), in which this diagnosis may not have been initially suspected clinically.

### TABLE OF CONTENTS/OUTLINE

INTRODUCTIONHighlight the variety of clinical presentations and imaging findings that may come to the radiologist's attention in the context of PE, summarizing the indirect signs to look for in non-directed studies.DIRECT SIGNSHighlight through different imaging studies what is considered a direct sign of PE.INDIRECT SIGNS• PULMONARY PARENCHYMA:Summarize the imaging features of pulmonary infarctions, differentiate from other conditions, discuss suspicion criteria, early signs, and progression.Explain the mosaic perfusion pattern, its appearance, differentials, and imaging representation.Demonstrate hyperperfusion edema in PE, its imaging aspects, and mechanism.• VASCULAR CALIBER VARIATIONS:Show how thrombi can alter vascular caliber in acute and chronic contexts, or how they can be detected in non-directed exams.• IODINE MAP:Demonstrate the imaging appearance of the iodine map and how it aids and suggests the diagnosis of PE.

## A (W)HOLE-SOME APPROACH TO CYSTIC LUNG DISEASE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Yashant Aswani, MD (*Abstract Co-Author*) Nothing to Disclose
Ajith Varrior, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. To differentiate a true pulmonary cyst(s) from its mimics2. To learn the step-wise approach to narrow down the list of differential diagnoses and arrive at a specific diagnosis3. To discuss specific cystic lung diseases

### TABLE OF CONTENTS/OUTLINE

1. What is cystic lung disease (air-filled structures versus fluid filled in rest of the body)? 2. Differentiation of true pulmonary cysts from cystic appearing lesions (cavity, bulla, pneumatocele, emphysema, honey combing, cystic bronchiectasis)3. Number of cysts: Are cysts solitary or localized versus multiple or diffuse?4. What is the distribution of cysts (upper lobe or lower lobe or subpleural)?5. Association with other pulmonary (nodules, ground glass) and extra-pulmonary findings (like renal tumors, plasma cell dyscrasia, autoimmune conditions)6. Algorithmic approach to cystic lung disease7. Discussion of specific entitiesLangerhans cell histiocytosis (LCH), Lymphangiomyomatosis (LAM), Lymphoid interstitial pneumonia (LIP), Birt Hogg Dube syndrome (BHD), amyloidosis, tracheobronchial papillomatosis, neurofibromatosis, cystic metastasis, congenital pulmonary airway malformation (CPAM) and bronchogenic cysts, Pneumocystis carini pneumonia (PCP) and desquamative interstitial pneumonia (DIP), cystic metastasis

Caio Nunes, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Histoplasmosis stands as the most prevalent endemic fungal disease in the U.S., with significant incidence in Central and South America. While primarily targeting the lungs, it can disseminate systemically based on the patient’s immune status and the quantity of inhaled fungus.The disease poses a significant diagnostic challenge, given the limited availability and sensitivity of non-invasive tests. Consequently, imaging examinations are usually part of the diagnostic process. Histoplasmosis manifests in diverse patterns on chest X-rays and computed tomography scans, varying with the disease stage and patient's immune response.It is paramount that radiologists remain cognizant of these potential findings. This presentation offers a didactic exploration of radiological findings across various clinical stages and forms of histoplasmosis, complemented by pertinent literature review.

### TABLE OF CONTENTS/OUTLINE

Brief review of relevant epidemiology and pathophysiologyClinical presentations: acute pulmonary histoplasmosis X subacute pulmonary histoplasmosis X chronic pulmonary histoplasmosis X disseminated progressive histoplasmosis Different presentations on chest CT: calcified lung nodules, disseminated micronodular disease, solitary pulmonary nodule (histoplasmoma), heterogeneous consolidation with enlarged lymph nodes, isolated enlarged lymph nodes, fibrosing mediastinitis, central airway involvementDiscussion of 18-FDG PET/CT as a complementary imaging modality (flip-flop sign as a potential auxiliary finding to differentiate histoplasmosis from lung cancer)Relevant differential diagnosis Conclusion and take home messages

## A CASE BASED REVIEW OF INHALATIONAL LUNG DISEASES: IMAGING FINDINGS AND CLINICAL FEATURES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Ryosuke Taiji, MD (*Abstract Co-Author*) Nothing to Disclose
Toshihiro Tanaka (*Abstract Co-Author*) Nothing to Disclose
Nagaaki Marugami (*Abstract Co-Author*) Nothing to Disclose
Dan Yamamoto, MD (*Abstract Co-Author*) Nothing to Disclose
Aya Yamada, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Inhalational lung diseases are caused by dust exposure, residential environment, smoking habits, pet keeping, and poisoning. These diseases occasionally show an upper lobe-predominant distribution with various imaging findings. Radiologists need to know more about each disease and obtain a detailed medical and exposure history.The purposes of this exhibit are: To depict typical imaging findings of inhalational lung diseasesTo discuss the clinical and radiological findings, and differential diagnosis

### TABLE OF CONTENTS/OUTLINE

1. Hypersensitivity pneumonitis (HP) Nonfibrotic HP: Fungi (e.g. Summer-type and Humidifier lung) Bird fancier’s lung Hot tub lung (Mycobacterium avium) Fibrotic HP: Bird fancier’s lung 2. Occupational lung disease Dust and fume inhalation: Pneumoconiosis (e.g. Silica, Fume and Stainless-steel) Asbestos-related diseases: Pleural plaque Benign asbestos pleural effusion, Diffuse pleural thickening, Round atelectasis Malignant pleural mesothelioma 3. Smoking-related disease Emphysema Airspace enlargement with fibrosis (AEF) Respiratory bronchiolitis-associated interstitial lung disease (RB-ILD) Desquamative interstitial pneumonia (DIP) Langerhans cell histiocytosis (LCH) 4. Poisoning and miscellaneous Chemical inhalation (e.g. Disinfectant and Bleach) Burn injury and smoke inhalation Lipoid pneumonia (e.g. Petroleum and Toluene)

### TEACHING POINTS

IgG4-related disease (IgG4-RD) is a systemic fibroinflammatory disorder with characteristic histologic findings (tumefactive lesions with IgG4-positive plasma cells and lymphocytic infiltration associated fibrosis), and may or may not coincide with elevated serum IgG4 levels. Diagnosis relies on histopathologic, serological, and radiological features. Chest involvement in IgG4-RD includes lymph node enlargements, pleuropulmonary involvement, and cardiovascular disease. Radiologists should consider IgG4-RD in their diagnoses due to significant diagnostic and prognostic value.1. Prototype the thoracic findings of IgG4-RD;2. Identify the key thoracic findings of IgG4-RD in cases with histopathological confirmation;3. Determine the importance of maintaining IgG4-RD as a differential diagnosis in the appropriate clinical-radiologic context.

### TABLE OF CONTENTS/OUTLINE

1. Introductiona) Epidemiology, physiopathology and clinical aspects of the IgG4-RD.2. The recent diagnostic criteria of American College of Rheumatology/European League against Rheumatism (ACR/EULAR) for IgG4-RD probability - repercussions in clinical practice and recommendations3. IgG4-RD associated thoracic imaging features - Case-by-case discussion reviewa) Paravertebralb) Retromediastinal fibrosisc) Cardiac Interstitial diseased) Ground-glass opacitiesPeribronchovascular involvemente) Lymph node enlargementf) Pleural disease4. The mimics of IgG4-RD in thoracic manifestations - including vascular, pleural, mediastinal and airway involvement.5. Conclusions "take-home messages"

### TEACHING POINTS

1) The diagnosis of developmental lung anomalies or infancy-acquired lung disorders later in adulthood can be challenging and often mistaken for something threatening. 2) The main categories can be divided in: diseases of the tracheobronchial system; diseases of the lung parenchyma, including congenital lung lesions, prematurity-related chronic lung disease, surfactant function disorders and post infectious abnormalities; and diseases of the vascular system. 3) Systematic approach and analysis of the imaging features on chest X-ray, CT and MRI are useful in facilitating the diagnosis.

### TABLE OF CONTENTS/OUTLINE

1) Diseases of the tracheobronchial system include primary ciliary dyskinesia, cystic fibrosis, alpha-1 antitrypsin deficiency, as well as the tracheobronchial branching abnormalities. 2) Congenital lung lesions most often encountered are the congenital pulmonary airway malformations (CPAMs), the bronchopulmonary sequestration (BPS), congenital lobar emphysema (CLE) and the bronchogenic cysts. 3) The prematurity-related chronic lung disease is related to the bronchopulmonary dysplasia (BPD) that often develops after mechanical ventilation in prematurely born infants with respiratory failure. 4) Disturbance of surfactant homeostasis can lead to development of pulmonary alveolar proteinosis and nonspecific interstitial pneumonia. 5) Postinfectious bronchiolitis obliterans or the hyperlucent lung syndrome is a rare complication of pulmonary infections in the childhood. 6) Vascular anomalies include interruption or absence of a main pulmonary artery, anomalous origin of the pulmonary arteries, anomalous pulmonary venous drainage, and pulmonary arteriovenous malformations.

Francesco Amorelli (*Abstract Co-Author*) Nothing to Disclose
Paulina Miranda, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The goal is to identify the different radiological patterns caused by radiation therapy in the lung parenchyma, along with their frequency and progression. It also aims to recognize the warning signs that help differentiate between expected post-radiation therapy changes and tumor recurrence.

### TABLE OF CONTENTS/OUTLINE

Radiation therapy provides local treatment for pulmonary neoplasms but can cause damage to surrounding tissues, particularly the lung parenchyma. Thus, distinguishing between post-radiation therapy changes and potential tumor recurrence or other non-radiation-induced pulmonary pathologies is crucial.In this work:- Classification: Post-radiation therapy changes are classified into early ( < 6 months) and late ( > 6 months). - Imaging Findings: We analyze the most common imaging findings: peri-bronchial consolidation, ground-glass opacities, and mass-like or scar patterns. - Complications: We evaluate potential complications. - Correlation: We correlate these findings with the radiation therapy plan, including duration, dose, and irradiated field. - Warning Signs: We highlight key warning signs indicating tumor recurrence or non-radiation-induced pathology, such as lesions outside the irradiated area, changes in lesion size after 12 months post-radiation therapy, or new-onset atelectasis.Radiation therapy is crucial in managing thoracic neoplastic lesions. Radiologists must understand post-treatment changes and potential complications, and be able to recognize warning signs of tumor recurrence or non-radiation-induced pathologies

### TEACHING POINTS

Chest wall neoplasms are uncommon entities that represent approximately 5% of all thoracic malignancies. Unfamiliarity with these lesions can pose a diagnostic dilemma. Radiologists must be acquainted with the imaging findings, differential diagnoses and complications of these neoplasms. With this exhibit we will:Review the typical imaging findings of chest wall neoplasms.Review the classification based on a wide range of tissues of origin.Discuss the usefulness of imaging methods to elucidate the origin and/or tissue composition of these lesions along with reviewing the evaluation for vascularization and local invasion.

### TABLE OF CONTENTS/OUTLINE

1. Introduction and Clinical characteristics2. Role of different modalities.3. Entities based on tissue originPrimary tumorsi. Cartilaginous and osseous tumors: 1. Fibrous dysplasia2. Osteochondroma3. Enchondroma 4. Chondrosarcoma5. Osteosarcoma6. Ewing sarcoma7. Multiple Myeloma. ii. Soft-tissue tumors:1. Lipoma2. Liposarcoma3.. Schwannoma4. Neurofibroma5. Elastofibroma dorsi6. ### TEACHING POINTS

Roughly 10-20% of lung cancers (LC) arise in non-smokers, presenting unique risk factors and biological traits crucial for accurate diagnosis and management. Radiologists must cultivate a knowledge-based toolkit to discern distinctive imaging features, enhancing precision in diagnosis and management recommendations for LC in this patient cohort. Attendees will leave prepared to handle LC challenges in non-smokers, armed with insights into future epidemiological trends, new risk factors, and cutting-edge imaging. Thus, the purpose of this exhibit is to:1. Provide an overview of the epidemiology related to LC among non-smokers and pertinent risk factors, such as environmental exposures, and genetic risk factors. 2. Review the distinctive imaging features including variations in tumor location, morphology, and response to treatment. 3. Describe advancements in risk modeling, utilizing imaging technology and data science, to address LC in non-smokers.

### TABLE OF CONTENTS/OUTLINE

1. Introduction:a. LC trends in non-smokers b. Epidemiological risk factors for developing lung cancer in non-smokers c. Eligibility criteria for LC screening 2. Case based radiological patterns of LC in non-smokers: a.Variations in tumor location and morphology b.Imaging characteristics of different histological subtypes 3. Future directions for early detection, diagnosis and monitoring using imaging modalities a. Overview of new risk stratification models that incorporate exposures and genetics as risk factors for LC in non-smokers. b. Discuss the role of computed tomography, magnetic resonance imaging, and molecular imaging to aid in diagnosis of LC. 4. Conclusion

### TEACHING POINTS

A cyst is any circumscribed and well-defined air-containing structure in the lung parenchyma. Cystic lesions occur due to various mechanisms such as airway obstruction with distal airspace dilatation (a check-valve mechanism), necrosis of airway walls, or lung parenchymal destruction by proteases. Cysts typically contain air, although, in some cases, they may be filled with fluid.In this exhibit, we will present computed tomography images and the histology of patients with multiple cystic lesions to explore their pathogenesis. Some cystic lesions increase in size over time, and we will illustrate the progression of the cystic lesions.

### TABLE OF CONTENTS/OUTLINE

1, Rare cystic lung disease Langerhans cell histiocytosis, Birt-Hogg-Dubé syndrome, lymphoid interstitial pneumonia, lymphangioleiomyomatosis (Figure 1) 2, Cystic lesions in genetic diseases; Neurofibromatosis, Down syndrome 3, Cystic lesions in infectious disease; pneumocystis pneumonia 4, Cystic lesions in collagen vascular diseases; Sjögren syndrome (Figure 2), antineutrophilic cytoplasmic antibody-associated vasculitis (Figure 3) 5, Cystic lesions in smokers; admixed emphysema and thick-walled large cysts as observed in combined pulmonary fibrosis and emphysema (Figure 4) 6, Others; cyst formation in multicentric Castleman’s disease, benign metastasizing leiomyoma (Figure 5)

### TEACHING POINTS

Interstitial lung disease (ILD) is a broad spectrum of pulmonary conditions that include idiopathic pulmonary fibrosis (IPF), connective tissue disease-ILD (CTD-ILD), hypersensitivity pneumonitis (HP), sarcoidosis, non-specific interstitial pneumonia (NSIP), amongst others. These non-IPF disease entities can present as fibrotic interstitial lung disease (F-ILD) or progressive F-ILD (also known as progressive pulmonary fibrosis (PPF)), which is disease progression despite adequate treatment. There is a growing prevalence of ILD and PPF, and clinicians face certain challenges regarding ambiguous categorization of disease, poor risk stratification, and lack of guidelines regarding the use of antifibrotic therapy. Diagnosis of PPF on high resolution computed tomography (HRCT) has recently been validated within a subset of criteria that can help identify a progressive phenotype in individuals with non-IPF ILD.

### TABLE OF CONTENTS/OUTLINE

• Define Progressive Fibrotic ILD and differentiate between Progressive fibrotic ILD and fibrotic ILD • Importance and role of imaging in diagnosing Progressive Fibrotic ILD • Schematic representation of the prevalence of the ILDs that may be associated with "Progressive Pulmonary Fibrosis (despite management)". • Describe the HRCT phenotypes and signs of progression. • Identify role of automated methods for identifying disease progression in the above setting.

## LUNG CANCER IN ASIA - A BURGEONING CRISIS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Srujana Ganti, MBChB, FRCR (*Abstract Co-Author*) Nothing to Disclose
Bimal Mayur Kumar Vora (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. 1.To raise awareness of the Lung cancer burden in Asia2. 2.Highlight how lung cancer in Asia is different to that in the West3. 3.Discuss lung cancer screening problems that are specific to the Asian continent4. 4.Discuss some potential solutions

### TABLE OF CONTENTS/OUTLINE

Lung cancer is a one of the most lethal cancers worldwide. Lung cancer in Asia, specifically, makes up a significant proportion of the global burden and the tumour biology as well as risk factors are different to that in the west. The poster will give an overview of lung cancer and its subtypes.It will then discuss the disease burden in Asia, ephasising the magnitude of the problem. The various risk factors, in addition to tobacco will be reviewed. The differences in tumour biology of Lung cancer in Asia to the west will be discussed, highlighting how this would affect treatment and management of lung cancer. Lung cancer screening has the potential to improve the early detection of cancer and improve mortality. However, it comes at significant healthcare costs and a robust infrastructure is required to be in place. The poster will give an overview of some of the existing screening programmes in Asia and also some of the challenges that are faced. Some potential solutions will also be discussed.

## AI-DRIVEN LUNG CANCER SCREENING PROGRAM: OPPORTUNITIES AND CHALLENGES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Amit Gupta, MD (*Abstract Co-Author*) Nothing to Disclose
Joshua Hunter, BS (*Abstract Co-Author*) Nothing to Disclose
Robert C. Gilkeson, MD (*Abstract Co-Author*) Research Consultant, Riverain Technologies, LLC;Research support, Koninklijke Philips NV;Research support, Siemens AG;Research support, General Electric Company;Consultant, HeartFlow, Inc
Cody R. Johnson, MD (*Abstract Co-Author*) Nothing to Disclose
Charit R. Tippareddy, MD (*Abstract Co-Author*) Nothing to Disclose
Syed Muhammad Awais Bukhari, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. To outline key statistics of lung cancer and review the current state of lung cancer screening in United States. 2. To learn about various currently available AI models and their role in lung cancer screening program 3. To understand the process of clinical deployment of AI technologies in lung cancer screening and the challenges involved.

### TABLE OF CONTENTS/OUTLINE

1. Lung Cancer: Clinical and Epidemiological Considerations o Risk Factors o Disease Burden in the USA o Current State of Screening Programs 2. Low Dose Lung Cancer Screening: Rationale o Trials: NLCST and NELSON trial o Lung-RADS o USPSTF Recommendations 3. Utility of AI technologies in the Lung Cancer Screening Program o Role in Imaging Analysis > Deep CNN-based AI algorithms > NLP and Dashboards o Role in Histopathological Analysis e.g. diagnosis and staging of tumor o Role in Biomarker Quantification: e.g. PDL-1 status o Role in Radiogenomics: e.g. tumor mutation burden determination o Additional Applications § Quality control and image enhancement § Reduction of observation errors and false negatives § Efficiency and Workflow Optimizations 4. Clinical Deployment of AI Tools in Lung Cancer Program and Involved Challenges o End-to-end pipeline for the clinical deployment of AI tools in the Lung Cancer Program o Challenges § Issues with Generalizability and data bias § Ethical and Regulatory Considerations § Integration dilemmas into clinical practice 5. Future Directions o Prescreening risk assessment characterization o Generation of patient-centric CT report o Liquid biopsies o Virtual biopsy technique o AI-aided ultra-low dose PET/CTs o AI-aided ultrashort echo time MR scanners

## BURNING OUT? TRY THE MRSA (MAKING REPORTING SEXY AGAIN) PILL WITH 50 MG AI AND 5 MG LLMS!

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Mannudeep K. Kalra, MD (*Abstract Co-Author*) Research Grant, Siemens AG;Research Grant, Riverain Technologies, LLC;Research Grant, Coreline Inc
Shambo Guha Roy, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Lina Karout, MD (*Abstract Co-Author*) Nothing to Disclose
Subba R. Digumarthy, MD (*Abstract Co-Author*) Consultant, Merck & Co, Inc;Consultant, Pfizer Inc;Consultant, Bristol-Myers Squibb Company;Consultant, Novartis AG;Consultant, F. Hoffmann-La Roche Ltd;Consultant, Polaris;Consultant, Cascadian;Consultant, AbbVie Inc;Consultant, Gradalis, Inc;Consultant, Bayer AG;Consultant, Zai Lab Limited;Consultant, Biengen;Consultant, Riverain Technologies, LLC;Consultant, Resonance Health;Consultant, Annalise-AI Pty Ltd;Research Grant, Lunit Inc;Research Grant, General Electric Company;Research Grant, Qure.ai;Speaker, Siemens AG
Parisa Kaviani, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Understanding the etiology and characteristics of burnout in radiology 2. Knowledge of available quantitative AI tools for reducing onerous aspects of radiology reporting 3. Strategies for the substance of AI outputs with the style of LLMs for bringing joy and efficiency to radiology reporting. 4. Understanding the operating and breaking scenarios for different AI tools in thoracic imaging

### TABLE OF CONTENTS/OUTLINE

1. Graphic summary of spiraling workload and burnout in radiology 2. Understanding the mundane, repetitive tasks in radiology reporting 3. Strengths and weakness of multi-vendor artificial intelligence (AI) tools for thoracic imaging 4. Where and how AI and large language models (LLMs) deliver the MRSA pill?

## APPLICATIONS OF LARGE LANGUAGE MODELS IN CARDIOTHORACIC IMAGING: A PRIMER FOR RADIOLOGISTS AND CARDIOLOGISTS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Joshua Hunter, BS (*Abstract Co-Author*) Nothing to Disclose
Amit Gupta, MD (*Abstract Co-Author*) Nothing to Disclose
Cody R. Johnson, MD (*Abstract Co-Author*) Nothing to Disclose
Charit R. Tippareddy, MD (*Abstract Co-Author*) Nothing to Disclose
Robert C. Gilkeson, MD (*Abstract Co-Author*) Research Consultant, Riverain Technologies, LLC;Research support, Koninklijke Philips NV;Research support, Siemens AG;Research support, General Electric Company;Consultant, HeartFlow, Inc
Syed Muhammad Awais Bukhari, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. To understand various Large Language Models (LLMs) and their functionality 2. To review currently available LLMs in the cardiothoracic imaging space 3. To highlight the role and applicability of LLMs in cardiothoracic imaging

### TABLE OF CONTENTS/OUTLINE

1. Large Language Models: A Primer o What are LLMs and their types? o Evolution of LLMs 2. LLMs in Radiology Workspace o RadBERT o ClinicalRadioBERT o Custom GPTs 3. Potential applications of LLMs in cardiothoracic imaging o Radiology reporting • Proofreading the reports • Potential time-saving with chest X-ray • Summarization of clinical history • Assisting with cardiac MRI reporting (structuring and adding guidelines) • Patient-centric reports and education (Simplifying the complex reports for patients) o Educational Applications • Instant Information Source • Evidence-based interactive learning • Case-based Exam Preparation • Quick Literature Review o Simplifying Complex Classifications e.g. Fleischner o Intelligent differential diagnosis o Information curation for lung cancer tumor board and ILD multidisciplinary discussions (combining Radiological, pathological, and Clinical information) o Assistance with Reporting to ACR for lung cancer screening program (Capture all the necessary elements to meet the ACR certification ) 4. Limitations of LLMs and mitigation tactics o Dependency on Training Data o Inaccurate Response Generation (Hallucination) o Poor complex reasoning o Probabilistic Nature (Stochasticity) o HIPAA Compliance o Bias o Radiologist Over-reliance o Operation costs 5. Future Directions o Need for robust radiology-specific LLMs o Multimodal medical LLMs o Seamless integration with EHR, RIS, and PACS

## FEBRILE NEUTROPENIA: A PRACTICAL APPROACH

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Alex Ha (*Abstract Co-Author*) Nothing to Disclose
Maya Vella, MD (*Abstract Co-Author*) Nothing to Disclose
Adam J. Yen, MD (*Abstract Co-Author*) Nothing to Disclose
Shravan Sridhar, MD, MS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Febrile neutropenia presents a challenging clinical dilemma and treatment success relies on early diagnosis and targeted antimicrobial therapy. Often, clinical teams look to radiologists to help narrow the differential diagnosis when a neutropenic patient's thoracic CT contains findings concerning for infection. Here, we examine the role of imaging and CT-guided biopsy in the management of febrile neutropenia, present an approach wherein clinical information is paired with a CT pattern to help the radiologist make an educated guess as to the underlying causative agent, and specify where either clinical information or imaging appearance can serve more useful.

### TABLE OF CONTENTS/OUTLINE

1. Introduce the problem2. Clinical presentation3. Initial workup (including imaging workup)4. Patternsa. Consolidation (±satellite nodules)b. Cavitary consolidationc. Nodulesd. GGOe. Halof. Reverse halog. Thoracic wall involvement5. Helpful clinical informationa. Time courseb. Antimicrobial responsec. Procalcitonind. B-D-Glucane. Galactomannanf. Serologiesg. BAL aspirate microscopyh. Cultures6. Less than 1 week from onseta. Consolidation/nodules - common bacteria i. Gram+ bacteria (MRSA, VRE) ii. Gram- (pseudomonas)b. GGO - mostly viral i. EBV, CMV, other viruses ii. PJP7. Consolidation/nodules + non-response to broad spectrum antibiotics - fungia. Candidab. Aspergillusc. Mucormycosisd. Tb8. Other organisms to consider - uncommon bacteriaa. Nocardiab. Actinomycesc. Tb9. Utility of biopsya. Fungal infectionb. Malignancyc. Non-diagnostic biopsyd. Platelet management10. Summary by imaging appearance11. Summary by helpful clinical information12. References

Tami J. Bang, MD (*Abstract Co-Author*) Nothing to Disclose
Gonzalo Dulcich SR, BMedSc (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Cigarette smoking continues to have a significant impact on the general population's health. The majority of morbidity and mortality from smoking is secondary to lung cancer, coronary artery disease, and chronic obstructive pulmonary disease (COPD). Additionally, a significant number of patients will develop diffuse parenchymal involvement related to smoking.Smoking related diffuse lung diseases comprise a heterogeneous group of disorders that can be classified into inflammatory (mostly chronic) and fibrotic entities. Despite their characteristic imaging findings with good pathologic correlation, they may overlap and it is not uncommon to see more than one entity in pathology. With this exhibit we will:- Review the imaging findings COPD related lung disease- Review clinical, imaging and pathological appearance of smoking related diffuse lung diseases- Highlight the spectrum of fibrotic findings related to smoking - Brief review of vaping and marijuana users associated lung injury

### TABLE OF CONTENTS/OUTLINE

1) Overview2) Entitiesa) COPD relatedChronic Bronchitis EmphysemaVanishing lung syndromeb) Smoking related diffuse lung disease i) InflammatoryAcute eosinophilic pneumoniaRespiratory bronchiolitisDesquamative Interstitial PneumoniaPLCHII) FibroticIPFSmoking related fibrosis (SRIF - AEF)CPFE3) ILAs4) Vaping - Marijuana users injury 5) Conclusions

Ami N. Rubinowitz, MD (*Abstract Co-Author*) Nothing to Disclose
Babina Gosangi, MD, MPH (*Abstract Co-Author*) Nothing to Disclose
Mamta Gupta (*Abstract Co-Author*) Nothing to Disclose
Abhishek R. Keraliya, MD (*Abstract Co-Author*) Nothing to Disclose
Mihai O. Andreca, MD, BS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. The esophageal wall is inherently weak because it lacks a serosal layer which makes it vulnerable to perforation.2. Chest CT with oral contrast and upper GI fluoroscopy are the imaging modalities of choice to establish the diagnosis3. A tract/ communication between the esophagus and an adjacent structure like trachea, or left atrium, is a direct sign of fistula formation.4. Indirect signs of esophageal fistulas include the presence of esophageal contents (oral contrast or food) in unexpected locations (such as pleura), presence of stranding/ induration of the mediastinal fat with the esophageal wall in close proximity to an adjacent organ, and visualization of extraluminal gas with discontinuity of the esophageal wall.

### TABLE OF CONTENTS/OUTLINE

1. Describe the anatomy of the esophagus with relationship to adjacent organs2. Imaging modalities for evaluation• Plain radiographs• Upper GI fluoroscopy• CT with oral contrast3. Signs of fistula on imaging• Direct signs- communication between the esophagus and an adjacent structure• Indirect signs- the presence of esophageal contents (oral contrast or food) in unexpected locations or extra-luminal gas4. Examples of various esophageal fistulas with a focus on imaging findings• Tracheoesophageal fistula• Bronchoesophageal fistula• Esophagopulmonary fistula• Atrio-esophageal fistula• Aorto-esophageal fistula• Pericardioesophageal fistula• Esophagopleural fistula• Esophagocutaneous fistula• Tumor-esophagus fistula

## SIZE IS NOT ALL THAT MATTERS: EXPLORING THE MORPHOLOGICAL AND METABOLIC CHARACTERISTICS OF SOLITARY PULMONARY NODULES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Maria G. Gracia Munoz, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The incidental encounter of solitary pulmonary nodules (SPNs) is highly common in the daily tasks of radiologists. The differential diagnosis of SPNs is extensive, and a significant percentage are malignant. Since timely detection of lung cancer has a crucial impact on patient prognosis, radiologists must be able to distinguish benign from malignant nodules with the highest possible precision and in early stages, while avoiding unnecessary follow-up studies and invasive diagnostic procedures. Ultimately, the determining factor regarding recommendations is the size, but taking into account the morphological and metabolic evaluation of the nodules can increase diagnostic accuracy in SPN assessment.

### TABLE OF CONTENTS/OUTLINE

Definition. General Imaging RecommendationsMorphological Characteristics: Attenuation, Shape and Margins, Internal Characteristics (calcifications, fat attenuation, cavitation), Complex Findings (pleural retraction, air bronchogram, bubble-like lucencies, cystic airspace), Location and Enhancement.Metabolic Characteristics: PET/CT with FDG. Indications, Metabolism of Different Neoplasms, Limitations, Use of Other Radiopharmaceuticals.Recommendations on How to Measure Pulmonary Nodules according to the Fleischner Society (in QA format).Fleischner Society Guidelines for Management of Incidental Pulmonary Nodules (General Characteristics, Risk Estimation, and Description of Recommendations)

Peter Illei, MD (*Abstract Co-Author*) Nothing to Disclose
Raheel Anwar, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

* Primary lung and extrathoracic tumors demonstrate diverse patterns of metastatic spread, leading to varying radiographic appearances on chest CT.* Surgery and radiotherapy cause distortions of the pulmonary anatomy that pose challenges in interpreting surveillance imaging and require understanding of expected post-treatment changes.* Accurate review of pulmonary findings on follow-up scans is essential for guiding optimal clinical management.

### TABLE OF CONTENTS/OUTLINE

* Chest CT surveillance for patients at risk for metastatic disease* Treatment-related disease: surgical resection, radiotherapy (radiation pneumonitis, organizing pneumonia, radiation fibrosis), immunotherapy (checkpoint inhibitor pneumonitis, pseudoprogression)* Intra-pulmonary spread: hematogenous metastases, lepidic spread, lymphangitic carcinomatosis, aerogenous metastases* Extra-pulmonary spread: nodal involvement, pleural dissemination, pericardial/cardiac metastases, osseous metastases

Karoly Viragh, MD (*Abstract Co-Author*) Nothing to Disclose
Sundus Lateef, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Silicosis is the oldest-recognized and most commonly diagnosed pneumoconiosis, historically associated with mining. In the last decade, there has been a surge of silicosis cases globally among stone countertop workers exposed to engineered stone (e.g. quartz) dusts. Silicosis has previously been uncommon among countertop workers, leading to delay in diagnosis, often due to difficulty differentiating imaging findings from sarcoidosis or atypical infection often favored as initial diagnoses. The goal of the current educational exhibit is to (1) raise awareness to the new silicosis epidemic, (2) depict the typical and atypical imaging features with clinicopathologic correlation when available, and (3) address important research questions. In addition to the rich imaging illustrations selected from one of the largest countertop manufacturer silicosis patient cohorts available in the USA, interactive (board-exam type) pointers will also be provided.

### TABLE OF CONTENTS/OUTLINE

1. Silicosis - historical perspective;2. Silicosis - pathophysiology, clinical presentation, management;3. Imaging technique (brief review of the ILO and ICOERD systems);4. Imaging illustration: Parenchyma abnormalities (small and large nodular opacities, septal thickening, fibrosis, consolidations); Airway abnormalities; Pleural abnormalities (effusions, pseudoplaque); Mediastinal abnormalities (lymphadenopathy); Complications;5. Cases: Acute silicosis; Accelerated silicosis; Chronic simple silicosis; Chronic complicated silicosis with progressive massive fibrosis; Silicosis with pneumothorax; Superimposed infections (e.g. mycobacterium); Differential diagnosis cases (sarcoidosis, infections)

Mariano Lorea (*Abstract Co-Author*) Nothing to Disclose
Guadalupe Comadran (*Abstract Co-Author*) Nothing to Disclose
Gonzalo Dulcich SR, BMedSc (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Consolidation is a common imaging finding defined as an opacity that completely obscures the underlying bronchi and vessels. In most cases, it is evidence of a pathologic process primarily within the air spaces when alveolar air is replaced by fluid, pus, blood, cells, or other material. Patients with parenchymal consolidation may have an acute or subacute/chronic presentation. Despite this classification, there is no precise definition to differentiate them. Persistent consolidation represents opacity that is still present at follow-up examinations and does not resolve in the expected time and after initial treatment. In these cases, imaging findings along with specific clinical information can help narrow the differential and guide management.Review the typical imaging appearance of different causes of persistent consolidation on CTEmphasis on the importance of distribution and clinical information as diagnostic keys.Discuss an imaging and clinical based approach when encountering patients with persistent consolidation

### TABLE OF CONTENTS/OUTLINE

### TEACHING POINTS

The purpose of this exhibit is: 1. To review usual and unusual cases related to the pulmonary vessels anomalies. 2. To correlate important findings with the anatomy, embryology, and pathophysiology, focusing on their clinical-radiological correlations. 3. To highlight their characteristics in order to familiarize radiologists, preventing unfavorable patient outcome. 4. To review CT and MRI protocols in the evaluation of patients with suspected pulmonary vessels anomalies.

### TABLE OF CONTENTS/OUTLINE

1. Applied embryology and anatomy of pulmonary artery and veins. 2. Techniques: X-ray, CT and MRI - pros and cons 3. Pulmonary artery anomalies: (a) origination and course (conotruncal abnormalities, atresia, sling); (b) intrinsic pulmonary artery anatomy (proximal interruption of the pulmonary artery, hypoplasia, stenosis); (c) pulmonary termination (arteriovenous malformations); (d) anastomotic vessels (anomalous origin of the coronary artery from the pulmonary artery, patent ductus arteriosus). 4. Pulmonary veins anomalies: (a) Total anomalous pulmonary venous return (TAPVR). (b) Partial anomalous pulmonary venous return (PAPVR). & 7; Type I: Supracardiac & 7; Type II: Cardiac & 7; Type III: Infracardiac & 7; Type IV: Mixed 5. Sample cases of pearls, pitfalls, diagnostic difficulties, and mimics. 6. Future directions 7. Summary and take-home messages.

## PNEUMONIA IN THE IMMUNOCOMPROMISED HOST

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Mark M. Hammer, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Identify the types of immunocompromise encountered in different clinical settings and associate these with specific opportunistic organisms.2. Describe the patterns of mycobacterial disease seen in HIV patients at different levels of CD4 count.3. Describe the imaging appearance of viral and fungal infections in neutropenic patients.

### TABLE OF CONTENTS/OUTLINE

1. Types of Immunocompromise: T-cell depletion, neutropenia, IgG deficiency, nonspecific2. Causes of pulmonary disease in immunocompromised patients: pulmonary edema, drug toxicity, radiation pneumonitis, malignancy, infection: community-acquired or opportunistic3. HIV infected patients: Tuberculosis, Pneumocystis, CMV pneumonia, Disseminated NTM, Kaposi’s sarcoma4. Organ transplants: fungi, mycobacteria, Nocardia, PTLD5. Neutropenic patients: Aspergillus, Mucor6. Bone marrow transplant: fungi, CMV pneumonia, idiopathic pneumonia syndrome

## PICTORIAL REVIEW OF THORACIC HEMATOMAS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Carlos S. Restrepo, MD (*Abstract Co-Author*) Nothing to Disclose
Emma C. Ferguson, MD (*Abstract Co-Author*) Nothing to Disclose
Daniel Ocazionez-Trujillo, MD (*Abstract Co-Author*) Nothing to Disclose
Erika G. Odisio, MD (*Abstract Co-Author*) Nothing to Disclose
Catalina Jaramillo, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1) Aortic Intramural hematoma is part of the aortic dissection spectrum and is diagnosed by crescentic hyperdensity of the aortic wall seen on unenhanced CT images. Additional findings associated with IMH include intramural blood pools and ulcer-like projections.2)A rare complication of Type A aortic dissection is the development of a pulmonary artery (PA) sheath hematoma, which can occur due to the shared adventitial layer between the ascending aorta and the PA, allowing dissection to extend between these vessels and possibly leading to PA lumen compromise.3)Pericardial hematomas can be secondary to blunt or penetrating chest trauma, post cardiac surgery and ventricular rupture. 4)Intramural hematomas of the esophagus can be spontaneous, emetogenic or iatrogenic in the setting of EGD. These hematomas vary in length and may obliterate the esophageal lumen.5)An extrapleural hematoma demonstrates the “fat sign” on CT, where thoracic soft tissues are pushed toward the ribs by intermediate/high density fluid in the extrapleural space. 6)Prevertebral hematoma usually indicates recent injury, as significant hematoma is uncommon after 2-3 weeks. Differential considerations for chronic prevertebral hematomas include infection or tumor.

### TABLE OF CONTENTS/OUTLINE

1) Great Vessels: Intramural hematoma of the aorta, traumatic aortic injury, adventitial sheath hematoma of the pulmonary artery. 2) Pericardium: Pericardial hematoma. 3) Mediastinum: Spontaneous hematoma of the mediastinum. 4) Esophagus: Intramural Hematoma of the Esophagus. 5) Pleura: Pleural hematoma, extrapleural hematoma. 6) Thoracic Spine: Paravertebral hematoma 7) Chest Wall and soft tissues: Breast hematoma, intramuscular hematoma.

Adriano Magna, MD (*Abstract Co-Author*) Nothing to Disclose
Mauricio Kenji Ota (*Abstract Co-Author*) Nothing to Disclose
Bruna P. De Oliveira, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- The purpose of this presentation is to demonstrate and help the radiologist deal with the variety of imaging manifestation patterns of primary pulmonary lymphoma, highlighting a case of primary MALT pulmonary lymphoma, an extremely rare disease, but the most common primary pulmonary lymphoma.- This article shows the radiological variability of primary pulmonary lymphoma in patients treated at a reference hospital, focusing on the importance of diagnostic methods: which of them are most sensitive for early diagnosis of the disease, the role in guidance procedures and monitoring response to treatment.

### TABLE OF CONTENTS/OUTLINE

-A compilation with the list of patients, epidemiological and clinical data, histopathological diagnosis, some microscopy images, some guided biopsy images, imaging patterns of diagnostic methods and their main role in the disease treatment line.- Examples of different imaging presentations of primary lung lymphoma, including an extremely rare case of primary MALT lung lymphoma, with details on how diagnostic methods are also important in assessing the evolution of response to treatment, providing resources to direct management and determine therapeutic success.

Brittany Cody (*Abstract Co-Author*) Nothing to Disclose
Zehavit Kirshenboim (*Abstract Co-Author*) Nothing to Disclose
Omer Onder, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1- Subsolid and cystic nodules, as well as the resulting primary lung neoplasms, are notable for their slow-growing nature. However, they can sometimes be overlooked or misclassified as elements of infectious or inflammatory conditions. 2- Being aware of the possible imaging findings of these lesions and current recommendations regarding follow-up is crucial for patient management. With the introduction of new guidelines, such as Lung-RADS 2022, there has been a shift towards a more comprehensive approach that includes these types of nodules, thereby highlighting their clinical significance. 3- This educational exhibit aims to enhance awareness among radiologists regarding primary lung neoplasms that may originate from or potentially evolve from subsolid and/or cystic nodules via a variety of case examples, further enriched by the inclusion of histopathologic examination images obtained after surgical resections.

### TABLE OF CONTENTS/OUTLINE

A. Introduction objectives B. Subsolid nodules - Nodule types and definitions -Adenocarcinoma spectrum - Lung-RADS 2022 recommendations - Pearls Pitfalls - Case examples important considerations C. Cystic nodules -Cystic lung cancer -Terminology and Lung-RADS 2022 recommendations -Pearls Pitfalls -Case examples important considerations D. Summary E. Conclusion

## IMAGING OF THE THORACIC AORTA: EVERYTHING YOU NEED TO KNOW

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Robert C. Gilkeson, MD (*Abstract Co-Author*) Research Consultant, Riverain Technologies, LLC;Research support, Koninklijke Philips NV;Research support, Siemens AG;Research support, General Electric Company;Consultant, HeartFlow, Inc
Syed Muhammad Awais Bukhari, MD (*Abstract Co-Author*) Nothing to Disclose
Amit Gupta, MD (*Abstract Co-Author*) Nothing to Disclose
Joshua Hunter, BS (*Abstract Co-Author*) Nothing to Disclose
Omar Altabbakh, DO (*Abstract Co-Author*) Nothing to Disclose
Cody R. Johnson, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Discuss the importance of the thoracic aorta and summarize key points for radiologists using the latest multidisciplinary surgical and clinical guidelines. 2. Illustrate the proper technique for measuring the thoracic aorta in a reproducible way and discuss the normal size and cutoff for pathologic enlargement (e.g. dilated vs aneurysm). 3. Understand the radiologist's role in evaluating pathology of the aorta and recommended imaging surveillance. 4. Discuss acute aortic syndromes and how they should be approached with the latest nomenclature. 5. Review the operative management, post-operative complications, and post-operative surveillance of the aorta. 6. Demonstrate the clinical implementation of artificial intelligence in cardiovascular disease/imaging.

### TABLE OF CONTENTS/OUTLINE

1. Embryology/Anatomy/Histology 2. Modalities for imaging the thoracic aorta 3. Defining normal size and correct measurement technique 4. Aneurysm Definition 5. Causes of thoracic aortic aneurysms a. Genetic (Ehlers-Danlos, Marfan’s, Loeys-Dietz) b. Congenital (bicuspid, Turner's, coarctation) c. Hypertension/Atherosclerosis d. Inflammatory aortitis 6. Recommended Screening/Surveillance 7. Acute aortic pathology a. Svensson classification b. Society of Vascular surgery reporting system c. Dissection d. Intramural Hematoma e. Penetrating Atherosclerotic Ulcer f. Atypical acute aortic pathologies 8. Operative Management of Aortic Pathology a. Post-operative aorta Complications b. Surveillance of post-operative aortic repairs 9. Artificial intelligence in Cardiovascular Imaging a. Clinical implementation of artificial intelligence into a PACs workflow

## TRACHEOBRONCHIAL PAPILLOMATOSIS: WHAT RADIOLOGISTS NEED TO KNOW

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Alexandre M. Silva, MD (*Abstract Co-Author*) Nothing to Disclose
Juliana A. Grill, MD (*Abstract Co-Author*) Nothing to Disclose
Tamires Morita, MD (*Abstract Co-Author*) Nothing to Disclose
Helen Ribeiro De Oliveira, MD (*Abstract Co-Author*) Nothing to Disclose
Brenda N. Lahlou, MD (*Abstract Co-Author*) Nothing to Disclose
Heytor Jose De Oliveira Cabral, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Review the etiology and the pathological mechanism of papillomatosis. Highlight the main organs affected in the respiratory system and their imaging characteristics. Emphasize pulmonary involvement and the risk of malignant transformation.

### TABLE OF CONTENTS/OUTLINE

1. Introduction.2. Etiological agent and forms of transmission.3. Pathological mechanism and histological features.4. Epidemiology and clinical findings.5. Tracheobronchial involvement.6. Pulmonary involvement and possible complications.7. Malignant transformation into squamous cell carcinoma.8. Therapeutic challenges.9. Take home message.

## CYSTIC LUNG CANCER - A PICTORIAL REPRESENTATION OF MORPHOLOGICAL TYPES BASED ON CT, GROWTH PATTERNS AND FDG PET UTILIZATION

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Thomas Taylor (*Abstract Co-Author*) Nothing to Disclose
Mohamed J. Thouseef, MD (*Abstract Co-Author*) Nothing to Disclose
Angela McKinnie (*Abstract Co-Author*) Nothing to Disclose
Chary Duraikannu, FRCR, MBBS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Morphological types: We outline four patterns of cystic lung malignancies, as described by Mascalchi et al: Type I - Cyst with exophytic solid component; Type II - Cyst with endophytic solid component; Type III - Cyst with wall thickening; Type IV - Multi-cystic lesion.2. Pathogenesis: prevailing theories include cyst formation via a check valve mechanism secondary to microscopic malignancy or growth along pre-existing bullae.3. Growth pattern: gradual replacement of cystic components by solid tissue observed during follow-up. 4. Histology: predominantly manifest as adenocarcinomas followed by squamous cell carcinoma. 5. Guidelines: current guidelines offer limited guidance on follow-up protocols. In our multidisciplinary meeting, we usually recommend an initial follow up period of 3 months for suspected cystic malignancy. PET imaging would be indicated if notable solid component.

### TABLE OF CONTENTS/OUTLINE

Background: Lung cancer remains a significant public health concern and ranks as the leading cause of cancer-related mortality in the UK, making up 21% of all cancer deaths between 2017 and 2019. Despite established screening protocols and expedited diagnostic pathways, the diverse presentations of primary lung tumours pose challenges for timely recognition, often leading to diagnostic delays. Through a series of illustrative cases, we aim to showcase the morphological and growth pattern of cystic lung cancers.

## EVOLVING LANDSCAPE OF CHEST WALL RECONSTRUCTION: A MULTIMODALITY IMAGING APPROACH

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Achala Donuru, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Chest wall reconstruction is a complex surgical procedure aiming to restore anatomical and functional integrity after chest wall injury or resection.
- Various imaging modalities play crucial roles in different stages of chest wall reconstruction, each offering unique advantages.
- Pre-operative planning: Imaging helps assess the extent of the defect, guide implant selection and sizing, and identify potential complications.
- Intra-operative guidance: Imaging provides real-time visualization of anatomical structures, facilitating precise implant placement and minimizing complications.
- Post-operative assessment: Imaging monitors healing progress, detects complications like infection or implant failure, and guides further management decisions.

### TABLE OF CONTENTS/OUTLINE

Introduction:
- Brief overview of chest wall reconstruction and its clinical significance.
- Importance of imaging in various stages of chest wall reconstruction. Pre-operative Imaging:
- Role of CT scans in defect characterization, implant planning, and surgical simulation.
- Advantages of MRI for soft tissue assessment and vascular mapping. Intra-operative Imaging:
- Utility of fluoroscopy and cone-beam CT for real-time guidance and accurate implant placement. Post-operative Imaging:
- Role of CT and MRI in evaluating healing progress, graft integration, and identifying complications.
- Potential applications of PET/CT for detecting early signs of infection or implant rejection. Multimodality Imaging Approach:
- Benefits of combining different imaging modalities for a comprehensive assessment throughout the reconstruction process.
- Examples of how each modality complements the others in different stages.

## EXPLORING CAVITARY LUNG LESIONS: PERSPECTIVES ON DIFFERENTIAL DIAGNOSIS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Manuel Sebastian Paez Alvarez, MD (*Abstract Co-Author*) Nothing to Disclose
Esnelly F. Berrios Bonilla, MD (*Abstract Co-Author*) Nothing to Disclose
Javier Tejedor Toquero, MD (*Abstract Co-Author*) Nothing to Disclose
Andres Enriquez-Puga, MBChB, MSc (*Abstract Co-Author*) Nothing to Disclose
Andrea Calero Ortega, MD (*Abstract Co-Author*) Nothing to Disclose
Maria M. Merideno Garcia, MBBCh (*Abstract Co-Author*) Nothing to Disclose
Elisabetta Ponte, MD (*Abstract Co-Author*) Nothing to Disclose
Jaime Lopez Martin, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The main objective of this study is to provide insights for proper characterization of cavitary lesions. To achieve this, we aim to fulfill the following three teaching points: firstly, ensuring that we are dealing with a true cavitary lesion and not a mimicker; secondly, once a cavitary lesion is confirmed, explaining how to evaluate it in 10 steps; and finally, elucidating the various entities that arise after cavitation, along with their respective clinical and imaging characteristics.

### TABLE OF CONTENTS/OUTLINE

- Objectives. - Definition of cavitation and examples of imaging. - Mimickers of cavitation and their definition: cyst, cystic bronchiectasis, emphysema, and bullae. Imaging examples of each. - Evaluation of cavitation in ten steps: confirming the cavity, assessing wall characteristics, identifying intracavitary material, recognizing enhancing foci, evaluating pleural communication, observing surrounding changes and ancillary findings, correlating with history and clinical presentation, assessing temporal evolution, determining the location of the cavity, and determining the number of cavities (solitary vs multiple). - Detailed presentation and explanation of the different entities following the semiological finding of cavitation, illustrating several cases of each: cancer, rheumatoid arthritis, vasculitis, infections (aspergillus, tuberculosis), septic emboli, etc. - Conclusions. - References.

## THE PE PUZZLE: IDENTIFYING AND DIFFERENTIATING MIMICS ON CTPA

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Daniel Ocazionez-Trujillo, MD (*Abstract Co-Author*) Nothing to Disclose
Carlos S. Restrepo, MD (*Abstract Co-Author*) Nothing to Disclose
Emma C. Ferguson, MD (*Abstract Co-Author*) Nothing to Disclose
Cihan Duran, MD (*Abstract Co-Author*) Nothing to Disclose
Catalina Jaramillo, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• Clues to distinguish mixing artifacts from true PE include poorly defined margins, attenuation >78 HU, unilateral lesions, and lesions that do not alter vessel caliber.• Distinguishing whether the defect occurs within the vessel lumen is crucial, as adjacent lymphadenopathy and endobronchial mucous plugging potentially create PE-like lesions.• Metastatic leiomyoma can extend to involve the right sided heart chambers and pulmonary arteries.• Primary sarcoma of the pulmonary artery generally demonstrates enhancement, luminal expansion and loss of the wall contours “eclipse sign”, that distinguishes it from real PE.

### TABLE OF CONTENTS/OUTLINE

CT Pulmonary Angiography (CTPA) is the study of choice for the evaluation of Pulmonary Embolism (PE), yet its interpretation is filled with challenges. This exhibit aims to clarify the technical and pathologic conditions that mimic PE on CTPA.Artifactsa) Cardiac and respiratory motion artifactb) Pulmonary artery mixing “smoke” artifact from slow flow and ipsilateral parenchymal abnormalities such as bronchiectasisc) Contrast bolus interruptiond) Pulmonary artery devicesPseudo-defects due to pathology at nearby anatomic structuresa) Hilar lymphadenopathyb) Endobronchial aspirationc) Pulmonary Vein ThrombosisTumorala) Direct tumoral invasion from bronchogenic carcinomab) Tumoral metastasis from renal cell carcinoma and uterine leiomyomac) Primary sarcoma of the pulmonary arteryMimickers of Chronic PEa) Thrombosis in situ secondary to chronic pulmonary hypertensionb) Pulmonary artery sheath hematoma in the setting of aortic dissectionc) Pulmonary artery thickening as a manifestation of vasculitis

## THE ATOLL WITHIN: A DEEP DIVE INTO THE REVERSE HALO SIGN IN CHEST CT

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Iclal Ocak, MD (*Abstract Co-Author*) Nothing to Disclose
Furkan Ufuk, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• Define the reverse halo sign and its diagnostic relevance in chest CT imaging. • Review the various etiologies associated with the reverse halo sign, emphasizing the differentiation between infectious, neoplastic, and inflammatory causes. • Illustrate the significance of integrating clinical history and other diagnostic tools to accurately interpret the reverse halo sign.

### TABLE OF CONTENTS/OUTLINE

1. Introduction to the Reverse Halo Sign Definition and visual characteristics Historical context and significance in radiology 2. Etiological Spectrum a) Idiopathic Organizing Pneumonia: The most common cause, involves inflammation and scarring of the small airways and alveoli. b) Fungal Infections: Various fungal infections can cause the reverse halo sign, including mucormycosis and aspergillosis. c) Bacterial Pneumonia: Certain bacterial infections, including tuberculosis and atypical mycobacterial infections, can sometimes manifest with this sign. d) Viral Infections: Viral pneumonias, such as those caused by influenza, COVID-19, can occasionally show a reverse halo sign. e) Pulmonary Infarction: Pulmonary embolism can result in a reverse halo sign due to hemorrhagic infarction. f) Malignancies: Rare, such as adenocarcinomas of the lung or lymphomatoid granulomatosis might present with a reverse halo sign. g) Autoimmune Diseases: Diseases like granulomatosis with polyangiitis and rheumatoid arthritis can sometimes show this pattern. h) Sarcoidosis: Although less common, sarcoidosis can occasionally present with a reverse halo sign. i) Treatment related: Drug or radiation induced pneumonitis. 3. Conclusion • Summary of key points • Future directions in research and imaging techniques

### TEACHING POINTS

Bronchiectasis is a common condition characterized by irreversible dilatation of the bronchi. It results from a wide range of infectious, inflammatory, neoplastic, and congenital disease processes. Recurrent infections and hemoptysis are the most common complications, both of which contribute substantially to morbidity and mortality. Imaging plays a key role in the initial diagnosis of bronchiectasis, evaluation for progression, and detection of complications. This exhibit will review the imaging features of bronchiectasis and highlight disease-specific differences in anatomic distribution, imaging appearance, and clinical features, which can aid in narrowing the differential diagnosis or in certain cases provide a confident diagnosis.

### TABLE OF CONTENTS/OUTLINE

1. Introduction (Definition, Pathophysiology, CXR/CT Findings, Mimics) 2. Case Examples: a. Focal (Bronchial Atresia, Carcinoid, Endobronchial Metastases, Aspirated Foreign Body) b. Central (ABPA, Cystic Fibrosis, Ciliary Dyskinesia, Mounier-Kuhn, Williams-Campbell) c. Upper Lobe (Cystic Fibrosis, Sarcoidosis, Silicosis, Berylliosis, Prior TB, Fibrotic HP) d. Lower Lobe (Infectious, Aspiration, Fibrotic ILD, Alpha-1 Antitrypsin Deficiency, Hypogammaglobulinemia) e. Right Middle Lobe and Lingula (Atypical Mycobacterium) f. Variable (Radiation Fibrosis, Bronchiolitis Obliterans) 3. Complications (Infection, Hemoptysis)

### TEACHING POINTS

Since the discovery of human immunodeficiency virus (HIV), the imaging findings of the numerous opportunistic infections have been extensively described. However, the high variability of imaging findings and multitude of opportunistic infections may be difficult to differentiate and present a diagnostic challenge. The purpose of this abstract is to present a comprehensive overview of the pulmonary infections seen in immunocompromised patients, as well as propose a pattern-based approach for differentiating pulmonary pathology. Teaching points include the following: 1. Define AIDS defining illness and review the relationship between CD4 levels and opportunistic infection 2. Review the imaging patterns and differential diagnoses of pulmonary infections among immunocompromised patients 3. Discuss non-infectious pulmonary pathology that is characteristic among immunocompromised patients and differentiate it from infectious processes

### TABLE OF CONTENTS/OUTLINE

1. Overview pulmonary infections in immunocompromised patients by CD4 and infection type 2. Review AIDs-defining illnesses 3. Present a CT pattern-based approach to pulmonary pathology, including the following imaging patterns: consolidation, cavitation, cyst, peribronchovascular opacity, halo/reverse halo, nodule/septal line, and ground glass 4. Differentiate imaging mimickers (for example, differentiate pneumatocele/blebs from a cavity or cyst) 5. Discuss non-infectious pulmonary pathology in immunocompromised patients, including immune reconstitution inflammatory syndrome and infection-associated pulmonary malignancy

Naga Sai Rasagna Mareddy, MBBS (*Abstract Co-Author*) Nothing to Disclose
Mohamed Ibrahim, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• Shared sheath pulmonary artery hematoma is a rare and underreported complication of Stanford type A aortic dissection. • Identify imaging features of acute type A aortic dissection and possible mimics. • Understanding the embryological development and anatomical relationship between the aorta and pulmonary arteries.

### TABLE OF CONTENTS/OUTLINE

• Embryological Development and Anatomical Relationship: - Overview of embryological development leading to the formation of the heart tube and aorticopulmonary septum. - Discussion of the anatomical relationship between the aorta and pulmonary arteries, including the presence of shared structures like the common aortopulmonary adventitia. - Highlighting how understanding embryology and anatomy enhances comprehension of pathological processes like aortic dissection. • Clinical Implications and Historical Descriptions: - Overview of clinical implications associated with acute type A aortic dissection, including potential complications and prognostic factors. - Historical descriptions of aortic dissection and its complications, including the concept of acquired aortopulmonary fistula. • Imaging protocol and features: o Discuss the imaging protocol in suspected acute chest pain scenario o Discuss the imaging features of shared sheath hematoma and its potential mimics o Discuss variety of acute dissection imaging findings and its mimics

## EFFECTS OF RADIATION THERAPY IN THORACIC ONCOLOGY REVISITED

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Elena Garcia Garrigos, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Marina Sirera Matilla, MD (*Abstract Co-Author*) Nothing to Disclose
Eloisa Feliu, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
David Ferrandez Ferrandez (*Abstract Co-Author*) Nothing to Disclose
Juan Arenas-Jimenez, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Both radiation and medical therapies for thoracic malignancies have evolved with combination and sequential strategies being an alternative to many tumors of the chest, mainly lung and breast cancer. Our goals are: To show how radiation therapy affects tumoral and non-tumoral tissues and how imaging can show those effects, with special emphasis on their chronology. To describe how radiation therapy has evolved from classic methods into more precise multiple beam stereotactic techniques thus expanding its indications and leading to more complex manifestations. To depict imaging findings related to radiation therapy, its associated complications and the effect of combining medical therapies such as immunotherapy with radiotherapy.

### TABLE OF CONTENTS/OUTLINE

1. Definition of radiation therapy types and their effects on tumoral and non-tumoral tissues 2. Differences between conventional radiotherapy and new techniques and indications. 3. Frequent effects of radiotherapy in the lungs, mediastinum, pleura and chest wall and their chronology. 4. Specific complications of radiotherapy and their differential diagnosis. 5. Radiological presentation of uncommon radiation therapy-related conditions: abscopal effect, delayed organizing pneumonia, radiation recall pneumonitis, radiation induced neoplasms. 6. Clues for diagnosing tumor recurrence in radiated lesions 7. Discussion of evidences about relationship of preexisting radiological interstitial lung abnormalities and immunotherapy with lung complications after radiation therapy. 8. Conclusions.

CHEE-82

## VASCULAR TUMORS IN THE THORAX: IMAGING CHARACTERISTICS, BIOPSY, AND MANAGEMENT OF ASSOCIATED COMPLICATIONS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Abhishek Chaturvedi, MD (*Abstract Co-Author*) Nothing to Disclose
Swati P. Deshmane, MBBS (*Abstract Co-Author*) Nothing to Disclose
Andrew C. Clark, DO (*Abstract Co-Author*) Nothing to Disclose
Adam Dykie, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Vascular tumors of the thorax have complex imaging findings; however, there also may be difficulty distinguishing them from other benign or malignant lesions. Vascular lesions can be present in the major vessels, mediastinum, lung parenchyma, or soft tissues and osseous structures of the chest wall. Cross sectional imaging with CT/MR and PET is essential in workup, although additional studies and biopsy may be needed for diagnosis. Deciding whether to biopsy, which technique to use, and which lesion to biopsy depends on various factors. Complications of image-guided biopsy and management of these complications should be considered, particularly given the increased concern for bleeding.

### TABLE OF CONTENTS/OUTLINE

This exhibit will provide background on vascular tumors including their subcategories and locations within the chest. Imaging characteristics of different vascular lesions on modalities such as CT, MRI, and PET will be reviewed, including techniques such as pre- and post-contrast imaging. Considerations for biopsy, such as malignant versus benign features, location, concern for bleeding, and treatment planning will then be discussed. Different methods for tissue sampling will be reviewed along with basic biopsy technique for vascular lesions. Biopsy may include ultrasound-guided, CT-guided, excisional, or intraluminal approaches. Complications of biopsy and their management will be discussed. Finally, conclusions will be drawn on the workup of vascular thoracic tumors through imaging characterization and biopsy.

### TEACHING POINTS

Interstitial lung disease (ILD) patients are known to have elevated risk for lung cancer with odds ratio ranging from 3.5-7.3. Lung cancer in ILD is often difficult to detect due to significant background reticulation and potential superimposed acute exacerbation that may obscure malignancy. However, accurate detection of lung cancer has important implications for clinical management and potential lung transplant candidacy. The purpose of this exhibit is to review the epidemiology of lung cancer in ILD patients, present a case-based approach to diagnosing lung cancer in patients with ILD, and review pitfalls of imaging ILD patients who also have lung cancer including cases in which lung cancer was initially missed.

### TABLE OF CONTENTS/OUTLINE

1. Title 2. Table of contents 3. Overview 4. Demographics and epidemiology 5. Pathogenesis 6. Histopathology of lung cancer in ILD vs normal lung 7. CT diagnosis a. Inconsistent with lung cancer i. Infection/inflammation 1. Acute exacerbation 2. Aspiration 3. Mycetoma ii. Manifestation of ILD 1. NSIP-OP 2. PPFE 3. PMF iii. Iatrogenic 1. Bronch bite hematoma b. Consistent with lung cancer i. Characteristic CT features nodules ii. Characteristic CT features lymphadenopathy/(asymmetric) iii. Time course iv. Evolution on CT 8. When suspicious finding identified 9. Tissue sampling 10. Utility of CT lung biopsy 11. CT lung biopsy complications 12. Confirming the diagnosis a. Confirmed i. Staging ii. Implication on transplant candidacy b. Non-malignant result i. Non-malignant vs non-diagnostic ii. Accept vs reject result iii. Utility of repeat CT lung biopsy 13. Case overview 14. Cases 15. Challenging cases and pitfalls 16. Summary 17. References

Juan Arenas-Jimenez, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Due to destructive, fibrotic and remodeling mechanisms, we can find a varied constellation of aerated lung lesions in chest CT scans of smoker patients that pose a diagnostic challenge for both the radiologists and pathologists. Radiologic terminology used for cystic lung lesions is complex and sometimes confusing, and the same applies to their pathologic correlation, with different names for similar findings. In this setting, the goals of this exhibit are to make an approach to these lesions trying to allow the reader: 1. To differentiate among the pathologic findings that characterize each type of aerated lung lesion in smokers. 2. To define the clue radiological findings and the diagnostic meaning of each subtype of cystic lung lesions in smokers. 3. To avoid pitfalls when interpreting aerated lung lesions in CT of smoker patients.

### TABLE OF CONTENTS/OUTLINE

1.Pathologic descriptions of airspaces enlargement and cystic lesions associated to fibrosis in the lungs of smokers: centrilobular and paraseptal emphysema, emphysema with fibrosis, smoking related interstitial fibrosis, airspace enlargement with fibrosis, smoking-related diffuse cystic lung disease and honeycombing. 2. Radiologic description of cystic lung lesions described in smokers and their meaning: emphysema, thin-walled cysts, thick-walled cysts, traction emphysema, cysts associated to desquamative interstitial pneumonia, smoking-related cysts and honeycombing cysts. 3. Pitfalls when interpreting cystic lesions. 4.Conclusions and quiz: how do I call this cyst?

Wassim Labaki, MD (*Abstract Co-Author*) Nothing to Disclose
Chiemezie Amadi, MD (*Abstract Co-Author*) Nothing to Disclose
Elizabeth Lee, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. There is a spectrum of etiologies and imaging appearance of filling defects in the airways. 2. Mucous plugs are a common finding on CT and although often dismissed, are associated with adverse outcomes in specific patient populations. 3. Understanding the importance of mucus plugging in muco-obstructive diseases and asthma is important for all radiologists. 4. Apart from mucus plugging, segmental and subsegmental intraluminal airway occlusions can be due to myriad conditions including infection, foreign bodies and neoplasms. 5. If high density is identified in airway occlusions specific entities including broncholiths and foreign bodies should be considered. 6. Opportunities and challenges relating to the evolving role of advanced imaging techniques in airways disease include air trapping quantification using parametric response mapping, airway wall thickness quantification and mucous plug quantification. These can provide prognostic information and may help quantify treatment response.

### TABLE OF CONTENTS/OUTLINE

1. Spectrum of intraluminal airway occlusions including: Muco-obstructive diseases (COPD, cystic fibrosis, primary ciliary dyskinesia, and non-cystic fibrosis bronchiectasis), asthma, allergic bronchopulmonary aspergillosis, obstruction leading to distal mucus plugging (neoplasms, bronchial atresia) and other etiologies (Diffuse: endobronchial infection, blood, plastic bronchitis, aspiration; Focal: foreign body, broncholiths, tumors) 2. Prognostic significance and current evidence related to mucus plugging in muco-obstructive diseases and asthma. 3. New techniques for quantification of airway wall thickening, mucus impaction and air trapping

### TEACHING POINTS

1. Identify imaging characteristics of non-tuberculous mycobacteria (NTM) infections across different patient populations.2. Understand the importance of differential diagnosis in imaging to distinguish NTM from other pulmonary conditions, including tuberculosis.3. Recognize the role of radiologists in the multidisciplinary management of NTM, emphasizing early detection and monitoring treatment response.

### TABLE OF CONTENTS/OUTLINE

1. Introduction to Non-tuberculous Mycobacteria a. Definition and Epidemiology b. Clinical Significance2. Imaging Features of NTM Infection a. Pulmonary NTM: Key Findings on Chest X-ray and CT b. Extra-pulmonary NTM: Diagnostic Challenges3. Differential Diagnosis a. Differentiating NTM from Tuberculosis and Other Lung Pathologies b. Role of Imaging in Guiding Biopsy and Further Testing4. Case Studies and Imaging Gallery a. Representative cases highlighting diagnostic features and pitfalls5. Conclusion a. Summary of Radiologist's Role in NTM Detection and Management6. PDF Upload Supplementary material includes detailed imaging studies, expanded case discussions, and a comprehensive review of NTM treatment protocols. This content aims to enhance understanding and provide a visual guide to assist radiologists in diagnosing and managing NTM infections effectively.

CHEE-87

## THORACIC FISTULAS - A MULTIFACETED CHALLENGE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Vinay V. Kandula, MBBS (*Abstract Co-Author*) Nothing to Disclose
Achala Donuru, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Early diagnosis and management of thoracic fistulas is critical for improving patient outcomes.
- Understanding the different causes (infection vs. malignancy) guides treatment decisions.
- Multimodality imaging, particularly MDCT, is essential for accurate diagnosis and fistula characterization.
- Management strategies involve addressing the underlying cause and potential fistula closure techniques.

### TABLE OF CONTENTS/OUTLINE

Diagnosis: Clinical suspicion is paramount, considering symptoms like cough, dyspnea, chest pain, recurrent infections, and nutritional issues.Imaging: CT scan with intravenous contrast is the mainstay for detailed fistula characterization, demonstrating the fistula tract and adjacent structures.Bronchoscopy: Valuable for evaluating airway fistulas, allowing visualization of the internal opening and potential foreign body removal.Esophagram: Useful for identifying esophageal fistulas, demonstrating contrast extravasation from the esophagus.Angiography: May be necessary for definitive diagnosis of vascular fistulas, depicting abnormal blood flow patterns.Management: The approach depends on fistula type and severity. Conservative management with antibiotics and nutritional support might be attempted for small fistulas. Endoscopic closure using stents or glue may be suitable for specific fistulas. Surgical repair is often definitive therapy, particularly for complex or large fistulas.

## WHAT YOU CAN LEARN FROM FALSE-NEGATIVE STUDIES IN AN ACADEMIC LUNG CANCER SCREENING PROGRAM

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Suzanne Byrne, MD (*Abstract Co-Author*) Nothing to Disclose
Ariadne DeSimone, MD, MPH (*Abstract Co-Author*) Nothing to Disclose
Kathryn Schulz, MD (*Abstract Co-Author*) Nothing to Disclose
Mark M. Hammer, MD (*Abstract Co-Author*) Nothing to Disclose
Silvia Arora, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. The most common causes of errors in diagnostic radiology are underreading, satisfaction of search, faculty reasoning, and location.2. Missed lung cancers tend to be paramediastinal or perihilar in location, therefore a radiologist should be aware of these blind spots, incorporate these locations into their search pattern, and consider integration of computer-aided detection software and AI algorithms.3. Missed lung cancers tend to be endobronchial lesions, therefore a radiologist should ensure comprehensive evaluation of the tracheobronchial tree on every examination.

### TABLE OF CONTENTS/OUTLINE

• Review types/causes of diagnostic errors in radiology• Review proposed methods to decrease errors in radiology• Highlight peer learning opportunity of monthly lung cancer screening (LCS) program conference and in learning from diagnostic errors • Define ‘false-negative studies’ within a LCS program• Review cases of missed lung cancers within a LCS program and discuss potential reasons for the ‘false negative’• Review cases of interval lung cancers within a LCS program• Review cases of slow-growing ground-glass or part-solid or cystic nodules within a LCS program

## NEW TERMINOLOGY IN ILD: PROGRESIVE PULMONARY FIBROSIS (PPF)

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Santiago Martinez-Jimenez, MD (*Abstract Co-Author*) Support, Reed Elsevier
Aura Ramirez, MD (*Abstract Co-Author*) Nothing to Disclose
Javier Leonardo Galindo Pedraza (*Abstract Co-Author*) Nothing to Disclose
Jorge Carrillo, MD (*Abstract Co-Author*) Nothing to Disclose
Ana M. Alvarado, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The term progressive pulmonary fibrosis (PPF), refers to progression in fibrosing interstitial lung diseases (ILDs) other than idiopathic pulmonary fibrosis (IPF). PPF is not a disease, but rather a behavior that different subtypes of fibrosing ILDs may develop overtime. A significant proportion of ILDs show progression, being more common in fibrosing hypersensitivity pneumonitis follow by ILDs associated with systemic autoimmune diseases and sarcoidosis. In patients with a pre-existing ILD, PPF is defined as prove of progression within the previous 12 months, with at least two of the following three criteria: worsening respiratory symptoms, physiological and radiological evidence of disease progression. Radiological findings of disease progression include: Increased extent or severity of traction bronchiectasis and bronchiolectasis, new ground-glass opacity with traction bronchiectasis, new fine reticulation, increased extent or coarseness of reticular abnormality, new or increased honeycombing and increased lobar volume loss. Progression of fibrosis is typically assessed visually. Semiquantitative assessment of the percentage of lung volume containing fibrotic feature may be a predictor of mortality.The assessment of ILDs needs a multidisciplinary approach including clinical, functional, imaging, and histopathological data to integrate a clinical probability for an accurate diagnosis and to assess the likelihood of progression.

### TABLE OF CONTENTS/OUTLINE

Introduction; Epidemiology; Physiopathology of pulmonary fibrosis; Definition criteria of PPF; Imaging approach to PPF; Differential diagnosis; Clinical Considerations: Treatment, Prognosis, and the role of imaging.

## NOVEL APPROACH FOR COMPREHENSIVE PERIOPERATIVE ASSESSMENT OF RESPIRATORY MALIGNANCY VIA ULTRA-LOW-DOSE LUNG CT UTILIZING AG FILTER AND DEEP LEARNING RECONSTRUCTION

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Hirofumi Uehara, PhD (*Abstract Co-Author*) Nothing to Disclose
Yasuyuki Ichinohe (*Abstract Co-Author*) Nothing to Disclose
Koichi Osuda, RT (*Presenter*) Nothing to Disclose

### TEACHING POINTS

In the current local treatment of respiratory malignancies, there are cases in which multiple CT examinations are required to prevent complications caused by intervention procedures.It includes (1)coil marking + Video-Assisted Thoracoscopic Surgery (VATS) partial resection for small lung cancer and (2)lung Radiofrequency Ablation.Ultra-low-dose lung CT examination combined with Ag filter and Deep Learning image Reconstruction (DLR) significantly reduce radiation dose, and reliably provides image quality sufficient for preoperative and postoperative assessment.We summarize the potential benefits of incorporating ultra-low-dose CT imaging into clinical practice in the management of respiratory malignancies.

### TABLE OF CONTENTS/OUTLINE

High-definition thin-section CT is performed for initial diagnostic assessment, judging surgical indication, and the detailed scan data allowed to simulate bronchoscopic coil-marking technique.Ultra-low-dose CT using Ag filter have been taken for confirm the marking-site immediately before surgery.In addition, it is used to assess the complications such as pneumothorax and hemothorax after surgery and for early pneumonia.We emphasize the importance of reducing radiation exposure while maintaining both diagnostic accuracy and intervention technique safety, and propose comprehensive approach for supporting respiratory malignancy treatment using appropriate scan protocol.

### TEACHING POINTS

Lung cancer, characterized by high morbidity and mortality rates, ranks among the most prevalent cancers, with smoking as its primary risk factor. The U.S. Preventive Services Task Force advises annual low-dose computed tomography (LDCT) screening for individuals aged 50 to 80 years with a 20-pack-year smoking history or who quit within the last 15 years. To standardize terminology and management guidelines, the American College of Radiology developed the Lung CT Screening Reporting and Data System (Lung-RADS®), recently updated in 2022. Early diagnosis is imperative for facilitating curative treatment and improving patient survival. Lung cancer screening with low-dose CT has demonstrated a 20% reduction in mortality compared to unscreened patients. Given the ongoing scientific advancements, radiologists must stay abreast of updates to identify suspicious lesions and determine appropriate management.

### TABLE OF CONTENTS/OUTLINE

Interactive Case-Based Learning Image characteristics according to Lung-RADS® v.2022 will be demonstrated, accompanied by respective recommendations, through an interactive question and answer format (quiz):-Atypical Pulmonary Cysts-Juxtapleural Nodules-Airway Nodules-Infectious or Inflammatory FindingsGeneral Summary: A comprehensive overview of LungRADS v2022 categories and concepts based on cases and illustrations

## USING IMAGING BIOMARKERS FOR COMPREHENSIVE LUNG PATHOLOGY DIAGNOSIS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Vinay V. Kandula, MBBS (*Abstract Co-Author*) Nothing to Disclose
Achala Donuru, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Differentiating between benign, infectious, and malignant lung pathologies remains a diagnostic challenge. This presentation explores the power of imaging biomarkers identified on CT, PET, MRI, and PET/MRI in guiding radiologists towards a confident diagnosis.By leveraging the expanding repertoire of imaging biomarkers, radiologists can enhance diagnostic accuracy across a spectrum of lung pathologies, ultimately leading to optimal patient management.

### TABLE OF CONTENTS/OUTLINE

CT Biomarkers for Pinpointing Pathology• Malignancy: Size and spiculation, attenuation, calcification• Infection: Consolidation, cavitation• Benign Conditions: Honeycombing, cyst characteristicsPET Scan Biomarkers for Metabolic ActivityMalignancy: Increased FDG uptake on PET/CT signifies hypermetabolic activity, a hallmark of lung cancer. Some infections and inflammatory processes can also show FDG avidity, requiring correlation with CT findings.MRI Biomarkers for Soft Tissue CharacterizationMalignancy: While not a first-line modality, MRI can offer valuable insights by differentiating between tumors and benign lesions based on signal intensity on T1 and T2 weighted images. Restricted diffusion on diffusion-weighted MRI can suggest malignancy.PET/MRI Scan BiomarkersParticularly beneficial for patients with contraindications to CT scans due to radiation concerns or kidney issues with contrast agents.Emerging Biomarkers and Advanced Techniques• Dotatate PET scans: Can be helpful in diagnosing lung carcinoid tumors.• Hyperpolarized gas MRI offers unique insights into gas exchange, alveolar integrity, and ventilation defects.• Dual tracer PET • Beyond FDG: Choline analogs, amino acid tracers

Akihiro Saitou (*Abstract Co-Author*) Nothing to Disclose
Wataru Fujishiro, RT (*Presenter*) Nothing to Disclose

### TEACHING POINTS

•Importance of understanding pulmonary arteriovenous anatomy before pulmonary segmentectomy •Visualization of pulmonary arteries (PA) and pulmonary veins (PV) by 3D-CT images •Benefits of non-contrast CT for the separation of PA and PV •Accuracy of automatic pulmonary arteriovenous separation by non-contrast CT and contrast CT •Optimal reconstruction parameters for automatic separation by non-contrast CT

### TABLE OF CONTENTS/OUTLINE

1. Pulmonary arteriovenous anatomy and critical anatomical variants 2. Explanation of the conventional methods and the novel method for 3D-CT images of pulmonary arteriovenous separation 3. Benefits: a) Does not require contrast media b) Eliminate artifacts c) Reduce radiation dose 4. Comparison of non-contrast and contrast 3D-CT images of pulmonary arteriovenous Outline: 3D-CT images of the pulmonary arteriovenous helps perform safe navigation during video-assisted thoracic surgery (VATS), which anatomically involves variety of blood vessels. Conventionally, 3D-CT images are reconstructed from contrast-enhanced CT data using a workstation semi-automatically. However, some patients are allergic to contrast media, have impaired renal function, or are receiving biguanides, and extreme caution must be exercised when performing contrast CT in these patients. We present a method to reconstruct 3D images of PA and PV automatically separated from non-contrast CT data by using state-of-the-art image processing technology. This method allows 3D-CT images of the pulmonary arteriovenous to be reconstructed without contrast, with low radiation, and high accuracy. 3D images of the pulmonary arteriovenous with non-contrast CT useful in VATS just as contrast-enhanced CT.

## THORACIC MRI FOR THE CHARACTERIZATION OF MEDIASTINAL ANTERIOR MASSES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Caroline Caramella (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Mediastinal anterior masses (MAM) represent an uncommon finding on CT. Whether there are clinical symptoms suggesting myasthenia or not, it is of the utmost importance to differentiate thymic hyperplasia from thymic epithelial tumours (thymoma or thymic carcinoma) and to rull out other diagnosis such as benign thymic cysts or other types of tumours (germinal-cell tumors, lymphoma, paraganglioma, ?). It will completely change the treatment strategy (surgery vs chemotherapy or withholding). In addition to FDG-PET-CT, MRI enables better identification of the tissue composition (cystic, presence of fat, ..). It also is useful in the surgical planning of mediastinal tumours by giving precious information on the cardio-vascular structures that can be involved in the mass, and on the possible presence of metastasis, especially in the pleura. Thoracic MRI is however rarely used in this context, due to misconception of its poor performances in lung imaging. We will present a simple MR protocol that enables MAM characterization and work-up, and give tips for dealing with a fortuitously discovered (or not) MMA.

### TABLE OF CONTENTS/OUTLINE

Table of content: - Thoracic MRI protocol - Different anterior mediastinal tumour types Reasoning algorithm

Maria J. Galante I, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Lung transplantation is a very complex life-saving treatment for patients with end-stage lung disease. The radiologist represents an important part of the process, from the presurgical imaging to postoperative control. Postsurgical imaging can be challenging since a wide spectrum of postoperative complications can appear. This work shows a comprehensive overview of post-transplant imaging from presurgical imaging to complications through a radiological perspective, hoping to serve as a guide for radiologists and clinicians involved in this complex procedure. With a systematic review of common and more rare post-transplant complications including rejection, haemorrage, airway complications, etc. , this educational poster highlights the highly important role of radiological imaging in early detection, and accurate diagnosis that may lead to a prompt intervention if needed.The main objectives are: - To review the main types of pulmonary transplants and surgical techniques. - To discuss pretransplant imaging- To suggests imaging protocols for the assesmento of complications- By knowing the main surgical techniques, predict the normal postsurgical changes. - To describe the main immediate, early, intermediate and late complications of this surgery- To provide images that can illustrate these complications

### TABLE OF CONTENTS/OUTLINE

1) Indications of lung transplant2) Contraindications3) Types of pulmonary transplants4) Surgical techniques5) Imaging pre-surgical assesment6) Immediate Complications7) Intermediate Complications8) Late Complications

## RADIOLOGICAL PERSPECTIVES OF LUNG DISEASE IN IDIOPATHIC INFLAMMATORY MYOPATHIES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Carlos Arteaga (*Abstract Co-Author*) Nothing to Disclose
Javier Leonardo Galindo Pedraza (*Abstract Co-Author*) Nothing to Disclose
Jorge Carrillo, MD (*Abstract Co-Author*) Nothing to Disclose
Jenny Londono (*Abstract Co-Author*) Nothing to Disclose
Santiago Martinez-Jimenez, MD (*Abstract Co-Author*) Support, Reed Elsevier
Ana M. Alvarado, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Idiopathic inflammatory myopathies (IIM) include a heterogeneous group of systemic autoimmune diseases characterized by varying degree of skeletal muscle inflammation and extramuscular manifestations. The main subtypes of IIM are dermatomyositis, polymyositis, clinically amyopathic dermatomyositis, antisynthetase syndrome, overlap syndrome, inclusion body myositis, and immune mediated necrotizing myopathy. Pulmonary involvement in the form of interstitial lung disease (ILD) is the most common extramuscular manifestation of IIM, contributing to an estimated 50% excess mortality. In up to 20% of cases, ILD precedes muscular symptoms, challenging early IIM diagnosis due to its unpredictable onset.The diversity within IIM clinical phenotypes is due to various autoantibodies, which include: myositis-specific autoantibodies (MSAs) and myositis-associated autoantibodies (MAAs). Some MSAs are associated with increased risk of ILD, such as Anti-synthetase autoantibodies, particularly Anti-Jo1 (up to 90%). Non-specific interstitial pneumonia is the most common HRCT finding in this grup. Myositis-associated rapidly progressive ILD is related with anti-MDA-5, which comes with increased mortality (up to 50%). Organizing pneumonia is the main HRCT pattern. Anti-PI-7 and anti-PI-12 are associated with higher incidence of ILD in the absence of clinical myositis.Other pulmonary manifestations of MII include: opportunistic infections, pulmonary hypertension, aspiration pneumonia, neoplasia and drug-induced pneumonitis.

### TABLE OF CONTENTS/OUTLINE

Definition; Classification; Clinical presentation; HRCT patterns; Other pulmonary manifestations of MII.

## LUNGS EXPOSED: A RADIOLOGICAL APPROACH TO OCCUPATIONAL LUNG DISEASES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Marie Bambrick, MBBCh (*Abstract Co-Author*) Nothing to Disclose
Micheal McInnis, MD (*Abstract Co-Author*) Speakers Bureau, Boehringer Ingelheim GmbH;Speakers Bureau, Bayer AG
Jimin Lee (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Occupational lung diseases often manifest over decades, challenging clinicians to identify the disease.- Progressive massive fibrosis has become increasingly common in recent years due to the popularity of artificial stones.- Chrysotile asbestos was still used and imported into the United States until the Environmental Protection Agency banned the material in March 2024.- Inhaled hard metal dust can result in giant cell interstitial lung disease or desquamative interstitial pneumonia.- Occupational lung diseases have characteristic appearances on high-resolution computed tomography and chest radiographs.- Mesothelioma most commonly arises from the pleura and presents with nodular pleural thickening.

### TABLE OF CONTENTS/OUTLINE

- Overview of various occupational lung diseases (pneumoconioses, occupational asthma, hypersensitivity pneumonitis) and their clinical presentations- Review of causative agents and environments for occupational lung diseases in the modern era- Overview of clinical and radiologic approach to diagnosing occupational lung diseases- Review of hallmark imaging abnormalities on computed tomography and radiographs through sample patient cases

## THE MYRIAD FACES OF NON THROMBOTIC PULMONARY EMBOLISM

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Rachna Madan, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Mark M. Hammer, MD (*Abstract Co-Author*) Nothing to Disclose
Anupama Ramachandran, MD (*Presenter*) Siemens AG

### TEACHING POINTS

To review the spectrum of imaging manifestations of non-thrombotic pulmonary artery embolism (NTPE).

### TABLE OF CONTENTS/OUTLINE

•NTPE represents embolization of nonthrombotic material, such as tumoral cells (or other cells types), organisms, gas or foreign material, into the pulmonary circulation.•In addition to causing occlusion of pulmonary micro- or macro-circulation, NTPE are often accompanied by endothelial and/or parenchymal injury, with an inflammatory reaction both in the systemic and pulmonary circulation.•Hence on imaging, NTPE maybe associated with a constellation of vascular and parenchymal imaging findings depending on the underlying etiology.•The etiologies can be grouped in 4 categories as follows:o Neoplastic entities: Pulmonary artery sarcoma, pulmonary tumor embolism, intravascular leiomyomatosis.o Inflammatory entities: Pulmonary arterial IgG4-related disease, Takayasu arteritis, Behcet diseaseo Iatrogenic entities: Pulmonary embolization of intravascular device (central venous catheter fragment, fractured pacemaker lead), coils from thoracic duct, cement embolization, air embolism, FDG hot clot artifact.o Miscellaneous entities: Septic embolism, fat embolism.•In this educational exhibit, we discuss the etiology and the spectrum of imaging findings of NTPE.

## EREE-1 NAVIGATING THE SLOPES: A COMPREHENSIVE REVIEW OF SNOWSPORTS MUSCULOSKELETAL INJURIES ENCOUNTERED IN THE EMERGENCY DEPARTMENT

Arash Azhideh, MD, MPH (*Abstract Co-Author*) Nothing to Disclose
Maryam Soltanolkotabi, MD (*Abstract Co-Author*) Nothing to Disclose
Majid Chalian, MD (*Abstract Co-Author*) Grant, The Boeing Company
Brian Y. Chan, MD (*Abstract Co-Author*) Nothing to Disclose
Amanda M. Crawford, MD (*Abstract Co-Author*) Nothing to Disclose
Ghazaleh Safazadeh, MD,MPH (*Presenter*) Nothing to Disclose

### TEACHING POINTS

-Understanding the biomechanics of snowsports and how they contribute to injury patterns. -Recognition and classification of common musculoskeletal injuries encountered in snowsports. -Diagnostic imaging modalities and their role in evaluating snowsports injuries. -Treatment options and rehabilitation strategies for various snow sports-related injuries. -Injury prevention strategies and recommendations for safe participation in snowsports.

### TABLE OF CONTENTS/OUTLINE

I. Introduction A. Overview of the popularity and diversity of snowsports. B. Importance of understanding radiologic findings of musculoskeletal injuries in snowsports. II. Biomechanics of Snowsports A. Overview of biomechanical forces involved in skiing, snowboarding, and other snowsports. B. Impact of terrain, speed, and equipment on injury risk. III. Common Musculoskeletal Injuries A. Upper Extremity Injuries -Shoulder Girdle Injuries: fracture/dislocations, rotator cuff injuries -Wrist/Hand Injuries: fracture/dislocations, ligamentous injuries B. Lower Extremity Injuries -Knee Injuries: ligamentous tears, meniscal injuries -Foot/Ankle Injuries: fractures, ligamentous injuries, tendon pathology C. Axial Injuries-Thoracolumbar spine injuries: compression/burst fractures, disc disease.-Pelvic injuries: stable vs unstable IV. Treatment and Rehabilitation A. Overview of conservative and surgical treatment options. B. Rehabilitation protocols for specific injuries. V. Injury Prevention A. Importance of proper equipment selection and fitting. B. Techniques for injury prevention and safe skiing/snowboarding practices. VI. Conclusion

## EREE-10 X-RAY ASSESSMENT OF ACUTE NEWBORN PATHOLOGIES

**Awards**

### TEACHING POINTS

1. To discuss the role of radiological imaging in assessing newborns presenting with distress symptoms, differentiating pathologic from normal findings on newborn X-rays. 2. Discuss indications for X-ray imaging and radioprotection considerations in newborns. 3. Present a structured approach to chest and abdominal X-ray assessment in newborns. 4. Highlight X-ray findings seen in preterm and full-term newborns with respiratory distress, cardiovascular, and gastrointestinal abnormalities, providing insights into the differential diagnosis of conditions causing distress in newborns based on radiological findings. 6. Assess normal positions and courses of lines and tubes. 7. Emphasize the role of radiologists in guiding clinical decision-making and optimizing patient outcomes.

### TABLE OF CONTENTS/OUTLINE

A. Introduction B. Radiation safety and the ALARA concept C. Structured approach to X-ray assessment D. Neonate in distress - chest X-ray a. Surfactant deficiency disease b. Transient tachypnea of the newborn c. Meconium aspiration syndrome d. Bronchopulmonary dysplasia e. Pneumothorax f. Pneumonia g. Congenital Anomalies (e.g., congenital pulmonary lymphangiectasia, diaphragmatic hernia, congenital lobar overinflation, pulmonary sequestration). E. Neonate in distress - abdominal X-ray a. Esophageal, duodenal, jejunal, ileal, anal atresia b. Duodenal web c. Malrotation d. Meconium ileus e. Perforation f. Necrotizing enterocolitis g. Hypertrophic pyloric stenosis F. Assessment of Lines and Tubes a. Endotracheal Tube b. Nasogastric Tube c. Umbilical Arterial Catheter d. Umbilical Venous Catheter e. Peripherally inserted central catheter f. ECMO catheter G. Conclusion

## EREE-11 ROLE OF MRI IN UROGENITAL TRAUMA

Ryo Ueda (*Abstract Co-Author*) Nothing to Disclose
Christian Roest, MSc (*Abstract Co-Author*) Grant, Siemens AG
Thomas C. Kwee, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Akitoshi Inoue, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Hiromi Edo, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Yuki Arita, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

CT, US, and urethrography have been the main imaging modalities for the evaluation of urogenital trauma, particularly in shock patients, thanks to their relatively short examination times. MRI is employed for evaluating urogenital trauma in hemodynamically stable patients because of the following advantages. (i) Higher contrast resolution allows for the depiction of more detailed anatomic information, which is essential in decision-making for surgical procedures, (ii) Its potential to detect mild parenchymal or luminal wall injury without contrast medium, and (iii) The lack of ionizing radiation, which is particularly important for (follow-up) examinations in younger patients. MRI may provide value in several settings. For example, in urethral trauma associated with pelvic fractures, MRI offers a detailed evaluation of the proximal urethral stump, essential for urethral reconstruction surgery. While ultrasound remains the preferred method for diagnosing testicular rupture due to blunt trauma, MRI can be crucial in cases in which a large hematoma obscures the rupture of the tunica albuginea, helping to assess the need for orchiectomy. This exhibit discusses the criteria for employing MRI in urogenital trauma, and illustrates MRI findings of various urogenital trauma cases, emphasizing its growing importance in the appropriate diagnosis and pre- and post surgical assessment of urogenital injuries.

**TABLE OF CONTENTS/OUTLINE**

1, Overview of the anatomy and trauma classification for the urogenital organ 2, Pros and Cons for imaging modalities (Fluoroscopy, CT, US, and MRI) 3, Recommended MR protocol and its imaging findings for each organ a. Kidney b. Bladder and Ureter c. Urethra d. Testis e. Penis 4, Summary

Yashant Aswani, MD (*Abstract Co-Author*) Nothing to Disclose
Ananya Panda, MD, MBBS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Emphysematous conditions of abdomen are uncommon but potentially lethal conditions. It's important for radiologists to identify the correct pathology also avoid misdiagnosis and potential pitfalls. This exhibit also reviews pertinent clinical features that can help confirm diagnosis and avoid similar pitfalls. Lastly, we review management for better radiology reporting. At the end of the exhibit, the learner will be able to: 1. Review spectrum of emphysematous conditions of abdomen 2. Understand imaging mimics and clinical implications. 3. Be aware of next best steps as part of radiology reporting.

**TABLE OF CONTENTS/OUTLINE**

I. Emphysematous Gastritis. Pitfall: Hydrogen peroxide ingestion II. Gas Gangrene of Liver. Pitfall: Hepatic abscess Post-therapy changes III. Emphysematous Cholecystitis. Pitfall: Radiolucent gallstones Bilio-enteric fistula IV. Emphysematous Pancreatitis. Pitfall: Post-enteric fistula post-intervention changes V. Emphysematous Pyelonephritis. Pitfall: Emphysematous Pyelitis Post-therapy changes VI. Emphysematous Cystitis. Pitfall: Intraluminal Air Chyluria VII. Emphysematous Aortitis. Pitfall: Aorto-enteric fistula post-intervention changes VIII. Retroperitoneal Fasciitis. Pitfall: Pneumoretroperitoneum IX. Bowel Gangrene. Pitfall: Benign Pneumatosis Intestinalis Pneumatosis cystoides. X. Gas Gangrene of Abdomen Wall/ Fournier Gangrene. Pitfall: Benign Subcutaneous Emphysema XI. Gas Gangrene of Uterus. Pitfall: Endometritis Post-partum changes XII. Gas-forming Prostate Abscess Pitfall: Uro-symphyseal Fistula XIII. Emphysematous Vaginitis. Pitfall: Vaginal Tampon XIV. Emphysematous Epididymo-Orchitis. Pitfall: Air in Scrotum

## EREE-13 CT IMAGING OF SHOULDER GIRDLE AND PROXIMAL HUMERAL FRACTURES: BIOMECHANICAL PRINCIPLES, GRADING, AND SURGICAL RELEVANCE

David Dreizin, MD (*Abstract Co-Author*) Nothing to Disclose
Kathryn Champ, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

After completing the exhibit, participants will be able to: 1. Describe the role of CT and specific indications for this modality in the context of injuries to the superior suspensory complex of the shoulder (SSSC) and proximal humerus. 2. Explain the CT imaging features and parameters favoring surgical management for complex injuries including floating shoulder and bipolar glenohumeral fracture-dislocations. 3. List the common classification systems and subtypes for clavicular fractures, AC joint separations, and proximal humeral fractures, and imaging indications for surgical repair or reconstruction.

**TABLE OF CONTENTS/OUTLINE**

I. Introduction: i. Clinical scenarios for which CT and 3D CT are advocated ii. Review of shoulder girdle and proximal humeral anatomy. iii. Injury biomechanics with pathoanatomy. II. Classification systems, key imaging features, and indications for surgical repair. i. Clavicle fractures: Allman and Neer classifications, telescoping, comminution, fracture displacement, and proximity to coracoclavicular ligaments. ii. AC separations: Rockwood classification, and surgical management of high-grade subtypes. iii. Sternoclavicular separation and scapulothoracic dissociation in severe trauma. iv. Glenoid and proximal humerus fracture-dislocations: Bankart, Hill-Sachs, and bipolar fractures; engaging lesions: glenoid track and Hill-Sachs interval concepts v. SSSC double disruptions and the floating shoulder: typical and atypical subtypes. vi. Proximal humeral fractures: Neer classification; calcar integrity, and varus collapse. III. Conclusion: summary table- key CT features and surgical management implications.

## EREE-14 BABY ON BOARD: IMAGING OF BLUNT TRAUMA IN PREGNANCY

Jason A. Pietryga, MD (*Abstract Co-Author*) Consultant, Radiostics LLC
Kristen Olinger, MD (*Abstract Co-Author*) Nothing to Disclose
Mariana R. Defreitas, MD (*Abstract Co-Author*) Nothing to Disclose
David E. Bartlett, MD (*Abstract Co-Author*) Nothing to Disclose
Esha Sharda, MD (*Abstract Co-Author*) Nothing to Disclose
Christopher Ruggiero, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

(1) Discuss appropriate imaging for blunt trauma in pregnancy. (2) Review risk of imaging to the mother and fetus. (3) Recognize findings of trauma and its mimics in imaging of the gravid patient.

**TABLE OF CONTENTS/OUTLINE**

I. Background A. 1 in 12 pregnancies are affected by trauma, a leading cause of cause of death in pregnancy.B. Emergency Radiologists must understand appropriate imaging, risk of imaging, and traumatic findings in the expecting mother.II. Imaging selection A. Ultrasound is a useful tool for initial screening. i. Benefits of portability, lack of radiation, and high specificity. ii. Poor sensitivity in trauma limits its use. B. CT is first line in trauma imaging: i. Dose generally below 50 mGy ii. Threshold is unlikely to increase risk of fetal anomalies or loss. iii. Other radiation risks, including carcinogenesis must be considered. C. MRI may be appropriate: i. Subject to availability and time constraints.III. Injury patterns A. Radiologists must recognize imaging findings of trauma in pregnancy: i. Pregnancy-specific. 1. Placental abruption and uterine rupture. 2. Mimics - normal structures: cotyledons, chorionic plate indentations, and venous lakes. ii. Other injuries. 1. Abdominal visceral injuries. 2. Thoracic injuries. 3. Osseous injuries.IV. Conclusion A. Trauma in pregnancy is a leading cause of maternal and fetal mortality. B. Radiologists must: i. Know risks and benefits of imaging in pregnancy. ii. Be familiar with findings associated with trauma in pregnancy.

## EREE-15 BODY MRI ON CALL- A PRIMER FOR RADIOLOGY TRAINEES

Carolina A. Heming, MD (*Abstract Co-Author*) Nothing to Disclose
Yashant Aswani, MD (*Abstract Co-Author*) Nothing to Disclose
Maheen Rajput, MD (*Abstract Co-Author*) Nothing to Disclose
Ananya Panda, MD, MBBS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

With expanded access to MR systems, there is increasing role of Body MRI in emergency department/emergent conditions. Body MRI on-call is primarily used for problem-solving when US/CT are non-diagnostic. MRI offers non-radiation alternative when CT is contraindicated. Superior soft-tissue resolution of MRI provides non-contrast alternative when contrast is contraindicated. Familiarity with diverse conditions encountered in emergent settings can help on-call radiology trainees gain confidence and allow for seamless transition from training to independent practice. At end of this exhibit, learners will be able to: 1. Review spectrum of conditions encountered during on-call for which MRI may be indicated. 2. Know key protocols and high-yield sequences. 3. Understand added value of MRI for problem-solving.

**TABLE OF CONTENTS/OUTLINE**

I. Hepatobiliary a. Choledocholiathiasis b. Mirizzi syndrome c. Post-cholecystectomy syndrome d. Complicated Cholecystitis e. Biliary leak f. Cholangitis g. Hepatic lesion- infection/hemorrhage/mass with hemoperitoneum h. Hepatic Infarct/Vascular Thrombosis i. Bile duct/Periportal tumor invasion II. Pancreas a. Acute Complicated Pancreatitis b. Pancreatic Trauma III. GU/Pelvis a. Renal mass with tumor thrombus b. Prostate Abscess c. Post-Radiation Complications IV. OBGYN a. Pregnant Patient: GI/GU conditions b. Adnexal Torsion c. Ectopic pregnancy d. Fibroids-Red degeneration e. Placenta/Post-partum complications V. Bowel a. Appendicitis b. Crohn’s disease complications c. Perianal abscess d. Diverticulitis/mimics VI. Penis/Scrotum a. Trauma b. Infection VII. Acute presentation of cancers a. Pancreatic Cancer b. Gall bladder Cancer c. Colorectal Cancer

## EREE-16 VASCULAR EMERGENCIES IN HOSPITALIZED PATIENTS: FROM CHEST TO TOES

**Awards**
**Certificate of Merit**

Albert Hsiao, MD, PhD (*Abstract Co-Author*) Co-founder, Arterys Inc;Shareholder, Arterys Inc;Co-founder, Vektor.AI;Shareholder, Vektor.AI;Research Grant, Bayer AG;Research Grant, General Electric Company;Research Grant, KA Imaging
Brian Pogatchnik, MD (*Abstract Co-Author*) Nothing to Disclose
Sophie Y. Wong, MD (*Abstract Co-Author*) Nothing to Disclose
Stephan Altmayer, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Vascular emergencies commonly occur in the inpatient setting and must be quickly and accurately diagnosed to allow timely intervention. This exhibit will:1. Discuss common vascular imaging techniques and the terminology used to describe findings2. Illustrate a broad spectrum of disease categories through case examples, including body regions from the neck down3. Familiarize the reader with common pitfalls of vascular imaging

**TABLE OF CONTENTS/OUTLINE**

1. Imaging techniquesa. Triple phase scanb. Dual-energy scanc. Imaging optimization2. Acute bleed and pseudoaneurysma. Definition of conceptsb. Acute bleedingc. Pseudoaneurysm3. Ischemia and embolizationa. Sources of embolismb. Ischemia in the hospital4. Emergencies related to vascular devicesa. Linesb. ECMOc. IABPd. Others5. Pitfalls of vascular imaging

## EREE-17 A CHECKLIST APPROACH TO INTERPRETING CT ANGIOGRAPHY OF ABDOMINAL VASCULAR EMERGENCIES

Carlos S. Tapia SR, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Abdominal emergencies of vascular origin are a common cause of attention in emergency departments. CT angiography is the imaging method of choice to evaluate the abdominal vessels. The radiologist's evaluation with a checklist report allows for a faster and more precise diagnosis, offering all the dates the physician needs for a correct approach to the patient.The inferior vena cava is the most prominent vein in the body. The most common emergency is obstruction by a filling defect, usually a thrombus; based on the lack of expansion of the vessel lumen and the absence of enhancement of the filling defect, this can be differentiated from a tumoral thrombus.In cases of acute aortic syndrome, it is essential to identify the type: aortic dissection, acute intramural hematoma, and penetrating atherosclerotic ulcer. Then, classify in Stanford A or B, and do not forget to find signs of impending rupture. Acute arterial or venous mesenteric ischemia is a severe life-threatening condition. Early detection and treatment are of utmost importance, as any delay in diagnosis can lead to bowel necrosis, perforation, and septic shock.

**TABLE OF CONTENTS/OUTLINE**

Introduction. Abdominal vascular anatomy. Inferior vena cava thrombosis and congenital variants. Acute aortic syndrome. Aortic dissection. Acute intramural hematoma. Penetrating atherosclerotic ulcer. Signs of impending or contained rupture in abdominal aortic aneurysm. Vasculitis with abdominal vessel involvement. Venous bowel ischemia. Arterial Bowel ischemia. Bleeding angiodysplasia of the colon. Portal vein thrombosis and other emergencies. Pitfalls. Teaching points. Conclusions. Bibliography.

## EREE-18 ABDOMINAL PAIN IN PREGNANCY: BEYOND OBSTETRICS - INSIGHTS FROM MRI DIAGNOSTICS IN THE EMERGENCY ROOM

Camila B. Visconti, MEd (*Abstract Co-Author*) Nothing to Disclose
Patricia Leal, MD (*Abstract Co-Author*) Nothing to Disclose

Alice Schuch, MD (*Abstract Co-Author*) Nothing to Disclose
Natalia H. Concatto, MD (*Abstract Co-Author*) Nothing to Disclose
Ariane Giovanaz (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Present illustrative cases of the most prevalent non-obstetric causes of abdominal pain in pregnant women, featuring classic imaging findings and critical diagnostic signs.Assess the advantages of utilizing magnetic resonance imaging (MRI), while establishing a standardized MRI protocol for this evaluation.

**TABLE OF CONTENTS/OUTLINE**

IntroductionEpidemiology and risk factors of the most prevalent non-obstetric causes of abdominal pain in pregnant women.MR technique and discussionDescribe the main protocol and sequences of MRI used for assessing abdominal pain during pregnancy.Imaging features and pathology correlationDemonstrate MRI's efficacy in identifying various etiologies, from benign to potentially life-threatening conditions in pregnant women experiencing acute abdominal pain.ConclusionDiscuss the value of MRI in shaping medical management decisions for pregnant individuals with acute abdominal pain.

## EREE-19 RADIOLOGY UNDER THE GUN: GUIDE TO BULLSEYE DIAGNOSIS

Robert J. Dym, MD (*Abstract Co-Author*) Nothing to Disclose
Omar Jamil, MD (*Abstract Co-Author*) Nothing to Disclose
Daniel Giraldo Herrera, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. The U.S. epidemic of gun violence saw recent increases in the incidence of firearm-related injuries and deaths, and these may present a wide variety of diagnostic challenges in emergency departments.2. Firearm-related injuries constitute a unique category of traumatic injury given the high velocity of bullets and their penetrating mechanism with high-energy transfer.3. Understanding these types of injuries enables radiologists to assess the trajectory of the bullet, differentiate between direct and blast injury, and recommend follow-up interventions based on associated findings such as gross or subtle vascular injury, hollow viscus, or diaphragmatic injuries.

**TABLE OF CONTENTS/OUTLINE**

1. Background and Review of the Literature. 2. Spectrum of organ lacerations, with AAST and operative specimen correlates. 3. Spectrum of vascular injuries with angiography correlates. 4. Thoracic injuries with percussive contusions. 5. Atypical cases: migratory bullets, shotgun and non-civilian firearms, and non-bullet projectiles.

## EREE-2 AFTERMATH OF A PUNCH TO THE GUT: IMAGING FOLLOWING SELECTIVE NONOPERATIVE MANAGEMENT OF ABDOMINAL TRAUMA

Angelo G. Marino, DO (*Abstract Co-Author*) Consultant, Inari Medical, Inc;Speaker, Inari Medical, Inc
Nadia Solomon, MD, MSc (*Abstract Co-Author*) Nothing to Disclose
Douglas S. Katz, MD (*Abstract Co-Author*) Nothing to Disclose
Margarita V. Revzin, MD, MS (*Abstract Co-Author*) Nothing to Disclose
Yashant Aswani, MD (*Abstract Co-Author*) Nothing to Disclose
Anne Sailer, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Nonoperative management (NOM) is frequently conducted in trauma centers in patients with penetrating abdominal trauma who are hemodynamically stable without signs of diffuse peritonitis or evisceration.2. Although NOM has been relatively widely adopted for abdominal stab wounds, the concept has not been as embraced for GSWs given the higher associated incidence of visceral and abdominal vascular injuries and the morbidity and mortality associated with missed injuries.3. Recommendations of post-imaging guidelines for NOM patients with abdominal trauma is essential to screen for injuries (hollow organ, diaphragm injury, and delayed hemorrhage) that could have been missed on the initial trauma scan.

**TABLE OF CONTENTS/OUTLINE**

1. Briefly review indications for NOM and the role of angiography with embolization, endoscopic retrograde cholangiopancreatography with stenting, and percutaneous drainage to increase the success of NOM. 2. Propose a follow-up imaging algorithm for patients who undergo surgical and NOM.3. Case based review of successful and unsuccessful NOM including cases of missed hollow organ injury, delayed hemorrhage, and many more to highlight potential blind spots.

## EREE-20 ABDOMINAL BLUNT TRAUMA…YOU'VE GOT TO BE KIDNEY ME: A PRIMER OF THE REVISED AAST KIDNEY INJURY SCALE FOR DIAGNOSTIC RADIOLOGY RESIDENTS

Adriana L. Vargas Figueroa, MD (*Abstract Co-Author*) Nothing to Disclose
Ricardo ALBINO CAMACHO (*Abstract Co-Author*) Nothing to Disclose
Jose A. Lara, MD (*Abstract Co-Author*) Nothing to Disclose
Jean P. Inesta-Rivera, MD, MPH (*Abstract Co-Author*) Nothing to Disclose
Claudia Muns, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

-Review the grading of kidney injuries as defined by the AAST (American Association for the Surgery of Trauma) Kidney Injury Scale (2018). -Provide anatomical diagrams of grade I-V kidney injuries. -Contribute case examples with pathognomonic imaging findings of grade I-V kidney injuries on CT.-Define the possible complications of AAST kidney injuries and their corresponding management.-Provide a self-assessment tool for the classification of kidney injuries.

**TABLE OF CONTENTS/OUTLINE**

- Educational Objectives and Introduction- AAST Kidney Injury Scale Grade I-V and Possible Complications- Anatomical diagrams, CT imaging findings, and management - Self-assessment with multiple cases in quiz format Renal injuries may result from both blunt and penetrating trauma, and thus a high index of suspicion for these should be maintained in patients presenting with post-traumatic microscopic or gross hematuria. Expectant or non-surgical management has become the standard of care for most renal injuries, primarily due to high rates of iatrogenic nephrectomies and poor postoperative renal function. However, surgical management remains the gold standard for severe renal injuries with a higher AAST grade. Consequently, performing an appropriate imaging evaluation and establishing an accurate renal injury grade are imperative for determining appropriate management. Contrast-enhanced CT in combination with the AAST Kidney Injury Scale have become the gold standard for evaluating renal injuries. Our aim is to provide a

review of the Renal Injury Grades established by the AAST Kidney Injury Scale, provide case examples, and discuss corresponding management and their possible complications.

### EREE-21 "FACE TIME WITH RADIOLOGY: UNMASKING LE FORT FRACTURES"

Jose A. Lara, MD (*Abstract Co-Author*) Nothing to Disclose
Alejandro Gonzalez, BS (*Abstract Co-Author*) Nothing to Disclose
Adriana Perez, MD (*Abstract Co-Author*) Nothing to Disclose
Claudia Muns, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- 1. Define Le Fort I-III maxillofacial fractures and review anatomy- 2. Discuss the underlying pathophysiology and its major implications- 3. Provide radiological CT imaging highlighting key features

#### TABLE OF CONTENTS/OUTLINE

- I. Educational Objectives and Introduction- II. Review anatomy- III. General information on Le Fort fractures and mechanisms of fractures- IV. CT Imaging findings of Le Fort fractures- V. Self-assessment with multiple cases in quiz format-VI. ConclusionLe Fort classification is used to guide the classification and management of complex midfacial fractures. These fractures are classified as LeFort I, II, and III based on the direction of the fracture: horizontal, pyramidal, or transverse. Moreover, common to all Le Fort fractures is involvement of the pterygoid processes. Complex facial fractures such as these compromise the airway and cause significant blood loss due to the high vascularity of the anatomical region and significant swelling of the involved structures. Le Fort I is characterized by a horizontal fracture resulting from a downward impact directed against the alveolar ridge with the involvement of the anterolateral margin of the nasal fossa. Le Fort II is due to high energy impact directed against the lower and/or mid maxilla, with involvement of the inferior orbital rim. Le Fort III is a transverse fracture resulting from an impact against the nasal bridge and the upper maxilla with Involvement of the zygomatic arch characterizes this fracture.

### EREE-22 STROKE 101: FIRST CONTACT TRAINEE'S GUIDE FOR BRAIN CT

Alejandra Isabel Villalobos Tzec, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

This exhibit serves as an essential resource for first-year residents, offering a comprehensive overview of stroke diagnosis. Stroke progresses through distinct stages: hyperacute, acute, subacute, and chronic. The hyperacute stage includes the hyperdense vessel sign, subtle loss of gray-white matter distinction, vanishing basal ganglia, and the absence of the cortical ribbon, termed the "insular ribbon sign." These patterns indicate reduced blood flow obstruction within the first six hours. Detecting these changes in typical stroke sites is crucial (MCA territory). Employ the ASPECTS score to assist physicians in selecting appropriate treatment strategies. Acute and subacute phase (6- 36 hours) will be depicted as hypodensities, sulci effacement, gyral swelling, and even “hemorrhagic” transformation may occur. Chronic stage (>36 hours): will be shown as focal and sometimes large areas of low attenuation, the key is to look for prominent sulci and gyrus, as well as, enlarged ventricles. Differential diagnosis to keep in mind when “hypodensities” are seen in the brain CT, include, enlarged perivascular spaces, leukoaraiosis and nonvascular causes, such as neoplasms, cerebral contusion, inflammation or thrombosis, During the first stages, differential diagnosis will include: high hematocrit (polycythemia) and other causes of diffuse cerebral edema.

#### TABLE OF CONTENTS/OUTLINE

Brain anatomy made simple. Protocol for CT acquisition.Learning how to read a CT. Stroke sequence. CT imaging according to stages of the ischemic cascade.Differential diagnosis for hypodensities; leukoaraiosis and enlarged perivascular spaces.

### EREE-23 PHOTON-COUNTING DETECTOR CT FOR FORENSIC PATHOLOGY: THE FIRST EXPERIENCE

Kojima Masatoshi, RT (*Abstract Co-Author*) Nothing to Disclose
Yohsuke Makino, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) While photon-counting detector CT (PCD-CT) is beginning to be used clinically, its use in forensic pathology is still minimal. 2) In our forensic autopsy facility, a prototype PCD-CT is being evaluated and used routinely with conventional energy-integrating detector CT (EID-CT) scanning for pre-autopsy examination. 3) Real cases with autopsy results are exhibited to show the PCD-CT effectiveness compared to EID-CT in forensic pathology. 4) Ultra-high-resolution mode of PCD-CT is highly useful in forensic practices such as fracture detection and coronary angiography. 5) Multi-energy discrimination also can be used some forensic practices such as bone marrow edema detection and drug overdose cases.

#### TABLE OF CONTENTS/OUTLINE

Introduction: Basic knowledge of PCD-CT that is useful in forensic medicineObjectiveUtility of ultra-high-resolution mode in forensic pathologyUtility of multi-energy-discrimination mode in forensic pathologySummary

### EREE-24 POSTPARTUM COMPLICATIONS: HEAD TO TOE

Robin B. Levenson, MD (*Abstract Co-Author*) Nothing to Disclose
Juliana J. Tobler, MD (*Abstract Co-Author*) Nothing to Disclose
Alyssa Sherwill, MD (*Abstract Co-Author*) Nothing to Disclose
Carl C. Flink, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

-Normal CT and US appearance of the postpartum uterus: Twice its normal size with endometrium thicker than 2 cm with intracavitary gas s/p cesarian section(CS). CS scar appears as low attenuation in the LUS. Uterine Discontinuity is common.-Bladder flap hematoma (BFH): Heterogeneous collection between the uterus and bladder-Uterine Dehiscence: Incomplete rupture. Serosa remains intact. Associated with BFH larger than 5cm.-Uterine Rupture: separation of all the layers of the uterine wall communication with the peritoneum. Hemoperitoneum will be present.-Retained Products of Conception (RPOC): Persistent placental or trophoblastic tissue in the uterine cavity. postpartum hemorrhage.-Endometritis: #1 cause of postpartum fever. US first line. Heterogenous debris with gas-Primary Postpartum hemorrhage: Etiology: atony, trauma, BFH, rupture, abnormal placentation-Thrombosis: venous thrombus can progress to thrombophlebitis and thromboemolic events.-Eclampsia: may present with seizure. MR imaging showing edema or posterior reversible encephalopathy-Cardiomyopathy: Echocardiogram and Cardiac MRI will demonstrate systolic dysfunction. MRI may demonstrate delayed ventricular enhancement

**TABLE OF CONTENTS/OUTLINE**

-Introduction -Normal Postpartum Uterus -Postpartum Uterine Pathology -Bladder Flap Hematoma -Dehiscence Rupture -Retained Products of Conception -Endometritis -Postpartum Hemorrhage -Thrombosis/Thromboembolic Events -Gonadal v. thrombophlebitis -Pulmonary Emboli/DVT -Eclampsia-Cardiomyopathy

## EREE-25 AAST GRADING SYSTEM FOR COMMON EMERGENCY GENERAL SURGICAL (EGS) CONDITIONS OF THE ABDOMEN AND PELVIS

Azfar Siddiqui, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Review AAST grading system for common emergency general surgical (EGS) conditions of the abdomen and pelvis. Provide pictorial review for various grades.

**TABLE OF CONTENTS/OUTLINE**

Background AAST EGS grades range from I through V, reflecting an escalating clinical progression from mild disease limited within the organ itself to severe disease that is widespread. 1. Bowel Ischemia 2. Intestinal obstruction 3. Hernia 4. Acute cholecystitis 5. Acute pancreatitis 6. Perforated peptic ulcer disease 7. Acute appendicitis 8. Acute diverticulitis 9. Perirectal abscess 10. Infectious colitis 11. Pelvic inflammatory disease Limitation

## EREE-26 RHEUMATOLOGIC DISEASES EMERGENCY: WHAT SHOULD RADIOLOGISTS KNOW?

Maryam Soltanolkotabi, MD (*Abstract Co-Author*) Nothing to Disclose

Sara Haseli, MD (*Abstract Co-Author*) Nothing to Disclose
Behzad Aminzadeh (*Abstract Co-Author*) Nothing to Disclose
Arash Azhideh, MD, MPH (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

· Review the different rheumatologic diseases emergencies· Illustrate the pattern of involvement on different imaging modalities· Discuss the role of imaging in detecting emergencies in early stages

**TABLE OF CONTENTS/OUTLINE**

In this exhibit, we aim to provide a review of different rheumatologic diseases and emergency conditions affecting different organs. We will explore the specific features of emergencies of following diseases:· Rheumatoid arthritis:§ Atlantoaxial instability§ Tenosynovitis, tendon rupture§ Carpal tunnel syndrome§ Osteoporotic fracture§ Cricoarytenoid arthritis§ Ruptured of synovial cyst (pseudothrombophlebitis syndrome)§ Septic arthritis§ Pericarditis, myocarditis§ Pleuritis, interstitial lung disease, drug-induced lung disease§ Vasculitis: meningitis, alveolar hemorrhage, transverse myelitis, gastrointestinal (hemorrhage, bowl ischemia, necrotizing vasculitis)· Gouty arthritis:§ Acute gout attack§ Renal stones· Ankylosing spondylitis:§ Spinal fracture (chalk stick fracture)§ Cauda equina syndrome· Systemic lupus erythematosus§ Vasculitis: diffuse alveolar hemorrhage, CNS, mesenteric§ Thromboembolism: pulmonary embolism, dural sinus thrombosis, CNS stroke, avascular necrosis§ Infection: digital gangrene/ulcer, septic arthritis§ Inflmmation: pericarditis, acute lupus pneumonitis, transverse myelitis, Libman-Sacks endocarditis with valvular dysfunction· Scleroderma§ Aspiration pneumonitis§ MyocarditisFinally, we will describe different patterns of involvement that influence the imaging findings of rheumatologic diseases emergency.

## EREE-27 TWISTS OF FATE: MULTIMODALITY IMAGING OF INTERNAL ORGAN TORSION

Reham M. Ellessy, MBBCh (*Abstract Co-Author*) Nothing to Disclose
Khaled M. Elsayes, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Maryam Rezvani, MD (*Abstract Co-Author*) Nothing to Disclose

Douglas M. Rogers, MD (*Abstract Co-Author*) Royalties, RELX
Akram M. Shaaban, MBBCh (*Abstract Co-Author*) Royalties, RELX
Moataz Ahmed Sayed Mohammed Soliman, MD,MSc (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

A. Understand the pathophysiology behind organ torsionB. Recognizing common clinical presentation of organ torsionC. Multimodality multiorgan imaging features of torsionD. Identify updates in management and Imaging follow-up

**TABLE OF CONTENTS/OUTLINE**

A. Introduction1. Risk factors for Organ torsion2. General pathophysiological considerationB. Torsion in Cardiothoracic Imaging1. Lung torsion2. Transplant lung torsion3. Pedunculated tumor torsion.C. Torsion in genitourinary Imaging1. Renal transplant torsion2. Testicular torsion, testicular appendage torsion3. Ovarian torsion4. Fallopian tube torsion5. Adnexal cyst torsionD. Other organ torsion1. Gall bladder torsion2. Splenic torsion3. Splenule torsion4. Omental and mesentric fat torsionE. Gastrointestinal torsion1. Gastric volvulus2. Mid-gut volvulus3. Cecal volvulus and cecal bascule4. Sigmoid volvulusF. Imaging pitfalls and common mimicsG. Management: Conservative and surgical updates in management

## EREE-28 SEAL THE DRIP: A MULTIMODALITY APPROACH FOR CSF LEAKAGE DIAGNOSIS AND MANAGEMENT

Ali Morshid, MD (*Abstract Co-Author*) Nothing to Disclose
Mohamed Badawy, MD (*Abstract Co-Author*) Nothing to Disclose
Reham M. Ellessy, MBBCh (*Abstract Co-Author*) Nothing to Disclose
Arwa Kaoud, MD (*Abstract Co-Author*) Nothing to Disclose
Moataz Ahmed Sayed Mohammed Soliman, MD,MSc (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

• Describe the anatomy and physiology of CSF flow.• Outline the various etiologies of CSF leak as a cause of intracranial hypotension.• Describe the common imaging modalities used to diagnose CSF leak• Elaborate Imaging findings and pitfalls associated with CSF leak.• Discuss the role of IR (Interventional Radiology) in the management of CSF leak.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction:a. Anatomy of Dural spaces.b. Physiology of normal CSF circulation.2. Etiological classification of intracranial hypotension:a. Congenitalb. Acquired i. Traumatic ii. Iatrogenicc. Spontaneous3. Clinical presentation and diagnostic workup.4. Imaging features of intracranial hypotension5. Imaging findings of CSF leak:a. Conventional Myelography (standard and lateral decubitus) i. Technique ii. Image interpretationb. CT and MRI Cysternographyc. CT Myelogram (static and dynamic)d. MRI Myelogram (CSF leak protocol)6. Algorithmic imaging approach for the diagnosis of CSF leak7. Differential diagnoses, concurrent diagnoses, and imaging pitfalls8. Therapeutic interventionsa. Epidural blood patch (directed and multilevel)b. Epidural Fibrin patch injectionc. Epidural glue injectiond. Transvenous embolization for CSF venous fistulas9. Follow-up imaging.10. Conclusion and take-home message

## EREE-29 EXTREMITIES VASCULAR EMERGENCY: THE IMPACT OF IMAGING ON EARLY DIAGNOSIS AND MANAGEMENT

Sanaz Asadian, MD (*Abstract Co-Author*) Nothing to Disclose

Maryam Yousefiasl, MPH (*Abstract Co-Author*) Nothing to Disclose
Sara Haseli, MD (*Abstract Co-Author*) Nothing to Disclose
Arash Azhideh, MD, MPH (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Review the different vascular emergencies affecting extremities Illustrate the imaging findings of vascular trauma on different imaging modalities Identify the different interventional procedures for treatment of vascular injuries

**TABLE OF CONTENTS/OUTLINE**

Blunt trauma, iatrogenic and penetrating trauma may cause life-threatening vascular injuries necessitate prompt diagnosis in the emergency room. Limb function and proper management depend on rapid diagnosis as late diagnosis can lead to morbidity and mortality. CT angiography can detect these injuries with high sensitivity and specificity. It is essential for radiologists to be familiar with the different patterns of vascular injuries, from arterial transection and active bleeding to late complications such as arteriovenous fistula. Interventional radiology plays an important role in the management of these cases. In this exhibit, we will review the imaging findings of different traumatic vascular injuries as follows: Arterial injury: Acute pathologies: Arterial transection Iatrogenic injuries Traumatic and contusion injuries Active bleeding and extravasation Intimal flap Dissection Vasospasms Occlusion Late pathologies: Pseudoaneurysm AV-fistula True aneurysm Treatment of arterial injuries Venous injuries: Acute pathologies: Thrombosis Vessel wall injuries Chronic pathologies: Venous insufficiency Treatment of venous injuries

## EREE-3 NEW DIAGNOSIS OF CANCER IN THE EMERGENCY DEPARTMENT: AN EDUCATIONAL TOOL TO OPTIMIZE DIAGNOSTIC WORKUP

Natalie A. Sanders, BA (*Abstract Co-Author*) Nothing to Disclose
Kiran K. Maddu, MBBS (*Abstract Co-Author*) Nothing to Disclose
Hayden Smith (*Abstract Co-Author*) Nothing to Disclose
Mendel Lebowitz (*Abstract Co-Author*) Nothing to Disclose
Carrie N. Hoff, MD (*Abstract Co-Author*) Nothing to Disclose
Christian Gomez, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

-Learn a systematic approach to reporting incidental cancers on Emergency Department studies.-Review imaging appearances and cancer staging guidelines for the most common cancers found in the ED.-Understand mimics, pitfalls, and special considerations-Discuss accurate reporting and appropriate recommendations for additional imaging.

**TABLE OF CONTENTS/OUTLINE**

Many cancers are incidentally found on imaging performed during the Emergency Department (ED) workup, with an estimated 20-50% of breast, colon and lung cancers diagnosed in the ED globally (PMID: 36622062). In a Medicare database study, 11% of cancer diagnoses were ED-mediated. Furthermore, cancer-related imaging in the ED has been shown to negatively affect report turnaround times and radiology workflow, which cause additional delays in patient care (PMID: 31759782).This exhibit will review newly diagnosed cancers in the Emergency Department utilizing an educational mnemonic and multimodal approach to help radiologists accurately triage these complex cases. Topics that will be discussed include:Educational Mnemonic "BIILD"?: Borders,? Internal?, Interfaces,? Lymph Nodes?, Distant Metastatic Lesions"BIILD" In Practice:? Breast Cancer?, Colorectal Cancer?, GU Cancer?, Lung Cancer,? Pancreatic Cancer?Special Considerations, Mimics, and Pitfalls. Topics include, but not limited to:? Indeterminate and Indolent lesions?, Benign "mass-like lesions?, Initial Presentation of Metastatic Disease?, Superimposed Findings?, Lymphadenopathy of Unknown Origin?, Infection/Inflammatory Disease?, Post-Treatment changes?, Non-contrast StudiesReporting Considerations

## EREE-30 DON'T DROP THE BALL: ULTRASOUND PRESENTATIONS OF THE PENIS AND TESTICLES IN THE EMERGENCY

Gabriel Pianowski Pajanoti, MD (*Abstract Co-Author*) Nothing to Disclose
Thais Rocha (*Abstract Co-Author*) Nothing to Disclose
Angelo C. Duarte, MD (*Abstract Co-Author*) Nothing to Disclose
Diego R. Pereira, MD (*Abstract Co-Author*) Nothing to Disclose
Manoel Barbosa, MD (*Abstract Co-Author*) Nothing to Disclose
Lais Abduch, MD (*Abstract Co-Author*) Nothing to Disclose
Guilherme Naves (*Abstract Co-Author*) Nothing to Disclose
Helen Ribeiro De Oliveira, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Review the main anatomical landmarks of the penis and testiclesHighlight the most frequent penile and testicular disorders in emergency servicesIllustrate and describe the ultrasound findings of these injuries

**TABLE OF CONTENTS/OUTLINE**

IntroductionMain anatomical landmarksUltrasound technique and normal featuresTesticles injuries: epididymitis and orchitis, testicular torsion, testicular trauma, testicular cancerPenile lesions: priapism, penile traumaTake home message

## EREE-31 ACUTE ISCHEMIC STROKE IN CHILDREN: NAVIGATING DIAGNOSTIC AND MANAGEMENT PATHWAYS - WHAT THE EMERGENCY RADIOLOGIST NEEDS TO KNOW

Manohar M. Shroff, MD, FRCPC (*Abstract Co-Author*) Nothing to Disclose
Vivek B. Pai, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Prakash Muthusami, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Neetika Gupta, MBBS, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. To highlight the distinct aetiopathogenesis, differential diagnosis and imaging features of acute ischemic stroke in pediatric population.2. To outline imaging protocols and enhanced imaging based diagnostic approaches in suspected pediatric acute ischemic stroke, including emerging roles of fast MRI and vessel wall imaging in the emergency setting. 3. To emphasize collaborative interdisciplinary approach and efficient 'stroke code' pathways to ensure prompt management, mitigate patient selection, and judicious use of endovascular thrombectomy in aptly selected cases.

**TABLE OF CONTENTS/OUTLINE**

The primary objective of the exhibit is to comprehensively evaluate the frequently encountered and rare imaging findings in pediatric acute ischemic stroke, focussing on imaging techniques and protocols and their implications for patient selection and management in the emergency setting. Typical and atypical causes and risk factors specifically associated with acute ischemic stroke in children will be discussed. This exhibit will illustrate the imaging findings pivotal in guiding such interventions with goals to improve outcomes. Mechanical thrombectomy is now being increasingly used in children with large vessel occlusion. There are specific contraindications to thrombectomy, such as focal cerebral arteriopathy. Using a case-based approach, we will demonstrate an imaging-based diagnostic approach for pediatric acute ischemic stroke, streamline emergency management protocols, guide intervention, and ultimately improve short- and long-term outcomes.

## EREE-32 BREAKING BARRIERS: A GUIDE TO TRAUMATIC DIAPHRAGMATIC INJURIES

Noah G. Ditkofsky, MD, FRCPC (*Abstract Co-Author*) Nothing to Disclose
Robert K. Moreland, MD (*Abstract Co-Author*) Nothing to Disclose
Yigal Frank, MD (*Abstract Co-Author*) Nothing to Disclose
Joel Kosowan, MD (*Abstract Co-Author*) Nothing to Disclose
David Gomez (*Abstract Co-Author*) Nothing to Disclose
Shobhit Mathur, MD (*Abstract Co-Author*) Nothing to Disclose
Vinu Mathew, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1.To demonstrate various direct and indirect CT signs of traumatic diaphragmatic injury.2.To discuss the mimics of traumatic diaphragmatic injury. 3.To describe differences in approach while interpreting blunt and penetrating traumatic diaphragmatic injuries.4.To understand what the surgeons need to know to appropriately manage the patient

**TABLE OF CONTENTS/OUTLINE**

• Direct CT signs- Segmental diaphragmatic defect, dangling diaphragm, absent diaphragm. • Indirect CT signs related to herniation- Collar sign, humps and band sign, dependent viscera sign, herniation through a defect, sinus cutoff sign, elevated abdominal organ sign, abdominal content peripheral to the diaphragm or lung. • Indirect CT signs not related to herniation- Thickening of the diaphragm, diaphragmatic or per diaphragmatic contrast media extravasation, hypo enhancing diaphragm. • Mimics of diaphragmatic injury- Chronic eventration/elevation of the diaphragm, chronic hernias (Bochdelek, Morgagni, hiatal). • The importance of trajectory (‘trajectory sign’) in penetrating trauma. • Points to include in report: what the surgeon wants to know.

## EREE-33 THE IMPACT OF BLUNT TRAUMA ON THE DIAPHRAGM

Omar Jamil, MD (*Abstract Co-Author*) Nothing to Disclose
Robert J. Dym, MD (*Abstract Co-Author*) Nothing to Disclose
Nina E. Glass, MD (*Abstract Co-Author*) Nothing to Disclose
Inessa A. Goldman, MD (*Abstract Co-Author*) Nothing to Disclose
Kevin Chu, BA, DO (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

•Unlike penetrating diaphragmatic injuries which can be predicted with high accuracy by visualizing the trajectory of the insult, blunt diaphragmatic injuries represent a diagnostic challenge, requiring a high index of suspicion.•When a focal diaphragmatic defect is not directly visualized, diagnosis relies on recognition of key signs, such as “hump,” “collar," "dependent viscera," “band sign,” among others.•Blunt diaphragmatic ruptures require surgical treatment regardless of size due to possible catastrophic outcomes in case of missed or delayed diagnosis.•Understanding the anatomic relations, functional significance, and embryological development improves detection of diaphragmatic injuries and decreases incidence of “non-therapeutic” laparotomies.

**TABLE OF CONTENTS/OUTLINE**

•Overview of the anatomy and embryological development of the diaphragm with respect to blunt trauma and radiologic assessment•Imaging modalities: discussion of the utility and limitations of radiographs and CT in diagnosis•Comprehensive overview of imaging features and signs with examples.•Surgical context including Western Trauma Association guidelines and review of American Association for the Surgery of Trauma grading score•Common pitfalls and mimics, such as non-traumatic and congenital diaphragmatic defects

## EREE-34 LINES AND TUBES AND BALLOONS, OH MY!: A PRIMER ON ABDOMINOPELVIC SUPPORT DEVICES

Jason A. Pietryga, MD (*Abstract Co-Author*) Consultant, Radiostics LLC
Samuel J. Galgano, MD (*Abstract Co-Author*) Research support, Blue Earth Diagnostics Ltd;Research support, Novartis AG;Research Support, Curium SAS

Keon Mahmoudi, MD (*Abstract Co-Author*) Nothing to Disclose
John P. Nazarian, MD (*Abstract Co-Author*) Nothing to Disclose
Nicholas G. Rhodes, MD (*Abstract Co-Author*) Nothing to Disclose
Lindsey Shwayyat, MD (*Abstract Co-Author*) Nothing to Disclose
Elisabeth Sidden, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Discuss support devices used in the gastrointestinal and genitourinary systems and indications for their use. 2. Review the normal imaging appearance of these devices and relevant anatomical landmarks. 3. Demonstrate relevant imaging findings in identifying support device malposition and resulting complications.

**TABLE OF CONTENTS/OUTLINE**

Radiologic confirmation of support device placement is standard clinical practice and accounts for many radiographic studies performed in the emergent setting. The large number of devices used in the gastrointestinal (GI) and genitourinary (GU) systems, some less commonly encountered, can make it challenging for the trainee to confirm their positioning on radiographs. A comprehensive reference detailing these devices will allow correct identification of appropriate device position and prompt recognition of device-related complications. This exhibit reviews GI and GU system support devices, including esophageal balloon tamponade devices, temperature probes, impedance-pH monitors, esophageal stents, gastrointestinal tubes, percutaneous and internally-placed cholecystostomy tubes, percutaneous nephrostomy tubes, urinary stents, suprapubic catheters, and urinary catheters. Radiographically visible device structural components, device utility, and indications for placement are discussed. Imaging findings indicative of appropriate and inappropriate device placement and complications associated with device malposition are shown.

## EREE-35 TRAUMATIC AORTIC INJURIES - IMAGING AND MANAGEMENT

Sanjeeva P. Kalva, MBBS, MD (*Abstract Co-Author*) Grants to the institution: NIH, BD, Black Swan, Trisalus, CRICO; Royalties: Elsevier, Springer, Thieme Consulting fee: Penumbra, Okami Medical, Boston Scientific, Medtronic, Covidien, Instylla, BD, Cannon, Varian, SIRTEX Stocks: Biogen Inc, Clover Health Investments Corp, Inovio Pharmaceuticals, Moderna Inc, Pfizer Inc, Novavax Inc, Orphazyme, Cassava Sciences Inc, Vivos Therapeutics Inc, Ardelyx Inc, Althea Health, Sarepta Therapeutics, Clover Health Investments Corp, CureVac BV, Immunoprecise Antibodies Ltd, Infinity Pharmaceuticals Inc, Zymergen Inc, BioNTech SE, Trillium Therapeutics Inc, Theravance Biopharma Inc, Doximity Inc, Eargo Inc, Allogent Therapeutics Inc, NRx Pharmaceuticals Inc, Atea Pharmaceuticals Inc,

Kausthubh Hegde, MBBS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Introduction to Traumatic Aortic Injuries (TAI)
- Imaging techniques - including multi-detector CT (MDCT), CT-angiogram (CTA) and intravascular ultrasound (IVUS)
- Management Evolution: transition from surgical to endovascular repair

**TABLE OF CONTENTS/OUTLINE**

- Traumatic Aortic Injury: epidemiology, common mechanisms of injury and impact on healthcare
- Diagnostic Imaging Strategies (with case-based examples)- Role of chest radiographs in initial assessment- Detailed exploration of MDCT, CTA, and IVUS capabilities in identifying TAI
- Classification Systems (Society for Vascular Surgery and Harborview classification) and imaging features of TAI: intimal flaps, pseudoaneurysms, and mediastinal hematomas
- Management protocols and role of radiologists- Historical perspective: from open surgical repair to endovascular approaches- Criteria for choosing between surgical and endovascular repair based on imaging findings- Post-operative imaging and long-term surveillance strategies
- Case Studies and Clinical Outcomes- Review of typical cases with imaging studies and treatment outcomes- Discussion of complex cases illustrating decision-making challenges

## EREE-36 THE ATYPICAL AND EQUIVOCAL APPENDIX

**Awards**
**Certificate of Merit**

Adnan M. Sheikh, MD (*Abstract Co-Author*) Nothing to Disclose
Rajesh Bhayana, MD, FRCPC (*Abstract Co-Author*) Nothing to Disclose
Vanessa Murad, MD (*Abstract Co-Author*) Nothing to Disclose

**TEACHING POINTS**

1. Air in appendix - is it appendicitis or not ? 2. Periappendicitis vs secondary appendicitis 3. Small bowel obstruction can mimic appendicitis and vice versa 4. Cecal diverticulitis can mimic appendicitis and vice versa 5. Terminal ileitis can mimic appendicitis and vice vera 6. Pelvic inflammatory disease can mimic appendicitis and vice versa 7. Appendiceal diverticulitis - identification and significance 8. Epiploic appendagitis of the appendix- identification and significance 9. Appendiceal mucocele - identification and significance 10. How to approach an equivocal appendix? How to report an equivocal appendix? What to do next ?

**TABLE OF CONTENTS/OUTLINE**

Imaging first approach in evaluation of suspected appendicitis, with algorithm to select appropriate imaging modality/protocol. Identification of equivocal appendicitis with emphasis on auxillary features that may lead to diagnosis. Ideal reporting and communication of the equivocal appendicitis. Differentiation between periappendicitis and secondary appendicitis. Appendicitis mimicking bowel obstruction and vice versa. Cecal diverticulitis mimicking appendicitis and vice versa. Other common mimickers and confounders in evaluation of appendicitis like terminal ileitis and pelvic inflammatory disease (with or without tuboovarian abscess). Appendiceal diverticulitis, imaging features and significance. Epiploic appendagitis of the appendix, imaging features and significance. Appendiceal mucocele, identification and differentiation from appendicitis. "Take Home" algorithm for the evaluation of atypical and equivocal appendix.

## EREE-37 POST CARDIAC ARREST SYNDROME: MULTIMODALITY IMAGING EVALUATION

Babina Gosangi, MD, MPH (*Abstract Co-Author*) Nothing to Disclose
Manroop Kaur, MD (*Abstract Co-Author*) Nothing to Disclose
Cristina Fuss, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Christopher P. Gange JR, MD (*Abstract Co-Author*) Stockholder, Pfizer Inc Stockholder, Bristol-Myers Squibb Company Research Consultant, Bayer AG Medical Advisory Board, AIxSCAN, Inc Shareholder, AIxSCAN, Inc
Mamta Gupta (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Post cardiac arrest syndrome (PCAS) is a complex condition characterized by a myriad of physiological derangements following successful resuscitation from cardiac arrest. Integration of Multimodality Imaging: Understand the complementary roles of various imaging modalities in the comprehensive evaluation of post cardiac arrest syndrome (PCAS). 2. Identifying Myocardial Dysfunction: Recognize the imaging hallmarks of myocardial dysfunction to guide prognosis and management decisions.3. Assessment of Neurological Injury: Utilize advanced imaging techniques, including MRI and CT, to assess for hypoxic-ischemic brain injury, cerebral edema, and other neurological sequelae of cardiac arrest, aiding in prognostication and treatment planning.4. Evaluation of Systemic Complications: Appreciate the role of imaging in identifying systemic complications of PCAS, including pulmonary edema, acute respiratory distress syndrome (ARDS), and multiorgan dysfunction syndrome (MODS), to guide supportive care strategies.5. Prognostic Implications: Understand the prognostic value of imaging findings in PCAS, such as the extent of myocardial injury, presence of neurological damage, and severity of systemic complications,6. Therapeutic Decision-Making: Integrate imaging findings into the formulation of individualized treatment plans for patients with PCAS.

### TABLE OF CONTENTS/OUTLINE

• Introduction and overview of Post Cardiac Arrest Syndrome • Pathophysiology of Post Cardiac Arrest Syndrome • Role of Multimodality Imaging in PCAS Evaluation • Discussion of teaching Points and Key Imaging Findings on cases basis

## EREE-38 HEMOPTYSIS IN THE EMERGENCY DEPARTMENT: CHECK-LIST BASED APPROACH TO GUIDE THE INTERVENTIONAL RADIOLOGIST

Aurea Diez Tascon, MD (*Abstract Co-Author*) Nothing to Disclose
Amine Moultamis, MD (*Abstract Co-Author*) Nothing to Disclose
Maria Aguilar Picapiedra (*Abstract Co-Author*) Nothing to Disclose
Milagros Marti de Gracia, MD, PhD (*Abstract Co-Author*) Nothing to Disclose

Maria-Luz Parra Gordo, PhD, MD (*Abstract Co-Author*) Nothing to Disclose
Angel Romero Guzman (*Abstract Co-Author*) Nothing to Disclose
Juan Diego De La Morena Molina, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. To illustrate the bronchial arteries anatomy and primary mechanisms of injury.2. To review the indications and optimal imaging modality for the evaluation of life-threatening hemoptysis. 3. To emphasize the utility of employing a structured report template to streamline targeted endovascular treatment planning.

### TABLE OF CONTENTS/OUTLINE

1. Review the anatomy, classification and branching patterns of the bronchial arteries through illustrations, CT, and correlation with arteriography. 2. Main mechanisms of bronchial arteries injury. Graphical representation of alterations in pulmonary vascularization under hypoxic conditions. 3. Imaging evaluation in the Emergency Department. When and how to perform the study? 3.1 Indications of urgent study. 3.2 Optimal imaging protocol. 4. Proposal of a structured report. Serving as a roadmap to the Interventional Radiologist employing a checklist-based approach utilizing four key descriptors. 4.1 Signs of alveolar hemorrhage. 4.2 Signs of hemorrhage in the airway. 4.3 Vascular signs: a) Hypertrophy of bronchial arteries; b) Pseudoaneurysms c) Arteriovenous malformations. 4.4 Identification of the responsible lesion. 5. Illustrated pearls and common pitfalls that could influence the optimal treatment. 6. Take home points.

## EREE-39 BUGS ON THE BRAIN: PARASITIC AND VECTOR-BORNE INFECTIONS OF THE HEAD, NECK, AND NERVOUS SYSTEM

Douglas S. Katz, MD (*Abstract Co-Author*) Nothing to Disclose

Nadia Solomon, MD, MSc (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Describe a variety of parasitic and vector-borne diseases likely to bring patients to the emergency room due to neurologic and infectious symptoms associated with manifestations affecting the head, neck, and nervous system. Provide a brief introduction to these infections, including the epidemiology, clinical presentations, and medical sequelae/complications. Provide an array of case examples demonstrating imaging features associated with acute and chronic, and common and uncommon sequelae of these infections across multiple imaging modalities. Provide a brief overview of management and treatment of these infections.

**TABLE OF CONTENTS/OUTLINE**

This exhibit will review parasitic and vector-borne infections that are likely to result in emergency room visits due to disease manifestations within the brain, neck, and nervous system. This will include protozoan infections (e.g., Chagas disease, leishmaniasis, cerebral malaria, toxoplasmosis), helminthic infections (e.g., cystic echinococcosis, cysticercosis), and vector-transmitted bacterial (e.g., Lyme disease) and viral infections (e.g., Eastern equine encephalitis, Powassan virus). It will provide a multimodality review of imaging findings, although primarily focusing on computed tomography and magnetic resonance imaging. It will review specific (e.g., multiloculated cysts characteristic of cystic echinococcosis) and nonspecific (e.g., mosquito- or tick-borne viral encephalitis) imaging findings, as well as common (e.g., mucocutaneous leishmaniasis, orbital cysticercosis) and uncommon sequelae (e.g., neurological manifestations of Chagas) of these diseases which can be appreciated on imaging studies of the head and neck.

## EREE-4 THE AORTIC BLUEPRINT: UNDERSTANDING PATHOLOGIES, NAVIGATING COMPLICATIONS, AND APPROACHING TREATMENT

Mili Rohilla, MD (*Abstract Co-Author*) Nothing to Disclose
Joshua R. Russell, DO (*Abstract Co-Author*) Nothing to Disclose
Kuldip S. Mann, MD (*Abstract Co-Author*) Nothing to Disclose
Samruddhi V. Jain JR, MD, MBBS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Gain insight into the anatomy and pathophysiology underlying aortic pathologies. 2. A thorough review of imaging findings encompassing diverse aortic pathologies and associated complications. 3. Explore the treatment approaches including preoperative evaluation for endovascular interventions.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction to aortic anatomy- • Overview of aortic structure and function • Pathophysiology 2. Role of CT imaging in the evaluation of acute pathologies, protocol, and imaging findings 3. Imaging of different aortic pathologies: • Acute aortic syndrome - - Aortic dissection- Ų Classification Ų Imaging findings Ų Treatment - Penetrating ulcer- Ų Definition Ų Imaging features - Intramural hematoma Ų Definition Ų Imaging features • Aortic aneurysm - Ų Definition Ų Etiology Ų Diagnostic Criteria Ų Treatment Planning and Follow-Up • Aortic atherosclerosis and acute thrombosis Ų Risk Factors Ų Imaging Evaluation Ų Clinical Implications and Management Strategies • Aortic fistula Ų Etiology Ų Imaging findings Ų Management 4. Imaging features of common complications: • Pericardial effusion/hemorrhage • Aortic dissection extending in coronary vessels • Ruptured aortic aneurysm 5. Endovascular aortic interventions with preoperative imaging evaluation. Comprehensive understanding, early diagnosis, and timely intervention are paramount in mitigating the impact of aortic diseases and improving patient outcomes. This abstract focuses on arming radiologists with comprehensive knowledge of various aortic pathologies. Moreover, it encompasses details regarding pre-operative imaging for TAVR surgeries, aiding radiologists in discerning crucial elements to include in their reports.

## EREE-40 AORTOILIOFEMORAL (AIF) LOWER EXTREMITY CT ANGIOGRAPHY

Richard Tsai, MD (*Abstract Co-Author*) Nothing to Disclose

Anup S. Shetty, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Lower extremity CT angiography is a frequently ordered exam in both the emergency and outpatient settings, for indications ranging from peripheral arterial disease and trauma to infectious and inflammatory conditions. Given the wide range of anatomic coverage, these studies place a premium on both optimal imaging technique and efficient but comprehensive interpretation. This exhibit will:1) Discuss the imaging technique and rationale for lower extremity CTA AIF2) Describe normal anatomy and key collateral vascular pathways3) Illustrate reporting strategies and image manipulation techniques for efficient interpretation and reporting4) Cover the spectrum of disease processes affecting the lower extremity vasculature, including peripheral arterial disease, trauma, and infectious and inflammatory disorders

**TABLE OF CONTENTS/OUTLINE**

- The role of CT AIF imaging- Anatomy: normal anatomy, variants and key collateral vascular pathways- Imaging technique: Timing, kVp, bolus tracking, repeat delayed imaging, advanced techniques (metal artifact reduction, spectral/photon counting CT); combining with chest and AAA imaging- Search pattern, reporting, and pitfalls: templated reporting, extravascular findings, bolus timing (outrunning of bolus or venous contamination), blooming, satisfaction of search- Peripheral arterial disease: stenosis, occlusion, bypass grafts, stents, embolic disease, peripheral aneurysms- Trauma: active extravasation, pseudoaneurysm, occlusion, vasospasm, transection, dissection, arteriovenous fistula, iatrogenic injury- Infectious/inflammatory: graft infection, mycotic pseudoaneurysms, cystic adventitial disease, Buerger’s disease

## EREE-41 HEAD SPIN

Mathew Storey, MBChB (*Abstract Co-Author*) Nothing to Disclose
Robert P. Barker, FRCR, MRCP (*Abstract Co-Author*) Nothing to Disclose
Nora Sangvik Grandal, MBBS (*Abstract Co-Author*) Nothing to Disclose
Najeed Khan, BMBS, MSc (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Acute dizziness is a common reason for presentation to the Emergency Department, but rather than a diagnosis, it is an imprecise descriptor of symptoms with an estimated misdiagnosis rate of 80%. Distinguishing terms such as vertigo and light-headedness are unhelpful as symptom quality does not reliably predict the cause of dizziness. Indiscriminate application of CT and MRI has a low yield in acute dizziness. Despite this, over 50% of patients attending ED with dizziness will have a CT brain to exclude a posterior circulation stroke. This poster highlights a novel algorithm to stratify patients into 1

of 4 major syndrome categories: each with its own differential diagnoses, targeted examination techniques, and recommended imaging modality. By addressing the following teaching points, this educational exhibit aims to improve understanding of acute dizziness and equip the vetting radiologist with a framework to facilitate effective discussion with clinicians and ensure the appropriate use of medical imaging:
- Establish a practical definition of acute dizziness.
- Illustrate the relevant neuroanatomical principles behind eye movements and their relationship to the vestibular system.
- Provide a framework to establish the appropriate use of targeted radiological imaging for patients presenting with acute dizziness.
- Provide a variety of example cases with important radiological imaging findings in patients presenting with acute dizziness.

**TABLE OF CONTENTS/OUTLINE**

- Defining dizziness
- The Triage-TiTrATE-Test algorithm
- Triage
- Timing and Triggers
- Targeted examination and Tests
- Nystagmus and the Vestibulo-ocular reflex pathway
- Example cases with radiological findings
- Summary

## EREE-42 FALLING THROUGH THE CRACKS: PEER LEARNING IN TRAUMA TORSO CT

**Awards**
**Certificate of Merit**

Robin B. Levenson, MD (*Abstract Co-Author*) Nothing to Disclose
Karen S. Lee, MD (*Abstract Co-Author*) Nothing to Disclose
Mohamed G. Aboseria, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Trauma torso CT is a staple of Emergency Department (ED) trauma evaluation. Given time sensitivity, complexity, and various findings that may be encountered at CT, in addition to potential distractions in the acute setting, imaging findings may be inadvertently overlooked or misinterpreted. Contributory factors include inattentional blindness, satisfaction of search, framing bias due to the provided indication, and ambiguity effect due to unfamiliarity with a finding. Familiarity with these contributory factors can enhance a radiologist's search pattern and appropriate management.

**TABLE OF CONTENTS/OUTLINE**

This exhibit will focus on trauma torso CT peer learning cases from our institution, including contributory factors which may have led to the diagnostic error and teaching pearls to avoid potential pitfalls/biases in diagnosis. A) Case based imaging review of missed/misinterpreted thoracic findings on trauma torso CT including diaphragmatic rupture, aortic injury, and pulmonary embolism. B) Case based imaging review of missed/misinterpreted gastrointestinal findings on trauma torso CT including hepatic laceration, gastric perforation following gunshot wound, and diaphragmatic slip mistaken for hepatic subcapsular hematoma. C) Case based imaging review of missed/misinterpreted genitourinary findings on trauma torso CT including bladder rupture, placental abruption, and duplicated renal arteries mistaken for dissection. D) Case based imaging review of missed/misinterpreted musculoskeletal findings on trauma torso CT including misaligned right hip arthroplasty, mid thoracic spine fracture in the setting of DISH, and subtle right femoral neck fracture.

## EREE-43 INSIGHTS INTO ACUTE MESENTERIC ISCHEMIA: ESSENTIAL KNOWLEDGE FOR RADIOLOGY RESIDENTS

Javier Azpeitia Arman, MD (*Abstract Co-Author*) Nothing to Disclose
Nicolas Rodriguez Ramirez, MD (*Abstract Co-Author*) Nothing to Disclose
Lorena Melian Iribar, MD (*Abstract Co-Author*) Nothing to Disclose
Silvia Cayon Somacarrera, MD (*Abstract Co-Author*) Nothing to Disclose
Itxaso Galan-Gonzalez (*Abstract Co-Author*) Nothing to Disclose
Ana Ines Rubio Aguilera, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1) Learn the correct computed tomography scan protocol. 2) Recognize the different subtypes of acute mesenteric ischemia in imagen tests. 3) Become familiar with gastrointestinal tract vascular anatomy. 4) Learn the typical computed tomography scan findings and indicators of irreversible ischemia.

**TABLE OF CONTENTS/OUTLINE**

Mesenteric ischemia can manifest as either acute (95%) or chronic (5%; typically associated with diffuse atherosclerotic disease). Acute Mesenteric Ischemia (AMI) is a critical medical condition resulting from reduced blood flow to the intestines. Subtypes of AMI include arterial occlusion (embolic and thrombotic), venous occlusion, non-occlusive mesenteric ischemia (NOMI), and closed-loop obstruction. Among these, arterial occlusion is the most prevalent subtype and carries the worst prognosis. The gastrointestinal tract receives perfusion from the celiac trunk, the superior mesenteric artery (SMA), and the inferior mesenteric artery (IMA). In cases of mesenteric ischemia, collateral pathways between these arteries become crucial, offering protective blood flow in patients with vascular stenosis or occlusion. Irreversible ischemic injury occurs within six hours following complete vascular occlusion. The diagnosis of AMI can be challenging because symptoms and laboratory tests are often nonspecific, requiring a high degree of clinical suspicion. Computed tomography (CT) is the most sensitive and specific imaging test for diagnosing AMI, making it the preferred imaging modality when suspicion arises. Moreover, CT enables the exclusion of alternative causes of acute abdominal pain.

## EREE-44 A PUNCH TO THE GUT: CT FINDINGS IN BLUNT TRAUMATIC INJURY TO THE BOWEL AND MESENTERY

Sarah Hickman, MBBS (*Abstract Co-Author*) Research collaboration, Vara;Research collaboration, ScreenPoint Medical BV;Research collaboration, Lunit Inc;Research collaboration, Kheiron Medical Technologies Ltd;Research collaboration, Alphabet Inc;Research collaboration, Volpara Health Technologies Limited
Gurinder Nandra, FRCR,MBChB (*Abstract Co-Author*) Nothing to Disclose
Saigeet Eleti, FRCR, MBBChir (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Bowel and mesenteric injuries are the third most common type of injury in blunt trauma to the abdomen; detected in 5% of patients at laparotomy. Bowel injury may often be occult at clinical presentation and physical examination is unreliable. Delayed diagnosis is associated with significant morbidity and mortality due to haemorrhage or perforation leading to peritonitis and sepsis. Multidetector CT is the modality of choice when evaluating trauma patients that are haemodynamically stable. It may be performed rapidly and has high sensitivity and specificity in identifying bowel and mesenteric

injuries. Through retrospective review of patients presenting to our Level 1 trauma centre, we present the range of CT imaging appearances of bowel and mesenteric injury in blunt abdominal trauma and correlate them with surgical findings.We use a split-bolus protocol which enables arterial and venous enhancement in a single pass of the CT gantry. Additional techniques such as oral contrast may be used for image optimisation. Dual energy CT may be used to increase conspicuity of bowel injury. CT findings of bowel injury include discontinuity of the bowel wall, extraluminal gas or contrast, bowel wall thickening, abnormal enhancement and adjacent haematoma/fat stranding which are variably specific for traumatic injury.CT findings of mesenteric injury include mesenteric haematoma, abrupt termination of a mesenteric vessel or vessel irregularity. Imaging findings may be subtle and it is important that the radiologist is aware of the spectrum of appearances to minimise delay in time to intervention.

**TABLE OF CONTENTS/OUTLINE**

IntroductionImaging Technique CT features Bowel InjuryCT features Mesenteric InjurySummary

## EREE-45 IMAGING REVIEW OF ACUTE MEDIASTINITIS BASED ON ETIOLOGY

Alberto Hidalgo, MD (*Abstract Co-Author*) Nothing to Disclose
VICTOR PINEDA SANCHEZ, PhD, MD (*Abstract Co-Author*) Nothing to Disclose
Noemi Canete, MD (*Abstract Co-Author*) Nothing to Disclose

Adria Roset Altadill, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Acute mediastinitis is a life-threatening condition depicted at CT by increased mediastinal fat attenuation, pneumomediastinum and organized fluid collections. Acute mediastinitis can be caused by iatrogenic procedures, head and neck infections, gastroesophageal perforation and osteoarticular infections. Specific imaging findings may point towards the origin of the infection, which is advantageous to guide treatment decisions.

**TABLE OF CONTENTS/OUTLINE**

Acute mediastinitis is a life-threatening condition that results from inflammation and infection of the soft tissues and fat contained within the mediastinum. The different etiologies of acute mediastinitis include iatrogenic causes, extension from head and neck infections, intestinal perforation, or spread from osteoarticular infections. CT is an essential examination to diagnose acute mediastinitis and determine the extent of the disease. Common imaging features include increased mediastinal fat attenuation, pneumomediastinum, organized fluid collections and pleural effusions. Additionally, certain findings may help identify the source of the infection, which is advantageous for appropriate management. Signs of sternal dehiscence with adjacent inflammatory changes point towards a postoperative origin. The existence of oropharyngeal or cervical (air-)fluid collections extending to the mediastinum are highly suggestive of descending necrotizing mediastinitis. Esophageal perforation can be inferred indirectly by esophageal wall thickening and extraluminal air. Finally, cortical bone disruption or widening of an articular joint with adjacent mediastinal spread may indicate an osteoarticular origin.

## EREE-46 CLOSED LOOP SMALL BOWEL OBSTRUCTION: WHEN TO EVOKE THIS DIAGNOSIS

Masis Isikbay, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Closed Loop Small Bowel Obstruction (CLSBO) should always be considered when evaluating a case of small bowel obstruction (SBO).2. CLSBO is a mechanical diagnosis (an isolated loop of bowel) and secondary signs of bowel ischemia are not required to make the diagnosis (but should be evaluated).3. CLSBO is a devastating missed diagnosis and requires prompt surgical management.

**TABLE OF CONTENTS/OUTLINE**

INTROPathophysiology of CLSBO- Clinical presentation patterns- Prompt diagnosis is critical for management (decision to go to the operating room)- CT of the Abdomen/Pelvis is an important part of the workup CT FEATURESTo raise suspicion for CLSBO consider the following pathway:1. Evaluate for any presence of SBO (Figure 1), which is required for a CLSBO. Always consider CLSBO for any case of SBO.2. Look for more than one transition point next to one another ("closed loop" physiology, Figure 2).3. Evaluate for other common patterns of CLSBO: "balloons on a string" appearance (Figure 3), isolated portion of distended bowel, decompressed bowel proximal/distal to affected loop.4. Evaluate for signs of bowel inflammation (bowel wall thickening, mesenteric fat stranding, free fluid, Figure 4) and bowel ischemia/necrosis (bowel wall hypo-enhancement, Figure 5).5. Understand that it is a mechanical diagnosis (bowel inflammation is often present but NOT required to make the diagnosis especially if caught very early). SUMMARY-These key imaging features help raise suspicion for CLBSO- Definitive diagnosis will come from operative findings- If unsure ask for backup/help to avoid delaying care for the patient

## EREE-47 ROLE OF NON-CONTRAST MRI IN THE ED SETTING OF ACUTE ABDOMINOPELVIC PAIN

Frank H. Miller, MD (*Abstract Co-Author*) Advisory Board, Bayer AG;Advisory Board, Guerbet SA
Camila L. Vendrami, MD, MD (*Abstract Co-Author*) Nothing to Disclose
Courtney C. Moreno, MD (*Abstract Co-Author*) Nothing to Disclose
Dallas Sturdevant, DO (*Abstract Co-Author*) Nothing to Disclose
Pardeep K. Mittal, MD (*Abstract Co-Author*) Nothing to Disclose
Thomas L. Estes JR, MD (*Abstract Co-Author*) Nothing to Disclose
Nikolas Brozovich, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1.To review epidemiology of most common acute abdominal and pelvic pathologies. 2. To provide MRI findings of common causes of acute abdomen including appendicitis, acute cholecystitis, acute pancreatitis, diverticulitis, ovarian torsion, Meckel's diverticulum. TOA, Torsed fibroid. Testicular infarction. Testcular trauma, Prostatic abscess. Splenic infarct, and Crohns 3. Discuss abbreviated non-contrast MRI protocols for acute emergencies.

**TABLE OF CONTENTS/OUTLINE**

Epidemiology of acute abdomen and pelvis • MRI findings of - Appendicitis - Acute cholecystitis - Acute pancreatitis - Diverticulitis - Ovarian torsion - Meckel's diverticulum •-TOA, Torsed fibroid-Testicular infarction.-Testcular trauma-Prostatic abscess-Splenic infarct.-Crohns

## EREE-48 YOU'LL POKE YOUR EYE OUT KID! AN ORBITAL TRAUMA PRIMER FOR THE ON CALL RADIOLOGY RESIDENT

Han Zhong, MD (*Abstract Co-Author*) Nothing to Disclose
Emily R. Convery, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Orbital trauma is a common situation residents encounter on call. However, reading and interpreting orbital imaging can be overwhelming especially in cases of complex trauma or in cases where there is underlying orbital pathology. A systematic approach to investigating the orbits is key to making crucial findings. Understanding the anatomy of the orbit is helpful in creating a search pattern for residents to follow. Injury can occur to the orbital wall bones, the globe itself, the extraconal soft tissues, or a combination of those compartments. The mechanism of injury and elements of the physical exam in addition to imaging findings will guide clinician's decisions about patient management, specifically if the patient will require emergent surgery or if close follow up is sufficient. It is important for residents to know what clinicians are looking for so that information can be included in the radiology report for clinical decision-making.

### TABLE OF CONTENTS/OUTLINE

1) Overview of Orbital Anatomy2) Orbital Imaging Search Pattern3) Mechanisms of Injury4) Red flag symptoms5) Orbital wall fractures6) Complications of orbital wall fractures7) Globe Injury - rupture, anterior chamber injury, posterior chamber injury8) Extraconal soft tissue injury9) Management options

## EREE-49 INTERSTITIAL LUNG DISEASE WITH ACUTE MANIFESTATIONS: TIPS FOR THE GENERAL AND EMERGENCY RADIOLOGISTS

Elena Garcia Garrigos, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Almudena I. Urena Vacas, MD (*Abstract Co-Author*) Nothing to Disclose
Marina Sirera Matilla, MD (*Abstract Co-Author*) Nothing to Disclose
Eloisa Feliu, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
David Ferrandez Ferrandez (*Abstract Co-Author*) Nothing to Disclose
Juan Arenas-Jimenez, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The differential diagnosis of patients presenting with acute diseases manifesting as diffuse lung abnormalities at chest CT is a challenge. Among the many possible causes, we can find interstitial lung diseases (ILD) presenting with acute manifestations both as a debut in previously undiagnosed conditions or as a complication of known ILD. In the acute setting, a correct radiological orientation can be the clue for an adequate clinical management, perhaps contributing to a better outcome. In this exhibit our goals are: 1. To describe the clinical and radiological characteristics of ILD manifesting as acute lung diseases. 2. To show imaging findings that should suggest an acute debut of an unknown ILD. 3. To depict characteristic radiological findings of acute complications in patients with known ILD.

### TABLE OF CONTENTS/OUTLINE

1.Introduction: Global overview of ILD with acute manifestations. 2. Tips for diagnosing ILD with acute presentation. 3. Radiological manifestations and clinical information that should suggest a new onset of ILD. 3. Acute complications of ILD (acute exacerbation of ILD, lung toxicity, specific infections related to therapy). 4. Discussion of specific conditions (acute interstitial pneumonia, organizing pneumonia, non-specific interstitial pneumonia, acute exacerbation of ILD, rapidly progressive ILD, hypersensitivity pneumonitis, lung toxicity, granulomatous and lymphocytic interstitial lung disease,?)

## EREE-5 SPONTANEOUS HEMOPERITONEUM: WHERE DOES THE BLOOD COME FROM?

Roberto Garcia Figueiras, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Sandra Baleato Gonzalez, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Paula Buades, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Spontaneous hemoperitoneum (SH) is defined as the presence of blood within the peritoneal cavity coming from a non-traumatic origin. It is a challenging diagnosis in the emergency setting, often because of the absence of clinical suspicion and its low frequency. Radiologists play a fundamental role in the identification and location of the source of bleed, both essential to be able to deliver the best care possible for the patient. This exhibit aims to:1. Synthesize the potential causes of SH to facilitate a systematic search approach. 2. Summarize the different imaging techniques of significant value for the detection and characterization of SH, in order to ascertain which is the best course of action when assessing SH cases. 3. Review relevant diagnoses to consider when evaluating a patient with SH.

### TABLE OF CONTENTS/OUTLINE

1. Introduction: overview of non-traumatic hemoperitoneum 2. Potential causes of bleeding within the peritoneum.2. Imaging techniques: US, CT and dual-energy CT, MRI. Diagnostic protocol based on imaging in the setting of SH. 3. Key clues to find the hemorrhagic source: not-to-miss signs on CT imaging, and relevant anatomical concepts.4. Cases: collection of cases presented schematically to best illustrate the main entities to think about when searching the origin of SH, focusing on significant differences between etiologies and hints to facilitate a correct diagnosis. These cases will be organized by pathophysiological groups: 4.1. Gynecological4.2. Post-surgical4.3. Neoplasms4.4. Hematological4.5. Vascular 4.6. Systemic conditions.5. Conclusion

## EREE-50 RADIOLOGICAL INSIGHTS: EXPLAINING FIREARM TRAUMA WITH BALLISTICS KNOW-HOW

Sofia Thais Escobar Narro, MD (*Abstract Co-Author*) Nothing to Disclose
Elena Sierra, MD (*Abstract Co-Author*) Nothing to Disclose
Esteban Mayayo-Sinues (*Abstract Co-Author*) Nothing to Disclose
Paloma Briceno Torralba, MD (*Abstract Co-Author*) Nothing to Disclose
Amalia Aranaz Murillo, MD (*Abstract Co-Author*) Nothing to Disclose
Samuel Roldan Minana (*Abstract Co-Author*) Nothing to Disclose
Elena Pascual Perez, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Ballistic effects studies the consequences of projectiles fired when they impact the target and this knowledge is fundamental for interpreting images of gunshot victims.2. The cavities a bullet creates are influenced by the type of firearm, bullet velocity and trajectory, and tissue penetrated.3. X-rays locate projectiles, CT scans evaluate organic damage and entry/exit points and MRI assesses injuries and potential long-term consequences

**TABLE OF CONTENTS/OUTLINE**

This poster aims to explore the characteristics of gunshot wounds inflicted by various types of firearms, delve into the field of ballistic effects, and assess the role of different imaging modalities.Forensic radiology, particularly ballistic effects, is a subdivision of ballistics that studies the mechanisms of action, effects, and consequences of projectiles when they impact the target. These depend on the kinetic energy of the bullet and the temporary and permanent cavity it creates. This knowledge is fundamental for interpreting images of gunshot victims and producing our radiological report.Radiological imaging plays a crucial role in emergency settings and future management. X-rays aid in identifying the location of projectiles and determining the composition of bullets. CT offers a detailed evaluation of organ damage and entry/exit points. MRI helps assess injuries and potential long-term consequences, crucially distinguishing ferromagnetic materials to prevent adverse effects from imaging procedures.

## EREE-51 THE INVISIBLE INJURY: A COMPREHENSIVE IMAGING REVIEW OF SCAPULOTHORACIC DISSOCIATION

Babina Gosangi, MD, MPH (*Abstract Co-Author*) Nothing to Disclose
Hector Figueroa-Monsanto (*Abstract Co-Author*) Nothing to Disclose
Mariana Travieso Diffoot (*Abstract Co-Author*) Nothing to Disclose
Max Schreiber (*Abstract Co-Author*) Nothing to Disclose
Carol Sanchez Santana (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Review the epidemiology and etiology of scapulothoracic dissociation and commonly associated injuries. Demonstrate key imaging features for the initial evaluation and detection of scapulothoracic dissociation and its associated vascular and neurological injuries on various imaging modalities. Discuss additional thoracic injuries affecting the lungs, pleura, and mediastinum. Explain Zelle's classification of injuries for determining the severity and management of scapulothoracic dissociation.

**TABLE OF CONTENTS/OUTLINE**

I. Introduction- Definition, Problem statement- mortality/ morbidity data II. Anatomy of relevant structures III. Mechanism of injury- High energy trauma IV. Imaging modalities- Chest X-ray, Chest CT, Shoulder CT, CT Angiogram for vascular evaluation, MRI branchial plexus V. Injuries Bony and ligamentous injuries, Lung injuries- Contusions, Pleural injuries- Pneumothorax, hemothorax, Mediastinal injuries- Pneumomediastinum, Vascular injuries- Pseudoaneurysm, dissection, Neurological injuries- Brachial plexus injuries, epidural hematoma VI. Classification of injuries- Zelle's classification VII. Management

## EREE-52 ATRAUMATIC EMERGENCY IMAGING OF THE SPINE

Jisoo Kim, MD (*Abstract Co-Author*) Nothing to Disclose
Albert D. Jiao, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Computed tomography is often the first-line spinal imaging in the emergency setting, and careful evaluation can expedite appropriate management. 2. MRI is the most sensitivity imaging modality for noncompressive spinal emergencies, which requires careful consideration of clinical history such as symptom character and distribution. 3. Certain spinal pathologies such as spinal cord infarct require modifications to existing imaging protocols or real-time decision making from the radiologist, and therefore high pre-test clinical suspicion.

**TABLE OF CONTENTS/OUTLINE**

Compressive:Epidural - Primary spinal tumors or metastases with mass effect, discitis-osteomyelitis, disc herniation, degenerative disease, epidural lipomatosis, extramedullary hematopoisisSubdural - Subdural hematoma/empyema/hygromaIntradural/Extramedullary - Primary spinal tumors and cysts (shwannoma, meningioma, epidermoid), leptomeningeal metastasesNoncompressive: Inflammatory/Infectious - Guillain-Barre, Arachnoiditis, Transverse Myelitis, Neurosarcoidosis, Radiation-InducedVascular - Infarct, Arteriovenous malformation and fistula, VasculitisToxic-Metabolic - Subacute combined degeneration, nitrous oxideDemyelinating - Multiple sclerosis, neuromyelitis optica, acute disseminated encephalomyelitisMimics and other diagnoses:Crowned Dens Syndrome/CPPD, Calcific Tendinitis of the longus colli muscle, Osteoid osteoma/osteoblastoma, Treatment-related effects, including immune related adverse events and radiation osteitis, Iatrogenic injury/Postsurgical, Congenital/syndromic - Scheurmann disease, syringomyelia, tethered cord syndrome, sickle cell pain

## EREE-53 EMERGENCY NON-TRAUMATIC CARDIAC IMAGING FOR THE NON-CARDIAC RADIOLOGIST

**Awards**
**Cum Laude**

Christian P. Houbois, MD (*Abstract Co-Author*) Nothing to Disclose
Elsie Nguyen, MD, FRCPC (*Abstract Co-Author*) Nothing to Disclose

Felipe A. Sanchez, MD (*Abstract Co-Author*) Nothing to Disclose
Farah Cadour, MD, MS (*Abstract Co-Author*) Nothing to Disclose
Kate Hanneman, MD, MPH (*Presenter*) Speaker, Groupe Sanofi;Speaker, Amicus Therapeutics, Inc

**TEACHING POINTS**

1. Urgent cardiac abnormalities can be identified on non-gated chest imaging performed for another indication in patients presenting to the emergency department with non-traumatic acute chest pain, dyspnea or palpitations2. Coronary abnormalities identified on chest CT in the emergency department include plaque rupture resulting in myocardial ischemia and infarct, spontaneous coronary artery dissection, anomalous coronary artery origin with malignant course, and coronary vasculitis.3. Emergency non-coronary cardiac findings include aortic root dissection, stress-induced or other cardiomyopathy, cardiac masses and thrombus, epipericardial fat necrosis, myocarditis, pericarditis, and pericardial tamponade4. The heart should be evaluated on all thoracic imaging including the coronary arteries, cardiac chambers, pericardium, valves, and adjacent fat, with particular attention in patients presenting to the emergency department with acute chest pain, dyspnea, or palpitations where no other cause is identified

**TABLE OF CONTENTS/OUTLINE**

1. Review non-traumatic acute cardiac diseases and complications in the emergency department including incidence, presenting symptoms, pathophysiology, imaging findings, and clinical outcomes2. Describe the importance of evaluating the heart on emergency non-traumatic thoracic imaging performed for other indications such as evaluation of pulmonary embolism or aortic dissection3. Demonstrate acute cardiac abnormalities on chest x-ray

and chest CT performed for other indications in the emergency department including coronary artery, myocardial, pericardial, valvular and other cardiac abnormalities

## EREE-54 IMAGING FEATURES OF BLUNT THORACIC AORTIC INJURY: WHAT THE RADIOLOGIST NEEDS TO KNOW

**Awards**
**Certificate of Merit**

Andrew Sinensky, MD (*Abstract Co-Author*) Nothing to Disclose
Elana B. Smith, MD (*Abstract Co-Author*) Nothing to Disclose
Ishaan J. Bhatt, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Blunt traumatic aortic injuries (BTAI) are frequently classified using the Society of Vascular Surgery classification system. Management is based on injury grade and hemodynamic stability of the patient. 2. Proposed mechanisms for BTAI include shear/torsion forces, osseous pinch, and water-hammer phenomenon. 3. Cardiac, pulmonary, abdominal, and osseous injuries often occur concurrently with BTAI. End organ ischemia/infarcts may result from the vascular injury.

### TABLE OF CONTENTS/OUTLINE

1. Introduction2. CTA Techniques and Considerations• Whole-body CT• Cardiac gating• Bolus timing• Dual energy applications3. Injury Mechanism• Shear/Torsion• Osseous Pinch• Water-Hammer Phenomenon4. Injury locations5. Injury Grading - Society of Vascular Surgery• Grade I - Intimal Tear• Grade II - Intramural Hematoma• Grade III - Pseudoaneurysm• Grade IV - Rupture6. Associated Injuries and Complications7. Mimics of Injury - Non-traumatic pathologies, anatomic variants, and technical factors8. Management• Non-operative vs. endovascular vs. open• Treatment complications - infection, stent migration, endoleak, injury progression, fistula formation9. Summary

## EREE-55 THE NO-SO-CUTE ACUTE LIVER: PRESENTATIONS AND IMAGING OF EMERGENT LIVER PATHOLOGY

Joseph W. Owen, MD (*Abstract Co-Author*) Nothing to Disclose
James T. Lee, MD (*Abstract Co-Author*) Nothing to Disclose
Sophia Humphrey (*Abstract Co-Author*) Nothing to Disclose
Robert G. Meek (*Abstract Co-Author*) Nothing to Disclose

Andres R. Ayoob, MD (*Abstract Co-Author*) Nothing to Disclose
Elhamy R. Heba, MD, MD (*Abstract Co-Author*) Nothing to Disclose
Trae C. Brooks, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Abdominal pain is one of the most common reasons for visits to the emergency department, accounting for 5-10% of all visits (139.8 million in the US in 2021). The liver is the largest organ in the abdomen and has attributable pathology in 0.5-1% of these cases (non-biliary causes). CT and US are often complimentary examinations in the workup of suspected liver pathology in the ED, with US a modality of choice in the pediatric population to avoid radiation exposure when possible. MRI remains a problem-solving modality when other imaging is equivocal. When acute non-biliary liver pathology is suspected, the radiologist should be familiar with the imaging findings seen in various forms of liver pathology and should also be prepared to recommend the appropriate imaging examination to assist referring clinicians in reaching a diagnosis.

### TABLE OF CONTENTS/OUTLINE

1. Background and Epidemiology.2. Overview of Acute Non-biliary Liver Pathology.3. Multimodality Case Presentations.a.Trauma-Brief overview of current AAST guidelines for blunt/penetrating hepatic trauma,Discussion of key findings to distinguish between different AAST injury grades.b. Nonbiliary Hepatic Infection,Abscess,Hepatitis.c. Hepatic Vascular Emergencies- Budd-Chiari Syndrome,Portal vein thrombosis,Hepatic Artery Stenosisd. Emergent Complications of Hepatic Neoplasm-Adenoma,HCC,Diffuse metastasise. Post op/ Iatrogenic- Bilomas/fluid collection/hemorrhage,Vascular-Fistula (after biopsy),Pseudoaneurysm (liver transplants),Peripheral PVT after targeted therapy4. Summary and Recommendations5. References.

## EREE-56 RADIOLOGY AT THE FRONTLINE: EXPERIENCE OF THE MOBILE MILITARY HOSPITAL

Uliana Y. Pidvalna, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The term and description of "military trauma" are changing every time with new technologies of weapons. In parallel, the development of radiological modalities is a tool that could assist military doctors even on the frontline for prompt and precise decisions. In the case of the modern ongoing war, understanding evacuation steps with diagnostic modalities at each point is necessary. The purpose of this exhibit is: 1. To show the evacuation steps with accessible diagnostic modalities at different stages. 2. To illustrate imaging findings of frontline combat trauma at the mobile military hospital using different techniques (X-ray, US and CT). 3. To discuss the challenges and difficulties in assessing military trauma at the mobile military hospitals.

### TABLE OF CONTENTS/OUTLINE

1. Principles and application of evacuation steps from the frontline with accessible radiological modalities.2. Radiological imaging of head/chest/abdomen/pelvis/extremities on the frontline, including, but not limited to, pneumothorax, hemothorax, hemoperitoneum, bleeding, heart and great vessels injuries, traumatic amputations, brain injuries (X-ray, USG and non-contrast CT) at the mobile military hospital.3. Diagnostic modalities triage: experience of the mobile military hospital.

## EREE-57 FLAP TO FLOP: EMERGENCY IMAGING OF EXTRAMAMMARY COMPLICATIONS AFTER BREAST RECONSTRUCTION

**Awards**
**Cum Laude**

William J. Hoover, MD (*Abstract Co-Author*) Nothing to Disclose
Margarita V. Revzin, MD, MS (*Abstract Co-Author*) Nothing to Disclose
Long H. Tu, MD (*Abstract Co-Author*) Nothing to Disclose
Danling Chen, MD (*Abstract Co-Author*) Nothing to Disclose
Caroline Merriam, DO (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Surgical management of breast cancer is evolving quickly, with several breast reconstruction options available to patients after mastectomy or lumpectomy.
- Many breast reconstruction procedures utilize muscle, fat, and skin derived from the patient's abdomen, back, or extremities.
- Breast reconstruction may result in complications at flap donor sites including abscess, hematoma, wound dehiscence, or cellulitis.
- Many patients with donor site complications initially present to the Emergency Department, where evaluation often includes CT abdomen/pelvis or soft tissue ultrasound.
- This exhibit will review multimodality emergency imaging of complications at flap donor sites.
- The presentation will also compare expected post-operative changes with acute "can't miss" complications at flap donor sites.

**TABLE OF CONTENTS/OUTLINE**

- Imaging review of complications that occur at flap donor sites. This exhibit will discuss acute and long-term donor site complications for seven common breast reconstruction surgeries:
- Transverse rectus abdominis myocutaneous (TRAM) flap
- Deep inferior epigastric perforator (DIEP) flap
- Latissimus dorsi flap
- Superior gluteal artery perforator (SGAP) flap
- Transverse upper gracilis (TUG) flap
- Autologous fat grafting
- Omental flap
- Brief description of each reconstructive procedure, focusing primarily on relevant anatomy in the abdomen, back, or extremities.

## EREE-58 A HEAD TURNER: CERVICAL SPINE INJURIES, MANAGEMENT, AND COMPLICATIONS

Elana B. Smith, MD (*Abstract Co-Author*) Nothing to Disclose
Fayhaa Doja, BS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Blunt cervical spine injuries most often result from motor vehicle accidents and falls. Direction of force contributes to injury type. 2. AO classification systems exist for the upper (C0-C3) and subaxial (C3-C7) cervical spine. Injuries are further classified by location, osseous/ligamentous involvement, and stability. 3. Knowledge of spinal cord tract structure and function allows for prediction of neurologic deficits. For example, Brown-Sequard Syndrome causes ipsilateral weakness and impaired proprioception and contralateral loss of pain and temperature due to involvement of the corticospinal tract, dorsal column, and spinothalamic tract, respectively. 4. The postoperative cervical spine can be complicated by hardware failure, infection, nonunion, and fluid collections. Tracheal and esophageal injuries are unique to anterior approach surgeries.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction 2. Anatomy - Osseous - Ligamentous - Spinal Canal Spaces (epidural, subdural, subarachnoid) - Spinal Cord 3. Imaging Indications, Modalities, and Technical Factors4. AO Cervical Spine Classification - Upper Cervical Spine Injury (C0-C3) - Subaxial Cervical Spine Injury (C3-C7)5. Spinal Cord Injuries - Compression - Contusion - Transection - Infarct 6. Management- Nonoperative - Operative (upper vs. subaxial cervical spine) - Post-operative complications & 7; Hardware-related (malpositioning, failure, subsidence)& 7; Infection & 7; Nonunion& 7; Fluid collections & 7; Tracheo-esophageal& 7; Neurovascular & 7; Heterotopic ossification7. Summary

## EREE-59 MELENA AND HEMATOCHEZIA: ACUTE UPPER AND LOWER GASTROINTESTINAL BLEEDING- DIFFERENTIAL DIAGNOSIS AND ROLE OF IMAGING

Manohar Roda, MD, MBBS (*Abstract Co-Author*) Nothing to Disclose
Thomas L. Estes JR, MD (*Abstract Co-Author*) Nothing to Disclose
Frank H. Miller, MD (*Abstract Co-Author*) Advisory Board, Bayer AG;Advisory Board, Guerbet SA
Pardeep K. Mittal, MD (*Abstract Co-Author*) Nothing to Disclose
Camila L. Vendrami, MD, MD (*Abstract Co-Author*) Nothing to Disclose
Nikolas Brozovich, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Discuss causes of acute upper and lower gastrointestinal bleeding(melena vs hematochezia) 2. Describe diagnostic approach according to patient's clinical presentation 3. Describe role of different imaging modalities in the setting of acute GI bleeding and their pitfalls

**TABLE OF CONTENTS/OUTLINE**

This exhibit will discuss the etiology of acute GI bleeding above and below the ligament of Treitz. CT, MR, US, Radionuclide Scanning, Catheter angiography, and Endoscopy imaging findings will be discussed. In addition, the role of Intervention Radiology in the treatment of GI bleeding will be discussed.Upper GI bleeding- Gastric/duodenal ulcer, Gastritis, Variceal bleeding, Mallory-Weiss tear, Vascular lesions, and Neoplasms.Lower GI bleeding- Diverticular disease, Angiodysplasia, Neoplasms, Colitis(Ischemic/Inflammatory/Granulomatous), Intussusception, Meckel's diverticulum, Hemorrhoids, Benign anorectal lesions, and Anal fissures.

## EREE-6 HIGH REPRODUCIBILITY 3D-CTA WITH GENERATIVE AI : GENERATION OF PSEUDO-CONTRAST-ENHANCED CT IMAGE

Atsushi Teramoto, PhD (*Abstract Co-Author*) Nothing to Disclose
Masayoshi Niwa, RT (*Abstract Co-Author*) Nothing to Disclose
Masato Yoshida, RT (*Abstract Co-Author*) Nothing to Disclose
Yosuke Kuratani, BS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

We developed a method using Cycle-GAN to convert non-contrast-enhanced CT (non-CECT) images into pseudo-contrast-enhanced CT (pseudo-CECT) images. These pseudo-CECT images facilitate more accurate region of interest (ROI) setting during bolus tracking (BT), thus optimizing the timing for 3D-CTA imaging. Our study involved mutual conversion between contrast-enhanced CT (CECT) and non-CECT images, followed by ROI setting tests. The trained Cycle-GAN successfully produced pseudo-CECT and pseudo-non-CECT images resembling true CECT images. In ROI tests with pseudo-CECT

images, accuracy improved to nearly 50% compared to non-CECT images, greatly assisting in identifying common carotid artery and internal carotid artery locations. This method significantly aids technicians in ROI setting.

**TABLE OF CONTENTS/OUTLINE**

1. Analyze the current problems. 2. Development of a technique to convert non-CECT to CECT using CycleGAN. 3. Visual evaluation of the accuracy of depicting carotid arteries in a manner similar to contrast-enhanced CT imaging. 4. Comparison of the accuracy of ROI placement between pseudo-contrast images and non-contrast images. 5. Clinical implications

## EREE-60 DON'T MISS HOMICIDE-RELATED POSTMORTEM CT FINDINGS

Kazuo Awai, MD (*Abstract Co-Author*) Research Grant, Canon Medical Systems Corporation;Research Grant, Hitachi, Ltd;Research Grant, Fujitsu Limited;Research Grant, Nemoto Kyorindo co, Ltd;Research Grant, FUJIFILM Holdings Corporation
Yuko Nakamura, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Shintaro Morishita (*Abstract Co-Author*) Nothing to Disclose
Wataru Fukumoto, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Hidenori Mitani (*Abstract Co-Author*) Nothing to Disclose
Haruka Higashibori (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

One of the purposes of postmortem CT (PMCT) is to confirm or deny death by homicide. The differentiation between traumatic- and endogenous subarachnoid hemorrhage (SAH) is occasionally difficult. PMCT scans can reveal damage to gastrointestinal- and abdominal aortae due to blunt abdominal trauma elicited by trampling and punching; body surface inspection may not discover such damage. In stabbing victims, PMCT helps to determine the depth - and thus the type, size, and direction - of the weapon. Hyoid- and cricoid cartilage fractures point to strangulation. In decomposed corpses, anomalously vertebral separation may suggest homicide. Checking the airway of neonatal cadavers helps to determine whether the birth was normal or a stillbirth. However, in some instances PMCT findings may incorrectly point to homicide in natural-death cases and it does not reveal the cause of death in poisoning victims. We present homicide-related postmortem CT findings in forensic cases which radiologists should know.

**TABLE OF CONTENTS/OUTLINE**

1. Violent death •Traumatic subarachnoid hemorrhages (SAH) •Blunt abdominal trauma 2. Strangulation 3. Stabbing 4. Corpse mutilation 5. Neonatal corpses •Differentiation of normal births from stillbirths 6. Pitfall of homicide-related postmortem CT findings •Heat hematoma •Poisoning

## EREE-61 PELVIC INJURIES IN HIGH-VELOCITY TRAUMA: A CHECKLIST BASED APPROACH

Sameer B. Raniga, MD, FRCR (*Abstract Co-Author*) Nothing to Disclose
Alok K. Mittal, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Manickam Kumaravel, MD, FRCR (*Abstract Co-Author*) Nothing to Disclose
Shubham Arora, MD (*Abstract Co-Author*) Nothing to Disclose
Devpriyo Pal, MD,FRCR,MBBS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To recognize various anatomic bony landmarks on pelvic radiographs and CT. To understand the pathophysiology and biomechanics of injuries in pelvic trauma To learn how to approach CT with pelvic binders. To be aware of the most commonly used pelvic trauma classification schemes.To recognize pelvic injury patterns for accurate diagnosis and characterization of pelvic injuries to guide management decisions to ensure optimal clinical outcomes.To understand the treatment options, including the role of CT in planning treatment.To evaluate the postoperative appearance

**TABLE OF CONTENTS/OUTLINE**

Review the anatomy of the pelvis using illustrations, radiographs, and CT.Illustrate the spectrum of pelvic injuries and highlight crucial concepts for accurate diagnosis on radiographs/CT.Classify pelvic traumatic injuries with examples.An algorithmic approach to accurately predict and identify subtle injuries.A review of common pitfalls will be included. Understanding management principles and imaging evaluation of postoperative pelvic trauma

## EREE-62 SEAT BELT AORTIC INJURY: A DIAGNOSTIC CHALLENGE WITHIN THE SEAT BELT SYNDROME

Nerea Quilez (*Abstract Co-Author*) Nothing to Disclose
Andoni Azcona, MD (*Abstract Co-Author*) Nothing to Disclose
Lain Ibanez, MD (*Abstract Co-Author*) Nothing to Disclose
Susana Borruel, MD (*Abstract Co-Author*) Nothing to Disclose
Elena Martinez Chamorro (*Abstract Co-Author*) Nothing to Disclose
Miguel Diez, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- To review the key imaging findings of seat belt syndrome and to describe the seat belt aortic injury.
- To present the overall incidence of seat belt aortic injuries among 70 patients with seat belt signs.
- To illustrate the different types of vascular injuries and their locations, as well as the most commonly used classifications.
- To summarize the therapeutic management of seat-belt aortic injuries according to current guidelines. No one doubts the fact that seat belts save lives. However, when an individual is involved in a motor vehicle collision with properly positioned 3-point restraints, they can suffer potentially fatal injuries through multiple mechanisms. Seat belt vascular injuries, a condition with low incidence in the seat belt syndrome, can be a diagnostic challenge. This presentation aims to review the concept of seat belt aorta as well as other vascular injuries due to seat belt, providing images from real cases in our level 1 trauma center.

**TABLE OF CONTENTS/OUTLINE**

- What is seat belt syndrome? Summary of imaging findings on CT. - Seat belt aortic injury. Mechanism of injury.- Sites and types of injury. Imaging findings and current classification systems.- Evolution and current guideline-based therapeutic approaches.- Take home points.

## EREE-63 COMMON, UNCOMMON, AND RARE RENAL INFECTIONS AND OTHER SELECTED EMERGENCIES - WHAT THE RADIOLOGIST SHOULD KNOW

**Awards**
**Certificate of Merit**

Anne Sailer, MD (*Abstract Co-Author*) Nothing to Disclose
Danling Chen, MD (*Abstract Co-Author*) Nothing to Disclose
Paul Nikolaidis, MD (*Abstract Co-Author*) Nothing to Disclose
Yashant Aswani, MD (*Abstract Co-Author*) Nothing to Disclose
Lejla Aganovic, MD (*Abstract Co-Author*) Nothing to Disclose
Margarita V. Revzin, MD, MS (*Abstract Co-Author*) Nothing to Disclose
Irene Dixe de Oliveira Santo, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Review the role of imaging in the diagnosis and management of renal infections.2. Review the radiological findings and risk factors for acute and chronic renal infections and their complications.3. Discuss uncommon, rare, and opportunistic causes of renal infections.4. Overview of genitourinary infections in the renal transplant patient.5. Discuss a few other selected non-infectious renal emergencies.

**TABLE OF CONTENTS/OUTLINE**

1. Demographics and risk factors for renal infections.2. Imaging modalities used in the evaluation of renal infections.3. Role of imaging in the evaluation of renal infections: the immunocompromised patient, treatment non-responders, equivocal clinical diagnosis, evaluation of disease extent, renal transplant patients, and patients with congenital anomalies.4. Radiological findings with cases from our institution of acute renal infections: acute pyelonephritis, renal/perirenal abscesses, pyonephrosis, emphysematous pyelonephritis/pyelitis, emphysematous pyelonephritis in the renal transplant patient.5. Radiologic findings with cases from our institution of chronic renal infections: chronic pyelonephritis; xanthogranulomatous pyelonephritis.6. Uncommon causes of renal infections or infection-related renal disease: tuberculosis; parasites; COVID-related renal disease.7. Renal infection in the transplant patient: spectrum, complications, and sequelae.8. Spectrum of non-infectious renal emergencies: acute kidney injury (AKI), anuria, interstitial nephritis, rhabdomyolysis, hepatorenal syndrome, renal colic and renal stones, hematuria, renovascular disease, cholesterol embolism, and contrast nephropathy.

## EREE-64 MATTERS OF SUBSTANCE: CNS IMAGING OF RECREATIONAL DRUG USE

Mariana R. Defreitas, MD (*Abstract Co-Author*) Nothing to Disclose
Christopher Ruggiero, MD (*Abstract Co-Author*) Nothing to Disclose
David E. Bartlett, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Recognize common recreational drugs in the United States and their basic neurologic effects. 2. Understand the associated neuroimaging findings of complications.

**TABLE OF CONTENTS/OUTLINE**

Background A. Nearly 25% of surveyed U.S. Americans used illicit drugs in the last year. B. Common drugs of choice: cocaine, amphetamines, opioids, marijuana, nitrites, and industrial solvents.Relevance A. Given prevalence, radiologists must recognize imaging findings B. CNS imaging manifestations of recreational drug can present in imaging studies order through Emergency Department C. Radiologists can aid clinicians in providing timely and appropriate care.Implications of Imaging Findings: A. Appearance is dependent on factors such as drug of choice, route of consumption, and impurities present B. Imaging can mimic other disease processes C. Findings can be suggestive illicit drug use when clinical history is unavailable.Acute and Chronic Findings A. Neurovascular - Ischemic strokes, intracranial hemorrhage, posterior reversible encephalopathy syndrome (PRES), dissection, thrombosis, aneurysms, and AVFs. B. Encephalopathies (heroin and cocaine induced) C. Infectious (i) septic emboli, embolic strokes, and mycotic aneurysms indicates disseminated infection (ii) IVDU can also be associated with HIV infection and its complications, including CNS toxoplasmosis and primary CNS lymphoma.Conclusion A. Emergency Radiologists must be familiar with the neuroimaging findings of drug use

## EREE-65 WHAT'S GOING ON BACK THERE? PENETRATING RETROPERITONEAL TRAUMA!

Richard E. Healicon, BMBCh (*Abstract Co-Author*) Nothing to Disclose
Saigeet Eleti, FRCR, MBBChir (*Abstract Co-Author*) Nothing to Disclose
Susan Cross, MBChB, FRCR (*Abstract Co-Author*) Nothing to Disclose
Lukasz Zielinski, MBBCHIR (*Abstract Co-Author*) Nothing to Disclose
Ansab Fazili I, MBBS,BSC (*Abstract Co-Author*) Nothing to Disclose
Sarah Hickman, MBBS (*Presenter*) Research collaboration, Vara;Research collaboration, ScreenPoint Medical BV;Research collaboration, Lunit Inc;Research collaboration, Kheiron Medical Technologies Ltd;Research collaboration, Alphabet Inc;Research collaboration, Volpara Health Technologies Limited

**TEACHING POINTS**

-Clear understanding of the retroperitoneal spaces and contents allows radiologists to infer patterns of injury and suspected organ involvement, for example by recognizing the tracking of fluid and haematoma. -Retroperitoneal hematoma is often not seen on a FAST scan as it tracks posteriorly and deep as well as is obscured by bowel gas. -Retroperitoneal haemorrhage can result in a significant loss of circulating blood volume, haemodynamic instability and precipitate need for urgent intervention. -Following the pattern of gas and soft tissue injury in penetrating wounds helps to infer which structures are involved. Indirect signs of injury include: hematoma, active blush of contrast, fat stranding and free gas. -MPR and MIP reconstructions are crucial in evaluation of penetrating trauma; they allow visualisation of overlapping structures and review of vascular injuries. -Different types of delayed phase CT imaging helps to further characterise injuries as well as look for complications, such as, active bleeding, pseudoaneurysm, and urinoma.

**TABLE OF CONTENTS/OUTLINE**

1) Introduction to retroperitoneal anatomy - contents, fascia planes, and spaces 2) Phases of imaging in penetrating trauma 3) Vessel injury - IVC, aorta, internal thoracic and lumbar arteries + complications 4) Pancreatic injury + complications 5) Duodenal injury + complications 6) Kidney injury + complications 7) Conclusion

## EREE-66 ACUTE MESENTERIC ISCHEMIA (AMI): UNDERSTANDING THE IMAGING FINDINGS AND MAKING A CRITICAL DIAGNOSIS

**Awards**
**Certificate of Merit**

David H. Kim, MD (*Abstract Co-Author*) Shareholder, Elucent Medical
Perry J. Pickhardt, MD (*Abstract Co-Author*) Advisor, Bracco Group;Advisor, Zebra Medical Vision Ltd;Advisor, Nano X Imaging;
Giuseppe V. Toia, MD, MS (*Abstract Co-Author*) Research Consultant, General Electric Company;Research Grant, General Electric Company

Meghan G. Lubner, MD (*Abstract Co-Author*) Spouse, Consultant, Elephas Bio
Matthew H. Lee, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Acute mesenteric ischemia (AMI) is a bowel emergency that is infrequent but has high morbidity and mortality. 2. Imaging plays a central role in early diagnosis and management. 3. Most causes are arterial (embolus > in situ thrombosis). Other causes include mesenteric venous thrombosis and low flow states (non-occlusive mesenteric ischemia, NOMI). 4. Identifying clot in a mesenteric vessel (artery or vein) establishes the diagnosis. Bowel and mesentery then document location and severity. 5. Non-visualization of clot means NOMI or small clot not seen at imaging. 6. Decreased wall enhancement specific to arterial causes (decreased inflow), wall thickening can be venous (outflow obstruction) or arterial (reperfusion and injury).

**TABLE OF CONTENTS/OUTLINE**

1. Discuss the importance of identifying AMI and the role of imaging in establishing the diagnosis - high mortality, improved outcomes with early recognition. 2. Review the basic anatomy (vascular and bowel) and pathophysiology of AMI. 3. Describe the etiologies of primary AMI - embolic-arterial, thrombotic arterial, venous, NOMI - and secondary AMI (e.g. closed loop bowel obstruction). 4. Review the role of imaging including a basic review of CT/DECT performance along with the typical protocols and characteristic imaging features of AMI. 5. Present an interpretive approach to AMI with characteristic imaging findings - assess the SMA/SMV, evaluate the bowel and mesentery, use of DECT (iodine maps and virtual non-contrast). 6. Present case examples of AMI along with mimics.

## EREE-67 PEDIATRIC POLYTRAUMA. MECHANISMS OF INJURY AND RADIOLOGIC EVALUATION

MARIA PEREZ FERNANDEZ (*Abstract Co-Author*) Nothing to Disclose
Marta Sanmartin Lopez, MD (*Abstract Co-Author*) Nothing to Disclose
Anxo Martinez De Alegria, MD (*Abstract Co-Author*) Nothing to Disclose
Roberto Garcia Figueiras, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Ana Ecenarro Montiel (*Abstract Co-Author*) Nothing to Disclose
Maria Mercedes Linares Paz (*Abstract Co-Author*) Nothing to Disclose
Lorena Maria Miguez Fortes (*Abstract Co-Author*) Nothing to Disclose
Maria V. Trujillo Ariza, MD (*Abstract Co-Author*) Nothing to Disclose
Amadeo Arango (*Presenter*) Research Consultant, ABEONA Therapeutics

**TEACHING POINTS**

1) To review the pediatric anatomic and physiologic differences compared to adults relevant for trauma.2) To explain the most common mechanisms of injury in children who suffer major trauma.3) To show examples of typical pediatric traumatic lesions that may be missed by an unexperienced eye.4) To suggest tips to optimize the radiologic evaluation of these patients.

**TABLE OF CONTENTS/OUTLINE**

1) The concept of polytrauma.2) Clinical management of pediatric polytrauma.2.1 The primary survey.2.2 The secondary and further surveys.3) Pediatric anatomic and physiologic special features.4) Mechanisms of injury.4.1 Traffic accident (seat-belt injuries).4.2 Bicycle accident (handlebar injuries).4.4 Fall from height.4.5 Sport-related injuries.4.6 Physical child abuse.5) Radiologic evaluation.5.1 Cervical trauma.5.2 Thoracic trauma.5.3 Abdominal trauma.6) Conclusions.

## EREE-7 AN IN-DEPTH LOOK AT THE OCULAR GLOBE, THE RADIOLOGIST'S BLIND SPOT

**Awards**
**Magna Cum Laude**

Maria Perez Costas, MD (*Abstract Co-Author*) Nothing to Disclose
Alvaro Jose de la Iglesia Salas, MD (*Abstract Co-Author*) Nothing to Disclose
Alba Lopez-Castello, MD (*Abstract Co-Author*) Nothing to Disclose
Sabela Garcia Benito, MD (*Abstract Co-Author*) Nothing to Disclose
Monica Fernandez Blanco (*Abstract Co-Author*) Nothing to Disclose
Ana Robles Gomez, MD (*Abstract Co-Author*) Nothing to Disclose
Samuel Pereiro Perez, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- To review the relevant anatomy of the globe. - To discuss the key imaging findings in orbital emergencies encompassing traumatic, infectious, and vascular pathology. - To recognize potential incidental orbital findings and main post-surgical changes.

**TABLE OF CONTENTS/OUTLINE**

Traumatic, infectious, and vascular orbital pathology are a common reason for consultation in emergency departments, and imaging can play a crucial role in the diagnosis and proper therapeutic management, especially in cases where the clinical examination may be inconclusive. CT is preferred due to its high availability, resolution, and accuracy in assessing orbital structures and soft tissues, identifying foreign bodies, and ruling out collections. The poster will review ocular injuries including: I. Relevant globe anatomy. II. Infection - Preseptal vs post-septal cellulitis. III.Traumatic - Corneal laceration. - Lens injuries (lens dislocation and traumatic cataract). - Retinal detachment. - Vitreous hemorrhage. - Open-globe injury and potential mimics (phthisis bulbi, myopia, coloboma and Staphyloma). - Foreign bodies and potential mimics (optic drusen, scleral calcifications, and calcified cataract). IV. Post-surgical changes - Scleral buckle, vitrectomy, retinopexy, ocular prothesis, and gold eyelid weight. V. Vascular - Carotid cavernous fistula Understanding the basic anatomy and the key imaging findings of globe pathology in computed tomography, as well as potential incidental imaging findings, enables the radiologist to provide the physician with precise diagnostic information to guide proper therapeutic management and thereby prevent permanent vision loss and potential life-threatening complications.

## EREE-8 UNVEILING THE FLOW: STRATEGIES FOR DETECTING POSTTRAUMATIC ACTIVE ABDOMINAL BLEEDING FROM A LEVEL 1 TRAUMA CENTER

Chaitanya Ahuja, MD (*Abstract Co-Author*) Nothing to Disclose
Meghna Chadha, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Alejandro A. Tempra, MD (*Abstract Co-Author*) Nothing to Disclose
Joshua Strobel, MD (*Abstract Co-Author*) Nothing to Disclose
Carolina Soto-Davila, MD (*Abstract Co-Author*) Nothing to Disclose
Mariana Marrero-Castillo (*Abstract Co-Author*) Nothing to Disclose
Guillermo P. Sangster, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Prompt identification of the bleeding origin and detection of vascular injuries can increase the efficacy of surgical or angiographic treatment, mortality, and mobility during an abdominal trauma. 2. Dual-phase CT-scan is the gold standard imaging technique in hemodynamically stable patients due to its high sensitivity in distinguishing vascular injuries. Active bleeding is characterized by a jet or localized area of high attenuation within a hematoma. The focal area will vanish on delayed images into an enlarged, enhanced hematoma. 3. Vessel injury is identified by findings like an intimal dissection flap, absence of vascular enhancement caused by occlusion or spasm, vessel wall non-uniformity, and caliber changes. Delayed imaging is crucial to confirm vessel injury.

**TABLE OF CONTENTS/OUTLINE**

1. To identify different types of vessel injury, such as dissection, pseudoaneurysm, arteriovenous fistula, and active extravasation. 2. To Illustrate computed tomography (CT) common and uncommon imaging patterns in patients with active intrabdominal bleeding. 3. To differentiate active bleeding from other high-attenuation conditions: bone fragments, and dense foreign bodies. Early recognition of active traumatic abdominal bleeding positively impacts mobility and mortality, efficiently guiding pertinent surgical and interventional procedures. This educational exhibit will depict cases of acute posttraumatic abdominal bleeding from various etiologies. It will help radiologists familiarize themselves with classical signs, differential diagnosis of high-attenuation entities, and characterization of different types of vessel injury.

## EREE-9 IMAGING SPECTRUM OF AORTIC INTRAMURAL HEMATOMA (IMH): A RADIOLOGISTS' GUIDE

Maria Perez Costas, MD (*Abstract Co-Author*) Nothing to Disclose
Sabela Garcia Benito, MD (*Abstract Co-Author*) Nothing to Disclose
Samuel Pereiro Perez, MD (*Abstract Co-Author*) Nothing to Disclose
Elena Chavarri Sr, MD (*Abstract Co-Author*) Nothing to Disclose
Alba Lopez-Castello, MD (*Abstract Co-Author*) Nothing to Disclose
Ana Robles Gomez, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Aortic intramural hematoma is a potentially life-threatening condition among the diseases processes that comprise the spectrum of acute aortic syndromes and require immediate medical attention. - Review IMH definition, classification and pathophysiology. - Review CT protocol. - Discuss characteristic IMH imaging findings, natural progression, potential complications and main differential diagnosis. - Review ulcer-like projections and blood pools pathophysiology and evolution. - Outline a practical approach for quick reporting.

**TABLE OF CONTENTS/OUTLINE**

I. Introduction. II. IMH epidemiology, pathophysiology and classification. III. IMH CT findings, evolution, potential complications (aortic rupture, pulmonary artery intramural hematoma, aortic dissection...) and imaging risk predictors. IV. Ulcer-like projection and blood pool pathophysiology and evolution V. IMH differential diagnosis (aortitis, penetrating aortic ulcer, mural thrombus, retroperitoneal fibrosis, lymphoma...) VI. Report.

## NAVIGATING THE SLOPES: A COMPREHENSIVE REVIEW OF SNOWSPORTS MUSCULOSKELETAL INJURIES ENCOUNTERED IN THE EMERGENCY DEPARTMENT

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Arash Azhideh, MD, MPH (*Abstract Co-Author*) Nothing to Disclose
Maryam Soltanolkotabi, MD (*Abstract Co-Author*) Nothing to Disclose
Majid Chalian, MD (*Abstract Co-Author*) Grant, The Boeing Company
Brian Y. Chan, MD (*Abstract Co-Author*) Nothing to Disclose
Amanda M. Crawford, MD (*Abstract Co-Author*) Nothing to Disclose
Ghazaleh Safazadeh, MD,MPH (*Presenter*) Nothing to Disclose

### TEACHING POINTS

-Understanding the biomechanics of snowsports and how they contribute to injury patterns. -Recognition and classification of common musculoskeletal injuries encountered in snowsports. -Diagnostic imaging modalities and their role in evaluating snowsports injuries. -Treatment options and rehabilitation strategies for various snow sports-related injuries. -Injury prevention strategies and recommendations for safe participation in snowsports.

### TABLE OF CONTENTS/OUTLINE

I. Introduction A. Overview of the popularity and diversity of snowsports. B. Importance of understanding radiologic findings of musculoskeletal injuries in snowsports. II. Biomechanics of Snowsports A. Overview of biomechanical forces involved in skiing, snowboarding, and other snowsports. B. Impact of terrain, speed, and equipment on injury risk. III. Common Musculoskeletal Injuries A. Upper Extremity Injuries -Shoulder Girdle Injuries: fracture/dislocations, rotator cuff injuries -Wrist/Hand Injuries: fracture/dislocations, ligamentous injuries B. Lower Extremity Injuries -Knee Injuries: ligamentous tears, meniscal injuries -Foot/Ankle Injuries: fractures, ligamentous injuries, tendon pathology C. Axial Injuries-Thoracolumbar spine injuries: compression/burst fractures, disc disease.-Pelvic injuries: stable vs unstable IV. Treatment and Rehabilitation A. Overview of conservative and surgical treatment options. B. Rehabilitation protocols for specific injuries. V. Injury Prevention A. Importance of proper equipment selection and fitting. B. Techniques for injury prevention and safe skiing/snowboarding practices. VI. Conclusion

## X-RAY ASSESSMENT OF ACUTE NEWBORN PATHOLOGIES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Thurl Cledera, MD (*Abstract Co-Author*) Nothing to Disclose
Weronika Bernard, MD (*Abstract Co-Author*) Nothing to Disclose
Agata Nowelli (*Abstract Co-Author*) Nothing to Disclose
Muhammad Umair, MBBS (*Abstract Co-Author*) Nothing to Disclose
Caterina B. Monti, MD, PhD (*Abstract Co-Author*) Travel support, Bracco Group
Anna Jankowska, MD (*Abstract Co-Author*) Nothing to Disclose
Julia Niemierko, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. To discuss the role of radiological imaging in assessing newborns presenting with distress symptoms, differentiating pathologic from normal findings on newborn X-rays. 2. Discuss indications for X-ray imaging and radioprotection considerations in newborns. 3. Present a structured approach to chest and abdominal X-ray assessment in newborns. 4. Highlight X-ray findings seen in preterm and full-term newborns with respiratory distress, cardiovascular, and gastrointestinal abnormalities, providing insights into the differential diagnosis of conditions causing distress in newborns based on radiological findings. 6. Assess normal positions and courses of lines and tubes. 7. Emphasize the role of radiologists in guiding clinical decision-making and optimizing patient outcomes.

### TABLE OF CONTENTS/OUTLINE

A. Introduction B. Radiation safety and the ALARA concept C. Structured approach to X-ray assessment D. Neonate in distress - chest X-ray a. Surfactant deficiency disease b. Transient tachypnea of the newborn c. Meconium aspiration syndrome d. Bronchopulmonary dysplasia e. Pneumothorax f. Pneumonia g. Congenital Anomalies (e.g., congenital pulmonary lymphangiectasia, diaphragmatic hernia, congenital lobar overinflation, pulmonary sequestration). E. Neonate in distress - abdominal X-ray a. Esophageal, duodenal, jejunal, ileal, anal atresia b. Duodenal web c. Malrotation d. Meconium ileus e. Perforation f. Necrotizing enterocolitis g. Hypertrophic pyloric stenosis F. Assessment of Lines and Tubes a. Endotracheal Tube b. Nasogastric Tube c. Umbilical Arterial Catheter d. Umbilical Venous Catheter e. Peripherally inserted central catheter f. ECMO catheter G. Conclusion

## ROLE OF MRI IN UROGENITAL TRAUMA

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Ryo Ueda (*Abstract Co-Author*) Nothing to Disclose
Christian Roest, MSc (*Abstract Co-Author*) Grant, Siemens AG
Thomas C. Kwee, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Akitoshi Inoue, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Hiromi Edo, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Yuki Arita, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

CT, US, and urethrography have been the main imaging modalities for the evaluation of urogenital trauma, particularly in shock patients, thanks to their relatively short examination times. MRI is employed for evaluating urogenital trauma in hemodynamically stable patients because of the following advantages. (i) Higher contrast resolution allows for the depiction of more detailed anatomic information, which is essential in decision-making for surgical procedures, (ii) Its potential to detect mild parenchymal or luminal wall injury without contrast medium, and (iii) The lack of ionizing radiation, which is particularly important for (follow-up) examinations in younger patients. MRI may provide value in several settings. For example, in urethral trauma associated with pelvic fractures, MRI offers a detailed evaluation of the proximal urethral stump, essential for urethral reconstruction surgery. While ultrasound remains the preferred method for diagnosing testicular rupture due to blunt trauma, MRI can be crucial in cases in which a large hematoma obscures the rupture of the tunica albuginea, helping to assess the need for orchiectomy. This exhibit discusses the criteria for employing MRI in urogenital trauma, and illustrates MRI findings of various urogenital trauma cases, emphasizing its growing importance in the appropriate diagnosis and pre- and post surgical assessment of urogenital injuries.

### TABLE OF CONTENTS/OUTLINE

1, Overview of the anatomy and trauma classification for the urogenital organ 2, Pros and Cons for imaging modalities (Fluoroscopy, CT, US, and MRI) 3, Recommended MR protocol and its imaging findings for each organ a. Kidney b. Bladder and Ureter c. Urethra d. Testis e. Penis 4, Summary

## "DON'T GET AIR-BALLED!" EMPHYSEMATOUS CONDITIONS OF THE ABDOMEN-PEARLS AND PITFALLS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Yashant Aswani, MD (*Abstract Co-Author*) Nothing to Disclose
Ananya Panda, MD, MBBS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Emphysematous conditions of abdomen are uncommon but potentially lethal conditions. It's important for radiologists to identify the correct pathology also avoid misdiagnosis and potential pitfalls. This exhibit also reviews pertinent clinical features that can help confirm diagnosis and avoid similar pitfalls. Lastly, we review management for better radiology reporting. At the end of the exhibit, the learner will be able to: 1. Review spectrum of emphysematous conditions of abdomen 2. Understand imaging mimics and clinical implications. 3. Be aware of next best steps as part of radiology reporting.

### TABLE OF CONTENTS/OUTLINE

I. Emphysematous Gastritis. Pitfall: Hydrogen peroxide ingestion II. Gas Gangrene of Liver. Pitfall: Hepatic abscess Post-therapy changes III. Emphysematous Cholecystitis. Pitfall: Radiolucent gallstones Bilio-enteric fistula IV. Emphysematous Pancreatitis. Pitfall: Post-enteric fistula post-intervention changes V. Emphysematous Pyelonephritis. Pitfall: Emphysematous Pyelitis Post-therapy changes VI. Emphysematous Cystitis. Pitfall: Intraluminal Air Chyluria VII. Emphysematous Aortitis. Pitfall: Aorto-enteric fistula post-intervention changes VIII. Retroperitoneal Fasciitis. Pitfall: Pneumoretroperitoneum IX. Bowel Gangrene. Pitfall: Benign Pneumatosis Intestinalis Pneumatosis cystoides. X. Gas Gangrene of Abdomen Wall/ Fournier Gangrene. Pitfall: Benign Subcutaneous Emphysema XI. Gas Gangrene of Uterus. Pitfall: Endometritis Post-partum changes XII. Gas-forming Prostate Abscess Pitfall: Uro-symphyseal Fistula XIII. Emphysematous Vaginitis. Pitfall: Vaginal Tampon XIV. Emphysematous Epididymo-Orchitis. Pitfall: Air in Scrotum

## CT IMAGING OF SHOULDER GIRDLE AND PROXIMAL HUMERAL FRACTURES: BIOMECHANICAL PRINCIPLES, GRADING, AND SURGICAL RELEVANCE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

David Dreizin, MD (*Abstract Co-Author*) Nothing to Disclose
Kathryn Champ, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

After completing the exhibit, participants will be able to: 1. Describe the role of CT and specific indications for this modality in the context of injuries to the superior suspensory complex of the shoulder (SSSC) and proximal humerus. 2. Explain the CT imaging features and parameters favoring surgical management for complex injuries including floating shoulder and bipolar glenohumeral fracture-dislocations. 3. List the common classification systems and subtypes for clavicular fractures, AC joint separations, and proximal humeral fractures, and imaging indications for surgical repair or reconstruction.

### TABLE OF CONTENTS/OUTLINE

I. Introduction: i. Clinical scenarios for which CT and 3D CT are advocated ii. Review of shoulder girdle and proximal humeral anatomy. iii. Injury biomechanics with pathoanatomy. II. Classification systems, key imaging features, and indications for surgical repair. i. Clavicle fractures: Allman and Neer classifications, telescoping, comminution, fracture displacement, and proximity to coracoclavicular ligaments. ii. AC separations: Rockwood classification, and surgical management of high-grade subtypes. iii. Sternoclavicular separation and scapulothoracic dissociation in severe trauma. iv. Glenoid and proximal humerus fracture-dislocations: Bankart, Hill-Sachs, and bipolar fractures; engaging lesions: glenoid track and Hill-Sachs interval concepts v. SSSC double disruptions and the floating shoulder: typical and atypical subtypes. vi. Proximal humeral fractures: Neer classification; calcar integrity, and varus collapse. III. Conclusion: summary table- key CT features and surgical management implications.

EREE-14

## BABY ON BOARD: IMAGING OF BLUNT TRAUMA IN PREGNANCY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Jason A. Pietryga, MD (*Abstract Co-Author*) Consultant, Radiostics LLC
Kristen Olinger, MD (*Abstract Co-Author*) Nothing to Disclose
Mariana R. Defreitas, MD (*Abstract Co-Author*) Nothing to Disclose
David E. Bartlett, MD (*Abstract Co-Author*) Nothing to Disclose
Esha Sharda, MD (*Abstract Co-Author*) Nothing to Disclose
Christopher Ruggiero, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

(1) Discuss appropriate imaging for blunt trauma in pregnancy. (2) Review risk of imaging to the mother and fetus. (3) Recognize findings of trauma and its mimics in imaging of the gravid patient.

### TABLE OF CONTENTS/OUTLINE

I. Background A. 1 in 12 pregnancies are affected by trauma, a leading cause of cause of death in pregnancy.B. Emergency Radiologists must understand appropriate imaging, risk of imaging, and traumatic findings in the expecting mother.II. Imaging selection A. Ultrasound is a useful tool for initial screening. i. Benefits of portability, lack of radiation, and high specificity. ii. Poor sensitivity in trauma limits its use. B. CT is first line in trauma imaging: i. Dose generally below 50 mGy ii. Threshold is unlikely to increase risk of fetal anomalies or loss. iii. Other radiation risks, including carcinogenesis must be considered. C. MRI may be appropriate: i. Subject to availability and time constraints.III. Injury patterns A. Radiologists must recognize imaging findings of trauma in pregnancy: i. Pregnancy-specific. 1. Placental abruption and uterine rupture. 2. Mimics - normal structures: cotyledons, chorionic plate indentations, and venous lakes. ii. Other injuries. 1. Abdominal visceral injuries. 2. Thoracic injuries. 3. Osseous injuries.IV. Conclusion A. Trauma in pregnancy is a leading cause of maternal and fetal mortality. B. Radiologists must: i. Know risks and benefits of imaging in pregnancy. ii. Be familiar with findings associated with trauma in pregnancy.

## BODY MRI ON CALL- A PRIMER FOR RADIOLOGY TRAINEES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Carolina A. Heming, MD (*Abstract Co-Author*) Nothing to Disclose
Yashant Aswani, MD (*Abstract Co-Author*) Nothing to Disclose
Maheen Rajput, MD (*Abstract Co-Author*) Nothing to Disclose
Ananya Panda, MD, MBBS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

With expanded access to MR systems, there is increasing role of Body MRI in emergency department/emergent conditions. Body MRI on-call is primarily used for problem-solving when US/CT are non-diagnostic. MRI offers non-radiation alternative when CT is contraindicated. Superior soft-tissue resolution of MRI provides non-contrast alternative when contrast is contraindicated. Familiarity with diverse conditions encountered in emergent settings can help on-call radiology trainees gain confidence and allow for seamless transition from training to independent practice. At end of this exhibit, learners will be able to: 1. Review spectrum of conditions encountered during on-call for which MRI may be indicated. 2. Know key protocols and high-yield sequences. 3. Understand added value of MRI for problem-solving.

### TABLE OF CONTENTS/OUTLINE

I. Hepatobiliary a. Choledocholiathiasis b. Mirizzi syndrome c. Post-cholecystectomy syndrome d. Complicated Cholecystitis e. Biliary leak f. Cholangitis g. Hepatic lesion- infection/hemorrhage/mass with hemoperitoneum h. Hepatic Infarct/Vascular Thrombosis i. Bile duct/Periportal tumor invasion II. Pancreas a. Acute Complicated Pancreatitis b. Pancreatic Trauma III. GU/Pelvis a. Renal mass with tumor thrombus b. Prostate Abscess c. Post-Radiation Complications IV. OBGYN a. Pregnant Patient: GI/GU conditions b. Adnexal Torsion c. Ectopic pregnancy d. Fibroids-Red degeneration e. Placenta/Post-partum complications V. Bowel a. Appendicitis b. Crohn’s disease complications c. Perianal abscess d. Diverticulitis/mimics VI. Penis/Scrotum a. Trauma b. Infection VII. Acute presentation of cancers a. Pancreatic Cancer b. Gall bladder Cancer c. Colorectal Cancer

## A CHECKLIST APPROACH TO INTERPRETING CT ANGIOGRAPHY OF ABDOMINAL VASCULAR EMERGENCIES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Carlos S. Tapia SR, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Abdominal emergencies of vascular origin are a common cause of attention in emergency departments. CT angiography is the imaging method of choice to evaluate the abdominal vessels. The radiologist's evaluation with a checklist report allows for a faster and more precise diagnosis, offering all the dates the physician needs for a correct approach to the patient.The inferior vena cava is the most prominent vein in the body. The most common emergency is obstruction by a filling defect, usually a thrombus; based on the lack of expansion of the vessel lumen and the absence of enhancement of the filling defect, this can be differentiated from a tumoral thrombus.In cases of acute aortic syndrome, it is essential to identify the type: aortic dissection, acute intramural hematoma, and penetrating atherosclerotic ulcer. Then, classify in Stanford A or B, and do not forget to find signs of impending rupture. Acute arterial or venous mesenteric ischemia is a severe life-threatening condition. Early detection and treatment are of utmost importance, as any delay in diagnosis can lead to bowel necrosis, perforation, and septic shock.

### TABLE OF CONTENTS/OUTLINE

Introduction. Abdominal vascular anatomy. Inferior vena cava thrombosis and congenital variants. Acute aortic syndrome. Aortic dissection. Acute intramural hematoma. Penetrating atherosclerotic ulcer. Signs of impending or contained rupture in abdominal aortic aneurysm. Vasculitis with abdominal vessel involvement. Venous bowel ischemia. Arterial Bowel ischemia. Bleeding angiodysplasia of the colon. Portal vein thrombosis and other emergencies. Pitfalls. Teaching points. Conclusions. Bibliography.

## ABDOMINAL PAIN IN PREGNANCY: BEYOND OBSTETRICS - INSIGHTS FROM MRI DIAGNOSTICS IN THE EMERGENCY ROOM

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Camila B. Visconti, MEd (*Abstract Co-Author*) Nothing to Disclose
Patricia Leal, MD (*Abstract Co-Author*) Nothing to Disclose
Alice Schuch, MD (*Abstract Co-Author*) Nothing to Disclose
Natalia H. Concatto, MD (*Abstract Co-Author*) Nothing to Disclose
Ariane Giovanaz (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Present illustrative cases of the most prevalent non-obstetric causes of abdominal pain in pregnant women, featuring classic imaging findings and critical diagnostic signs.Assess the advantages of utilizing magnetic resonance imaging (MRI), while establishing a standardized MRI protocol for this evaluation.

### TABLE OF CONTENTS/OUTLINE

IntroductionEpidemiology and risk factors of the most prevalent non-obstetric causes of abdominal pain in pregnant women.MR technique and discussionDescribe the main protocol and sequences of MRI used for assessing abdominal pain during pregnancy.Imaging features and pathology correlationDemonstrate MRI's efficacy in identifying various etiologies, from benign to potentially life-threatening conditions in pregnant women experiencing acute abdominal pain.ConclusionDiscuss the value of MRI in shaping medical management decisions for pregnant individuals with acute abdominal pain.

## RADIOLOGY UNDER THE GUN: GUIDE TO BULLSEYE DIAGNOSIS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Robert J. Dym, MD (*Abstract Co-Author*) Nothing to Disclose
Omar Jamil, MD (*Abstract Co-Author*) Nothing to Disclose
Daniel Giraldo Herrera, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. The U.S. epidemic of gun violence saw recent increases in the incidence of firearm-related injuries and deaths, and these may present a wide variety of diagnostic challenges in emergency departments.2. Firearm-related injuries constitute a unique category of traumatic injury given the high velocity of bullets and their penetrating mechanism with high-energy transfer.3. Understanding these types of injuries enables radiologists to assess the trajectory of the bullet, differentiate between direct and blast injury, and recommend follow-up interventions based on associated findings such as gross or subtle vascular injury, hollow viscus, or diaphragmatic injuries.

### TABLE OF CONTENTS/OUTLINE

1. Background and Review of the Literature. 2. Spectrum of organ lacerations, with AAST and operative specimen correlates. 3. Spectrum of vascular injuries with angiography correlates. 4. Thoracic injuries with percussive contusions. 5. Atypical cases: migratory bullets, shotgun and non-civilian firearms, and non-bullet projectiles.

## AFTERMATH OF A PUNCH TO THE GUT: IMAGING FOLLOWING SELECTIVE NONOPERATIVE MANAGEMENT OF ABDOMINAL TRAUMA

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Angelo G. Marino, DO (*Abstract Co-Author*) Consultant, Inari Medical, Inc;Speaker, Inari Medical, Inc
Nadia Solomon, MD, MSc (*Abstract Co-Author*) Nothing to Disclose
Douglas S. Katz, MD (*Abstract Co-Author*) Nothing to Disclose
Margarita V. Revzin, MD, MS (*Abstract Co-Author*) Nothing to Disclose
Yashant Aswani, MD (*Abstract Co-Author*) Nothing to Disclose
Anne Sailer, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Nonoperative management (NOM) is frequently conducted in trauma centers in patients with penetrating abdominal trauma who are hemodynamically stable without signs of diffuse peritonitis or evisceration.2. Although NOM has been relatively widely adopted for abdominal stab wounds, the concept has not been as embraced for GSWs given the higher associated incidence of visceral and abdominal vascular injuries and the morbidity and mortality associated with missed injuries.3. Recommendations of post-imaging guidelines for NOM patients with abdominal trauma is essential to screen for injuries (hollow organ, diaphragm injury, and delayed hemorrhage) that could have been missed on the initial trauma scan.

### TABLE OF CONTENTS/OUTLINE

1. Briefly review indications for NOM and the role of angiography with embolization, endoscopic retrograde cholangiopancreatography with stenting, and percutaneous drainage to increase the success of NOM. 2. Propose a follow-up imaging algorithm for patients who undergo surgical and NOM.3. Case based review of successful and unsuccessful NOM including cases of missed hollow organ injury, delayed hemorrhage, and many more to highlight potential blind spots.

## ABDOMINAL BLUNT TRAUMA···YOU'VE GOT TO BE KIDNEY ME: A PRIMER OF THE REVISED AAST KIDNEY INJURY SCALE FOR DIAGNOSTIC RADIOLOGY RESIDENTS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Adriana L. Vargas Figueroa, MD (*Abstract Co-Author*) Nothing to Disclose
Ricardo ALBINO CAMACHO (*Abstract Co-Author*) Nothing to Disclose
Jose A. Lara, MD (*Abstract Co-Author*) Nothing to Disclose
Jean P. Inesta-Rivera, MD, MPH (*Abstract Co-Author*) Nothing to Disclose
Claudia Muns, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

-Review the grading of kidney injuries as defined by the AAST (American Association for the Surgery of Trauma) Kidney Injury Scale (2018). -Provide anatomical diagrams of grade I-V kidney injuries. -Contribute case examples with pathognomonic imaging findings of grade I-V kidney injuries on CT.-Define the possible complications of AAST kidney injuries and their corresponding management.-Provide a self-assessment tool for the classification of kidney injuries.

### TABLE OF CONTENTS/OUTLINE

- Educational Objectives and Introduction- AAST Kidney Injury Scale Grade I-V and Possible Complications- Anatomical diagrams, CT imaging findings, and management - Self-assessment with multiple cases in quiz format Renal injuries may result from both blunt and penetrating trauma, and thus a high index of suspicion for these should be maintained in patients presenting with post-traumatic microscopic or gross hematuria. Expectant or non-surgical management has become the standard of care for most renal injuries, primarily due to high rates of iatrogenic nephrectomies and poor postoperative renal function. However, surgical management remains the gold standard for severe renal injuries with a higher AAST grade. Consequently, performing an appropriate imaging evaluation and establishing an accurate renal injury grade are imperative for determining appropriate management. Contrast-enhanced CT in combination with the AAST Kidney Injury Scale have become the gold standard for evaluating renal injuries. Our aim is to provide a review of the Renal Injury Grades established by the AAST Kidney Injury Scale, provide case examples, and discuss corresponding management and their possible complications.

## "FACE TIME WITH RADIOLOGY: UNMASKING LE FORT FRACTURES"

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Jose A. Lara, MD (*Abstract Co-Author*) Nothing to Disclose
Alejandro Gonzalez, BS (*Abstract Co-Author*) Nothing to Disclose
Adriana Perez, MD (*Abstract Co-Author*) Nothing to Disclose
Claudia Muns, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- 1. Define Le Fort I-III maxillofacial fractures and review anatomy- 2. Discuss the underlying pathophysiology and its major implications- 3. Provide radiological CT imaging highlighting key features

### TABLE OF CONTENTS/OUTLINE

- I. Educational Objectives and Introduction- II. Review anatomy- III. General information on Le Fort fractures and mechanisms of fractures- IV. CT Imaging findings of Le Fort fractures- V. Self-assessment with multiple cases in quiz format-VI. ConclusionLe Fort classification is used to guide the classification and management of complex midfacial fractures. These fractures are classified as LeFort I, II, and III based on the direction of the fracture: horizontal, pyramidal, or transverse. Moreover, common to all Le Fort fractures is involvement of the pterygoid processes. Complex facial fractures such as these compromise the airway and cause significant blood loss due to the high vascularity of the anatomical region and significant swelling of the involved structures. Le Fort I is characterized by a horizontal fracture resulting from a downward impact directed against the alveolar ridge with the involvement of the anterolateral margin of the nasal fossa. Le Fort II is due to high energy impact directed against the lower and/or mid maxilla, with involvement of the inferior orbital rim. Le Fort III is a transverse fracture resulting from an impact against the nasal bridge and the upper maxilla with Involvement of the zygomatic arch characterizes this fracture.

## STROKE 101: FIRST CONTACT TRAINEE'S GUIDE FOR BRAIN CT

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Alejandra Isabel Villalobos Tzec, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

This exhibit serves as an essential resource for first-year residents, offering a comprehensive overview of stroke diagnosis. Stroke progresses through distinct stages: hyperacute, acute, subacute, and chronic. The hyperacute stage includes the hyperdense vessel sign, subtle loss of gray-white matter distinction, vanishing basal ganglia, and the absence of the cortical ribbon, termed the "insular ribbon sign." These patterns indicate reduced blood flow obstruction within the first six hours. Detecting these changes in typical stroke sites is crucial (MCA territory). Employ the ASPECTS score to assist physicians in selecting appropriate treatment strategies. Acute and subacute phase (6- 36 hours) will be depicted as hypodensities, sulci effacement, gyral swelling, and even “hemorrhagic” transformation may occur. Chronic stage (>36 hours): will be shown as focal and sometimes large areas of low attenuation, the key is to look for prominent sulci and gyrus, as well as, enlarged ventricles. Differential diagnosis to keep in mind when “hypodensities” are seen in the brain CT, include, enlarged perivascular spaces, leukoaraiosis and nonvascular causes, such as neoplasms, cerebral contusion, inflammation or thrombosis, During the first stages, differential diagnosis will include: high hematocrit (polycythemia) and other causes of diffuse cerebral edema.

### TABLE OF CONTENTS/OUTLINE

Brain anatomy made simple. Protocol for CT acquisition.Learning how to read a CT. Stroke sequence. CT imaging according to stages of the ischemic cascade.Differential diagnosis for hypodensities; leukoaraiosis and enlarged perivascular spaces.

## PHOTON-COUNTING DETECTOR CT FOR FORENSIC PATHOLOGY: THE FIRST EXPERIENCE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Kojima Masatoshi, RT (*Abstract Co-Author*) Nothing to Disclose
Yohsuke Makino, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1) While photon-counting detector CT (PCD-CT) is beginning to be used clinically, its use in forensic pathology is still minimal. 2) In our forensic autopsy facility, a prototype PCD-CT is being evaluated and used routinely with conventional energy-integrating detector CT (EID-CT) scanning for pre-autopsy examination. 3) Real cases with autopsy results are exhibited to show the PCD-CT effectiveness compared to EID-CT in forensic pathology. 4) Ultra-high-resolution mode of PCD-CT is highly useful in forensic practices such as fracture detection and coronary angiography. 5) Multi-energy discrimination also can be used some forensic practices such as bone marrow edema detection and drug overdose cases.

### TABLE OF CONTENTS/OUTLINE

Introduction: Basic knowledge of PCD-CT that is useful in forensic medicineObjectiveUtility of ultra-high-resolution mode in forensic pathologyUtility of multi-energy-discrimination mode in forensic pathologySummary

### TEACHING POINTS

-Normal CT and US appearance of the postpartum uterus: Twice its normal size with endometrium thicker than 2 cm with intracavitary gas s/p cesarian section(CS). CS scar appears as low attenuation in the LUS. Uterine Discontinuity is common.-Bladder flap hematoma (BFH): Heterogeneous collection between the uterus and bladder-Uterine Dehiscence: Incomplete rupture. Serosa remains intact. Associated with BFH larger than 5cm.-Uterine Rupture: separation of all the layers of the uterine wall communication with the peritoneum. Hemoperitoneum will be present.-Retained Products of Conception (RPOC): Persistent placental or trophoblastic tissue in the uterine cavity. postpartum hemorrhage.-Endometritis: #1 cause of postpartum fever. US first line. Heterogenous debris with gas-Primary Postpartum hemorrhage: Etiology: atony, trauma, BFH, rupture, abnormal placentation-Thrombosis: venous thrombus can progress to thrombophlebitis and thromboemolic events.-Eclampsia: may present with seizure. MR imaging showing edema or posterior reversible encephalopathy-Cardiomyopathy: Echocardiogram and Cardiac MRI will demonstrate systolic dysfunction. MRI may demonstrate delayed ventricular enhancement

### TABLE OF CONTENTS/OUTLINE

-Introduction -Normal Postpartum Uterus -Postpartum Uterine Pathology -Bladder Flap Hematoma -Dehiscence Rupture -Retained Products of Conception -Endometritis -Postpartum Hemorrhage -Thrombosis/Thromboembolic Events -Gonadal v. thrombophlebitis -Pulmonary Emboli/DVT -Eclampsia-Cardiomyopathy

### TEACHING POINTS

· Review the different rheumatologic diseases emergencies· Illustrate the pattern of involvement on different imaging modalities· Discuss the role of imaging in detecting emergencies in early stages

### TABLE OF CONTENTS/OUTLINE

In this exhibit, we aim to provide a review of different rheumatologic diseases and emergency conditions affecting different organs. We will explore the specific features of emergencies of following diseases:· Rheumatoid arthritis:§ Atlantoaxial instability§ Tenosynovitis, tendon rupture§ Carpal tunnel syndrome§ Osteoporotic fracture§ Cricoarytenoid arthritis§ Ruptured of synovial cyst (pseudothrombophlebitis syndrome)§ Septic arthritis§ Pericarditis, myocarditis§ Pleuritis, interstitial lung disease, drug-induced lung disease§ Vasculitis: meningitis, alveolar hemorrhage, transverse myelitis, gastrointestinal (hemorrhage, bowl ischemia, necrotizing vasculitis)· Gouty arthritis:§ Acute gout attack§ Renal stones· Ankylosing spondylitis:§ Spinal fracture (chalk stick fracture)§ Cauda equina syndrome· Systemic lupus erythematosus§ Vasculitis: diffuse alveolar hemorrhage, CNS, mesenteric§ Thromboembolism: pulmonary embolism, dural sinus thrombosis, CNS stroke, avascular necrosis§ Infection: digital gangrene/ulcer, septic arthritis§ Inflmmation: pericarditis, acute lupus pneumonitis, transverse myelitis, Libman-Sacks endocarditis with valvular dysfunction· Scleroderma§ Aspiration pneumonitis§ MyocarditisFinally, we will describe different patterns of involvement that influence the imaging findings of rheumatologic diseases emergency.

### TEACHING POINTS

Review the different vascular emergencies affecting extremities Illustrate the imaging findings of vascular trauma on different imaging modalities Identify the different interventional procedures for treatment of vascular injuries

### TABLE OF CONTENTS/OUTLINE

Blunt trauma, iatrogenic and penetrating trauma may cause life-threatening vascular injuries necessitate prompt diagnosis in the emergency room. Limb function and proper management depend on rapid diagnosis as late diagnosis can lead to morbidity and mortality. CT angiography can detect these injuries with high sensitivity and specificity. It is essential for radiologists to be familiar with the different patterns of vascular injuries, from arterial transection and active bleeding to late complications such as arteriovenous fistula. Interventional radiology plays an important role in the management of these cases. In this exhibit, we will review the imaging findings of different traumatic vascular injuries as follows: Arterial injury: Acute pathologies: Arterial transection Iatrogenic injuries Traumatic and contusion injuries Active bleeding and extravasation Intimal flap Dissection Vasospasms Occlusion Late pathologies: Pseudoaneurysm AV-fistula True aneurysm Treatment of arterial injuries Venous injuries: Acute pathologies: Thrombosis Vessel wall injuries Chronic pathologies: Venous insufficiency Treatment of venous injuries

Mendel Lebowitz (*Abstract Co-Author*) Nothing to Disclose
Carrie N. Hoff, MD (*Abstract Co-Author*) Nothing to Disclose
Christian Gomez, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

-Learn a systematic approach to reporting incidental cancers on Emergency Department studies.-Review imaging appearances and cancer staging guidelines for the most common cancers found in the ED.-Understand mimics, pitfalls, and special considerations-Discuss accurate reporting and appropriate recommendations for additional imaging.

### TABLE OF CONTENTS/OUTLINE

Many cancers are incidentally found on imaging performed during the Emergency Department (ED) workup, with an estimated 20-50% of breast, colon and lung cancers diagnosed in the ED globally (PMID: 36622062). In a Medicare database study, 11% of cancer diagnoses were ED-mediated. Furthermore, cancer-related imaging in the ED has been shown to negatively affect report turnaround times and radiology workflow, which cause additional delays in patient care (PMID: 31759782).This exhibit will review newly diagnosed cancers in the Emergency Department utilizing an educational mnemonic and multimodal approach to help radiologists accurately triage these complex cases. Topics that will be discussed include:Educational Mnemonic “BIILD”?: Borders,? Internal?, Interfaces,? Lymph Nodes?, Distant Metastatic Lesions“BIILD” In Practice:? Breast Cancer?, Colorectal Cancer?, GU Cancer?, Lung Cancer,? Pancreatic Cancer?Special Considerations, Mimics, and Pitfalls. Topics include, but not limited to:? Indeterminate and Indolent lesions?, Benign “mass-like lesions?, Initial Presentation of Metastatic Disease?, Superimposed Findings?, Lymphadenopathy of Unknown Origin?, Infection/Inflammatory Disease?, Post-Treatment changes?, Non-contrast StudiesReporting Considerations

## ACUTE ISCHEMIC STROKE IN CHILDREN: NAVIGATING DIAGNOSTIC AND MANAGEMENT PATHWAYS - WHAT THE EMERGENCY RADIOLOGIST NEEDS TO KNOW

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Manohar M. Shroff, MD, FRCPC (*Abstract Co-Author*) Nothing to Disclose
Vivek B. Pai, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Prakash Muthusami, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Neetika Gupta, MBBS, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. To highlight the distinct aetiopathogenesis, differential diagnosis and imaging features of acute ischemic stroke in pediatric population.2. To outline imaging protocols and enhanced imaging based diagnostic approaches in suspected pediatric acute ischemic stroke, including emerging roles of fast MRI and vessel wall imaging in the emergency setting. 3. To emphasize collaborative interdisciplinary approach and efficient 'stroke code' pathways to ensure prompt management, mitigate patient selection, and judicious use of endovascular thrombectomy in aptly selected cases.

### TABLE OF CONTENTS/OUTLINE

The primary objective of the exhibit is to comprehensively evaluate the frequently encountered and rare imaging findings in pediatric acute ischemic stroke, focussing on imaging techniques and protocols and their implications for patient selection and management in the emergency setting. Typical and atypical causes and risk factors specifically associated with acute ischemic stroke in children will be discussed. This exhibit will illustrate the imaging findings pivotal in guiding such interventions with goals to improve outcomes. Mechanical thrombectomy is now being increasingly used in children with large vessel occlusion. There are specific contraindications to thrombectomy, such as focal cerebral arteriopathy. Using a case-based approach, we will demonstrate an imaging-based diagnostic approach for pediatric acute ischemic stroke, streamline emergency management protocols, guide intervention, and ultimately improve short- and long-term outcomes.

Shobhit Mathur, MD (*Abstract Co-Author*) Nothing to Disclose
Vinu Mathew, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1.To demonstrate various direct and indirect CT signs of traumatic diaphragmatic injury.2.To discuss the mimics of traumatic diaphragmatic injury. 3.To describe differences in approach while interpreting blunt and penetrating traumatic diaphragmatic injuries.4.To understand what the surgeons need to know to appropriately manage the patient

### TABLE OF CONTENTS/OUTLINE

• Direct CT signs- Segmental diaphragmatic defect, dangling diaphragm, absent diaphragm. • Indirect CT signs related to herniation- Collar sign, humps and band sign, dependent viscera sign, herniation through a defect, sinus cutoff sign, elevated abdominal organ sign, abdominal content peripheral to the diaphragm or lung. • Indirect CT signs not related to herniation- Thickening of the diaphragm, diaphragmatic or per diaphragmatic contrast media extravasation, hypo enhancing diaphragm. • Mimics of diaphragmatic injury- Chronic eventration/elevation of the diaphragm, chronic hernias (Bochdelek, Morgagni, hiatal). • The importance of trajectory (‘trajectory sign’) in penetrating trauma. • Points to include in report: what the surgeon wants to know.

## THE IMPACT OF BLUNT TRAUMA ON THE DIAPHRAGM

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Omar Jamil, MD (*Abstract Co-Author*) Nothing to Disclose
Robert J. Dym, MD (*Abstract Co-Author*) Nothing to Disclose
Nina E. Glass, MD (*Abstract Co-Author*) Nothing to Disclose
Inessa A. Goldman, MD (*Abstract Co-Author*) Nothing to Disclose
Kevin Chu, BA, DO (*Presenter*) Nothing to Disclose

### TEACHING POINTS

•Unlike penetrating diaphragmatic injuries which can be predicted with high accuracy by visualizing the trajectory of the insult, blunt diaphragmatic injuries represent a diagnostic challenge, requiring a high index of suspicion.•When a focal diaphragmatic defect is not directly visualized, diagnosis relies on recognition of key signs, such as “hump,” “collar," "dependent viscera," “band sign,” among others.•Blunt diaphragmatic ruptures require surgical treatment regardless of size due to possible catastrophic outcomes in case of missed or delayed diagnosis.•Understanding the anatomic relations, functional significance, and embryological development improves detection of diaphragmatic injuries and decreases incidence of “non-therapeutic” laparotomies.

### TABLE OF CONTENTS/OUTLINE

•Overview of the anatomy and embryological development of the diaphragm with respect to blunt trauma and radiologic assessment•Imaging modalities: discussion of the utility and limitations of radiographs and CT in diagnosis•Comprehensive overview of imaging features and signs with examples.•Surgical context including Western Trauma Association guidelines and review of American Association for the Surgery of Trauma grading score•Common pitfalls and mimics, such as non-traumatic and congenital diaphragmatic defects

### TEACHING POINTS

1. Discuss support devices used in the gastrointestinal and genitourinary systems and indications for their use. 2. Review the normal imaging appearance of these devices and relevant anatomical landmarks. 3. Demonstrate relevant imaging findings in identifying support device malposition and resulting complications.

### TABLE OF CONTENTS/OUTLINE

Radiologic confirmation of support device placement is standard clinical practice and accounts for many radiographic studies performed in the emergent setting. The large number of devices used in the gastrointestinal (GI) and genitourinary (GU) systems, some less commonly encountered, can make it challenging for the trainee to confirm their positioning on radiographs. A comprehensive reference detailing these devices will allow correct identification of appropriate device position and prompt recognition of device-related complications. This exhibit reviews GI and GU system support devices, including esophageal balloon tamponade devices, temperature probes, impedance-pH monitors, esophageal stents, gastrointestinal tubes, percutaneous and internally-placed cholecystostomy tubes, percutaneous nephrostomy tubes, urinary stents, suprapubic catheters, and urinary catheters. Radiographically visible device structural components, device utility, and indications for placement are discussed. Imaging findings indicative of appropriate and inappropriate device placement and complications associated with device malposition are shown.

### TEACHING POINTS

- Introduction to Traumatic Aortic Injuries (TAI)
- Imaging techniques - including multi-detector CT (MDCT), CT-angiogram (CTA) and intravascular ultrasound (IVUS)
- Management Evolution: transition from surgical to endovascular repair

### TABLE OF CONTENTS/OUTLINE

- Traumatic Aortic Injury: epidemiology, common mechanisms of injury and impact on healthcare
- Diagnostic Imaging Strategies (with case-based examples)- Role of chest radiographs in initial assessment- Detailed exploration of MDCT, CTA, and IVUS capabilities in identifying TAI
- Classification Systems (Society for Vascular Surgery and Harborview classification) and imaging features of TAI: intimal flaps, pseudoaneurysms, and mediastinal hematomas
- Management protocols and role of radiologists- Historical perspective: from open surgical repair to endovascular approaches- Criteria for choosing between surgical and endovascular repair based on imaging findings- Post-operative imaging and long-term surveillance strategies
- Case Studies and Clinical Outcomes- Review of typical cases with imaging studies and treatment outcomes- Discussion of complex cases illustrating decision-making challenges

### TEACHING POINTS

1. Air in appendix - is it appendicitis or not ? 2. Periappendicitis vs secondary appendicitis 3. Small bowel obstruction can mimic appendicitis and vice versa 4. Cecal diverticulitis can mimic appendicitis and vice versa 5. Terminal ileitis can mimic appendicitis and vice vera 6. Pelvic inflammatory disease can mimic appendicitis and vice versa 7. Appendiceal diverticulitis - identification and significance 8. Epiploic appendagitis of the appendix- identification and significance 9. Appendiceal mucocele - identification and significance 10. How to approach an equivocal appendix? How to report an equivocal appendix? What to do next ?

### TABLE OF CONTENTS/OUTLINE

Imaging first approach in evaluation of suspected appendicitis, with algorithm to select appropriate imaging modality/protocol. Identification of equivocal appendicitis with emphasis on auxillary features that may lead to diagnosis. Ideal reporting and communication of the equivocal appendicitis. Differentiation between periappendicitis and secondary appendicitis. Appendicitis mimicking bowel obstruction and vice versa. Cecal diverticulitis mimicking appendicitis and vice versa. Other common mimickers and confounders in evaluation of appendicitis like terminal ileitis and pelvic inflammatory disease (with or without tuboovarian abscess). Appendiceal diverticulitis, imaging features and significance. Epiploic appendagitis of the appendix, imaging features and significance. Appendiceal mucocele, identification and differentiation from appendicitis. “Take Home” algorithm for the evaluation of atypical and equivocal appendix.

### TEACHING POINTS

1. Post cardiac arrest syndrome (PCAS) is a complex condition characterized by a myriad of physiological derangements following successful resuscitation from cardiac arrest. Integration of Multimodality Imaging: Understand the complementary roles of various imaging modalities in the comprehensive evaluation of post cardiac arrest syndrome (PCAS). 2. Identifying Myocardial Dysfunction: Recognize the imaging hallmarks of myocardial dysfunction to guide prognosis and management decisions.3. Assessment of Neurological Injury: Utilize advanced imaging techniques, including MRI and CT, to assess for hypoxic-ischemic brain injury, cerebral edema, and other neurological sequelae of cardiac arrest, aiding in prognostication and treatment planning.4. Evaluation of Systemic Complications: Appreciate the role of imaging in identifying systemic complications of PCAS, including pulmonary edema, acute respiratory distress syndrome (ARDS), and multiorgan dysfunction syndrome (MODS), to guide supportive care strategies.5. Prognostic Implications: Understand the prognostic value of imaging findings in PCAS, such as the extent of myocardial injury, presence of neurological damage, and severity of systemic complications,6. Therapeutic Decision-Making: Integrate imaging findings into the formulation of individualized treatment plans for patients with PCAS.

### TABLE OF CONTENTS/OUTLINE

• Introduction and overview of Post Cardiac Arrest Syndrome • Pathophysiology of Post Cardiac Arrest Syndrome • Role of Multimodality Imaging in PCAS Evaluation • Discussion of teaching Points and Key Imaging Findings on cases basis

### TEACHING POINTS

1. To illustrate the bronchial arteries anatomy and primary mechanisms of injury.2. To review the indications and optimal imaging modality for the evaluation of life-threatening hemoptysis. 3. To emphasize the utility of employing a structured report template to streamline targeted endovascular treatment planning.

### TABLE OF CONTENTS/OUTLINE

1. Review the anatomy, classification and branching patterns of the bronchial arteries through illustrations, CT, and correlation with arteriography. 2. Main mechanisms of bronchial arteries injury. Graphical representation of alterations in pulmonary vascularization under hypoxic conditions. 3. Imaging evaluation in the Emergency Department. When and how to perform the study? 3.1 Indications of urgent study. 3.2 Optimal imaging protocol. 4. Proposal of a structured report. Serving as a roadmap to the Interventional Radiologist employing a checklist-based approach utilizing four key descriptors. 4.1 Signs of alveolar hemorrhage. 4.2 Signs of hemorrhage in the airway. 4.3 Vascular signs: a) Hypertrophy of bronchial arteries; b) Pseudoaneurysms c) Arteriovenous malformations. 4.4 Identification of the responsible lesion. 5. Illustrated pearls and common pitfalls that could influence the optimal treatment. 6. Take home points.

### TEACHING POINTS

Describe a variety of parasitic and vector-borne diseases likely to bring patients to the emergency room due to neurologic and infectious symptoms associated with manifestations affecting the head, neck, and nervous system. Provide a brief introduction to these infections, including the epidemiology, clinical presentations, and medical sequelae/complications. Provide an array of case examples demonstrating imaging features associated with acute and chronic, and common and uncommon sequelae of these infections across multiple imaging modalities. Provide a brief overview of management and treatment of these infections.

### TABLE OF CONTENTS/OUTLINE

This exhibit will review parasitic and vector-borne infections that are likely to result in emergency room visits due to disease manifestations within the brain, neck, and nervous system. This will include protozoan infections (e.g., Chagas disease, leishmaniasis, cerebral malaria, toxoplasmosis), helminthic infections (e.g., cystic echinococcosis, cysticercosis), and vector-transmitted bacterial (e.g., Lyme disease) and viral infections (e.g., Eastern equine encephalitis, Powassan virus). It will provide a multimodality review of imaging findings, although primarily focusing on computed tomography and magnetic resonance imaging. It will review specific (e.g., multiloculated cysts characteristic of cystic echinococcosis) and nonspecific (e.g., mosquito- or tick-borne viral encephalitis) imaging findings, as well as common (e.g., mucocutaneous leishmaniasis, orbital cysticercosis) and uncommon sequelae (e.g., neurological manifestations of Chagas) of these diseases which can be appreciated on imaging studies of the head and neck.

### TEACHING POINTS

1. Gain insight into the anatomy and pathophysiology underlying aortic pathologies. 2. A thorough review of imaging findings encompassing diverse aortic pathologies and associated complications. 3. Explore the treatment approaches including preoperative evaluation for endovascular interventions.

### TABLE OF CONTENTS/OUTLINE

1. Introduction to aortic anatomy- • Overview of aortic structure and function • Pathophysiology 2. Role of CT imaging in the evaluation of acute pathologies, protocol, and imaging findings 3. Imaging of different aortic pathologies: • Acute aortic syndrome - - Aortic dissection- Ų Classification Ų Imaging findings Ų Treatment - Penetrating ulcer- Ų Definition Ų Imaging features - Intramural hematoma Ų Definition Ų Imaging features • Aortic aneurysm - Ų Definition Ų Etiology Ų Diagnostic Criteria Ų Treatment Planning and Follow-Up • Aortic atherosclerosis and acute thrombosis Ų Risk Factors Ų Imaging Evaluation Ų Clinical Implications and Management Strategies • Aortic fistula Ų Etiology Ų Imaging findings Ų Management 4. Imaging features of common complications: • Pericardial effusion/hemorrhage • Aortic dissection extending in coronary vessels • Ruptured aortic aneurysm 5. Endovascular aortic interventions with preoperative imaging evaluation. Comprehensive understanding, early diagnosis, and timely intervention are paramount in mitigating the impact of aortic diseases and improving patient outcomes. This abstract focuses on arming radiologists with comprehensive knowledge of various aortic pathologies. Moreover, it encompasses details regarding pre-operative imaging for TAVR surgeries, aiding radiologists in discerning crucial elements to include in their reports.

### TEACHING POINTS

Lower extremity CT angiography is a frequently ordered exam in both the emergency and outpatient settings, for indications ranging from peripheral arterial disease and trauma to infectious and inflammatory conditions. Given the wide range of anatomic coverage, these studies place a premium on both optimal imaging technique and efficient but comprehensive interpretation. This exhibit will:1) Discuss the imaging technique and rationale for lower extremity CTA AIF2) Describe normal anatomy and key collateral vascular pathways3) Illustrate reporting strategies and image manipulation techniques for efficient interpretation and reporting4) Cover the spectrum of disease processes affecting the lower extremity vasculature, including peripheral arterial disease, trauma, and infectious and inflammatory disorders

### TABLE OF CONTENTS/OUTLINE

- The role of CT AIF imaging- Anatomy: normal anatomy, variants and key collateral vascular pathways- Imaging technique: Timing, kVp, bolus tracking, repeat delayed imaging, advanced techniques (metal artifact reduction, spectral/photon counting CT); combining with chest and AAA imaging- Search pattern, reporting, and pitfalls: templated reporting, extravascular findings, bolus timing (outrunning of bolus or venous contamination), blooming, satisfaction of search- Peripheral arterial disease: stenosis, occlusion, bypass grafts, stents, embolic disease, peripheral aneurysms- Trauma: active extravasation, pseudoaneurysm, occlusion, vasospasm, transection, dissection, arteriovenous fistula, iatrogenic injury- Infectious/inflammatory: graft infection, mycotic pseudoaneurysms, cystic adventitial disease, Buerger’s disease

## TEACHING POINTS

Acute dizziness is a common reason for presentation to the Emergency Department, but rather than a diagnosis, it is an imprecise descriptor of symptoms with an estimated misdiagnosis rate of 80%. Distinguishing terms such as vertigo and light-headedness are unhelpful as symptom quality does not reliably predict the cause of dizziness. Indiscriminate application of CT and MRI has a low yield in acute dizziness. Despite this, over 50% of patients attending ED with dizziness will have a CT brain to exclude a posterior circulation stroke. This poster highlights a novel algorithm to stratify patients into 1 of 4 major syndrome categories: each with its own differential diagnoses, targeted examination techniques, and recommended imaging modality. By addressing the following teaching points, this educational exhibit aims to improve understanding of acute dizziness and equip the vetting radiologist with a framework to facilitate effective discussion with clinicians and ensure the appropriate use of medical imaging:
- Establish a practical definition of acute dizziness.
- Illustrate the relevant neuroanatomical principles behind eye movements and their relationship to the vestibular system.
- Provide a framework to establish the appropriate use of targeted radiological imaging for patients presenting with acute dizziness.
- Provide a variety of example cases with important radiological imaging findings in patients presenting with acute dizziness.

## TABLE OF CONTENTS/OUTLINE

- Defining dizziness
- The Triage-TiTrATE-Test algorithm
- Triage
- Timing and Triggers
- Targeted examination and Tests
- Nystagmus and the Vestibulo-ocular reflex pathway
- Example cases with radiological findings
- Summary

## FALLING THROUGH THE CRACKS: PEER LEARNING IN TRAUMA TORSO CT

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Robin B. Levenson, MD (*Abstract Co-Author*) Nothing to Disclose
Karen S. Lee, MD (*Abstract Co-Author*) Nothing to Disclose
Mohamed G. Aboseria, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Trauma torso CT is a staple of Emergency Department (ED) trauma evaluation. Given time sensitivity, complexity, and various findings that may be encountered at CT, in addition to potential distractions in the acute setting, imaging findings may be inadvertently overlooked or misinterpreted. Contributory factors include inattentional blindness, satisfaction of search, framing bias due to the provided indication, and ambiguity effect due to unfamiliarity with a finding. Familiarity with these contributory factors can enhance a radiologist's search pattern and appropriate management.

### TABLE OF CONTENTS/OUTLINE

This exhibit will focus on trauma torso CT peer learning cases from our institution, including contributory factors which may have led to the diagnostic error and teaching pearls to avoid potential pitfalls/biases in diagnosis. A) Case based imaging review of missed/misinterpreted thoracic findings on trauma torso CT including diaphragmatic rupture, aortic injury, and pulmonary embolism. B) Case based imaging review of missed/misinterpreted gastrointestinal findings on trauma torso CT including hepatic laceration, gastric perforation following gunshot wound, and diaphragmatic slip mistaken for hepatic subcapsular hematoma. C) Case based imaging review of missed/misinterpreted genitourinary findings on trauma torso CT including bladder rupture, placental abruption, and duplicated renal arteries mistaken for dissection. D) Case based imaging review of missed/misinterpreted musculoskeletal findings on trauma torso CT including misaligned right hip arthroplasty, mid thoracic spine fracture in the setting of DISH, and subtle right femoral neck fracture.

Itxaso Galan-Gonzalez (*Abstract Co-Author*) Nothing to Disclose
Ana Ines Rubio Aguilera, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1) Learn the correct computed tomography scan protocol. 2) Recognize the different subtypes of acute mesenteric ischemia in imagen tests. 3) Become familiar with gastrointestinal tract vascular anatomy. 4) Learn the typical computed tomography scan findings and indicators of irreversible ischemia.

### TABLE OF CONTENTS/OUTLINE

Mesenteric ischemia can manifest as either acute (95%) or chronic (5%; typically associated with diffuse atherosclerotic disease). Acute Mesenteric Ischemia (AMI) is a critical medical condition resulting from reduced blood flow to the intestines. Subtypes of AMI include arterial occlusion (embolic and thrombotic), venous occlusion, non-occlusive mesenteric ischemia (NOMI), and closed-loop obstruction. Among these, arterial occlusion is the most prevalent subtype and carries the worst prognosis. The gastrointestinal tract receives perfusion from the celiac trunk, the superior mesenteric artery (SMA), and the inferior mesenteric artery (IMA). In cases of mesenteric ischemia, collateral pathways between these arteries become crucial, offering protective blood flow in patients with vascular stenosis or occlusion. Irreversible ischemic injury occurs within six hours following complete vascular occlusion. The diagnosis of AMI can be challenging because symptoms and laboratory tests are often nonspecific, requiring a high degree of clinical suspicion. Computed tomography (CT) is the most sensitive and specific imaging test for diagnosing AMI, making it the preferred imaging modality when suspicion arises. Moreover, CT enables the exclusion of alternative causes of acute abdominal pain.

## A PUNCH TO THE GUT: CT FINDINGS IN BLUNT TRAUMATIC INJURY TO THE BOWEL AND MESENTERY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Sarah Hickman, MBBS (*Abstract Co-Author*) Research collaboration, Vara;Research collaboration, ScreenPoint Medical BV;Research collaboration, Lunit Inc;Research collaboration, Kheiron Medical Technologies Ltd;Research collaboration, Alphabet Inc;Research collaboration, Volpara Health Technologies Limited
Gurinder Nandra, FRCR,MBChB (*Abstract Co-Author*) Nothing to Disclose
Saigeet Eleti, FRCR, MBBChir (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Bowel and mesenteric injuries are the third most common type of injury in blunt trauma to the abdomen; detected in 5% of patients at laparotomy. Bowel injury may often be occult at clinical presentation and physical examination is unreliable. Delayed diagnosis is associated with significant morbidity and mortality due to haemorrhage or perforation leading to peritonitis and sepsis. Multidetector CT is the modality of choice when evaluating trauma patients that are haemodynamically stable. It may be performed rapidly and has high sensitivity and specificity in identifying bowel and mesenteric injuries. Through retrospective review of patients presenting to our Level 1 trauma centre, we present the range of CT imaging appearances of bowel and mesenteric injury in blunt abdominal trauma and correlate them with surgical findings.We use a split-bolus protocol which enables arterial and venous enhancement in a single pass of the CT gantry. Additional techniques such as oral contrast may be used for image optimisation. Dual energy CT may be used to increase conspicuity of bowel injury. CT findings of bowel injury include discontinuity of the bowel wall, extraluminal gas or contrast, bowel wall thickening, abnormal enhancement and adjacent haematoma/fat stranding which are variably specific for traumatic injury.CT findings of mesenteric injury include mesenteric haematoma, abrupt termination of a mesenteric vessel or vessel irregularity. Imaging findings may be subtle and it is important that the radiologist is aware of the spectrum of appearances to minimise delay in time to intervention.

Adria Roset Altadill, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Acute mediastinitis is a life-threatening condition depicted at CT by increased mediastinal fat attenuation, pneumomediastinum and organized fluid collections. Acute mediastinitis can be caused by iatrogenic procedures, head and neck infections, gastroesophageal perforation and osteoarticular infections. Specific imaging findings may point towards the origin of the infection, which is advantageous to guide treatment decisions.

### TABLE OF CONTENTS/OUTLINE

Acute mediastinitis is a life-threatening condition that results from inflammation and infection of the soft tissues and fat contained within the mediastinum. The different etiologies of acute mediastinitis include iatrogenic causes, extension from head and neck infections, intestinal perforation, or spread from osteoarticular infections. CT is an essential examination to diagnose acute mediastinitis and determine the extent of the disease. Common imaging features include increased mediastinal fat attenuation, pneumomediastinum, organized fluid collections and pleural effusions. Additionally, certain findings may help identify the source of the infection, which is advantageous for appropriate management. Signs of sternal dehiscence with adjacent inflammatory changes point towards a postoperative origin. The existence of oropharyngeal or cervical (air-)fluid collections extending to the mediastinum are highly suggestive of descending necrotizing mediastinitis. Esophageal perforation can be inferred indirectly by esophageal wall thickening and extraluminal air. Finally, cortical bone disruption or widening of an articular joint with adjacent mediastinal spread may indicate an osteoarticular origin.

## CLOSED LOOP SMALL BOWEL OBSTRUCTION: WHEN TO EVOKE THIS DIAGNOSIS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Spencer C. Behr, MD (*Abstract Co-Author*) Grant, Cancer Targeted Technology;Scientific Advisory Board, Novartis AG;Research Consultant, GenVivo
Andrew D. Chang, MD (*Abstract Co-Author*) Nothing to Disclose
Joelle Harwin, MD (*Abstract Co-Author*) Nothing to Disclose
Stephen G. Wahlig, MD (*Abstract Co-Author*) Nothing to Disclose
Alexia R. Tatem, MD, MPH (*Abstract Co-Author*) Nothing to Disclose
Masis Isikbay, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Closed Loop Small Bowel Obstruction (CLSBO) should always be considered when evaluating a case of small bowel obstruction (SBO).2. CLSBO is a mechanical diagnosis (an isolated loop of bowel) and secondary signs of bowel ischemia are not required to make the diagnosis (but should be evaluated).3. CLSBO is a devastating missed diagnosis and requires prompt surgical management.

### TABLE OF CONTENTS/OUTLINE

INTROPathophysiology of CLSBO- Clinical presentation patterns- Prompt diagnosis is critical for management (decision to go to the operating room)- CT of the Abdomen/Pelvis is an important part of the workup CT FEATURESTo raise suspicion for CLSBO consider the following pathway:1. Evaluate for any presence of SBO (Figure 1), which is required for a CLSBO. Always consider CLSBO for any case of SBO.2. Look for more than one transition point next to one another (“closed loop” physiology, Figure 2).3. Evaluate for other common patterns of CLSBO: “balloons on a string” appearance (Figure 3), isolated portion of distended bowel, decompressed bowel proximal/distal to affected loop.4. Evaluate for signs of bowel inflammation (bowel wall thickening, mesenteric fat stranding, free fluid, Figure 4) and bowel ischemia/necrosis (bowel wall hypo-enhancement, Figure 5).5. Understand that it is a mechanical diagnosis (bowel inflammation is often present but NOT required to make the diagnosis especially if caught very early). SUMMARY-These key imaging features help raise suspicion for CLBSO- Definitive diagnosis will come from operative findings- If unsure ask for backup/help to avoid delaying care for the patient

## YOU'LL POKE YOUR EYE OUT KID! AN ORBITAL TRAUMA PRIMER FOR THE ON CALL RADIOLOGY RESIDENT

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Han Zhong, MD (*Abstract Co-Author*) Nothing to Disclose
Emily R. Convery, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Orbital trauma is a common situation residents encounter on call. However, reading and interpreting orbital imaging can be overwhelming especially in cases of complex trauma or in cases where there is underlying orbital pathology. A systematic approach to investigating the orbits is key to making crucial findings. Understanding the anatomy of the orbit is helpful in creating a search pattern for residents to follow. Injury can occur to the orbital wall bones, the globe itself, the extraconal soft tissues, or a combination of those compartments. The mechanism of injury and elements of the physical exam in addition to imaging findings will guide clinician's decisions about patient management, specifically if the patient will require emergent surgery or if close follow up is sufficient. It is important for residents to know what clinicians are looking for so that information can be included in the radiology report for clinical decision-making.

### TABLE OF CONTENTS/OUTLINE

1) Overview of Orbital Anatomy2) Orbital Imaging Search Pattern3) Mechanisms of Injury4) Red flag symptoms5) Orbital wall fractures6) Complications of orbital wall fractures7) Globe Injury - rupture, anterior chamber injury, posterior chamber injury8) Extraconal soft tissue injury9) Management options

## INTERSTITIAL LUNG DISEASE WITH ACUTE MANIFESTATIONS: TIPS FOR THE GENERAL AND EMERGENCY RADIOLOGISTS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Elena Garcia Garrigos, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Almudena I. Urena Vacas, MD (*Abstract Co-Author*) Nothing to Disclose
Marina Sirera Matilla, MD (*Abstract Co-Author*) Nothing to Disclose
Eloisa Feliu, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
David Ferrandez Ferrandez (*Abstract Co-Author*) Nothing to Disclose
Juan Arenas-Jimenez, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The differential diagnosis of patients presenting with acute diseases manifesting as diffuse lung abnormalities at chest CT is a challenge. Among the many possible causes, we can find interstitial lung diseases (ILD) presenting with acute manifestations both as a debut in previously undiagnosed conditions or as a complication of known ILD. In the acute setting, a correct radiological orientation can be the clue for an adequate clinical management, perhaps contributing to a better outcome. In this exhibit our goals are: 1. To describe the clinical and radiological characteristics of ILD manifesting as acute lung diseases. 2. To show imaging findings that should suggest an acute debut of an unknown ILD. 3. To depict characteristic radiological findings of acute complications in patients with known ILD.

### TABLE OF CONTENTS/OUTLINE

1.Introduction: Global overview of ILD with acute manifestations. 2. Tips for diagnosing ILD with acute presentation. 3. Radiological manifestations and clinical information that should suggest a new onset of ILD. 3. Acute complications of ILD (acute exacerbation of ILD, lung toxicity, specific infections related to therapy). 4. Discussion of specific conditions (acute interstitial pneumonia, organizing pneumonia, non-specific interstitial pneumonia, acute exacerbation of ILD, rapidly progressive ILD, hypersensitivity pneumonitis, lung toxicity, granulomatous and lymphocytic interstitial lung disease,?)

## SPONTANEOUS HEMOPERITONEUM: WHERE DOES THE BLOOD COME FROM?

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Roberto Garcia Figueiras, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Sandra Baleato Gonzalez, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Paula Buades, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Spontaneous hemoperitoneum (SH) is defined as the presence of blood within the peritoneal cavity coming from a non-traumatic origin. It is a challenging diagnosis in the emergency setting, often because of the absence of clinical suspicion and its low frequency. Radiologists play a fundamental role in the identification and location of the source of bleed, both essential to be able to deliver the best care possible for the patient. This exhibit aims to:1. Synthesize the potential causes of SH to facilitate a systematic search approach. 2. Summarize the different imaging techniques of significant value for the detection and characterization of SH, in order to ascertain which is the best course of action when assessing SH cases. 3. Review relevant diagnoses to consider when evaluating a patient with SH.

### TABLE OF CONTENTS/OUTLINE

1. Introduction: overview of non-traumatic hemoperitoneum 2. Potential causes of bleeding within the peritoneum.2. Imaging techniques: US, CT and dual-energy CT, MRI. Diagnostic protocol based on imaging in the setting of SH. 3. Key clues to find the hemorrhagic source: not-to-miss signs on CT imaging, and relevant anatomical concepts.4. Cases: collection of cases presented schematically to best illustrate the main entities to think about when searching the origin of SH, focusing on significant differences between etiologies and hints to facilitate a correct diagnosis. These cases will be organized by pathophysiological groups: 4.1. Gynecological4.2. Post-surgical4.3. Neoplasms4.4. Hematological4.5. Vascular 4.6. Systemic conditions.5. Conclusion

Amalia Aranaz Murillo, MD (*Abstract Co-Author*) Nothing to Disclose
Samuel Roldan Minana (*Abstract Co-Author*) Nothing to Disclose
Elena Pascual Perez, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Ballistic effects studies the consequences of projectiles fired when they impact the target and this knowledge is fundamental for interpreting images of gunshot victims.2. The cavities a bullet creates are influenced by the type of firearm, bullet velocity and trajectory, and tissue penetrated.3. X-rays locate projectiles, CT scans evaluate organic damage and entry/exit points and MRI assesses injuries and potential long-term consequences

### TABLE OF CONTENTS/OUTLINE

This poster aims to explore the characteristics of gunshot wounds inflicted by various types of firearms, delve into the field of ballistic effects, and assess the role of different imaging modalities.Forensic radiology, particularly ballistic effects, is a subdivision of ballistics that studies the mechanisms of action, effects, and consequences of projectiles when they impact the target. These depend on the kinetic energy of the bullet and the temporary and permanent cavity it creates. This knowledge is fundamental for interpreting images of gunshot victims and producing our radiological report.Radiological imaging plays a crucial role in emergency settings and future management. X-rays aid in identifying the location of projectiles and determining the composition of bullets. CT offers a detailed evaluation of organ damage and entry/exit points. MRI helps assess injuries and potential long-term consequences, crucially distinguishing ferromagnetic materials to prevent adverse effects from imaging procedures.

## THE INVISIBLE INJURY: A COMPREHENSIVE IMAGING REVIEW OF SCAPULOTHORACIC DISSOCIATION

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Babina Gosangi, MD, MPH (*Abstract Co-Author*) Nothing to Disclose
Hector Figueroa-Monsanto (*Abstract Co-Author*) Nothing to Disclose
Mariana Travieso Diffoot (*Abstract Co-Author*) Nothing to Disclose
Max Schreiber (*Abstract Co-Author*) Nothing to Disclose
Carol Sanchez Santana (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Review the epidemiology and etiology of scapulothoracic dissociation and commonly associated injuries. Demonstrate key imaging features for the initial evaluation and detection of scapulothoracic dissociation and its associated vascular and neurological injuries on various imaging modalities. Discuss additional thoracic injuries affecting the lungs, pleura, and mediastinum. Explain Zelle's classification of injuries for determining the severity and management of scapulothoracic dissociation.

### TABLE OF CONTENTS/OUTLINE

I. Introduction- Definition, Problem statement- mortality/ morbidity data II. Anatomy of relevant structures III. Mechanism of injury- High energy trauma IV. Imaging modalities- Chest X-ray, Chest CT, Shoulder CT, CT Angiogram for vascular evaluation, MRI branchial plexus V. Injuries Bony and ligamentous injuries, Lung injuries- Contusions, Pleural injuries- Pneumothorax, hemothorax, Mediastinal injuries- Pneumomediastinum, Vascular injuries- Pseudoaneurysm, dissection, Neurological injuries- Brachial plexus injuries, epidural hematoma VI. Classification of injuries- Zelle's classification VII. Management

## ATRAUMATIC EMERGENCY IMAGING OF THE SPINE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Jisoo Kim, MD (*Abstract Co-Author*) Nothing to Disclose
Albert D. Jiao, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Computed tomography is often the first-line spinal imaging in the emergency setting, and careful evaluation can expedite appropriate management. 2. MRI is the most sensitivity imaging modality for noncompressive spinal emergencies, which requires careful consideration of clinical history such as symptom character and distribution. 3. Certain spinal pathologies such as spinal cord infarct require modifications to existing imaging protocols or real-time decision making from the radiologist, and therefore high pre-test clinical suspicion.

### TABLE OF CONTENTS/OUTLINE

Compressive:Epidural - Primary spinal tumors or metastases with mass effect, discitis-osteomyelitis, disc herniation, degenerative disease, epidural lipomatosis, extramedullary hematopoisisSubdural - Subdural hematoma/empyema/hygromaIntradural/Extramedullary - Primary spinal tumors and cysts (shwannoma, meningioma, epidermoid), leptomeningeal metastasesNoncompressive: Inflammatory/Infectious - Guillain-Barre, Arachnoiditis, Transverse Myelitis, Neurosarcoidosis, Radiation-InducedVascular - Infarct, Arteriovenous malformation and fistula, VasculitisToxic-Metabolic - Subacute combined degeneration, nitrous oxideDemyelinating - Multiple sclerosis, neuromyelitis optica, acute disseminated encephalomyelitisMimics and other diagnoses:Crowned Dens Syndrome/CPPD, Calcific Tendinitis of the longus colli muscle, Osteoid osteoma/osteoblastoma, Treatment-related effects, including immune related adverse events and radiation osteitis, Iatrogenic injury/Postsurgical, Congenital/syndromic - Scheurmann disease, syringomyelia, tethered cord syndrome, sickle cell pain

Farah Cadour, MD, MS (*Abstract Co-Author*) Nothing to Disclose
Kate Hanneman, MD, MPH (*Presenter*) Speaker, Groupe Sanofi;Speaker, Amicus Therapeutics, Inc

### TEACHING POINTS

1. Urgent cardiac abnormalities can be identified on non-gated chest imaging performed for another indication in patients presenting to the emergency department with non-traumatic acute chest pain, dyspnea or palpitations2. Coronary abnormalities identified on chest CT in the emergency department include plaque rupture resulting in myocardial ischemia and infarct, spontaneous coronary artery dissection, anomalous coronary artery origin with malignant course, and coronary vasculitis.3. Emergency non-coronary cardiac findings include aortic root dissection, stress-induced or other cardiomyopathy, cardiac masses and thrombus, epipericardial fat necrosis, myocarditis, pericarditis, and pericardial tamponade4. The heart should be evaluated on all thoracic imaging including the coronary arteries, cardiac chambers, pericardium, valves, and adjacent fat, with particular attention in patients presenting to the emergency department with acute chest pain, dyspnea, or palpitations where no other cause is identified

### TABLE OF CONTENTS/OUTLINE

1. Review non-traumatic acute cardiac diseases and complications in the emergency department including incidence, presenting symptoms, pathophysiology, imaging findings, and clinical outcomes2. Describe the importance of evaluating the heart on emergency non-traumatic thoracic imaging performed for other indications such as evaluation of pulmonary embolism or aortic dissection3. Demonstrate acute cardiac abnormalities on chest x-ray and chest CT performed for other indications in the emergency department including coronary artery, myocardial, pericardial, valvular and other cardiac abnormalities

## IMAGING FEATURES OF BLUNT THORACIC AORTIC INJURY: WHAT THE RADIOLOGIST NEEDS TO KNOW

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Andrew Sinensky, MD (*Abstract Co-Author*) Nothing to Disclose
Elana B. Smith, MD (*Abstract Co-Author*) Nothing to Disclose
Ishaan J. Bhatt, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Blunt traumatic aortic injuries (BTAI) are frequently classified using the Society of Vascular Surgery classification system. Management is based on injury grade and hemodynamic stability of the patient. 2. Proposed mechanisms for BTAI include shear/torsion forces, osseous pinch, and water-hammer phenomenon. 3. Cardiac, pulmonary, abdominal, and osseous injuries often occur concurrently with BTAI. End organ ischemia/infarcts may result from the vascular injury.

### TABLE OF CONTENTS/OUTLINE

1. Introduction2. CTA Techniques and Considerations• Whole-body CT• Cardiac gating• Bolus timing• Dual energy applications3. Injury Mechanism• Shear/Torsion• Osseous Pinch• Water-Hammer Phenomenon4. Injury locations5. Injury Grading - Society of Vascular Surgery• Grade I - Intimal Tear• Grade II - Intramural Hematoma• Grade III - Pseudoaneurysm• Grade IV - Rupture6. Associated Injuries and Complications7. Mimics of Injury - Non-traumatic pathologies, anatomic variants, and technical factors8. Management• Non-operative vs. endovascular vs. open• Treatment complications - infection, stent migration, endoleak, injury progression, fistula formation9. Summary

Andres R. Ayoob, MD (*Abstract Co-Author*) Nothing to Disclose
Elhamy R. Heba, MD, MD (*Abstract Co-Author*) Nothing to Disclose
Trae C. Brooks, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Abdominal pain is one of the most common reasons for visits to the emergency department, accounting for 5-10% of all visits (139.8 million in the US in 2021). The liver is the largest organ in the abdomen and has attributable pathology in 0.5-1% of these cases (non-biliary causes). CT and US are often complimentary examinations in the workup of suspected liver pathology in the ED, with US a modality of choice in the pediatric population to avoid radiation exposure when possible. MRI remains a problem-solving modality when other imaging is equivocal. When acute non-biliary liver pathology is suspected, the radiologist should be familiar with the imaging findings seen in various forms of liver pathology and should also be prepared to recommend the appropriate imaging examination to assist referring clinicians in reaching a diagnosis.

### TABLE OF CONTENTS/OUTLINE

1. Background and Epidemiology.2. Overview of Acute Non-biliary Liver Pathology.3. Multimodality Case Presentations.a.Trauma-Brief overview of current AAST guidelines for blunt/penetrating hepatic trauma,Discussion of key findings to distinguish between different AAST injury grades.b. Nonbiliary Hepatic Infection,Abscess,Hepatitis.c. Hepatic Vascular Emergencies- Budd-Chiari Syndrome,Portal vein thrombosis,Hepatic Artery Stenosisd. Emergent Complications of Hepatic Neoplasm-Adenoma,HCC,Diffuse metastasise. Post op/ Iatrogenic- Bilomas/fluid collection/hemorrhage,Vascular-Fistula (after biopsy),Pseudoaneurysm (liver transplants),Peripheral PVT after targeted therapy4. Summary and Recommendations5. ## RADIOLOGY AT THE FRONTLINE: EXPERIENCE OF THE MOBILE MILITARY HOSPITAL

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Uliana Y. Pidvalna, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The term and description of "military trauma" are changing every time with new technologies of weapons. In parallel, the development of radiological modalities is a tool that could assist military doctors even on the frontline for prompt and precise decisions. In the case of the modern ongoing war, understanding evacuation steps with diagnostic modalities at each point is necessary. The purpose of this exhibit is: 1. To show the evacuation steps with accessible diagnostic modalities at different stages. 2. To illustrate imaging findings of frontline combat trauma at the mobile military hospital using different techniques (X-ray, US and CT). 3. To discuss the challenges and difficulties in assessing military trauma at the mobile military hospitals.

### TABLE OF CONTENTS/OUTLINE

1. Principles and application of evacuation steps from the frontline with accessible radiological modalities.2. Radiological imaging of head/chest/abdomen/pelvis/extremities on the frontline, including, but not limited to, pneumothorax, hemothorax, hemoperitoneum, bleeding, heart and great vessels injuries, traumatic amputations, brain injuries (X-ray, USG and non-contrast CT) at the mobile military hospital.3. Diagnostic modalities triage: experience of the mobile military hospital.

## FLAP TO FLOP: EMERGENCY IMAGING OF EXTRAMAMMARY COMPLICATIONS AFTER BREAST RECONSTRUCTION

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Cum Laude**

William J. Hoover, MD (*Abstract Co-Author*) Nothing to Disclose
Margarita V. Revzin, MD, MS (*Abstract Co-Author*) Nothing to Disclose
Long H. Tu, MD (*Abstract Co-Author*) Nothing to Disclose
Danling Chen, MD (*Abstract Co-Author*) Nothing to Disclose
Caroline Merriam, DO (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Surgical management of breast cancer is evolving quickly, with several breast reconstruction options available to patients after mastectomy or lumpectomy.
- Many breast reconstruction procedures utilize muscle, fat, and skin derived from the patient's abdomen, back, or extremities.
- Breast reconstruction may result in complications at flap donor sites including abscess, hematoma, wound dehiscence, or cellulitis.
- Many patients with donor site complications initially present to the Emergency Department, where evaluation often includes CT abdomen/pelvis or soft tissue ultrasound.
- This exhibit will review multimodality emergency imaging of complications at flap donor sites.
- The presentation will also compare expected post-operative changes with acute "can't miss" complications at flap donor sites.

### TABLE OF CONTENTS/OUTLINE

- Imaging review of complications that occur at flap donor sites. This exhibit will discuss acute and long-term donor site complications for seven common breast reconstruction surgeries:
- Transverse rectus abdominis myocutaneous (TRAM) flap
- Deep inferior epigastric perforator (DIEP) flap
- Latissimus dorsi flap
- Superior gluteal artery perforator (SGAP) flap
- Transverse upper gracilis (TUG) flap
- Autologous fat grafting
- Omental flap
- Brief description of each reconstructive procedure, focusing primarily on relevant anatomy in the abdomen, back, or extremities.

## A HEAD TURNER: CERVICAL SPINE INJURIES, MANAGEMENT, AND COMPLICATIONS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Elana B. Smith, MD (*Abstract Co-Author*) Nothing to Disclose
Fayhaa Doja, BS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Blunt cervical spine injuries most often result from motor vehicle accidents and falls. Direction of force contributes to injury type. 2. AO classification systems exist for the upper (C0-C3) and subaxial (C3-C7) cervical spine. Injuries are further classified by location, osseous/ligamentous involvement, and stability. 3. Knowledge of spinal cord tract structure and function allows for prediction of neurologic deficits. For example, Brown-Sequard Syndrome causes ipsilateral weakness and impaired proprioception and contralateral loss of pain and temperature due to involvement of the corticospinal tract, dorsal column, and spinothalamic tract, respectively. 4. The postoperative cervical spine can be complicated by hardware failure, infection, nonunion, and fluid collections. Tracheal and esophageal injuries are unique to anterior approach surgeries.

### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Anatomy - Osseous - Ligamentous - Spinal Canal Spaces (epidural, subdural, subarachnoid) - Spinal Cord 3. Imaging Indications, Modalities, and Technical Factors4. AO Cervical Spine Classification - Upper Cervical Spine Injury (C0-C3) - Subaxial Cervical Spine Injury (C3-C7)5. Spinal Cord Injuries - Compression - Contusion - Transection - Infarct 6. Management- Nonoperative - Operative (upper vs. subaxial cervical spine) - Post-operative complications & 7; Hardware-related (malpositioning, failure, subsidence)& 7; Infection & 7; Nonunion& 7; Fluid collections & 7; Tracheo-esophageal& 7; Neurovascular & 7; Heterotopic ossification7. Pardeep K. Mittal, MD (*Abstract Co-Author*) Nothing to Disclose
Camila L. Vendrami, MD, MD (*Abstract Co-Author*) Nothing to Disclose
Nikolas Brozovich, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Discuss causes of acute upper and lower gastrointestinal bleeding(melena vs hematochezia) 2. Describe diagnostic approach according to patient's clinical presentation 3. Describe role of different imaging modalities in the setting of acute GI bleeding and their pitfalls

### TABLE OF CONTENTS/OUTLINE

This exhibit will discuss the etiology of acute GI bleeding above and below the ligament of Treitz. CT, MR, US, Radionuclide Scanning, Catheter angiography, and Endoscopy imaging findings will be discussed. In addition, the role of Intervention Radiology in the treatment of GI bleeding will be discussed.Upper GI bleeding- Gastric/duodenal ulcer, Gastritis, Variceal bleeding, Mallory-Weiss tear, Vascular lesions, and Neoplasms.Lower GI bleeding- Diverticular disease, Angiodysplasia, Neoplasms, Colitis(Ischemic/Inflammatory/Granulomatous), Intussusception, Meckel's diverticulum, Hemorrhoids, Benign anorectal lesions, and Anal fissures.

## HIGH REPRODUCIBILITY 3D-CTA WITH GENERATIVE AI : GENERATION OF PSEUDO-CONTRAST-ENHANCED CT IMAGE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Atsushi Teramoto, PhD (*Abstract Co-Author*) Nothing to Disclose
Masayoshi Niwa, RT (*Abstract Co-Author*) Nothing to Disclose
Masato Yoshida, RT (*Abstract Co-Author*) Nothing to Disclose
Yosuke Kuratani, BS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

We developed a method using Cycle-GAN to convert non-contrast-enhanced CT (non-CECT) images into pseudo-contrast-enhanced CT (pseudo-CECT) images. These pseudo-CECT images facilitate more accurate region of interest (ROI) setting during bolus tracking (BT), thus optimizing the timing for 3D-CTA imaging. Our study involved mutual conversion between contrast-enhanced CT (CECT) and non-CECT images, followed by ROI setting tests. The trained Cycle-GAN successfully produced pseudo-CECT and pseudo-non-CECT images resembling true CECT images. In ROI tests with pseudo-CECT images, accuracy improved to nearly 50% compared to non-CECT images, greatly assisting in identifying common carotid artery and internal carotid artery locations. This method significantly aids technicians in ROI setting.

### TABLE OF CONTENTS/OUTLINE

1. Analyze the current problems. 2. Development of a technique to convert non-CECT to CECT using CycleGAN. 3. Visual evaluation of the accuracy of depicting carotid arteries in a manner similar to contrast-enhanced CT imaging. 4. Comparison of the accuracy of ROI placement between pseudo-contrast images and non-contrast images. 5. Clinical implications

Wataru Fukumoto, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Hidenori Mitani (*Abstract Co-Author*) Nothing to Disclose
Haruka Higashibori (*Presenter*) Nothing to Disclose

### TEACHING POINTS

One of the purposes of postmortem CT (PMCT) is to confirm or deny death by homicide. The differentiation between traumatic- and endogenous subarachnoid hemorrhage (SAH) is occasionally difficult. PMCT scans can reveal damage to gastrointestinal- and abdominal aortae due to blunt abdominal trauma elicited by trampling and punching; body surface inspection may not discover such damage. In stabbing victims, PMCT helps to determine the depth - and thus the type, size, and direction - of the weapon. Hyoid- and cricoid cartilage fractures point to strangulation. In decomposed corpses, anomalously vertebral separation may suggest homicide. Checking the airway of neonatal cadavers helps to determine whether the birth was normal or a stillbirth. However, in some instances PMCT findings may incorrectly point to homicide in natural-death cases and it does not reveal the cause of death in poisoning victims. We present homicide-related postmortem CT findings in forensic cases which radiologists should know.

### TABLE OF CONTENTS/OUTLINE

1. Violent death •Traumatic subarachnoid hemorrhages (SAH) •Blunt abdominal trauma 2. Strangulation 3. Stabbing 4. Corpse mutilation 5. Neonatal corpses •Differentiation of normal births from stillbirths 6. Pitfall of homicide-related postmortem CT findings •Heat hematoma •Poisoning

## SEAT BELT AORTIC INJURY: A DIAGNOSTIC CHALLENGE WITHIN THE SEAT BELT SYNDROME

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Nerea Quilez (*Abstract Co-Author*) Nothing to Disclose
Andoni Azcona, MD (*Abstract Co-Author*) Nothing to Disclose
Lain Ibanez, MD (*Abstract Co-Author*) Nothing to Disclose
Susana Borruel, MD (*Abstract Co-Author*) Nothing to Disclose
Elena Martinez Chamorro (*Abstract Co-Author*) Nothing to Disclose
Miguel Diez, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- To review the key imaging findings of seat belt syndrome and to describe the seat belt aortic injury.
- To present the overall incidence of seat belt aortic injuries among 70 patients with seat belt signs.
- To illustrate the different types of vascular injuries and their locations, as well as the most commonly used classifications.
- To summarize the therapeutic management of seat-belt aortic injuries according to current guidelines. No one doubts the fact that seat belts save lives. However, when an individual is involved in a motor vehicle collision with properly positioned 3-point restraints, they can suffer potentially fatal injuries through multiple mechanisms. Seat belt vascular injuries, a condition with low incidence in the seat belt syndrome, can be a diagnostic challenge. This presentation aims to review the concept of seat belt aorta as well as other vascular injuries due to seat belt, providing images from real cases in our level 1 trauma center.

### TABLE OF CONTENTS/OUTLINE

- What is seat belt syndrome? Summary of imaging findings on CT. - Seat belt aortic injury. Mechanism of injury.- Sites and types of injury. Imaging findings and current classification systems.- Evolution and current guideline-based therapeutic approaches.- Take home points.

Margarita V. Revzin, MD, MS (*Abstract Co-Author*) Nothing to Disclose
Irene Dixe de Oliveira Santo, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Review the role of imaging in the diagnosis and management of renal infections.2. Review the radiological findings and risk factors for acute and chronic renal infections and their complications.3. Discuss uncommon, rare, and opportunistic causes of renal infections.4. Overview of genitourinary infections in the renal transplant patient.5. Discuss a few other selected non-infectious renal emergencies.

### TABLE OF CONTENTS/OUTLINE

1. Demographics and risk factors for renal infections.2. Imaging modalities used in the evaluation of renal infections.3. Role of imaging in the evaluation of renal infections: the immunocompromised patient, treatment non-responders, equivocal clinical diagnosis, evaluation of disease extent, renal transplant patients, and patients with congenital anomalies.4. Radiological findings with cases from our institution of acute renal infections: acute pyelonephritis, renal/perirenal abscesses, pyonephrosis, emphysematous pyelonephritis/pyelitis, emphysematous pyelonephritis in the renal transplant patient.5. Radiologic findings with cases from our institution of chronic renal infections: chronic pyelonephritis; xanthogranulomatous pyelonephritis.6. Uncommon causes of renal infections or infection-related renal disease: tuberculosis; parasites; COVID-related renal disease.7. Renal infection in the transplant patient: spectrum, complications, and sequelae.8. Spectrum of non-infectious renal emergencies: acute kidney injury (AKI), anuria, interstitial nephritis, rhabdomyolysis, hepatorenal syndrome, renal colic and renal stones, hematuria, renovascular disease, cholesterol embolism, and contrast nephropathy.

EREE-64

## MATTERS OF SUBSTANCE: CNS IMAGING OF RECREATIONAL DRUG USE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Mariana R. Defreitas, MD (*Abstract Co-Author*) Nothing to Disclose
Christopher Ruggiero, MD (*Abstract Co-Author*) Nothing to Disclose
David E. Bartlett, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Recognize common recreational drugs in the United States and their basic neurologic effects. 2. Understand the associated neuroimaging findings of complications.

### TABLE OF CONTENTS/OUTLINE

Background A. Nearly 25% of surveyed U.S. Americans used illicit drugs in the last year. B. Common drugs of choice: cocaine, amphetamines, opioids, marijuana, nitrites, and industrial solvents.Relevance A. Given prevalence, radiologists must recognize imaging findings B. CNS imaging manifestations of recreational drug can present in imaging studies order through Emergency Department C. Radiologists can aid clinicians in providing timely and appropriate care.Implications of Imaging Findings: A. Appearance is dependent on factors such as drug of choice, route of consumption, and impurities present B. Imaging can mimic other disease processes C. Findings can be suggestive illicit drug use when clinical history is unavailable.Acute and Chronic Findings A. Neurovascular - Ischemic strokes, intracranial hemorrhage, posterior reversible encephalopathy syndrome (PRES), dissection, thrombosis, aneurysms, and AVFs. B. Encephalopathies (heroin and cocaine induced) C. Infectious (i) septic emboli, embolic strokes, and mycotic aneurysms indicates disseminated infection (ii) IVDU can also be associated with HIV infection and its complications, including CNS toxoplasmosis and primary CNS lymphoma.Conclusion A. Emergency Radiologists must be familiar with the neuroimaging findings of drug use

## WHAT'S GOING ON BACK THERE? PENETRATING RETROPERITONEAL TRAUMA!

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Richard E. Healicon, BMBCh (*Abstract Co-Author*) Nothing to Disclose
Saigeet Eleti, FRCR, MBBChir (*Abstract Co-Author*) Nothing to Disclose
Susan Cross, MBChB, FRCR (*Abstract Co-Author*) Nothing to Disclose
Lukasz Zielinski, MBBCHIR (*Abstract Co-Author*) Nothing to Disclose
Ansab Fazili I, MBBS,BSC (*Abstract Co-Author*) Nothing to Disclose
Sarah Hickman, MBBS (*Presenter*) Research collaboration, Vara;Research collaboration, ScreenPoint Medical BV;Research collaboration, Lunit Inc;Research collaboration, Kheiron Medical Technologies Ltd;Research collaboration, Alphabet Inc;Research collaboration, Volpara Health Technologies Limited

### TEACHING POINTS

-Clear understanding of the retroperitoneal spaces and contents allows radiologists to infer patterns of injury and suspected organ involvement, for example by recognizing the tracking of fluid and haematoma. -Retroperitoneal hematoma is often not seen on a FAST scan as it tracks posteriorly and deep as well as is obscured by bowel gas. -Retroperitoneal haemorrhage can result in a significant loss of circulating blood volume, haemodynamic instability and precipitate need for urgent intervention. -Following the pattern of gas and soft tissue injury in penetrating wounds helps to infer which structures are involved. Indirect signs of injury include: hematoma, active blush of contrast, fat stranding and free gas. -MPR and MIP reconstructions are crucial in evaluation of penetrating trauma; they allow visualisation of overlapping structures and review of vascular injuries. -Different types of delayed phase CT imaging helps to further characterise injuries as well as look for complications, such as, active bleeding, pseudoaneurysm, and urinoma.

### TABLE OF CONTENTS/OUTLINE

1) Introduction to retroperitoneal anatomy - contents, fascia planes, and spaces 2) Phases of imaging in penetrating trauma 3) Vessel injury - IVC, aorta, internal thoracic and lumbar arteries + complications 4) Pancreatic injury + complications 5) Duodenal injury + complications 6) Kidney injury + complications 7) Conclusion

# Abstract Archives of the RSNA, 2024

EREE-66

## ACUTE MESENTERIC ISCHEMIA (AMI): UNDERSTANDING THE IMAGING FINDINGS AND MAKING A CRITICAL DIAGNOSIS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

David H. Kim, MD (*Abstract Co-Author*) Shareholder, Elucent Medical
Perry J. Pickhardt, MD (*Abstract Co-Author*) Advisor, Bracco Group;Advisor, Zebra Medical Vision Ltd;Advisor, Nano X Imaging;
Giuseppe V. Toia, MD, MS (*Abstract Co-Author*) Research Consultant, General Electric Company;Research Grant, General Electric Company
Meghan G. Lubner, MD (*Abstract Co-Author*) Spouse, Consultant, Elephas Bio
Matthew H. Lee, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Acute mesenteric ischemia (AMI) is a bowel emergency that is infrequent but has high morbidity and mortality. 2. Imaging plays a central role in early diagnosis and management. 3. Most causes are arterial (embolus > in situ thrombosis). Other causes include mesenteric venous thrombosis and low flow states (non-occlusive mesenteric ischemia, NOMI). 4. Identifying clot in a mesenteric vessel (artery or vein) establishes the diagnosis. Bowel and mesentery then document location and severity. 5. Non-visualization of clot means NOMI or small clot not seen at imaging. 6. Decreased wall enhancement specific to arterial causes (decreased inflow), wall thickening can be venous (outflow obstruction) or arterial (reperfusion and injury).

### TABLE OF CONTENTS/OUTLINE

1. Discuss the importance of identifying AMI and the role of imaging in establishing the diagnosis - high mortality, improved outcomes with early recognition. 2. Review the basic anatomy (vascular and bowel) and pathophysiology of AMI. 3. Describe the etiologies of primary AMI - embolic-arterial, thrombotic arterial, venous, NOMI - and secondary AMI (e.g. closed loop bowel obstruction). 4. Review the role of imaging including a basic review of CT/DECT performance along with the typical protocols and characteristic imaging features of AMI. 5. Present an interpretive approach to AMI with characteristic imaging findings - assess the SMA/SMV, evaluate the bowel and mesentery, use of DECT (iodine maps and virtual non-contrast). 6. Present case examples of AMI along with mimics.

## PEDIATRIC POLYTRAUMA. MECHANISMS OF INJURY AND RADIOLOGIC EVALUATION

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

MARIA PEREZ FERNANDEZ (*Abstract Co-Author*) Nothing to Disclose
Marta Sanmartin Lopez, MD (*Abstract Co-Author*) Nothing to Disclose
Anxo Martinez De Alegria, MD (*Abstract Co-Author*) Nothing to Disclose
Roberto Garcia Figueiras, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Ana Ecenarro Montiel (*Abstract Co-Author*) Nothing to Disclose
Maria Mercedes Linares Paz (*Abstract Co-Author*) Nothing to Disclose
Lorena Maria Miguez Fortes (*Abstract Co-Author*) Nothing to Disclose
Maria V. Trujillo Ariza, MD (*Abstract Co-Author*) Nothing to Disclose
Amadeo Arango (*Presenter*) Research Consultant, ABEONA Therapeutics

### TEACHING POINTS

1) To review the pediatric anatomic and physiologic differences compared to adults relevant for trauma.2) To explain the most common mechanisms of injury in children who suffer major trauma.3) To show examples of typical pediatric traumatic lesions that may be missed by an unexperienced eye.4) To suggest tips to optimize the radiologic evaluation of these patients.

### TABLE OF CONTENTS/OUTLINE

1) The concept of polytrauma.2) Clinical management of pediatric polytrauma.2.1 The primary survey.2.2 The secondary and further surveys.3) Pediatric anatomic and physiologic special features.4) Mechanisms of injury.4.1 Traffic accident (seat-belt injuries).4.2 Bicycle accident (handlebar injuries).4.4 Fall from height.4.5 Sport-related injuries.4.6 Physical child abuse.5) Radiologic evaluation.5.1 Cervical trauma.5.2 Thoracic trauma.5.3 Abdominal trauma.6) Conclusions.

## AN IN-DEPTH LOOK AT THE OCULAR GLOBE, THE RADIOLOGIST'S BLIND SPOT

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Magna Cum Laude**

Maria Perez Costas, MD (*Abstract Co-Author*) Nothing to Disclose
Alvaro Jose de la Iglesia Salas, MD (*Abstract Co-Author*) Nothing to Disclose
Alba Lopez-Castello, MD (*Abstract Co-Author*) Nothing to Disclose
Sabela Garcia Benito, MD (*Abstract Co-Author*) Nothing to Disclose
Monica Fernandez Blanco (*Abstract Co-Author*) Nothing to Disclose
Ana Robles Gomez, MD (*Abstract Co-Author*) Nothing to Disclose
Samuel Pereiro Perez, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- To review the relevant anatomy of the globe. - To discuss the key imaging findings in orbital emergencies encompassing traumatic, infectious, and vascular pathology. - To recognize potential incidental orbital findings and main post-surgical changes.

### TABLE OF CONTENTS/OUTLINE

Traumatic, infectious, and vascular orbital pathology are a common reason for consultation in emergency departments, and imaging can play a crucial role in the diagnosis and proper therapeutic management, especially in cases where the clinical examination may be inconclusive. CT is preferred due to its high availability, resolution, and accuracy in assessing orbital structures and soft tissues, identifying foreign bodies, and ruling out collections. The poster will review ocular injuries including: I. Relevant globe anatomy. II. Infection - Preseptal vs post-septal cellulitis. III.Traumatic - Corneal laceration. - Lens injuries (lens dislocation and traumatic cataract). - Retinal detachment. - Vitreous hemorrhage. - Open-globe injury and potential mimics (phthisis bulbi, myopia, coloboma and Staphyloma). - Foreign bodies and potential mimics (optic drusen, scleral calcifications, and calcified cataract). IV. Post-surgical changes - Scleral buckle, vitrectomy, retinopexy, ocular prothesis, and gold eyelid weight. V. Vascular - Carotid cavernous fistula Understanding the basic anatomy and the key imaging findings of globe pathology in computed tomography, as well as potential incidental imaging findings, enables the radiologist to provide the physician with precise diagnostic information to guide proper therapeutic management and thereby prevent permanent vision loss and potential life-threatening complications.

## UNVEILING THE FLOW: STRATEGIES FOR DETECTING POSTTRAUMATIC ACTIVE ABDOMINAL BLEEDING FROM A LEVEL 1 TRAUMA CENTER

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Chaitanya Ahuja, MD (*Abstract Co-Author*) Nothing to Disclose
Meghna Chadha, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Alejandro A. Tempra, MD (*Abstract Co-Author*) Nothing to Disclose
Joshua Strobel, MD (*Abstract Co-Author*) Nothing to Disclose
Carolina Soto-Davila, MD (*Abstract Co-Author*) Nothing to Disclose
Mariana Marrero-Castillo (*Abstract Co-Author*) Nothing to Disclose
Guillermo P. Sangster, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Prompt identification of the bleeding origin and detection of vascular injuries can increase the efficacy of surgical or angiographic treatment, mortality, and mobility during an abdominal trauma. 2. Dual-phase CT-scan is the gold standard imaging technique in hemodynamically stable patients due to its high sensitivity in distinguishing vascular injuries. Active bleeding is characterized by a jet or localized area of high attenuation within a hematoma. The focal area will vanish on delayed images into an enlarged, enhanced hematoma. 3. Vessel injury is identified by findings like an intimal dissection flap, absence of vascular enhancement caused by occlusion or spasm, vessel wall non-uniformity, and caliber changes. Delayed imaging is crucial to confirm vessel injury.

### TABLE OF CONTENTS/OUTLINE

1. To identify different types of vessel injury, such as dissection, pseudoaneurysm, arteriovenous fistula, and active extravasation. 2. To Illustrate computed tomography (CT) common and uncommon imaging patterns in patients with active intrabdominal bleeding. 3. To differentiate active bleeding from other high-attenuation conditions: bone fragments, and dense foreign bodies. Early recognition of active traumatic abdominal bleeding positively impacts mobility and mortality, efficiently guiding pertinent surgical and interventional procedures. This educational exhibit will depict cases of acute posttraumatic abdominal bleeding from various etiologies. It will help radiologists familiarize themselves with classical signs, differential diagnosis of high-attenuation entities, and characterization of different types of vessel injury.

## IMAGING SPECTRUM OF AORTIC INTRAMURAL HEMATOMA (IMH): A RADIOLOGISTS' GUIDE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Maria Perez Costas, MD (*Abstract Co-Author*) Nothing to Disclose
Sabela Garcia Benito, MD (*Abstract Co-Author*) Nothing to Disclose
Samuel Pereiro Perez, MD (*Abstract Co-Author*) Nothing to Disclose
Elena Chavarri Sr, MD (*Abstract Co-Author*) Nothing to Disclose
Alba Lopez-Castello, MD (*Abstract Co-Author*) Nothing to Disclose
Ana Robles Gomez, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Aortic intramural hematoma is a potentially life-threatening condition among the diseases processes that comprise the spectrum of acute aortic syndromes and require immediate medical attention. - Review IMH definition, classification and pathophysiology. - Review CT protocol. - Discuss characteristic IMH imaging findings, natural progression, potential complications and main differential diagnosis. - Review ulcer-like projections and blood pools pathophysiology and evolution. - Outline a practical approach for quick reporting.

### TABLE OF CONTENTS/OUTLINE

I. Introduction. II. IMH epidemiology, pathophysiology and classification. III. IMH CT findings, evolution, potential complications (aortic rupture, pulmonary artery intramural hematoma, aortic dissection...) and imaging risk predictors. IV. Ulcer-like projection and blood pool pathophysiology and evolution V. IMH differential diagnosis (aortitis, penetrating aortic ulcer, mural thrombus, retroperitoneal fibrosis, lymphoma...) VI. Report.

Ana Paula Fraga Cintra Gonzaga (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Provide an overview of Frantz tumor (solid pseudopapillary tumor of the pancreas). Discuss typical and atypical cases with an emphasis on image characteristics. Review the main differential diagnoses of Frantz tumor with a didactic approach.Offer helpful tips for challenging cases to improve accurate diagnosis and patient outcomes.Develop a radiological survival guide for the interpretation of pancreatic lesions with solid and cystic components.

### TABLE OF CONTENTS/OUTLINE

This presentation aims to provide a comprehensive overview of the main features of Frantz Tumor, including epidemiology, associations, pathology, radiographic features, prognosis, and treatment. Using case-based presentations, we will explore the classic and uncommon imaging manifestations of Frantz tumor, including multiplicity, ductal obstruction, simulation of other tumors such as neuroendocrine, intratumoral calcification, occurrence in male patients and children, distant metastasis, parenchymal and extracapsular invasion.We will discuss how to differentiate from benign lesions and malignant neoplasms, including pancreatic pseudocyst, mucinous cystadenoma, neuroendocrine tumors, gastrointestinal stromal tumors, and pancreatic adenocarcinoma. Provide tips for challenging cases where the diagnosis may not be apparent from imaging alone, and radiologists can still play a key role in contributing to better patient outcomes.

## GIEE-10 ASSESSMENT PRIOR TO LIVER RESECTION; WHAT A RADIOLOGIST SHOULD KNOW?!

**Awards**
**Certificate of Merit**

Sergio Klimkowski, MD (*Abstract Co-Author*) Nothing to Disclose
Imran Ahmed, MD (*Abstract Co-Author*) Nothing to Disclose
Mindy X. Wang, MD (*Abstract Co-Author*) Nothing to Disclose
Ann A. Shi, MD (*Abstract Co-Author*) Nothing to Disclose
Khaled M. Elsayes, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. 1. Introduce the complexity, nature, epidemiology, diagnostic and therapeutic approaches. 2. 2. Discuss the indications of liver resection. 3. 3. Discuss radiologists' roles in detection, proper characterization and staging of the cause. 4. 4. Demonstrate the proper localization. 5. 5. Discuss the criteria for technical resectability. 6. 6. Summarize different types of surgical resection.

### TABLE OF CONTENTS/OUTLINE

1) - Introduction to importance of preresection liver assessment a) Complexity of disease. b) The occult nature of the disease. c) The changing epidemiology. d) The rapidly evolving diagnostic and therapeutic approaches.2) - Indications of liver resection a) Common malignant indications include: - HCC - Cholangiocarcinoma - Metastases (commonly colorectal) b) Liver transplant.3) - Role of Imaging: a) Detection b) Proper characterization c) Localization d) Staging e) Anatomical variants-4) - Resectability criteria a) Technical resectability criteria. b) Future liver remnant volume.5) - Types of surgical resection: a) Anatomic resection. b) Non-anatomic (wedge).

## GIEE-100 BEYOND FISTULAS: IMAGING OF ANORECTAL, PERIANAL, AND PERINEAL PATHOLOGIES

Luciana Ramacho Rolim Araujo, MD (*Abstract Co-Author*) Nothing to Disclose
Fernanda G. Velloni, MD (*Abstract Co-Author*) Nothing to Disclose
Eduardo Gomes De Menezes JR, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. This review aims to discuss and to recognize the differential diagnosis of perianal, perineal and anorectal diseases besides fistulas, which often represent a radiological challenge.2. Illustrate with cases the imaging features of main differential diagnosis using computed tomography (CT) and magnetic resonance imaging (MRI).3. Provide a diagnostic approach with a workflow proposal for the differential diagnosis of perianal, perineal and anorectal diseases.

**TABLE OF CONTENTS/OUTLINE**

1 - Introduction 2- Anatomy- Perineal- Anal canal and rectum 3 - Compartmental Approach- Perineal- Anal Canal and Rectum 4 - Diseases? Infection And Inflammation- Pilonidal Disease- Hidradenitis Suppurativa- Fournier Gangrene- Vulvar Abscess- Infectious Myositis- Endometriosis? Neoplasm- Urogenital - Female reproductive tract - Male reproductive tract- Anorectal- Epithelial- Non-epithelial- Carcinoid- Secondary? Vascular- Hemorrhoidal disease / Anorectal varices- Vascular malformation- Congestive Edema? Congenital- Middle Raphe Cyst- Retrorectal developmental cysts? Miscellaneous- Trauma- Pudendal Nerve Entrapment Syndrome 5 - Conclusion

## GIEE-101 INTESTINAL COMPLICATIONS IN THE ONCOLOGIC PATIENT: SPECTRUM OF CT FINDINGS AND IMAGING-BASED DIAGNOSTIC APPROACH

Eduard Andia Navarro (*Abstract Co-Author*) Nothing to Disclose
Marisol Rodriguez Arias (*Abstract Co-Author*) Nothing to Disclose
ANA SANCHEZ MARQUEZ (*Abstract Co-Author*) Nothing to Disclose
Eva Maria Merino Serra (*Abstract Co-Author*) Nothing to Disclose
Maria Pardo Antunez (*Abstract Co-Author*) Nothing to Disclose
David Martinez De La Haza (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The purpose of this exhibit is:1. To review the variety of symptomatic and potentially serious intestinal complications that may occur in patients with oncologic pathology, many of which might be related to previous or ongoing therapies2. To evaluate CT findings in these patients, emphasizing the signs that might lead us to a correct diagnosis3. To gain an awareness of the importance of the global context of the patient (including clinical manifestations and underlying treatment such as chemotherapy, radiation therapy and immunotherapy) in the diagnostic approach.

**TABLE OF CONTENTS/OUTLINE**

- INTRODUCTION- CLINICAL CONTEXT1. Symptoms (diarrhea, obstruction, pseudo-obstruction, other) and blood test parameters2. Oncologic background: primary neoplasm (visceral or hematologic), oncologic therapy- SPECTRUM OF CT FINDINGS1. Mural thickening: type, distribution, extension, severity2. Abnormal enhancement3. Intestinal distension4. Strictures5. Other: pneumoperitoneum, pneumatosis intestinalis, fluid collections- TYPE OF COMPLICATIONSA. Infectious enterocolitis (viral, bacterial, pseudomembranous colitis)B. Neutropenic enterocolitisC. Immunotherapy-mediated enterocolitisD. Radiation-induced enteritisE. Graft vs host diseaseF. Tumor progression-relatedG: Other: ischemic colitis, stercoral colitis, perforation, iatrogenic- TAKE-HOME POINTS

## GIEE-102 PORTOSYSTEMIC SHUNTS: ANATOMY, TREATMENT, AND COMPLICATIONS WITH 3D CINEMATIC RENDERING CORRELATES

**Awards**
**Certificate of Merit**

Shanna A. Matalon, MD (*Abstract Co-Author*) Nothing to Disclose
Khushboo Jhala, MD,MBA (*Abstract Co-Author*) Nothing to Disclose
Bardia Nadim, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Spontaneous portosystemic shunts occur in portal hypertension due to reconstitution of embryonic venous channels in order to act as “release valves.”2. Major complications of portal hypertension include acute variceal bleeding and hepatic encephalopathy.3. 3D cinematic rendering is able to show contiguous pathways and highlight complex vascular anatomy related to portosystemic shunts, which can sometimes be difficult to conceptualize on standard CT reformats due to tortuosity.4. Transjugular intrahepatic portosystemic shunt (TIPS) can be used for refractory esophageal variceal bleeding and ascites, and balloon-occluded retrograde transvenous obliteration (BRTO) can be used to treat gastric varices with large gastrorenal or splenorenal shunts.5. CT evident complications of TIPS and BRTO include stent occlusion, and clinical presentation is often similar to the original manifestations of portal hypertension.

**TABLE OF CONTENTS/OUTLINE**

1. Normal portal and mesenteric venous anatomy2. Pathophysiology of Portal Hypertensiona. Prehepaticb. Intrahepaticc. Posthepatic3. Anatomic Collateral Pathways Complications4. Interventional Procedures and Complicationsa. Transjugular intrahepatic portosystemic shunt (TIPS): for refractory esophageal variceal bleeding and ascitesi. Anatomyii. Imagingiii. Complicationsb. Transvenous obliteration of varices: for gastric ectopic varices (not esophageal)i. Anatomy1. Gastrorenal shunt 2. Splenorenal shuntii. Imagingiii. Complicationsc. Balloon dilation of hepatic vein (for thrombosis/web in hepatic vein)d. Transhepatic clot thrombolysis (PV thrombosis)e. Splenic artery embolization (sinistral portal hypertension)

## GIEE-104 IMAGING APPROACH TO THE DIAGNOSIS OF SOLITARY SOLID PANCREATIC HEAD MASSES

Azfar Siddiqui, MD (*Abstract Co-Author*) Nothing to Disclose
Amjad N. Mohammed I, MRCS, FRCR (*Abstract Co-Author*) Nothing to Disclose
Mohamed Elbanan, MD (*Abstract Co-Author*) Nothing to Disclose

Ayesha Nasrullah, MD,FRCR (*Abstract Co-Author*) Nothing to Disclose
Maaz Ghouri, MD, FRCR (*Abstract Co-Author*) Nothing to Disclose
Ayman H. Gaballah, MD, FRCR (*Abstract Co-Author*) Nothing to Disclose
David L. Raj, MD (*Abstract Co-Author*) Nothing to Disclose

Nanda Deepa Thimmappa, MD (*Abstract Co-Author*) Nothing to Disclose
Amr S. Abdelaziz, MD (*Abstract Co-Author*) Nothing to Disclose
Joe Jose, MD (*Abstract Co-Author*) Nothing to Disclose
Kazi A. Irfan, MD, FRCR (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

-Explain the imaging signs of pancreatic ductal adenocarcinoma arising in the head of the pancreas-Discuss the hypoenhancing pancreatic head masses, which can mimic pancreatic ductal adenocarcinoma-Highlight the different imaging appearances of pancreatic neuroendocrine neoplasms-Review the differentials of hyperenhancing pancreatic masses-Enumerate the different masses that can arise adjacent to the head of the pancreas, which can mimic a pancreatic head mass-Illustrate the cystic pancreatic lesions which can have an imaging appearance of a solid pancreatic mass

**TABLE OF CONTENTS/OUTLINE**

-Spectrum of pancreatic head lesions-Imaging techniques in the evaluation of focal pancreatic lesions-Typical imaging appearance of pancreatic ductal adenocarcinoma-Pancreatic head masses that can mimic pancreatic ductal adenocarcinoma*Neoplastic*Non-neoplastic*Extrapancreatic masses arising adjacent to the pancreas*Cystic pancreatic lesions-Features that can help differentiate between pancreatic ductal adenocarcinoma and its mimics-Imaging appearance of pancreatic neuroendocrine tumors-Other hyperenhancing pancreatic head masses-Algorithm for differentiating between different pancreatic head masses

## GIEE-105 TRUE BEAUTY COMES FROM WITHIN: WHEN INTESTINAL CONTENTS HELP YOU GET THE DIAGNOSIS

Leonardo K. Bittencourt, MD, PhD (*Abstract Co-Author*) Research Consultant, Canon Medical Systems Corporation
Daniel Lahan-Martins, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Fernanda G. Velloni, MD (*Abstract Co-Author*) Nothing to Disclose
Cassia T. Guimaraes, MD (*Abstract Co-Author*) Nothing to Disclose
Roberto Blasbalg, MD (*Abstract Co-Author*) Nothing to Disclose
Martin Horwarth, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

•When assessing for gastrointestinal conditions, while radiologists focus on the patters of distention, wall thickening and enhancement of bowel loops, the assessment of the contents of the involved loops can often be forgotten or neglected, potentially leading to wrong or delayed diagnosis.•Many intestinal and systemic diseases can alter the contents of the small intestine and the colon. The identification of these pathological intestinal contents can assist in the diagnosis of specific pathologies.•Equally important is recognizing luminal intestinal findings that do not correspond to any pathology, but are rather physiological or variants of normality.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction.2. Review of the anatomy of the digestive tract, the path of the food bolus and its changes along the way.3. Image of physiological intestinal contents.4. Findings of intestinal contents that have no clinical significance (tablets, contents of different densities, fruit seeds, medical devices, foreign body?).5. Pathological findings of intestinal contents (steatorrhea, gallstones, blood, bezoar, food impactation).6. Assessment of specific pathologies (foreign body ingestion, bezoar, gallstone ileus, Bouveret syndrome, cystic fibrosis?).7. Take home notes.8 .Bibliography.

## GIEE-106 ASSESSMENT OF DISEASE ACTIVITY IN PATIENTS WITH CROHN'S DISEASE: CORRELATION BETWEEN MAGNETIC RESONANCE ENTEROGRAPHY AND INTESTINAL ULTRASOUND

Myung-Won You, MD (*Abstract Co-Author*) Nothing to Disclose
Choongwui Cho, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

-compare the diagnostic yield of intestinal ultrasound(IUS) and MR enterography (MRE) for disease activity in patients with Crohn's disease(CD)-assess the correlation between IUS and MRE in the diagnosis of disease activity in patients with CD

**TABLE OF CONTENTS/OUTLINE**

1) Twenty-six cases with CD who underwent IUS and MRE within a 3-month interval- per-segment diagnosis: 7 divided segments of small and large bowels2) Diagnostic criteria of active inflammation- qualitative criteria/quantitative criteria on IUS- qualitative criteria/quantitative criteria on MRE3) Comparison of diagnosis of active inflammation on IUS vs. MRE- percentage and location of active inflammation- percentage and location of complication4) Correlation between MaRIA and IBUS-SAS scores5) Diagnostic performance of IUS with MaRIA>11 cut-off6) Concordant/discordant cases between IUS and MRE

## GIEE-107 DUAL-ENERGY COMPUTED TOMOGRAPHY 2.0 IN GASTROINTESTINAL IMAGING: QUANTITATIVE IMAGING, BIOMARKERS, AND OTHER DEVELOPMENTS

Ramiro Mendez (*Abstract Co-Author*) Nothing to Disclose
Sandra Baleato Gonzalez, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Carlos Fraga Pineiro (*Abstract Co-Author*) Instructor, General Electric Company
Gabriel C. Fernandez, MD (*Abstract Co-Author*) Nothing to Disclose

Andres Cano, DIPLPHYS (*Abstract Co-Author*) Nothing to Disclose
Gonzalo Tardaguila de la Fuente, MD (*Abstract Co-Author*) Nothing to Disclose
Marta Girones Sanguesa (*Abstract Co-Author*) Nothing to Disclose
Roberto Garcia Figueiras, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Dual-energy CT (DECT) imaging has broadened the potential of CT imaging by offering multiple types of DECT-derived images. DECT shows profound capabilities to improve diagnosis in gastrointestinal (GI) imaging based on its superior material differentiation, but also on the use of DECT-derived quantitative values that have considerable potential to serve as imaging-based biomarkers in multiple clinical applications.The aim of this exhibit is:-To review physical concepts of DECT and technical parameters influencing image quality and DECT quantification.-To discuss advantages and limitations of quantitative DECT imaging in different clinical scenarios-To provide a comprehensive and practical overview of possible diagnostic pitfalls that may be encountered using quantitative DECT imaging.-To evaluate future perspectives for quantitative DECT imaging and photon-counting technology.

**TABLE OF CONTENTS/OUTLINE**

-Basic concepts of DECT: atomic numbers, energy levels, and other physics concepts.-Understanding the different types of DECT-derived images and their use in GI imaging.-Principles of quantitative DECT imaging: iodine, fat, and iron concentrations / extracellular volume, effective atomic number, and electron-density values.-Cutting-edge applications of quantitative DECT in GI imaging: lesion detection and characterization, accurate tumor staging, prognostic and predictive value, therapy planning, treatment response assessment, and body composition.-Pitfalls and artifacts in quantitative DECT imaging: how to avoid them.-Future directions: from quantitative DECT-derived biomarkers (radiomics and radiogenomics) to photon-counting CT in GI imaging.-Conclusions

## GIEE-108 UNRAVELING BODY PACKER: RADIOLOGISTS KEY INSIGHTS

Mohammad Mohsin Arshad, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

-Background, terminology, and epidemiology of body packing.-Understand the usual clinical and radiological signs displayed by individuals who conceal illicit materials internally and investigate the importance of employing multiple imaging methods such as X-rays, ultrasounds, CT scans, and MRIs to assess and address such situations.

**TABLE OF CONTENTS/OUTLINE**

1. Concept/background of body packing.2. Clinical presentation of body packers.3. A radiological assessment that needs to be done.4. What radiologists need to know!5. Case-based review.

## GIEE-109 HEPATIC VENOUS MALFORMATION (HEMANGIOMA): RADIOLOGIC SPECTRUM, DIFFERENTIAL DIAGNOSIS, AND MANAGEMENT STRATEGIES

Faeze Salahshour (*Abstract Co-Author*) Nothing to Disclose
Mohammad Mehdi M. Mehrabi Nejad (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Radiologic Presentation Variability Understanding the spectrum of typical and atypical radiologic presentations of Hepatic Venous Malformations (HVMs). 2. Red Flags: Identifying key indicators suggesting alternative diagnoses beyond HVM. 3. Imaging Mimics Exploring conditions that closely resemble HVM on various imaging modalities. 4. Management Strategies Discussing approaches to the management and treatment of HVM.

**TABLE OF CONTENTS/OUTLINE**

1. Definition and Characteristics of HVM 2. Diagnostic Criteria and Modalities 3. Typical Imaging Presentations of HVM 4. Atypical Imaging Presentations of HVM a. Liver Hemangiomatosis b. Sclerosant HVM c. Flash-filling HVM d. HVM with shunt 5. Red Flags Requiring Attention a. Medical history correlates: liver disease or cancer c. Heterogeneous signal in MRI e. Diffusion restriction on DWI and ADC map f. Atypical enhancement patterns 6. Mimickers of HVM a. Angiosarcoma b. Retroperitoneal Paraganglioma c. Neuroendocrine Metastasis d. Choriocarcinoma Metastasis e. Colorectal Metastasis f. Inactive Hydatid Cyst g. Calcified Foci Post-Metastatic Treatment 7. Complication a. Budd-Chiari syndrome b. Kasabach-Merritt Syndrome c. Rupture 8. Biopsy Indications 9. Management Approaches for HVM 10. Take-Home Message

## GIEE-11 LOST ART OF BARIUM SWALLOW

Amit K. Sahu, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Bharat Aggarwal, MD (*Abstract Co-Author*) Nothing to Disclose
Bhavya Arora, MBBS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Barium swallow is a radiographic exam using contrast to evaluate esophagus's structure and some functions. It helps diagnose conditions like motility disorders, strictures, and perforations, as well as distal issues such as hiatal hernias and reflux. Despite CT imaging, it remains useful. While it can identify common pathologies, more complex swallowing issues may require a modified barium swallow evaluation.

**TABLE OF CONTENTS/OUTLINE**

Anatomy of esophagus: The normal course, appearance and constrictions.Indications: Dysphagia, GERD, hiatus hernia, Repeated vomiting, epigastric pain, post-operative leakTechnique: Initial scout film to rule out any foreign body and as control for post-contrast study followed by swallowing barium under video fluoroscopy in upright lateral position for pharynx and to rule out aspiration. Image with patient instructed to say ‘Eeee’ is taken to visualize the hypopharynx. As the patient swallows, frontal and oblique views are taken. Prone in right anterior oblique to assess motility of esophagus and competence of the gastro-esophageal junction. Single contrast versus double contrast barium swallow Clinical significance: Structural: Diverticulum, Stricture, Hiatus herniaNeoplastic: Lipoma, Leiomyoma, AdenocarcinomaMobility: Achalasia, Hypoperistalsis, Diffuse esophageal spasmsTraumatic: Iatrogenic, Perforation, Post caustic injuryPediatric: Tacheo-esophageal fistula, Esophageal atresiaContraindication: Relative contraindications is perforation.Complications: Aspiration, leakage from a perforation

## GIEE-110 ROLE OF IMAGING IN THE MANAGEMENT OF PATIENTS WITH INFLAMMATORY BOWEL DISEASE (IBD): A CASE-BASED REVIEW

**Awards**
**Certificate of Merit**

Elena Serrano Tamayo, MD (*Abstract Co-Author*) Nothing to Disclose
Noelia Bravo Alcobendas, MD (*Abstract Co-Author*) Nothing to Disclose
Alba Fernandez-Rodriguez, MD (*Abstract Co-Author*) Nothing to Disclose
Lucia Martinez De Vega, MD (*Abstract Co-Author*) Nothing to Disclose
Raquel Garcia Latorre, MD (*Abstract Co-Author*) Nothing to Disclose
Elena Canales Lachen (*Abstract Co-Author*) Nothing to Disclose
Ana Villanueva, MD (*Abstract Co-Author*) Nothing to Disclose
Ana M. Vera-Carmona, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Inflammatory bowel disease (IBD) is a chronic condition affecting the gastrointestinal tract that is comprised of two disorders: Crohn’s disease (CD) and ulcerative colitis (UC). They are relapsing and destructive diseases that can result in progressive bowel damage if not adequately treated, with the

resultant impairment of the quality of life of patients.Therefore, clinicians need clear and objective information on disease activity and extent to adequately adapt the treatment in IBD patients (drug change or optimization, endoscopic dilatation or surgical treatment).Magnetic resonance enterography (MRE) and intestinal ultrasonography (IUS) can accurately evaluate these parameters, currently playing a pivotal role in the monitoring and management of IBD patients, while computed tomography (CT) is usually reserved to the emergency setting.

**TABLE OF CONTENTS/OUTLINE**

Introduction:- IBD: definition and clinical course- Imaging techniques used for the monitoring of IBD diagnosed patients.- Treatment modalities available in IBD and its indications: pharmacological treatment, endoscopic dilatation and surgery.Review of the role of imaging in the management of IBD patients through a case-series in which different clinical scenarios and outcomes are shown.ConclusionsReferences

## GIEE-111 THE ROLE OF MRI IN RECTAL CANCER IN THE ERA OF NEW NEOADJUVANT THERAPEUTIC STRATEGIES, WATCH & WAIT, AND MINIMALLY INVASIVE SURGERY

**Awards**
**Certificate of Merit**

Sandra Baleato Gonzalez, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Stephanie Nougaret, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Ana Marhuenda, MD (*Abstract Co-Author*) Nothing to Disclose
Antonio Luna, MD, PhD (*Abstract Co-Author*) Speaker, General Electric Company
David H. Kim, MD (*Abstract Co-Author*) Shareholder, Elucent Medical
Joan C. Vilanova, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Juan-Ramon R. Ayuso, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Roberto Garcia Figueiras, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Rectal cancer (RC) presents significant diagnostic and therapeutic challenges. The introduction of new neoadjuvant therapeutic strategies (total neoadjuvant therapy [TNT], RC treatment without radiation, immunotherapy [IT]), minimally invasive surgery, and non-surgical options (watch and wait [WW] strategy) in RC is mainly based on MRI findings that provide essential information for treatment selection. MRI serves an increasingly pivotal role in the diagnosis, staging, treatment stratification, response assessment, and follow-up of patients with RC. MRI can assess both the anatomical extent of invasion (offering a surgical roadmap) and the pattern of tumor infiltration with factors involved in local spread and tumor relapse and factors involved in systemic dissemination not included in the usual TNM staging.The aim of this exhibit is:-To review the implications for prognosis and choice of treatment of MRI findings of local tumor spread (depth of invasion, mesorectal fascia [MRF] involvement, lymph node metastases, perineural and lymphatic invasion) and systemic dissemination (extramural vascular invasion and tumor deposits).-To evaluate limitations of MRI to assess some key pathological, molecular, and genetic features in RC.-To discuss the role of MRI in the era of new therapeutic strategies in RC.-To review the limitations of MRI in the assessment of RC response.

**TABLE OF CONTENTS/OUTLINE**

-Basic concepts of MRI in RC: TNM-staging and MRI-based surgical roadmap.-MR-derived prognostic features in RC.-The changing role of MRI in RC with TNT, IT, WW, and minimally invasive surgery for staging, restaging, and follow up in RC.-Future role of functional MRI and radiomics in RC.-Conclusions

## GIEE-112 BUBBLE INSIGHTS: NAVIGATING CEUS LI-RADS AND ITS DISTINCTIONS FROM CT-MRI LI-RADS

Hyun-Jung Jang, MD (*Abstract Co-Author*) Nothing to Disclose
Tae Kyoung Kim, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Vanessa Murad, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Emphasizing the efficacy of contrast-enhanced ultrasound (CEUS) in characterizing hepatic observations among high-risk populations for hepatocellular carcinoma (HCC). 2. Exploring the key differences of CEUS LI-RADS from CT/MRI LI-RADS: - Real-time imaging capabilities.- Purely intravascular contrast agents.- Option for repeated injections and replenishments.- Suitability for patients with renal failure. 3. Presenting illustrative cases to highlight crucial differences between CEUS LI-RADS and CT/MRI LI-RADS.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction: - Overview of CEUS LI-RADS and microbubble contrast agents.2. Real-time imaging: - Detection and assessment of arterial phase hyperenhancement (APHE).- Evaluation of APHE patterns.3. Purely intravascular contrast agents:- Significance of the timing and degree of washout.- Consistent demonstration of washout in non-HCC malignancies.- Utilization of CEUS-guided biopsy for small isoechoic malignancies.- Discrepancies in LR-M criteria between CEUS and CT/MRI.4. Availability of repeated injections and replenishments:- Minimization of failed examinations due to timing issues or patient's motion/breathing.- Utility in the assessment of APHE patterns.5. Suitability for patients with renal failure:- No known renal toxicity of microbubble contrast agents.6. Clinical Applications:- Literature review relevant literature, including recent studies on the utility of CEUS LI-RADS across various indications and prospects.

## GIEE-113 ALCOHOL-RELATED PANCREATITIS: PATHOPHYSIOLOGY, NATURAL HISTORY, AND IMAGING CORRELATIONS

Abhijit A. Raut, MD (*Abstract Co-Author*) Nothing to Disclose
Anoushka Maheshwari (*Abstract Co-Author*) Nothing to Disclose
Sachin Kumar, MBBS (*Abstract Co-Author*) Nothing to Disclose
Mukesh G. Harisinghani, MD (*Abstract Co-Author*) Nothing to Disclose
Sharad Maheshwari, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Alcohol abuse imposes a substantial burden on our healthcare system. Addressing this issue with appropriate public health strategies is paramount, given its modifiable nature. Alcohol-induced pancreatitis ranks as the second most common cause following gallstones, contributing to nearly one-third of acute pancreatitis cases in the US. Its spectrum encompasses acute interstitial pancreatitis, acute pancreatic necrosis, recurrent acute pancreatitis, and can progress to chronic pancreatitis with sustained alcohol use, which becomes irreversible. Understanding the unique natural history of alcohol-related pancreatitis aids in diagnosis and guides management effectively. Computed Tomography (CECT) stands as the imaging modality of choice in acute settings. Meanwhile, Magnetic Resonance Imaging (MRI) proves more sensitive for detecting subtle changes and offers both morphological and functional insights in chronic cases. The exhibit will elucidate the imaging implications of this distinctive disease spectrum.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction 2. Epidemiology 3. Pathophysiology Natural History 4. Patterns of Excessive Drinking: a. Binge drinking b. High-intensity drinking 5. Imaging Techniques 6. Imaging Features: a. Mild Acute Pancreatitis b. Severe Acute Pancreatitis c. Acute Recurrent Pancreatitis d. Early Chronic Pancreatitis e. Late or Irreversible Chronic Pancreatitis

## GIEE-114 INSIGHTS INTO SICKLE CELL DISEASE: UNVEILING ABDOMINAL IMAGING FINDINGS

Daniella B. Parente, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Clara Fiorot, MD (*Abstract Co-Author*) Nothing to Disclose
Andre Ferreira, MD (*Abstract Co-Author*) Nothing to Disclose
Paula Castro, MD (*Abstract Co-Author*) Nothing to Disclose
Luiza Ambrozino, MD (*Abstract Co-Author*) Nothing to Disclose
Luana Alves, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Explore the abnormal hemoglobin structure in Sickle Cell Disease (SCD) and its correlation with sickling and red blood cell damage.
- Define the common abdominal and pelvic manifestations of SCD, elucidating their characteristic imaging features using CT scan and MRI, and discuss findings in each organ.
- Understand the role of imaging in diagnosing acute crises, potential complications, and chronic consequences of SCD in the abdomen and pelvis.

**TABLE OF CONTENTS/OUTLINE**

I. Introduction
- Understand the basic mechanisms of Sickle Cell Disease (SCD): abnormal hemoglobin causing red blood cell sickling and vaso-occlusion.
- Emphasize the importance of abdominal and pelvic imaging for diagnosing and managing complications arising from SCD. II. Abdominal and Pelvic Manifestations of SCD
- Recognize how SCD leads to abdominal disorders through vaso-occlusion and hemolysis.
- Discuss the potential complications of chronic hemolysis, such as iron overload in the liver:
- Vaso-occlusion and its consequence: tissue and organ ischemia and infarction
- Hemolysis
- Functional asplenia and increased risk of infection III. Imaging Findings of SCD in the Abdomen and Pelvis
- Extramedullary hematopoiesis
- Organ-specific findings based on imaging:
- Liver
- Gallbladder
- Spleen
- Kidneys
- Gastrointestinal tract
- Male reproductive organs IV. Conclusion
- Early recognition of abdominal complications through imaging allows for prompt management and improved patient outcomes.

## GIEE-115 BEYOND THE BASICS: UNCOMMON ANORECTAL NEOPLASMS

Maialen Imizcoz, MD (*Abstract Co-Author*) Nothing to Disclose
Jokin Zabalza Unzue (*Abstract Co-Author*) Nothing to Disclose
Laida Etxeberria Kaiuela, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. To describe and illustrate the radiological and histopathological findings of uncommon anorectal neoplasms. 2. To highlight the radiological differentiating features that may prove useful to reach an accurate diagnosis in anorectal mases.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction: Why is it important to recognise uncommon anorectal neoplasms by imaging tests? 2. Essential anatomy of the anorectum. 3. Uncommon anorectal neoplasms: radiological and histopathological findings. • Rectal gastrointestinal stromal tumor • Anorectal malignant melanoma • Rectal neuroendocrine tumor • Rectal lymphoma • Rectum sarcoma • Carcinoma arising from anal fistula • Linitis plastica of the rectum 4. Review of differentiating radiological features of uncommon anorectal neoplasms on CT/MRI. 5.Conclusion

## GIEE-116 NAVIGATING POST-LOCOREGIONAL THERAPY IMAGING IN HCC: INSIGHTS AND UPDATES

Ozerk Turan (*Abstract Co-Author*) Nothing to Disclose
Jade J. Wong-You-Cheong, MD (*Abstract Co-Author*) Author, Reed Elsevier
Barton F. Lane, MD (*Abstract Co-Author*) Research support, Siemens AG;License agreement, Siemens AG
Izzet Altun, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1- Locoregional treatment (LRT) is widely used for hepatocellular carcinoma (HCC), with radiologists playing a critical role in assessing treatment response. 2-The LI-RADS Treatment Response Algorithm (LR-TRA) is a standardized system for evaluating treatment response after LRT for HCC, introducing a new approach in 2024 based on radiation and non-radiation therapies. 3-This educational exhibit will focus on imaging techniques and features of post-LRT HCC, incorporating updates on LR-TRA v2024.

**TABLE OF CONTENTS/OUTLINE**

1-Indications, role, and basic concepts of locoregional therapies, including radiofrequency ablation, microwave ablation, cryoablation, stereotactic radiation, transarterial chemoembolization, and radioembolization. 2-CT and MRI study protocols for HCC. 3- Review of CT and MRI imaging features after LRT for HCC. 4- Case-based overview of the 2024 LI-RADS non-radiation and radiation TRA. 5- Discussion on the role of contrast-enhanced ultrasound in monitoring treatment response after LRT. 5- Summarization of LRT techniques and imaging features for HCC with LR-TRA v2024 updates.

## GIEE-117 CANCER-ASSOCIATED FIBROSIS: WHAT RADIOLOGISTS NEED TO KNOW

Mariko Irizato (*Abstract Co-Author*) Nothing to Disclose
Toshihiro Tanaka (*Abstract Co-Author*) Nothing to Disclose

Kiyoyuki Minamiguchi (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The purpose of this exhibit is to review the components and role of fibrous extracellular matrix (ECM) in cancer, to understand representative cases of abdominal cancer with abundant fibrosis (e.g., gastrointestinal, hepatobiliary, and pancreatic) in multimodality imaging, and to focus on imaging feature of cancer-associated fibrosis that are relevant to clinical outcomes.

**TABLE OF CONTENTS/OUTLINE**

ECM plays an important role in cancer progression. Cancer-associated fibrosis (e.g., fibrous capsule and fibrous stroma) is excessive accumulation of fibrous proteins such as collagen and laminin in the ECM, dramatically altering the biological properties of the cancer. The impact of the cancer-associated fibrosis on clinical prognosis is a matter of interest, but controversial for each cancer: fibrous capsule in colorectal liver metastases is involved in a favorable prognosis by physiologically confining cancer cells, whereas fibrous stroma in cholangiocarcinoma in poor prognosis by promoting cancer growth. Multimodality imaging to infer cancer-associated fibrosis is useful not only for diagnosis but also for predicting clinical prognosis such as overall survival, recurrence free survival, and treatment response. Table of contents is as follows;1) Overview of cancer-associated fibrosis2) Representative case presentation 3) Clinical application of multimodality imaging reflecting cancer-associated fibrosis

## GIEE-118 COLORECTAL CANCER AMONG GEN X, MILLENNIALS, AND GEN Z: CURRENT UPDATE ON PATHOLOGY, IMAGING FINDINGS, AND MANAGEMENT OF EARLY-ONSET COLORECTAL CANCER

Sukeshi Arora (*Abstract Co-Author*) Speakers Bureau, Bayer AG;Speakers Bureau, Exelixis, Inc;Advisory Board, AstraZeneca PLC;Advisory Board, BridgeBio Pharma;Institutional research support, Faron Pharmaceuticals;Institutional research support, Caris Life Sciences;Institutional research support, Ipsen SA;Institutional research support, Lexicon Pharmaceuticals, Inc;Institutional research support, Eli Lilly and Company;Institutional research support, BeiGene, Ltd;Institutional research support, Isofol Medical AB;;;;
Aishwarya Vemula (*Abstract Co-Author*) Nothing to Disclose
Sriram Jaganathan, MD (*Abstract Co-Author*) Nothing to Disclose
Alia Nazarullah (*Abstract Co-Author*) Nothing to Disclose
Shahedur Rahman (*Abstract Co-Author*) Nothing to Disclose
Ebe Ewere, BS (*Abstract Co-Author*) Nothing to Disclose
Venkata S. Katabathina, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Discuss the increasing incidence, risk factors and unique characteristics of early-onset colorectal cancer (EOCRC)
- Review genetic features, molecular biology, prognosis natural history of EOCRC
- Describe salient imaging findings of primary/metastatic EOCRC discuss role of CT/MRI/PET-CT in management.
- Discuss current screening guidelines, targeted therapeutics future directions in early diagnosis treatment

**TABLE OF CONTENTS/OUTLINE**

; EOCRC: Cancer in younger than 50 years old. ; Epidemiology ; Risk factors: genetics, obesity, sedentary lifestyle, sweetened beverages, westernized lifestyle, inflammation gut microbiome ; Comparing EOCRC vs. late-onset CRC in pathogenesis, genetics, pathology, molecular biology, clinical features, treatment, prognosis natural history ; Genetics molecular biology: 30% are genetic; Microsatellite Instability-High, TP53, CTNNB1 ; Grading and Staging ; Imaging Techniques: Radiography, Contrast enema, CT, MRI PET/CT ; Salient imaging findings ; Radiogenomics ; Management Prognosis ; Current screening guidelines and the role of CT Colonography ; Lifestyle modifications ; Future screening directions (new screening modalities and ways to identify at-risk population) ; Targeted Therapeutics ; Conclusion EOCRC is an emerging clinical problem that affects an increasing number of young patients. Salient features of EOCRC include left colon/rectal distribution, mucinous/signet ring histology, higher pathologic grade, poorer cell differentiation, more advanced stage poor prognosis. Radiologists play a pivotal role in timely diagnosis, screening, and management of EOCRC. Imaging helps in surveillance testing efficacy of novel drugs.

## GIEE-119 THE JEOPARDY OF CROHN'S DISEASE: CAN YOU IDENTIFY ALL THE SIGNS AND SYMPTOMS?

Lindsay Duy, MD (*Abstract Co-Author*) Nothing to Disclose
Madison N. Crank, MD, BS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Optimization of fluoroscopic technique and use of CT and MR enterography to identify fistulous tractsReview the diagnostic findings suggesting Crohn's disease using consensus definitions, including extraintestinal manifestationsReview the complications of Inflammatory Bowel Disease (IBD), focusing on fistulous tracts

**TABLE OF CONTENTS/OUTLINE**

Using an interactive slideshow/gameshow format designed for resident education, review high yield facts about Crohn's with the following teaching points:Overview of IBD with a focus on Crohn's diseaseA. Crohn's diseaseB. Ulcerative colitisImaging techniques, protocols, and utility in assessing for Crohn'sA. CT enterographyB. MR enterographyC. Fluoroscopy a. Small bowel follow through b. FistulagramSeries of cases with teaching points to educate residents on the common diagnostic findings of Crohn's, including consensus definitionsA. Wall ThickeningB. Mural wall stratification: a. Target sign b. Fat halo signC. Mesenteric changes: a. Comb sign b. Creeping fat c. AdenopathyD. Diminished motilityE. Extraintestinal manifestations: a. Primary Sclerosing Cholangitis b. Arthritis c. Renal stonesSeries of cases reviewing complications of Crohn's disease and potential pitfallsA. Stricture: a. Fibrotic stricture b. Inflammatory stricture with string signB. Fistula: a. Simple fistula b. Complex fistula with clover leaf or star signC. Ulceration: a. Aphthous ulcer b. Deep ulcerationD. CobblestoningE. SacculationF. Sinus tractG. Inflammatory mass versus colonic adenocarcinomaH. Misdiagnosis of ulcerative colitis

## GIEE-12 ESOPHAGRAM REGAINING STRENGTH IN ACHALASIA

Manuel Alejandro Garrido, MD (*Abstract Co-Author*) Nothing to Disclose
Mildreth Juliana Acuna Rojas, MEd (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Achalasia is an esophageal motility disorder, characterized by impaired relaxation of the lower esophageal sphincter.The global incidence ranging from 0.03 to 1.63 per 100,000 persons per year and the prevalence its 1.8 to 12.6 per 100,000 persons per year.Exists functional loss of myenteric plexus ganglion cells in the distal esophagus and lower esophageal sphincter. The diagnosis started with clinical suspiction, the syntoms are dysphagia to solids and liquids, regurgitation, occasional chest pain with or without weight loss, perform high resolution manometry, endoscopic and esophagram.The achalasia is relacionated with systemic diseases, tumors and others esophagus trastorns.The radiological technique consists of a series of fluoroscopy

images of the pacient, specifically to esophagus while ingesting contrast medium.It is important to keep in mind that the esophagram is a study with greater accessibility, fewer risks and lower cost compared to endoscopy, which is why it represents a great option for diagnosis.

**TABLE OF CONTENTS/OUTLINE**

Introduction, Epidemiology, Anatomic review, Physiology, Pathophysiology, Diagnosis, Radiological technique, Clinical case, Conclusions, References.

## GIEE-120 ROLE OF IMAGING IN BARIATRIC SURGICAL PROCEDURES

Ayman H. Gaballah, MD, FRCR (*Abstract Co-Author*) Nothing to Disclose
Ayesha Nasrullah, MD,FRCR (*Abstract Co-Author*) Nothing to Disclose
Azfar Siddiqui, MD (*Abstract Co-Author*) Nothing to Disclose

Amr S. Abdelaziz, MD (*Abstract Co-Author*) Nothing to Disclose
Maged Algazzar, MD (*Abstract Co-Author*) Nothing to Disclose
Kazi A. Irfan, MD, FRCR (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Different types of bariatric surgeries, advantages and disadvantages of each surgery. Surgical technique. Expected normal post-operative imaging appearance Multimodality imaging of postoperative complications after bariatric surgeries

**TABLE OF CONTENTS/OUTLINE**

Types of bariatric surgical procedures-Restrictive Adjustable gastric banding -Sleeve gastrectomy -Vertical banded gastroplasty (fixed pouch size) -Bypass (malabsorptive) -Biliopancreatic diversion -Duodenal switch -Jejuno-ileal bypass -Combined Roux-en-Y gastric bypass Surgical techinques, expected surgical changes and surgical complications post sleeve gastrectomy, laparoscopic gastric banding, Roux-en-Y gastric bypass, biliopancreatic diversion with duodenal switch and vertical banded gastroplasty Imaging techniques- the role of Computed Tomography and FluoroscopyImaging algorithm in evaluation of expected post-surgical changes and post-operative complications Multimodality imaging features of post-surgical complications

## GIEE-121 ARTIFICIAL INTELLIGENCE IN IMAGING DIAGNOSIS OF LIVER TUMORS: CURRENT STATUS AND FUTURE PROSPECTS

Takamichi Murakami, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Keitaro Sofue, MD (*Abstract Co-Author*) Nothing to Disclose
Yuki Suzuki, PhD (*Abstract Co-Author*) Nothing to Disclose
Noriyuki Tomiyama, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Atsushi Nakamoto, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Masatoshi Hori, MD, PhD (*Presenter*) Research Grant, Canon Medical Systems Corporation

**TEACHING POINTS**

1. Explore artificial intelligence (AI) applications in liver tumor imaging, including lesion detection, differentiation, segmentation, image quality enhancement, and radiomics. 2. Examine the integration of AI in liver tumor diagnostics within clinical practice. 3. Discuss how radiologists utilize AI in diagnosing liver tumors. 4. Review future advancements in AI technologies and their potential impact on patient management.

**TABLE OF CONTENTS/OUTLINE**

A. IntroductionB. Detection of Liver Tumors Using AI B-1. Principles of AI in tumor detection B-2. Features of liver tumor detection AI: Comparison with AI used in other organs such as lungs B-3. Case studies in clinical practice C. Characterization of Liver Tumors Using AI C-1. Principles of AI in tumor characterization C-2. Comparative features of liver tumor AI applications D. Segmentation Using AI D-1. Segmentation of the liver D-2. Automatic Segmentation of the Anatomical Liver Segments D-3. Tumor segmentation D-4. Clinical implementation E. Deep Learning Reconstruction E-1. Benefits in spatial resolution improvement E-2. Contributions to image noise reduction E-3. Reduction of radiation exposure in CT E-4. Reduction in MRI imaging times enhances patient throughput and comfort F. Radiomics F-1. Principles of radiomic feature extraction and analysis F-2. Advantages for patients with liver tumors G. Clinical Roles and Prospects of AI in Evaluating Liver Tumors G-1. Impact on clinical decision-making G-2. Future developments and their potential impact H. Conclusion

## GIEE-122 NAVIGATING THE COMPLEXITY OF HEPATIC INFLAMMATORY PSEUDOTUMORS IN IMAGING

Junichi Matsumoto, MD (*Abstract Co-Author*) Nothing to Disclose
Taichi Kitagawa, MD (*Abstract Co-Author*) Nothing to Disclose
Kazuto Kozaka, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

In the context of inflammatory pseudotumors (IPT) of the liver, there exists a dichotomy between pathologically well-defined disease entities and those clinically employed with ambiguity. This educational exhibit aims to categorize these into narrow-sense IPT and broad-sense IPT, consolidating the clinical and radiographic hallmarks of the various diseases within each classification to enhance the diagnostician’s comprehension.

**TABLE OF CONTENTS/OUTLINE**

1. Narrow-sense Inflammatory Pseudotumor of the Liver (Specifically defined entities at the view point of pathology)To resolve the confusion regarding IPT of the liver, we will explain the histopathological classification and imaging findings. This includes an explanation of the fibrohistiocytosis type and lymphoplasmacytosis type (IgG4 related IPT of the liver), as well as pseudolymphoma.2. Broad-sense Inflammatory Pseudotumor of the Liver (Broad

Definition of IPT, including liver abscess) We will focus on the changes in imaging findings at wide spectrum of Inflammatory Pseudotumors.3. Differential Diagnosis and Miscellaneous lesions: We will discuss intrahepatic cholangiocarcinoma, inflammatory myofibroblastic tumors (including those related to Epstein-Barr virus), atypical forms of hepatocellular carcinoma, and other conditions such as iatrogenic IPT and recurrent liver masses of unknown etiology.

## GIEE-123 INSIDE OUT: NAVIGATING LYMPH NODES IN RECTAL ADENOCARCINOMA WITH MRI - FROM ANATOMY TO NEOADJUVANT THERAPY

**Awards**
**Cum Laude**

Mona H. Hassan, MBBS, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Provide short overview of rectal adenocarcinoma and its significance. Gain a deep understanding of lymph node anatomy draining the rectal area. Learn how MRI provides a detailed roadmap for assessing lymph nodes in rectal adenocarcinoma and how it is superior over the other imaging modalities. Discover the telltale signs that help differentiate between benign and malignant lymph nodes. Explain the normal lymph node characteristics: size, shape and signal intensity features indicating the abnormal lymph nodes as morphology and signal changes. Decoding lymph node status and learn when they are loco-regional and when they are distant metastasis. Uncover insights into treatment response through a comparison of pre and post therapy MRI images. Discuss the changes observed in lymph nodes after neoadjuvant therapy and their implication for treatment. Identify common traps in lymph node assessment with MRI and learn how to avoid these traps. Explore real life case studies and discover how accurate MRI lymph node assessment improves patient outcomes. Understand the important key elements of an MRI report.

### TABLE OF CONTENTS/OUTLINE

Introduction Lymph node stations for rectal adenocarcinoma MRI technique Role of MRI in primary L.N staging and important anatomic landmarks Detection of suspicious lymph node at MRI: benign vs. malignant lymph nodes Criteria of diagnosis: lymph node size, signal and morphology, what is more important and when? Is it loco-regional or distant metastatic lymph node? Role of MRI in lymph node assessment after therapy The effect of proper staging on clinical implication and treatment planning Common traps in lymph node assessment How to avoid pitfalls and traps Key elements of an MRI report Conclusion

## GIEE-124 NAVIGATING THE PANCREATIC DUCT: AN UP-TO-DATERADIOLOGICAL EXPEDITION THROUGH THE INTRALUMINAL PATHOLOGIES

Venkat Abhinav Katabathina (*Abstract Co-Author*) Nothing to Disclose
Anil K. Dasyam, MD (*Abstract Co-Author*) Nothing to Disclose
Amir Borhani, MD (*Abstract Co-Author*) Institutional research agreement, Siemens AG
Ka-Kei Ngan, MD (*Abstract Co-Author*) Nothing to Disclose
Varaha Tammisetti, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Nikhil Vaishnav Tirukkovalur (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. In addition to iatrogenic devices, biologic material may form in the duct or extend into the duct with potentially deleterious short-term and long-term clinical consequences. 2. Several premalignant and malignant neoplasms can arise in or grow into the pancreatic duct (PD) lumen. Imaging manifestations can sometimes be challenging.

### TABLE OF CONTENTS/OUTLINE

1. Embryology, histology and normal anatomy of PD 2. Role of imaging modalities in assessment of pancreatic duct - advantages and limitations of each 3. Congenital anomalies of pancreatic duct, acquired PD disruption and their clinical implications 4. Alterations in normal composition of pancreatic juice - clinical implications and relevant imaging manifestations - Alterations in pH, enzymes (exocrine pancreatic insufficiency) and DNA 5. Expected and unexpected Iatrogenic devices /foreign material in the PD 6. Non-neoplastic pathologic biologic material in the pancreatic ducal lumen a. Formed in the PD lumen - Protein plugs, calculi and mucin b. Extraneous elements extending into the PD lumen - Blood (hemosuccus pancreaticus), pus (abscess), bile (pancreatobiliary fistula), urine (pancreaticoureteral fistula) and enteric contents/gas from pancreato-enteric fistula 7. Neoplastic entities in the PD lumen a. Primary intraductal neoplastic entities i. Pancreatic intraepithelial neoplasia ii. Intraductal papillary mucinous neoplasm iii. Intraductal oncocytic papillary neoplasm iv. Intraductal tubulopapillary neoplasm v. Colloid carcinoma b. Neoplastic entities growing into PD lumen i. NET ii. PDAC 8. Summary

## GIEE-125 BURSTING THE BUBBLE: A REVIEW OF PNEUMATOSIS INTESTINALIS

Manjiri K. Dighe, MD (*Abstract Co-Author*) Research Grant, Koninklijke Philips NV;Research Grant, General Electric Company
Rajat Bhargava, MD, MBBS (*Abstract Co-Author*) Nothing to Disclose
Minal C. Jagtiani, FRCR,MBBS (*Abstract Co-Author*) Nothing to Disclose
Saubhagya Srivastava, MBBS (*Abstract Co-Author*) Nothing to Disclose
Karthika Devi D S, MBBS (*Abstract Co-Author*) Nothing to Disclose
Thomas Perez, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Discuss the causes and hypothesis of pneumatosis intestinalis (PI) 2. Types of PI: Benign and life-threatening 3. Elaborate the hypotheses for development of PI and discuss the causes for rising incidence 4. Discuss the available treatment options

### TABLE OF CONTENTS/OUTLINE

1. Pneumatosis Intestinalis (PI) - Prevalence and overview 2. Clinical scenarios encountered: ischemia related to thromboembolic events, hypoperfusion, abdominal trauma, post-surgical intervention, pulmonary disease (COPD), systemic disease (autoimmune myositis, SLE), immunocompromised states, post solid organ transplantation 3. Current hypotheses for the development of pneumatosis intestinalis: benign or pathological: Commonly discussed theories: mechanical and bacteria. Mechanical theory proposes that pressurized intraluminal air dissects through the mucosa of compromised bowel and tracks along mesenteric vessels, propagated by peristalsis. Bacterial theory states that gas-producing bacteria invade intramural compartments and congregate in small gas cysts, which is supported by improvement following antibiotic use 4. Pneumatosis post-solid organ transplant- what additional factors do we need to consider? Benign/ life threatening, clinical indicators, immunosuppression and predisposition to PI 5. Current treatment options for pneumatosis intestinalis: emergent survival intervention and revascularization versus medical management (antibiotics, elemental diet and oxygen therapy) 6. Post-surgical pneumatosis: commonly discussed outcomes

## GIEE-126 PANCREATIC TUMOR IMAGING PITFALLS AND HOW TO AVOID THEM

Eric P. Tamm, MD (*Abstract Co-Author*) Institutional Research Grant, General Electric Company. This relationship ended 8/31/21 with end of the period of grant support.
Achal Sarna, MD (*Abstract Co-Author*) Nothing to Disclose
Ott Le, MD (*Abstract Co-Author*) Nothing to Disclose
Mahmoud M. Al-Hawary, MD (*Abstract Co-Author*) Nothing to Disclose
Juan J. Ibarra-Rovira, MD (*Abstract Co-Author*) Nothing to Disclose
Sanaz Javadi, MD (*Abstract Co-Author*) Nothing to Disclose
Priya R. Bhosale, MD (*Abstract Co-Author*) Nothing to Disclose
Vincenzo K. Wong, MD (*Abstract Co-Author*) Nothing to Disclose
Mamie Gao, MD (*Abstract Co-Author*) Nothing to Disclose
Ayman H. Gaballah, MD, FRCR (*Abstract Co-Author*) Nothing to Disclose
Gillis G. Schwartz, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1) illustrate where pancreatic tumor imaging pitfalls may arise 2) approaches to overcome/avoid pitfalls for a variety of pancreatic tumor types

**TABLE OF CONTENTS/OUTLINE**

Pitfalls of imaging technique and how to avoid them. Pitfalls of management/interpretation. For pancreatic cancer (PDAC), staging issues including pancreatitis and use of short term follow-up, hepatic steatosis and the use of MRI, and strategies for postop monitoring to detect subtle recurrence including careful use of postop baseline, common and uncommon recurrence sites including pancreatic remnant, and use of PET/CT. Will also address pancreatic cancer mimics including metastases from other primaries (e.g. renal cell carcinoma), tumors near pancreas, inflammatory conditions, post-surgical changes, and normal fatty changes. For pancreatic neuroendocrine tumors (PNET), tools for staging (DOTATATE vs FDG PET), treatment response (MR imaging including T2 and delayed gadoxetate for following liver metastases), and for differential diagnosis (heat-damaged Tc-99m RBC SPECT CT to identify accessory splenic tissue). For pancreatic cystic lesions, monitoring for solid lesions developing in pancreas remote from cysts, need for history as abscesses and pseudocysts can mimic cystic neoplasms, and review of old studies e.g. given possible cystic evolution of PNETs. In screening populations at high risk for PDAC, inspecting also for primary cancers outside pancreas, i.e. BRCA (e.g. breast, ovarian, prostate and melanoma).

## GIEE-127 WHEN RADIOLOGISTS JOIN THE FBI: FOREIGN BODY INVESTIGATION; AN IMAGING REVIEW OF GASTROINTESTINAL FOREIGN BODIES AND THEIR CLINICAL SIGNIFICANCE, MANAGEMENT, AND COMPLICATIONS

Frank J. Santisi, MD (*Abstract Co-Author*) Nothing to Disclose
Veniamin Barshay, MD (*Abstract Co-Author*) Nothing to Disclose
Sunil Jeph, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Mary M. Woodruff, DO (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Foreign bodies in the gastrointestinal tract, while infrequently encountered, provide memorable cases. In this case based review, we aim to provide the clinical significance and medical management of these foreign bodies. Recognizing and identifying the location and potential complications of a foreign body in the gastrointestinal tract provides a key role in the clinical patient management. We aim to provide a comprehensive review of gastrointestinal foreign bodies using highlighted cases of common and more uncommon complications. Selected cases focus on foreign bodies below the diaphragm.

**TABLE OF CONTENTS/OUTLINE**

Identifying different materials of foreign bodies on imaging.Clinical management and interventions based on type and location of foreign body.Case based review of complications from foreign bodies with key imaging findings and management. Sample cases include:Bowel perforation with liver abscess from ingested plastic spoonBowel and bladder perforation from ingested penBowel obstruction from ingested rubber toyBowel perforation with abdominal wall involvement from ingested penFocal inflammatory reaction from unknown foreign bodyHighlighted teaching cases with key imaging findings and clinical management. Sample cases include:Ingested materials including nail clippers, pen, pencil, pulse ox probe, glass, coins Migrated iatrogenic foreign bodies, various malpositioned gastrointestinal stents and surgical clipsBezoarAttempted overdose with ingested pills

## GIEE-128 A PRACTICAL GUIDE TO CROHN'S IMAGING, THE GOOD, THE BAD AND THE UGLY: TIPS FROM TWO CONTINENTS

Arun Gupta, MBChB (*Abstract Co-Author*) Nothing to Disclose
Alex Fitzhugh, MBBS (*Abstract Co-Author*) Nothing to Disclose
Saubhagya Srivastava, MBBS (*Abstract Co-Author*) Nothing to Disclose
Karthika Devi D S, MBBS (*Abstract Co-Author*) Nothing to Disclose
Minal C. Jagtiani, FRCR,MBBS (*Abstract Co-Author*) Nothing to Disclose
Palveer Bhogal, MBBS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Provide a brief overview of Crohn's disease (CD) with epidemiology, phenotype classification, pathophysiology 2. Compare the spectrum of findings in CD with US, CT and MR Enterography - discussing the strengths, limitations and practical problems faced in daily practice 3. Discuss standardized acquisition protocol for MRE and the significance of sequences used: Europe vs North American protocols (including anti-peristaltic agents) 4. To provide a schematic description of how imaging findings can affect the clinical management strategy

**TABLE OF CONTENTS/OUTLINE**

1. Crohn's disease - Overview and epidemiology 2. US small bowel (SB) preparation and benefits: High resolution and dynamic imaging, practical/economic efficiencies 3. US SB findings: Mural, extraluminal, doppler and motility assessment 4. MR Enterography protocol a. Contrast agents - oral and IV b. Role of antiperistaltic agents: specific differences in two continents c. Sequences utilized and their significance: delayed post contrast imaging in detecting fibrotic stricturing, diffusion-weighted imaging (DWI) d. Role of fluoroscopic sequences 5. MRE/ CTE mural findings: Intramural edema, segmental mural hyperenhancement, bowel wall thickening, ulcerations, sacculations and fibrosis 6. MRE/ CTE mesenteric and extraintestinal findings: Perienteric edema, fibrofatty proliferation, reactive lymphadenopathy, "comb sign", penetrating and perianal CD 7. Signs of active vs chronic inflammation, utility of MRE activity scores 8. Structured reporting: Updated terminology 9. How do imaging findings affect clinical management strategies in CD?

## GIEE-129 OOPS I DROPPED IT AGAIN: MULTI-MODALITY REVIEW OF DROPPED GALLSTONE EVOLUTION, IMAGING APPEARANCE, AND RELEVANT MANAGEMENT

Tasmia Amjad (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Dropped gallstones exhibit a highly variable appearance based on imaging modality, extent of calcification, and scaring or active inflammation. Apparent growth is often due to edema, fibrosis, or shifting calculi. Complications are uncommon. However, they are important to recognize as abscesses and fistulae involving dropped gallstones usually require surgical management.

**TABLE OF CONTENTS/OUTLINE**

Brief discussion of epidemiology and clinical relevance of dropped gallstones. Discussion of the relevant anatomy and both expected and less common locations of dropped gallstone pathology. Examples of variable appearance of dropped gallstones across multiple modalities and changes that occur with time. Discussion of drop gallstone induced complications. Case based review of key learning points and potential pitfalls.

## GIEE-13 CHOLANGIOCARCINOMA: ONE WORD, MANY FACES. A PRIMER FOR RADIOLOGY RESIDENTS

Tatiana J. Ludena Camacho I, MD (*Abstract Co-Author*) Nothing to Disclose
Angel Garrido Urincho, MD (*Abstract Co-Author*) Nothing to Disclose
Dulce A. Sanchez Nava, MD (*Abstract Co-Author*) Nothing to Disclose
Aura Maria M. Gonzalez Peralta, MD, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

• To analyze the role of state-of-the-art imaging techniques in the diagnosis and staging of cholangiocarcinomas.• To describe magnetic resonance imaging features in the spectrum of cholangiocarcinoma, associated with imaging techniques additional.• To discuss management and prognostic implications of classifications according to growth pattern of CCA.• To review the additional value of magnetic resonance cholangiopancreatography in the evaluation of a periductal infiltrating or intraductal growth type tumor.

**TABLE OF CONTENTS/OUTLINE**

Introduction.Anatomic Considerations.Classification.Technique and protocol MRI.Case-based review.Teaching points.Conclusions.

## GIEE-130 CONTRAST ENHANCED US (CEUS) EVALUATION OF HEPATOCELLULAR CARCINOMA TREATED WITH NONRADIATION LOCOREGIONAL THERAPIES

**Awards**
**Magna Cum Laude**

Andrej Lyshchik, MD, PhD (*Abstract Co-Author*) Royalties, RELX;Speaker, General Electric Company;Consultant, General Electric Company;Research support, General Electric Company;Consultant, BioClinica, Inc;Consultant, WCC, Inc;Consultant, Bracco Group;Advisory Board, Bracco Group
Aman Khurana, MD (*Abstract Co-Author*) Nothing to Disclose
Krishna Mundada, MBBS,MBBS (*Abstract Co-Author*) Nothing to Disclose
Mojdeh Mirmomen, MD (*Abstract Co-Author*) Nothing to Disclose

Yuko Kono, MD, PhD (*Abstract Co-Author*) Equipment support, Canon Medical Systems Corporation;Equipment support, General Electric Company;Support, Lantheus Holdings;Support, Bracco Group
Fregenet Gichamo, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

; Review LI-RADS® CEUS NONRADIATION TRA v2024.; Discuss a standardized CEUS imaging protocol for post-treatment assessment of HCC.; Describe typical CEUS enhancement patterns of HCC following nonradiation locoregional therapy, including Transarterial chemoembolization (TACE), Transarterial bland embolization (TAE), Radiofrequency ablation (RFA), Microwave ablation (MWA) or Percutaneous ethanol ablation (PEA).; Discuss diagnostic criteria for tumor viability using CEUS after non-radiation locoregional therapy of HCC.; Identify possible pitfalls of CEUS categorization of treated HCC and explore scenarios where CEUS is not appropriate for post-treatment assessment.; Explore future directions for post-treatment CEUS of liver lesions and the importance of individualised patient care.

**TABLE OF CONTENTS/OUTLINE**

Overview of LI-RADS® CEUS Nonradiation TRA v2024 algorithm; Treated lesion definitions.; CEUS Imaging criteria for intralesional and perilesional tumor viability.; Case-based review of CEUS LR-Viable, LR-TR Nonviable and LR-TR Equivocal after different locoregional treatment modalities, including TACE, TAE, RFA, MWA or PEA.; Suggested imaging workup options time intervals for different treatment modalities. Limiting factors for CEUS only post-treatment assessment; Location, depth and size of treatment cavity.; Time required to assess multiple lesions.; Detection of new lesions.; US artifacts typically seen with treatment cavities. Research Gaps and future studies• Individualized patient care with CEUS- To identify ideal patient cohort based on tumor characteristics and guide in recommending most appropriate follow up imaging modality amongst CEUS, MRI and CT.

## GIEE-131 HIATAL HERNIAE: FILLING IN THE INFORMATION HIATUS

Alberto Martinez-Isla (*Abstract Co-Author*) Nothing to Disclose
Philip J. Shorvon, FRCR, FRCPC (*Abstract Co-Author*) Nothing to Disclose
Minal C. Jagtiani, FRCR,MBBS (*Abstract Co-Author*) Nothing to Disclose
Palveer Bhogal, MBBS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Define a hiatal hernia (HH). Describe prevalence, types and variants 2. Discuss the imaging modalities with pictorial review 3. Outline the imaging findings in HH 4. Discuss the available surgical and endoscopic options for correction and discuss the relevance of imaging findings 5. Discuss the complications of surgery and available imaging investigations used post operatively

**TABLE OF CONTENTS/OUTLINE**

1. Definition - herniation of stomach through the esophageal hiatus. Other organs can also herniate 2. Prevalence: Natural incidence increases with age: 60% people over 60 years. High prevalence in GERD patients; exact mechanism discussed 3. Clinical importance: Prevalence and health impact. About 6% of all primary care prescriptions are for proton pump inhibitors, many for reflux associated with hiatal herniae 4. Types • 1 Sliding • 2 Paraesophageal • 3 Mixed • 4 Additional herniation of other viscera • Paracrural: Rare and not true hiatal hernia but must be differentiated 5. Complications Cameron lesions, ischemia, strictures, Barrett's esophagus, volvulus, throat symptoms 6. Investigative imaging modalities and findings 7. Presurgical planning:

what information does the surgeon need from a radiology report? 8. Surgical (and endoscopic) options • Surgical repair (Mostly laparoscopic. Other options included open repair - transabdominal or transthoracic approach. Use of fundoplication, mesh and gastropexy discussed) • Endoscopic suturing / plication 9. Complications and their imaging: Pneumothorax, infection, bleeding, perforation/ leak, recurrence 10. Post op investigation/prognosis: plain film, fluoroscopy, CT

### GIEE-132 PANCREATIC CYSTIC LESIONS: CT, MR AND ECHO-ENDOSCOPIC CORRELATION

Lourdes del Campo, PhD (*Abstract Co-Author*) Nothing to Disclose
Itxaso Galan-Gonzalez (*Abstract Co-Author*) Nothing to Disclose
Silvia Cayon Somacarrera, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

- To depict the different types of pancreatic cystic lesions with their corresponding image characteristics on CT, MR and echo-endoscopy - To identify the image characteristics that help to evaluate the potencial degree of aggressiveness of each one of them

#### TABLE OF CONTENTS/OUTLINE

The term pancreatic cystic lesion encompasses a wide range of lesions that range from completely benign to potentially malignant entities. Given the increasing incidental detection of pancreatic cystic lesions, it is important for radiologists to know the characteristics of each of them and the radiological signs suspicious of malignancy, thus avoiding surgical interventions and unnecessary healthcare costs. In addition, it is also important to determine the need for follow-up. We have reviewed all pancreatic cystic neoplasms detected in our center since 2005. Their radiological characteristics are shown through the use of CT, MR and echo-endoscopy when available. We also describe the signs that lead to suspicion of malignancy and the follow-up diagnostic algorithm developed by the multidisciplinary committee of our center.

### GIEE-133 PHYSICS INSIGHTS INTO LIVER MRI: EDUCATIONAL GUIDANCE FOR PROTOCOL OPTIMIZATION

Simon Gauvin, MD (*Abstract Co-Author*) Nothing to Disclose
Evan McNabb (*Abstract Co-Author*) Nothing to Disclose
Khaled Alanazi (*Abstract Co-Author*) Nothing to Disclose
Veronique Fortier (*Abstract Co-Author*) Nothing to Disclose
Caroline Reinhold, MD, MSc (*Abstract Co-Author*) Research Grant, Imagia Cybernetics Inc
Jeremy Dana, MD, PhD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

MRI quality can be defined by the signal-to-noise ratio, contrast-to-noise ratio, and spatial resolution. - Signal-to-noise ratio is inversely proportional to spatial resolution and proportional to scan time, leading to necessary clinically relevant compromises. - Field-of-view should be adjusted to the patient's width to improve spatial resolution, e.g. conspicuity of the biliary tree, while maintaining the matrix size and being time neutral. - Conventional TSE should be preferred over radial TSE or HASTE/SSFSE to achieve optimal liver contrast-to-noise ratio, especially for tumoral characterization or detection. - Multi-shot echo planar diffusion-weighted imaging is more robust than single-shot to distortion artifacts from air-filled structures but more time-consuming.

#### TABLE OF CONTENTS/OUTLINE

1. MRI quality: signal-to-noise ratio, contrast-to-noise ratio, spatial resolution. 2. Understanding the impact of key technical parameters (field-of-view, matrix size, slice thickness, averages, etc.) on MRI quality and scan time. 3. Understanding tissue contrast (T1 T2) and how to image it (TR, TE, Flip angle). 4. Understanding different types of pulse sequence and their applications in liver imaging in the perspective of their strengths and limitations: TSE (conventional, radial, driven equilibrium, single-shot), DWI/ADC (acquisition modes, etc.), MRCP, fat suppression techniques, contrast agent (dynamic acquisition and impact on other pulse sequences). 5. Insight into quantitative liver MRI: fat and iron quantification, MR Elastography. 6. Insight into acceleration techniques and deep learning reconstructions. 7. Revelling the hidden companions of MRI: respiration, quality control.

### GIEE-134 BEYOND THE WHITE PAPERS: AN UPDATE ON THE MANAGEMENT OF INCIDENTAL FINDINGS SEEN ON IMAGING STUDIES OF THE ABDOMEN AND PELVIS

Michael T. Corwin, MD (*Abstract Co-Author*) Consultant, Corcept Therapeutics Inc
Michael C. Larson, MD, PhD (*Abstract Co-Author*) Stockholder, D3Sciences;Stockholder, Emagine Solutions Technology
Ramit Lamba, MD (*Abstract Co-Author*) Nothing to Disclose
Ghaneh Fananapazir, MD (*Abstract Co-Author*) Nothing to Disclose
Benjamin Carney, MS, MD (*Abstract Co-Author*) Nothing to Disclose
Chirag Govardhan, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1) To discuss the imaging findings and management recommendations for common incidental findings seen on imaging studies of the abdomen and pelvis that are not covered by the existing ACR White Papers. 2) To review up-to-date evidence regarding incidental findings that support or contradict existing White Paper recommendations.

#### TABLE OF CONTENTS/OUTLINE

1) The importance of incidental findings. 2) What are the White Papers? 3) Hepatic: Topics not covered by the White Papers include hyperechoic lesions and solid hypoechoic lesions on ultrasound. Updates on hepatic topics include hyperenhancing lesions on contrast-enhanced CT. 4) Biliary: Updates on biliary topics include extrahepatic biliary ductal dilatation, focal fundal gallbladder wall thickening, and gallbladder polyps. 5) Renal: Topics not covered by the White Papers include hyperechoic lesions on ultrasound and T1-hyperintense lesions on MRI. Updates on renal topics include indeterminate homogeneous renal masses on contrast-enhanced CT (21-39 HU range). 6) Bowel: Topics not covered by the White Papers include incidental intussusception of the small bowel and colon. 7) Mesentery: Topics not covered by the White Papers include misty mesentery/sclerosing mesenteritis. 8) Testicular: Topics not covered by the White Papers include microlithiasis and isolated right-sided varicoceles. 9) Spleen: Updates on splenic topics include cystic lesions and solid lesions.

### GIEE-135 PROGNOSTIC AND PREDICTIVE IMAGING MARKERS OF HEPATOCELLULAR CARCINOMA: A PICTORIAL ESSAY

**Awards**
**Certificate of Merit**

Claude B. Sirlin, MD (*Abstract Co-Author*) Research Grant, General Electric Company;Research Grant, Siemens AG;Research Grant, Bayer AG;Research Grant, Gilead Sciences, Inc;Research collaboration, Gilead Sciences, Inc;Research Grant, Koninklijke Philips NV;Research Grant, Pfizer Inc;Equipment support, General Electric Company;Consultant, Pfizer Inc;Consultant, AMRA AB;Consultant, Guerbet SA;Officer, Livivos, Inc;Advisor, Quantix Bio LLC

Banmeet Padda (*Abstract Co-Author*) Nothing to Disclose
Jean-Sebastien S. Billiard, MD,FRCPC (*Abstract Co-Author*) Nothing to Disclose
Claudia Deyirmendjian, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Recognize known prognostic markers in hepatocellular carcinoma (HCC);
- Understand imaging features associated with HCC prognosis;
- Identify these features on CT and MRI.

**TABLE OF CONTENTS/OUTLINE**

1) Introduction distinction between prognostic markers (predict natural history or outcome) vs. predictive features (predict responsiveness or lack of response to therapy before the therapy is applied), novel imaging markers of HCC to improve patient management. 2) Prognostic pathologic features epidemiology, histologic classification, associated prognosis. 3) Prognostic molecular features proliferative versus non-proliferative HCC, molecular subclasses, genetic features, main signaling pathways, epigenetic features. 4) Emerging prognostic imaging features radiologic characteristics associated with proliferative and non-proliferative HCC, LI-RADS categories, case examples, biologic rationale, predictors of microvascular invasion, limitations of discussed imaging features. 5) Management and predictive features medical and interventional or surgical therapies, current role of biomarkers, considerations for specific pathologic and molecular subtypes. 6) Future directions validation of prognostic and predictive markers, integration of such markers into the radiology LI-RADS report.

## GIEE-136 MULTI-PHASE CT OR SPLIT BOLUS CT: SPLIT BOLUS CT CAN REDUCE RADIATION DOSE AND IMPROVE DIAGNOSTIC ACCURACY IN ABDOMINAL CONTRAST-ENHANCED CT

Koji Muroga (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To learn the reduction of radiation exposure in the abdominal multi-phase CT.To learn the advantages of decreasing the number of scans.To learn the methods for decreasing the number of scans.To learn split bolus CT to acquire the images with combined dual-contrast phases.To learn the advantages of split bolus CT.

**TABLE OF CONTENTS/OUTLINE**

A. Reduction of radiation exposure in abdominal contrast-enhanced CT. B. Advantages of reducing number of scans. C. Images with combined dual-contrast phases. D. Method of obtaining images combined arterial and venous phases. E. Advantages of split-bolus CT. / Split-bolus CT can obtain the images combined arterial and venous phases by a single-phase scanning in abdominal contrast-enhancement CT. As a result, split-bolus CT can reduce the radiation dose by 46% by reducing the number of scans compared to multi-phase CT. In addition, Split-bolus CT can obtain the CT images without misregistration. This allows simultaneous and accurate assessment of the position and size of vessels, organs, and tumors, improving diagnostic accuracy, and is particularly beneficial before gastrointestinal laparoscopic surgery. High diagnostic accuracy on reduced CT images can improve efficiency and reduce the workload for radiologists and surgeons.

## GIEE-137 FIRST STOPS ON A DIRE ROUTE: MAPPING GI CANCER'S NODAL METASTASIS

Fernanda L. Mazzucato, MD (*Abstract Co-Author*) Nothing to Disclose
Cynthia L. Borborema, MD (*Abstract Co-Author*) Nothing to Disclose
Giuseppe D'Ippolito, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Ulysses S. Torres, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Eduardo O. Pacheco, MSc, MD (*Abstract Co-Author*) Nothing to Disclose
Bruna K. Andreucci, MD (*Abstract Co-Author*) Nothing to Disclose
Julia De Toledo Mendes, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Delineate the specific pathways of first nodal metastasis corresponding to tumor sites within the esophagus, stomach, liver, gallbladder, small bowel, and colorectum. 2. Explore pertinent clinical and radiological data for assessing adenopathies in patients diagnosed with these tumor types, alongside the staging classification systems employed for their evaluation, illustrated with clinical radiological examples. 3. Analysis of the functions and constraints of imaging methods, focusing on CT and MRI.

**TABLE OF CONTENTS/OUTLINE**

1.Global burden from the major cancers of the gastrointestinal tract. 2. Common Pathways of first nodal metastasis of the gastrointestinal tract. 3. Illustrations of common pathways. 4. The TNM Classification of gastrointestinal malignancies and its key clinical value in guiding patient management decision-making. 5.Case-based presentation of the main gastrointestinal malignancies with first nodal metastasis in MRI and CT imaging, encompassing conditions such as gastric, gallbladder, distal ileum, right colon, rectal, and anal neoplasms. 6.Outlining key take-home messages.

## GIEE-138 DIAGNOSTIC ERRORS IN ULTRASOUND OF THE PANCREAS - A COMPREHENSIVE CASE-BASED REVIEW ON LESSONS LEARNT FROM QUALITY ASSURANCE ROUNDS

**Awards**
**Certificate of Merit**

Irene Ai Linn Wong (*Abstract Co-Author*) Nothing to Disclose
Denise Simin Lau (*Abstract Co-Author*) Nothing to Disclose
Catherine Wan Ting Tan (*Abstract Co-Author*) Nothing to Disclose
Yuet Wah Wong (*Abstract Co-Author*) Nothing to Disclose

Rafidah Abu Bakar, MMedSc (*Abstract Co-Author*) Nothing to Disclose
Voon Chee Ma (*Abstract Co-Author*) Nothing to Disclose
Nanda Venkatanarasimha, FRCR, FRANZCR (*Abstract Co-Author*) Nothing to Disclose
Ying Ying Kho (*Abstract Co-Author*) Nothing to Disclose
Gaik Mooi Tan Florence (*Abstract Co-Author*) Nothing to Disclose
Si Min Teo, MSc (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Provide a comprehensive review of the sonographic features of the normal pancreas, anatomical variants, common and uncommon pathologies including their mimics. 2. Illustrate and discuss potential errors/misdiagnosis on ultrasound pancreas based on lessons learnt from quality assurance rounds. 3. Discuss tips and tricks that can help prevent these errors and improve diagnostic accuracy.

**TABLE OF CONTENTS/OUTLINE**

1. Review anatomy and anatomical variants on ultrasound 2. Scanning techniques 3. Case-based review of a wide variety of diagnostic errors encountered in pancreatic ultrasound, which include: (i) Perceptual errors, such as false negatives involving neoplasms and intrapancreatic splenunculus. (ii) Interpretive errors, including mimics of neoplasms, inflammatory conditions and focal fatty sparing. (iii) Errors related to information transfer, involving inaccurate interpretation of neoplasms, pseudocyst and splenosis due inadequate correlation with clinical history. (iv) Errors related to processes, encompassing undetected malignancy attributed to incomplete assessment, and inadequate assessment of cystic neoplasms. 4.Correlative imaging studies and illustrations will be reviewed. 5. Tips to mitigate these potential errors will be highlighted.

## GIEE-139 LOOKING BEHIND THE RECTUM. A COMPREHENSIVE GUIDE TO RETRORECTAL-PRESACRAL SPACE WITH RADIOLOGIC-PATHOLOGIC CORRELATION

**Awards**
**Certificate of Merit**

Sara Moron Hodge (*Abstract Co-Author*) Nothing to Disclose
Eva Pena Burgos (*Abstract Co-Author*) Nothing to Disclose
Maria del Mar Tapia Vine, MD (*Abstract Co-Author*) Nothing to Disclose
Amine Moultamis, MD (*Abstract Co-Author*) Nothing to Disclose
Angel Romero Guzman (*Abstract Co-Author*) Nothing to Disclose
Paula A. Hidalgo, MD (*Abstract Co-Author*) Nothing to Disclose
Carmen Martin Hervas (*Abstract Co-Author*) Nothing to Disclose
Nuria Saturio Galan (*Abstract Co-Author*) Nothing to Disclose
Maria Aguilar Picapiedra (*Abstract Co-Author*) Nothing to Disclose
Juan Diego De La Morena Molina, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. To illustrate the anatomy and embryology of the retrorectal-presacral space.2. To propose a stepwise-based imaging approach to facilitate the differential diagnosis of retrorectal-presacral masses and review its related lesions.

**TABLE OF CONTENTS/OUTLINE**

1. Review the anatomy and embryology of the retrorectal-presacral space through illustrations, MRI images, and cadaveric correlation. 2. Classification of the spectrum of masses from a histopathological perspective to globally assess the heterogeneity of lesions in this location. 3. Imaging evaluation. 3.1 Diagnostic clues for assessing posterior pelvic-space dependency. 3.2 Morphological evaluation of the lesion. 3.2.1 Learn to identify red flags indicative of malignancy. 3.2.2 Stratify the lesions into cystic or solid-complex, and into the presence or absence of fat content. 4. Develop an algorithm approach that facilitates the differential diagnosis for retrorectal-presacral masses grouping the lesions according to the descriptors mentioned previously into: 4.1 Non-fat containing cystic masses. 4.2 Fat containing cystic masses. 4.3 Non-fat containing solid-complex masses. 4.4 Fat-containing solid-complex masses. 5. Present multimodality imaging of these lesions following this approach with radio-pathologic correlation. 6. Review of the management of retrorectal-presacral lesions. Focus on indications for biopsy and access route. 7. Take home points.

## GIEE-14 CHALLENGES AND PITFALLS IN RECTAL CANCER MRI: FROM IMAGE ACQUISITION TO INTERPRETATION

Christopher A. Mejias, MD (*Abstract Co-Author*) Nothing to Disclose
Achille Mileto, MD (*Abstract Co-Author*) Consultant, Bayer AG
Bahar Mansoori, MD (*Abstract Co-Author*) Nothing to Disclose
Lindsey Durowoju (*Abstract Co-Author*) Nothing to Disclose

Yongjun Liu (*Abstract Co-Author*) Nothing to Disclose
Karthika Devi D S, MBBS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1) Currently faced challenges in optimized preparation and acquisition techniques in rectal cancer MRI.2) Review challenging concepts in reporting of initial staging of rectal cancer.3) Assessing rectal cancer response to treatment and pitfalls in reporting post-treatment MRI.4) Challenges of management of rectal cancer post-neo-adjuvant treatment from surgeons' standpoint.5) Review imaging patterns and management of rectal cancer recurrence.6) Discuss the future role of radiology in rectal cancer patients.

**TABLE OF CONTENTS/OUTLINE**

1. Importance of Optimized Preparation and Acquisition TechniqueUse of spasmolyticsBowel prepMicro-enemaBladder emptyingRectal gelIV contrast2. ReportingStagingTumor to anal verge distance measurementsT staging for cancers with anal sphincter complex involvementDefinition of T stage based on MRF vs peritoneal involvementDefinitions for lymph node vs tumor depositsDefinitions to assess regional and non-regional lymph nodesAssessment of EMVI in locally advanced rectal cancer-Sensitivity specificity of MRI-Role of DWI-Prognostic significance.3. Post treatment/ re-stagingMutinous tumormTRG/post-treatment scan T staging in anal canal involvementHigh inter-reader variability in post treatment settingRates of rad-path discordance clinical outcomesChallenges of the surgeon in post-treatment cases.4. Pelvic recurrence of rectal cancerImaging patternsPrognosisManagement5. Future directionsMotion mitigation strategies (AI-enabled denoising methods, faster MRI acquisition, etc)Texture analysis and combined approaches.

## GIEE-140 "MISS ME NOT"- THE MANY FACES OF MECKEL'S DIVERTICULUM

**Awards**
**Cum Laude**

Yashant Aswani, MD (*Abstract Co-Author*) Nothing to Disclose
Ahmad I. Farah, MBBS (*Abstract Co-Author*) Nothing to Disclose
Ananya Panda, MD, MBBS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

• Review the embryology and anatomy of Meckel's Diverticulum (MD) • Review role of radiology and normal appearances of MD • Discuss multimodality imaging of complications of MD

**TABLE OF CONTENTS/OUTLINE**

I. Embryology and Anatomy of Meckel's Diverticulum (MD) II. Normal MD on different imaging modalities III. Role of Radiology IV. Complications of MD 1. MD with heterotopic gastric /pancreatic mucosa 2. MD with enteroliths/ foreign bodies 3. Meckel's diverticulitis a) Uncomplicated Meckel's diverticulitis b) Meckel's diverticulitis with Perforation c) Meckel's diverticulitis with Abscess 4. MD with small bowel obstruction a). Due to Volvulus b). Due to Inverted MD c). Due to Internal hernia d). Littre's Hernia e). Intussusception 5. MD with active GI bleeding 6. MD associated with malignancy (neuroendocrine tumor, gastrointestinal stromal tumor, etc.) V. Common Differential Diagnosis and Imaging Pearls.

## GIEE-141 UPDATE IN ESOPHAGEAL SURGERY: TECHNIQUES, EXPECTED FINDINGS AND POSTOPERATIVE COMPLICATIONS

Noelia Bravo Alcobendas, MD (*Abstract Co-Author*) Nothing to Disclose
Lucia Martinez De Vega, MD (*Abstract Co-Author*) Nothing to Disclose

## GIEE-143 MRI OF RECTAL CANCER AFTER NEOADJUVANT TREATMENT: IMAGING PEARLS

Raquel Garcia Latorre, MD (*Abstract Co-Author*) Nothing to Disclose
Ana Villanueva, MD (*Abstract Co-Author*) Nothing to Disclose
Alba Salgado Parente, MD (*Abstract Co-Author*) Nothing to Disclose
Elena Canales Lachen (*Abstract Co-Author*) Nothing to Disclose
Noelia Bravo Alcobendas, MD (*Abstract Co-Author*) Nothing to Disclose
Alba Fernandez-Rodriguez, MD (*Abstract Co-Author*) Nothing to Disclose
Ana M. Vera-Carmona, MD (*Abstract Co-Author*) Nothing to Disclose
Lucia Martinez De Vega, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Brief description of the current situation, epidemiology and therapeutic options for rectal cancer. Watch and Wait strategy. Review of anorectal anatomy in MRI and semiology of rectal adenocarcinoma.Review of the study acquisition protocol: need for oblique sequences to the tumor.Review of imaging findings after radio-chemotherapy treatment by using illustrative cases. Degree of response and main false positives.Proposal of structured report and simple conceptual classification.

**TABLE OF CONTENTS/OUTLINE**

Colorectal cancer represents the second most frequent tumor diagnosed in the population after breast and prostate. Given its high prevalence and the fact that its incidence is increasing in young patients, an "organ-preserving" therapeutic management is currently preferred after achieving a complete tumor response with effective neoadjuvant chemoradiotherapy; thus, avoiding the harmful effects and morbidity of surgery. This strategy is known as "Watch Wait" and consists of a close follow-up where MRI plays a leading role. Therefore, correct acquisition of the study is essential, using high-resolution T2 morphological and diffusion sequences angled to the tumor, which allow us to accurately assess and rule out tumor remnants or recurrences. In addition, it is necessary to have a deep knowledge of the imaging findings in response after treatment, both of the primary tumor and lymph node involvement, as well as to identify the main pitfalls. All this with the aim of providing useful and accurate information to the clinician.

## GIEE-144 TECHNIQUES FOR OPTIMIZING SONOGRAPHIC ANALYSIS OF GALLBLADDER POLYPS

Malak Itani, MD (*Abstract Co-Author*) Nothing to Disclose
Katerina Konstantinoff, MD (*Abstract Co-Author*) Nothing to Disclose
William D. Middleton, MD (*Abstract Co-Author*) Nothing to Disclose
Aya Kamaya, MD (*Abstract Co-Author*) Royalties, RELX;Research Grant, Canon Medical Systems Corporation
Christopher I. Fung, MD (*Abstract Co-Author*) Stockholder, Mikata Health
Sharlene A. Teefey, MD (*Abstract Co-Author*) Nothing to Disclose
Katharina Feister, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

In 2022, the Society of Radiologists in Ultrasound (SRU) Consensus Conference updated the risk-stratification and management guidelines for gallbladder polyps (GBP) based on their shape size. Optimizing sonographic diagnosis analysis of a GBP is important as it allows appropriate classification clinical decision making. This exhibit will:1. Review the SRU GBP management guidelines 2. Discuss sonographic techniques for optimizing gray scale Doppler parameters useful in diagnosing analyzing GBPs

**TABLE OF CONTENTS/OUTLINE**

1. General techniques for evaluating the GB: fasting state, subcostal intercostal scans, tips if GB is difficult to identify2. Techniques to diagnose GBPs: a. Exclude shadowing: highest transmit frequency, single focal zone at the level of interest, turn off real time compounding b. Exclude mobility: scan in different positions (upright, prone, RPO) c. Document internal vascularity: optimize Doppler parameters with low pulse repetition frequency wall filter, high gain color threshold, adjust transmit frequency based on depth d. Exclude signs of adenomyomatosis: Comet tail/Twinkle artifacts, cystic spaces3. Techniques for analyzing polyps: a. Measurement: largest diameter of largest GBP, round to nearest mm b. Shape (pedunculated vs sessile): increase transmit frequency, decrease depth image width, magnify image, cine clips to show wiggle c. Other signs: adjacent wall thickening, liver invasion/metastasis, adenopathy4. Alternative/further imaging: a. Follow up US: poor exam, contracted GB, can't distinguish sludge vs GBP b. CEUS for sludge vs GBP analysis of GBP enhancement c. CT vs MRI

## GIEE-145 OPTIMIZING SONOGRAPHIC ANALYSIS OF SUPERFICIAL SOFT TISSUE MASSES

Sharlene A. Teefey, MD (*Abstract Co-Author*) Nothing to Disclose
Malak Itani, MD (*Abstract Co-Author*) Nothing to Disclose
William D. Middleton, MD (*Abstract Co-Author*) Nothing to Disclose
Katharina Feister, MD (*Abstract Co-Author*) Nothing to Disclose
Katerina Konstantinoff, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The Society of Radiologists in Ultrasound (SRU) recently published a consensus conference statement that provided guidelines for categorization management of superficial soft tissue masses (SSTM). This included an unillustrated review of techniques for optimizing the examination.This exhibit aims to: Expand elaborate on optimal US techniques for imaging SSTMs and provide an illustrated review. Provide abundant examples of how optimal technique leads to improved diagnosis. Summarize SRU guidelines for SSTMs.

**TABLE OF CONTENTS/OUTLINE**

1. Required equipment - Essential: Multiple linear probes of varying frequency, grayscale with harmonic imaging spatial compounding, color, power spectral Doppler. Useful but non-essential: Bedside table adjustable stool, panoramic scans, dual screen grayscale/Doppler, advanced techniques (e.g. contrast enhanced US)2. Generic imaging protocol - Longitudinal transverse grayscale images, static images cine clips at rest with dynamic maneuvers, measurement in 3 orthogonal planes, Doppler3. Optimizing imaging techniques with case examples - Adjusting transmit frequency to match the depth of lesion, comparison to surrounding tissues contralateral side when applicable, dynamic maneuvers - compression, muscle contraction, Valsalva etc., Doppler settings - scale, frequency, gain etc.4. Characterize lesions based on sonographic appearance - Composition (solid, cystic, mixed), echogenicity, margins, internal architecture, location/relationship to adjacent structures, vascularity, classic benign lesions5. Summarize SRU consensus guidelines for categorization management of SSTMs

## GIEE-147 SIMPLE MUCINOUS CYST OF PANCREAS: IS IT REALLY A BENIGN LESION?

Bengi Gurses (*Abstract Co-Author*) Nothing to Disclose
Duygu Atasoy, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Develop an understanding of simple mucinous cysts (SMC)
- Understand difference of SMC from other mucinous cysts in pancreas
- Learn imaging features of SMC
- Compare SMC to other similar cystic lesions to make differential diagnosis.
- Discuss relation of SMC and PDAC

**TABLE OF CONTENTS/OUTLINE**

- Cystic Lesions of Pancreas
- Mucinous Cysts of Pancreas
- Definition of Simple Mucinous Cysts
- Pathologic Definition of SMC
- Imaging Features of SMC
- Differential Diagnosis of SMC
- Misnomer or Not: Are SMCs Truly Simple?
- Malignancy Potential of SMC
- SMC and PDAC: Is There a Relationship?

## GIEE-148 RARE CYSTIC LESIONS OF PANCREAS

Bengi Gurses (*Abstract Co-Author*) Nothing to Disclose
Duygu Atasoy, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Learn classification of pancreatic cystic lesions
- Develop an awareness of rare pancreatic cystic lesions
- Learn imaging features of retention cysts, squamoid cysts of pancreatic ducts, simple mucinous cysts
- Learn to make differential diagnosis.
- Discuss malignancy potential of rare pancreatic cysts

**TABLE OF CONTENTS/OUTLINE**

- Cystic Lesions of Pancreas
- Classification of Cystic Lesions
- Neoplastic Cysts of Pancreas
- Non-neoplastic Cysts of Pancreas
- Retention Cysts

- Simple Mucinous Cysts
- Squamoid Cyst of Pancreatic Ducts
- Lymphoepithelial Cysts
- Awareness: Radiologic Differentiation of Rare Cystic Lesions from Other Pancreatic Lesions
- Attention: Clinical Importance of Rare Cystic Lesions
- Fear: Malignancy Potential of Rare Pancreatic Cystic Lesions

## GIEE-149 JOURNEY EXPLORING THE VALUABLE IMAGING QUANTITATIVE PARAMETERS IN HEPATOCELLULAR CARCINOMA: CURRENT USE AND POTENTIAL APPLICATIONS

**Awards**
**Certificate of Merit**

Tetsuya Tachiiri (*Abstract Co-Author*) Nothing to Disclose
Nagaaki Marugami (*Abstract Co-Author*) Nothing to Disclose
Kiyoyuki Minamiguchi (*Abstract Co-Author*) Nothing to Disclose
Toshihiro Tanaka (*Abstract Co-Author*) Nothing to Disclose
Mariko Irizato (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The purpose of this exhibit is to review various quantitative values (e.g.,tumor steatosis, stiffness, vascularity, etc.) of multimodality imaging reported in hepatocellular carcinoma (HCC), to clarify the background that these quantitative values reflect (e.g., histopathology and immunopathology), and to discuss the potential application of these quantitative values in the coming era of personalized therapy for HCC.

### TABLE OF CONTENTS/OUTLINE

In HCC, there have been many reports of quantitative parameters using MRI, perfusion-CT, PET-CT, etc. with the aim of improved clinical prognosis and clarification of the tumor biology. However, no report has summarized these parameters previously reported, resulting in a sporadic situation. Additionally, in recent years, there has been an exponential increase in reports on radiomics, an emerging field in image analysis for characterizing HCC. Understanding these quantitative parameters as well as the background they represent will help clinicians consider about treatment strategy based on these values.Table of contents is as follows.1) Overview of quantitative values reported in HCC2) Association of the quantitative values with their background through representative case3) Potential application of these quantitative values to current treatment strategy in HCC

## GIEE-15 THE REAL QUESTION- IS IT RESECTABLE? RESPONSE EVALUATION AFTER NEOADJUVANT THERAPY IN PANCREATIC CARCINOMA: A GREEN SIGNAL FOR SURGERY

Jitin Goyal, MBBS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Neoadjuvant treatment (NAT) aims to downstage borderline resectable and locally advanced pancreatic adenocarcinomas to make patients amenable to surgery with R0 resection and prolongation of overall survival.Contrast Enhanced Computed tomography (CT) remains the primary imaging tool for assessing treatment response after neoadjuvant therapy due to higher spatial resolution and multiplanar reconstruction. Nevertheless, the interpretation of imaging findings remains challenging, due to similarity between viable tumor and treatment-related changes following NAT. In various studies ,changes in tumor size or volume following neoadjuvant therapy were not significantly associated with R0 resection or survival outcomes. Increased tumor attenuation in the arterial and venous phases after neoadjuvant therapy was associated with R0 resection in patients with locally advanced and borderline resectable tumors. Partial regression of tumor-vessel contact after neoadjuvant therapy had 100% positive predictive value for R0 resection, regardless of the degree of either reduction in tumor size or residual vascular involvement.Decreased venous stenosis or decreased contour deformation indicates improved venous involvement after NAT.

### TABLE OF CONTENTS/OUTLINE

Favorable imaging findings on Contrast Enhanced Computed tomography after neoadjuvant therapy include partial regression of tumor contact with peripancreatic vessels, a mild fat-stranding perivascular halo in place of solid tumor contact with a vessel, and reduction in tumor size according to RECIST 1.1 guidelines.

## GIEE-150 IMPACT OF FAT ESTIMATION OF PANCREATIC PARENCHYMA

Atsushi Higaki, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Yoshihiko Fukukura, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Tsutomu Tamada, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Akira Yamamoto, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Kiyoka Maeba, MD (*Abstract Co-Author*) Nothing to Disclose
Akihiko Kanki, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The purpose of this presentation is:1) To demonstrate the epidemiology of intrapancreatic fat and the characteristic imaging findings of computed tomography and magnetic resonance imaging, including the radiologic-pathologic correlations.2) To learn about the relationship between intrapancreatic fat and various metabolic diseases, pancreatitis, pancreatic cancer, and intraductal papillary mucinous neoplasm.

### TABLE OF CONTENTS/OUTLINE

CONTENTS ORGANIZATIONThe fat in pancreatic parenchyma for1. Metabolic diseases2. Pancreatitis3. Pancreatic fistula4. Intraductal papillary mucinous neoplasm5. Pancreatic cancer

## GIEE-151 IMAGING SPECTRUM AND DIAGNOSTIC CHALLENGES OF ATYPICAL HEPATOCELLULAR CARCINOMA

Igor Goykhman, DO (*Abstract Co-Author*) Nothing to Disclose
Joseph Nenow, MD (*Abstract Co-Author*) Nothing to Disclose
Vivian W. Huang, DO (*Abstract Co-Author*) Nothing to Disclose
Angelica Patino, MD (*Abstract Co-Author*) Nothing to Disclose
Zahraa Al-Turaihi, MD (*Abstract Co-Author*) Nothing to Disclose
Ryan J. Smith, MD (*Abstract Co-Author*) Nothing to Disclose
Zachary B. Hoskins, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Hepatocellular carcinoma (HCC) is a high mortality malignancy, with imaging playing a crucial role in early detection. 2. Recognize the typical imaging features of hepatocellular carcinoma. 3. Infiltrative HCC can have features which overlap with typical HCC, or can look markedly abnormal with features including tumor-in-vein. 4. Identify features found in biphenotypic tumors and their overlap with HCC and cholangiocarcinoma. 5. Infiltrative HCC and biphenotypic tumors do not behave like typical HCC, therefore a radiologist should have a high index of suspicion for these entities in patients with chronic liver disease.

**TABLE OF CONTENTS/OUTLINE**

I. Introduction a. Mortality of HCC b. Imaging utilization in the pre-operative evaluation II. Typical HCC a. Arterial phase hyperenhancement and washout i. Physiology ii. CT iii. MRI b. Ancillary features c. Ultrasound III. Infiltrative HCC, on a spectrum of cases that resemble typical HCC to more atypical. a. Mimickers b. Cases which retain features of typical HCC c. Cases which are difficult to characterize d. Cases with tumor-in-vein i. MRI appearance ii. Ultrasound 1. Spectral Doppler 2. Differentiation from bland thrombus IV. Combined HCC/cholangiocarcinoma a. Statistics in chronic liver disease b. Imaging findings of typical cholangiocarcinoma c. Imaging characteristics i. Cases that resemble HCC ii. Cases that resemble cholangiocarcinoma

## GIEE-152 BEYOND THE BULGE: A FOUNDATIONAL REVIEW OF DYNAMIC ULTRAOUND OF THE ABDOMINAL WALL

Young H. Kim, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Aniket Pandya, MD (*Abstract Co-Author*) Nothing to Disclose
Patrick Svrcek, MD (*Abstract Co-Author*) Nothing to Disclose
Christine Yao, BA, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Our educational exhibit aims to provide a foundation for the ultrasound (US) evaluation of abdominal wall "bulges" or hernias, particularly with the use of dynamic maneuvers. First, a comprehensive understanding of the variations in abdominal wall anatomy to the level of the inguinal region is crucial to the diagnostic process. Using both positional changes (upright, supine) and manipulation of intra-abdominal pressure (Valsalva, coughing) during ultrasound examination will allow for real-time assessment of the behaviors and movement of herniated contents. Effective use of dynamic maneuvers can increase sensitivity and accuracy of US, which can eliminate the need for more costly cross-sectional imaging with CT or MRI. When assessing a hernia, we will highlight the importance of documenting features such as size, sac contents, and estimated fascial defect. Additionally, we will review post-operatively imaging such as expected and unexpected surgical changes. Finally, we will also cover both common and rare differential diagnoses or mimics of hernias when evaluating for an abdominal wall palpable complaint.

**TABLE OF CONTENTS/OUTLINE**

1. Learn overview of anterior abdominal anatomy with specific attention to ultrasound appearance and the common locations for abdominal wall hernias to arise. 2. Recognize classic imaging features of abdominal wall hernias and hernia sac contents. ?3. Understand how dynamic imaging maneuvers such as (positional changes, Valsalva, etc.) is key to the evaluation of an abdominal hernia. 4. Review the expected post-operative appearance of a hernia repair and common post-operative complications. 5. Appreciate imaging features of common and rare mimics of abdominal wall hernias.

## GIEE-153 HEPATIC ELASTOGRAPHY: THE IMPORTANCE OF ITS INTERPRETATION

Marcos R. Queiroz, MD, MBA (*Abstract Co-Author*) Nothing to Disclose
Luiz Nascimento (*Abstract Co-Author*) Nothing to Disclose
Miguel J. Neto (*Abstract Co-Author*) Nothing to Disclose
Fernanda Fleming (*Abstract Co-Author*) Nothing to Disclose
Victor Arthur Ohannesian (*Abstract Co-Author*) Nothing to Disclose
Pedro Carani (*Abstract Co-Author*) Nothing to Disclose
Marcelo R. Silva, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Ultrasound elastography was described for the first time in 2003 as a novel method for assessing and staging liver fibrosis.- Together with B-mode and Doppler study evaluation, both able to be performed simultaneously with elastography, a complete liver profile is created with a single exam.- Adequate interpretation of elastography results requires the patient's clinical condition and laboratory exams to be taken into context by the radiologist.- Multiple factors, such as high-intensity physical activity, beta-blocker use, and recent excessive alcohol consumption, can affect elastography results.- It is fundamental that the radiologist has knowledge to not only perform the elastography exam but also interpret results considering each patient's clinical context.

**TABLE OF CONTENTS/OUTLINE**

- Introduction on hepatic ultrasound elastography- Confounding factors that increase liver stiffness- Interpretation of elastography on patients with viral hepatitis and non-alcoholic fatty liver disease- Clinical cases and discussion

## GIEE-154 PANCREATIC NEUROENDOCRINE TUMORS: CT FEATURES TO HELP PREDICT TUMOR GRADE

Elliot K. Fishman, MD (*Abstract Co-Author*) Co-founder, HipGraphics, Inc Stockholder, HipGraphics, Inc Institutional Grant support, Siemens AG Institutional Grant support, General Electric Company Consultant, Exact Sciences Corporation Consultant, Imaging Endpoints II LLC
Linda C. Chu, MD (*Abstract Co-Author*) Nothing to Disclose
Satomi Kawamoto, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Pancreatic neuroendocrine tumors (PanNETs) are increasingly diagnosed in the recent decades, and treatment strategy of PanNETs have been evolved due to better understanding of tumor biology 2. Tumor stage and grade are critical for guide treatment and predict prognosis. 3. CT features to help predict histological tumors grade are presented and discussed. However, accurate prediction of tumor grade is difficult on imaging alone. 4. Radiomics has emerged as a valuable tool and applied to predict grading of PanNET. Review and discuss pros and cons of this technique in predicting tumor grade.

**TABLE OF CONTENTS/OUTLINE**

1. Review pathological tumor grade according to WHO classification. 2. CT features to suggest low grade PanNETs. (a) Tumor size: small PanNETs are typically low grade, but not all tumors. (b) Tumor vascularity/enhancement: low grade PanNETs are typically hypervascular with intense homogeneous enhancement, but not all tumors. (c) Cystic/necrotic tumors: Small cystic PanNETs are often low grade, and necrosis are often associated with high grade PanNET, but they may be difficult to differentiate on CT. (d) Presence of calcification: Calcifications are more often associated with higher grade PanNETs but can be seen in low grade PanNETs. (e) Biliary duct, pancreatic duct, vascular and adjacent organ involvement are more commonly associated with

higher grade PanNETs, though there are exceptions. 3. Review and discuss recent advances of radiomics technique and current limitations in predicting PanNET tumor grade compared to CT imaging features alone.

## GIEE-155 LYMPHOMAS OFF THE BEATEN PATH: EXPLORING UNCOMMON ABDOMINAL MANIFESTATIONS

Giuseppe D'Ippolito, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Daniel Bekhor, MD (*Abstract Co-Author*) Nothing to Disclose
Ulysses S. Torres, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Eduardo O. Pacheco, MSc, MD (*Abstract Co-Author*) Nothing to Disclose
Levi B. Oliveira, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- To overview the pathophysiology and clinical manifestations of lymphomas. - To highlight the main radiological aspects and sites of involvement. - To alert about less common manifestations and unusual sites of involvement and discuss differential diagnoses.

### TABLE OF CONTENTS/OUTLINE

This presentation will overview the classics findings in abdominal lymphomas, that frequently involve nodal and extranodal structures, for knowledge of the usual presentation of the disease. The most classical findings include nodal disease, with solitary or multiple enlarged nodes, with a huge round mass or a lobular homogeneous density with uniform enhancement. When in extranodal involvement, the studies describe the spleen, liver, gastrointestinal tract, pancreas, abdominal wall, genitourinary tract, adrenal, peritoneal cavity, and biliary tract, in decreasing order of frequency. We describe and illustrate with schematic figures and imagens, rare cases of lymphoma with lymph nodes necrosis in patients without treatment, primary commitment of liver, pancreas, bilateral adrenal, non-Hodgkin peritoneum involvement, ovary, testicle, kidney, stomach, and bowel. A brief literature review of these rare manifestations and discuss why they are unusual, bringing frequency and epidemiological data for the radiology community keep in mind these unusual aspects to suspect when faced with challenging cases.

## GIEE-156 EXAMINE THE PECULIAR PHENOMENA OF BONE MARROW ACTIVITY MIGRATING TO NEW SITES

Aley Talans, MD (*Abstract Co-Author*) Nothing to Disclose
Eduardo O. Pacheco, MSc, MD (*Abstract Co-Author*) Nothing to Disclose

Ulysses S. Torres, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Julia De Toledo Mendes, MD (*Abstract Co-Author*) Nothing to Disclose
Nathalia Goncalves Dias (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Provide an overview of Extramedullary Hematopoiesis (EMH).Define the profile of patients with EMH from a clinical and laboratory point of view. Review typical and atypical presentations of EMH with emphasis on abdominal imaging. Present the main differential diagnoses.

### TABLE OF CONTENTS/OUTLINE

Review of the pathophysiology of EMH, with an understanding of the emergence of lesions made up of erythroid precursors (generally irregular aggregates of erythroblasts, immature granulocytes, and occasional megakaryocytes), as well as their usual and unusual distribution in the abdomen. Presentation of the patient's epidemiological profile through real cases with clinical and laboratory data, facilitating the understanding of the disease, and revealing in which situations EMH should be considered as a diagnostic possibility and in which its probability becomes remote. As well as the presentation of image stigmas that may reveal that the patient evaluated has sickle cell anemia, thalassemia, myelofibrosis, or chronic myeloid leukemia, among the most common causes. Exposure of a series of cases with typical and atypical presentation of EMH, with emphasis on the usual findings of the disease, which involve paraspinal nodules, expansion of the ribs, organomegaly, focal masses in the liver or spleen, renal involvement (parenchymal, intrapelvic or perirenal), lymphnode involvement, nodules or peritoneal masses and masses at sites of splenectomy or nephrectomies. Presentation of differential diagnoses from an imaging point of view, highlighting the importance of clinical and epidemiological knowledge for a correct diagnostic approach.

## GIEE-157 PRE AND POST-OPERATIVE EVALUATION OF SURGICALLY MANAGED BOWEL ENDOMETRIOSIS: GUIDING THE BETTER CHOICE, MONITORING THE OUTCOME

Lucas R. Torres, MD (*Abstract Co-Author*) Nothing to Disclose

### TEACHING POINTS

To present the intestinal surgical approach techniques for endometriosis and the indication of each approach according to the degree and site of the lesions. Expose the imaging aspects after laparoscopic resections and anastomoses of intestinal endometriosis lesions. Correlate post-surgical MRI findings, transvaginal ultrasound, and colonoscopy. Distinguish usual post-surgical findings from complications and residual disease.

### TABLE OF CONTENTS/OUTLINE

Bowel involvement is one the most severe forms of deep endometriosis, present in up to 30-40% of patients with deep endometriosis, and many of them will require surgical intervention.Several types of surgery have been used for the management of bowel endometriosis. Most of resection techniques are unknow for the radiologists, and the postoperative findings following bowel resection will depend on the surgical technique applied. To present the surgical techniques currently used to treat intestinal endometriosis through didactic drawings and illustrations of surgical steps depending on the characteristics of the lesion and its location in the rectosigmoid, cecum, appendix or ileum, proposing a clinical reasoning flowchart for choosing the most appropriate surgical procedure.Case-based review in a multimodality approach (US, MRI, colonoscopy and surgical specimens), following a timeline, with positive outcomes, demonstrating usual postoperative findings as well related complications. Practical tips illustrated by cases to assist radiologists in the differential diagnosis of post-surgical changes and residual endometriotic disease.

## GIEE-16 SHIFTING PERSPECTIVE: EFFECTIVELY INCORPORATING THE DIXON METHOD INTO ABDOMINAL AND PELVIC MRI INTERPRETATIONS

Andres R. Ayoob, MD (*Abstract Co-Author*) Nothing to Disclose
Kyle Kleiman (*Abstract Co-Author*) Nothing to Disclose
James T. Lee, MD (*Abstract Co-Author*) Nothing to Disclose
Ronak Patel, BS (*Abstract Co-Author*) Nothing to Disclose
Joseph W. Owen, MD (*Abstract Co-Author*) Nothing to Disclose
Elhamy R. Heba, MD, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The Dixon method creates four image sets from a single acquisition: in-phase and out-of-phase images, acquired via a dual-echo technique, and fat-only and water-only images, reconstructed created from dual-phase source data, showing fat or water T1-signal intensity, respectively. These images provide information to allow confident identification of: (1) Macroscopic (adipocytes) and microscopic fat (or small volume) through India ink artifact and signal loss on out-phase images and (2) substances causing magnetic susceptibility (e.g. gas, iron, blood products, and metal) through signal loss on out-of-phase images. Fat-only images provide an alternative sequence for identifying fat while water-only images yield a T1-weighted fat suppressed sequence. These sequences can be integrated into imaging protocols for the abdomen and pelvis and incorporated in radiologist's search patterns. Knowledge of basic physics principles behind image generation can facilitate understanding of imaging appearances and improve diagnostic confidence.

### TABLE OF CONTENTS/OUTLINE

1. Review of physics principles underlying Dixon chemical-shift imaging 2. Case-based approach using the Dixon method to characterize diffuse and focal abnormalities in the abdomen and pelvis on MRI: Use of dual-phase gradient echo imaging to identify lipid through use of signal loss and India ink artifact Use of T2* effects/magnetic susceptibility artifact to identify gas, iron, blood products, and metal Use of fat-only images as an alternative sequence for identifying fat Use of water-only images as a fat-suppressed sequence 3. Discussion of integration into imaging protocols and search patterns to maximize benefits and limiting image overload

## GIEE-17 EVALUATION AND MANAGEMENT OF COMPLICATIONS AFTER LIVING DONOR LIVER TRANSPLANTS REQUIRING COMPLEX BILIARY ANASTOMOSES

**Awards**
**Certificate of Merit**

Karthik M. Sundaram, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Richard D. Shlansky-Goldberg, MD (*Abstract Co-Author*) Nothing to Disclose
Ann T. Foran, MBBCh (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1) Due to the limited availability of deceased donor liver transplants (DDLTs), living donor liver transplants (LDLTs) are becoming more common. 2) However, variant intrahepatic ductal anatomy, can increase risk of complications and exclusion of optimal donors. 3) New surgical techniques has allowed for the creation of complex biliary anastomoses, increasing the number of successful LDLTs. 4) Biliary complications following LDLT requiring multiple biliary anastomoses are higher compared to DDLTs. 5) Post-operative imaging allows for identifying the variant reconstructed biliary anatomy complications to ensure timely treatment. 6) In this exhibit, we illustrate pre- post-operative magnetic resonance imaging/ magnetic resonance cholangiopancreatography (MRI/MRCP) of donors recipients after LDLTs requiring complex biliary anastomoses. 7) We focus on recognizing the most common biliary complications mimics as well as management approaches.

### TABLE OF CONTENTS/OUTLINE

1) Discuss surgical techniques including ductoplasty, creation of a single orifice containing multiple ducts in a Roux limb, the presence of multiple separate anastomoses. 2) Evaluation of the pre-operative variant intrahepatic ductal anatomy and post-operative imaging appearances of LDLTs after multiple anastomoses by MRCP and hepatobiliary phase MRI. 3) Review complications and mimics following LDLT including anastomotic and non-anastomotic strictures, cholestasis, anastomotic leak, biliary cast syndrome, cholangitis, and biliary sepsis. 4) Management options for biliary complications including medical, ERCP in the cases of hepaticojejunostomy, placement of external/internal drains, the need for retransplant.

## GIEE-18 ACR LI-RADS ULTRASOUND SURVEILLANCE V2024: UPDATE OF ULTRASOUND LI-RADS V2017

Aya Kamaya, MD (*Abstract Co-Author*) Royalties, RELX;Research Grant, Canon Medical Systems Corporation
David T. Fetzer, MD (*Abstract Co-Author*) Research support, General Electric Company;Research support, Koninklijke Philips NV;Research support, Siemens AG;Consultant, Koninklijke Philips NV;Advisory Board, Koninklijke Philips NV;Consultant, General Electric Company;Advisory Board, General Electric Company
Shuchi K. Rodgers, MD (*Presenter*) Royalties, RELX

### TEACHING POINTS

1. ACR LI-RADS and the American Association for the Study of Liver Disease (AASLD) recommend hepatocellular cancer surveillance in at-risk individuals with ultrasound and serum alpha-fetoprotein (AFP) every six months. 2. LI-RADS Ultrasound Surveillance is a framework for performance, interpretation, and reporting of HCC surveillance US and is composed of an US Category (US-1, US-2, or US-3) and a Visualization Score (VIS A, VIS B, or VIS C). 3. The LI-RADS Ultrasound Surveillance v2024 offers a pathway for alternative surveillance modalities in cases of VIS C-scored exams and elevated AFP without sonographic correlate. 4. Due to the low likelihood of malignancy, there is a reduced surveillance interval for US-2 Subthreshold observations in v2024.

### TABLE OF CONTENTS/OUTLINE

1. Offer rationale for hepatocellular cancer surveillance 2. Review evidence and published literature on US LI-RADS v2017 3. Discuss rationale for LI-RADS US Surveillance v2024 updates 4. Present updated LI-RADS US Surveillance v2024 algorithm 5. Compare AASLD and ACR LI-RADS US Surveillance recommendations 6. Highlight tips and tricks for implementing LI-RADS US Surveillance 7. Present case examples

## GIEE-19 AGE-RELATED PANCREATIC HYPERINTENSITY A PROMISING INDICATOR FOR LOCALIZED AUTOIMMUNE PANCREATITIS SUBTITLE ABDOMINAL ULTRASONOGRAPHY AS A VALUABLE TOOL FOR EARLY DETECTION OF AUTOIMMUNE PANCREATITIS DISEASE WITH LESIONS SMALLER THAN 20MM

Norifumi Nishi (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Adjustments to the settings of the ultrasound device, including magnification, filtering, gain, and sensitivity time control, are necessary to depict localized lesions accurately. Autoimmune pancreatitis tends to occur more frequently in the elderly population, typically around the age of 65, with a higher incidence in middle-aged to elderly individuals. In ultrasound images of the pancreas, aging-related effects often result in increased brightness, making localized lesions easier to detect. Autoimmune pancreatitis typically exhibits irregular contours and internal patchy or punctate hyperechoic spots in localized lesions of approximately 20 mm in size. Early detection via ultrasound examination not only facilitates prompt diagnosis but also makes differentiation from other modalities easier.

**TABLE OF CONTENTS/OUTLINE**

Adjustments of ultrasound device settings to confirm the contours and internal structure of localized lesions. Age-related changes in pancreatic brightness enhancing the detectability of localized lesions, particularly in the middle-aged to elderly population. Characteristics of autoimmune pancreatitis with localized lesions of approximately 20 mm, including contour and internal features. Facilitation of evaluation of lesions of approximately 20 mm identified via ultrasound examination using other diagnostic modalities. Early diagnosis enables treatment to progress before the condition worsens.

## GIEE-2 PANCREATIC LESIONS 101: A BEGINNER'S GUIDE

Monica Chapa-Ibarguengoitia, MD (*Abstract Co-Author*) Nothing to Disclose
Ana C. Gandara, MD (*Abstract Co-Author*) Nothing to Disclose
Bethsabel Rodriguez Encinas, MD (*Abstract Co-Author*) Nothing to Disclose
Maria Isabel I. Leon Garcia (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Understand the basic anatomy of the pancreas and its anatomical relationships. Identify the main characteristics of cystic and solid lesions through multimodality imaging techniques. Recognize key data that assist in the differential diagnosis of pancreatic lesions. Distinguish features of benignity and malignancy. Correlate radiological images with histopathological diagnoses

**TABLE OF CONTENTS/OUTLINE**

1. Introduction: - Anatomy of the pancreas - Anatomical relationships2. Solid pancreatic lesions: - Pancreatic Adenocarcinoma - Pancreatic Metastasis - Solid Pseudopapillary Tumor - Pancreatic Neuroendocrine Tumor - Focal Pancreatitis - Intrapancreatic Accessory Spleen3. Cystic pancreatic lesions: - Mucinous Neoplasm - Serous Cystoadenoma - Intraductal Papillary Mucinous Neoplasm - Intrapancreatic Gastric Duplication Cyst4. Summary: - Key Points

## GIEE-20 TOTAL PANCREATECTOMY AND ISLET AUTOTRANSPLANTATION (TPIAT): IMAGING OF EXPECTED FINDINGS AND COMPLICATIONS

Laura R. Carucci, MD (*Abstract Co-Author*) Nothing to Disclose
Ryan D. Clayton, MD (*Abstract Co-Author*) Nothing to Disclose
Jill Bruno, DO (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

TPIAT is performed throughout the US, with increasing prevalence over the last two decades. Goals of TPIAT are to alleviate pain due to debilitating chronic or acute recurrent pancreatitis and to prevent development of brittle diabetes by infusion of pancreatic islet cells. Imaging plays a key role in evaluating patients who have undergone TPIAT. Radiologists must be aware of the surgical procedure, expected post-operative findings on imaging studies, complications and role of imaging, and potential imaging pitfalls.

**TABLE OF CONTENTS/OUTLINE**

Review TPIAT background, indications and goals. Discuss surgical procedure and expected imaging findings of TPIAT. Describe expected post-surgical anatomy following TPIAT. Demonstrate imaging of post-operative complications and sequelae of TPIAT. Complications may include: leak (bowel, bile), abscess, hematoma, biliary stricture, bowel obstruction (anastomotic stricture, adhesions, incisional or internal hernia), delayed gastric emptying, bezoar, vascular abnormalities (thrombosis, pseudoaneurysm), omental infarcts, nodular hepatic steatosis. Show imaging of expected post-surgical findings and pitfalls.

## GIEE-21 IT'S PERITONEUM O'CLOCK! A PRACTICAL APPROACH ON PERITONEAL DISSEMINATION OF MALIGNANT DISEASES

Mauricio Zapparoli, MD, MSc (*Abstract Co-Author*) Nothing to Disclose
Vitor L. Vieira, MD (*Abstract Co-Author*) Nothing to Disclose
Oscar Orozco (*Abstract Co-Author*) Nothing to Disclose
Fabio Costa, MD (*Abstract Co-Author*) Nothing to Disclose
Gabriel Da Silva Eli, MD (*Abstract Co-Author*) Nothing to Disclose
Matheus Taborda, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Peritoneum dissemination of malignant diseases is common, and its imaging assessment may be challenging.CT is still the workhorse of peritoneal evaluation, and in experienced hands has similar accuracy compared to MRI.PCI is an important tool in the preoperative setting to evaluate the extent of peritoneal disease.Standardized PCI evaluation methods can improve accuracy and reduce misdiagnosis. MRI evaluation should include high-resolution T2 non-fat sat, DWI, and T1 fat sat contrast-enhanced sequences.Coronal DWI gives a wider panorama of the abdominal cavity and reduces the chance of missing lesions in the abdominopelvic transition.

**TABLE OF CONTENTS/OUTLINE**

IntroductionReview the diseases that can potentially disseminate through the peritoneumMain location and pathophysiology of peritoneal lesions.Pros and cons of different imaging methods used to evaluate the peritoneum.Peritoneal Cancer Index (PCI)Use and indications of Radiological PCI assessment in the preoperative settingExamples of different PCI scores.Suggested standardized methodology to calculate PCI - Peritoneum O'Clock.Post-treatment evaluationImportance of baseline studies performed immediately after CRS and HIPEC.Remission and relapse cases.Standard protocolSuggestion of standard MRI protocol with optimal sequences to evaluate the peritoneum.

## GIEE-22 3 FOREIGN-BODIES PROBLEMS: THE CHALLENGES IN THE EVALUATION OF ABDOMINAL FOREIGN BODIES

Lais Abduch, MD (*Abstract Co-Author*) Nothing to Disclose
Sarah De Menezes (*Abstract Co-Author*) Nothing to Disclose
Heytor Jose De Oliveira Cabral, MD (*Abstract Co-Author*) Nothing to Disclose
Fabio Lewin, MD (*Abstract Co-Author*) Nothing to Disclose
Brenda N. Lahlou, MD (*Abstract Co-Author*) Nothing to Disclose
Priscila Akemi d. Takitani, MD (*Abstract Co-Author*) Nothing to Disclose
Vinicius C. Fiorot, MD (*Abstract Co-Author*) Nothing to Disclose
Igor R. Oliveira, MD (*Abstract Co-Author*) Nothing to Disclose
Priscilla Claudia Raddo Venancio, MD (*Abstract Co-Author*) Nothing to Disclose
Daniel B. Montel, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To simplify the three major issues related to the evaluation of foreign bodies in the abdomen: their characterization, detection of complications, and description in the report.To explore the utility of various imaging techniques, including plain radiography, CT, MRI, and ultrasound, for the identification and characterization of abdominal foreign bodies.To highlight the potential complications arising from abdominal foreign bodies, such as perforation, obstruction, or infection. Delineate the role of radiologists in identifying complications, aiding in management decisions, and tracking post-removal outcomes.To guide the preparation of the medical report, considering medical and legal factors.

### TABLE OF CONTENTS/OUTLINE

Introduction.Image evaluation and foreign body detection.Expected attenuation of the different foreign body material (metal, plastic, wood, glass, bones, etc).Foreign bodies in the gastrointestinal and genitourinary tract arising from ingestion or introduction through natural orifices, such as anus, vagina, and, less frequently, the urethra.Foreign bodies complications such as perforation, gatrointestinal occlusion, and infection. Iatrogenic post-surgical foreign bodies.How to report abdominal foreign bodies.Conclusion.

## GIEE-23 THE ROLE OF ABDOMINAL IMAGING IN EVALUATING PATIENT SUITABILITY FOR HIPEC

Leonardo K. Bittencourt, MD, PhD (*Abstract Co-Author*) Research Consultant, Canon Medical Systems Corporation
Ifeanyi Ekpunobi, BS (*Abstract Co-Author*) Nothing to Disclose
Michaela Cooley, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Cytoreduction with hyperthermic intraperitoneal chemotherapy (HIPEC) has been developed and become more prominent over the last 20 years. Due to its use at primarily high volume and specialized institutions, important imaging findings, especially those related to prediction of patient outcomes after HIPEC, are not widely known. This educational exhibit takes the reader through learning about the cytoreduction/HIPEC procedure, opt-in criteria, and common imaging findings before and after treatment.

### TABLE OF CONTENTS/OUTLINE

1. What is hyperthermic intraperitoneal chemotherapy (HIPEC)? a. Definition; b. Benefits over traditional chemotherapy; c. Candidacy requirements; d. Origins of cancers typically treated with HIPEC2. Opt-in criteria for HIPEC. a. Patient factors for candidacy; b. Imaging modalities used in evaluation; c. Highlight on why CT is the preferred modality3. Common CT imaging findings of carcinomatosis. a. Common imaging findings discussed and shown on CT; b. Discussion of the pathophysiology of each imaging finding; c. Discussion on how to evaluate each imaging finding4. CT findings that relate to prognosis if HIPEC is performed. a. Imaging findings related to worsening prognosi; b. Pathophysiology of why some imaging findings correlate to worse outcomes; c. Discussion on who should be excluded from HIPEC treatment5. Disease burden and complications post-HIPEC; a. Possible outcomes after HIPEC and cytoreduction surgery; b. Complications of HIPEC and cytoreduction; c. How imaging plays a role in surveillance of disease; d. Discussion on frequency of imaging and notable findings

## GIEE-24 DON'T RELY ON LUCK - HAVE A PROPER LOOK! POST OPERATIVE COLORECTAL CANCER IMAGING: A GUIDE TO HELPING YOUR SEARCH PATTERN

Snehal Lapsia, FRCR,MBBS (*Abstract Co-Author*) Nothing to Disclose
Sophie Cheshire, MBChB, FRCR (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Common post operative colorectal cancer surgeries highlighting anatomy Tips and tricks including where to look for subtle recurrence Mimics of recurrent disease

### TABLE OF CONTENTS/OUTLINE

This multimodality pictorial review aims to enhance the skills of the radiologist when reviewing colorectal cancer follow up imaging. Knowledge of surgical technique and post operative anatomy is crucial when identifying residual, recurrent or metastatic disease on post treatment imaging. It is vital to have a focused search pattern of key review areas to identify early recurrence in a timely manner to allow appropriate treatment or reintervention. We present an overview of post surgical anatomy for common colorectal surgeries with an emphasis on the draining vascular and lymph node pathways. Early disease recurrence based on these pathways is demonstrated on an array of imaging including CT, PET CT and MRI. Tips and tricks are provided to overcome common blindspots and potential errors. Examples include: mesocolic nodal recurrence post right hemicolectomy, rectal stump recurrence post anterior resection, IMA suture recurrence vs suture granuloma at the IMA division, presacral recurrence post abdominal perineal resection and detection of mucinous nodal disease on MR.

## GIEE-25 A PREVALENT HEALTH PROBLEM: CASE-BASED REVIEW OF THE PATHOPHYSIOLOGY, IMAGING FEATURES, AND CONFOUNDING IMPACT OF HEPATIC STEATOSIS IN DIAGNOSTIC IMAGING

Andres R. Ayoob, MD (*Abstract Co-Author*) Nothing to Disclose
James T. Lee, MD (*Abstract Co-Author*) Nothing to Disclose
Amanda C. Gibson, DO (*Abstract Co-Author*) Nothing to Disclose
Joseph W. Owen, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Review the pathophysiology of hepatic steatosis including alcoholic and non-alcoholic steatohepatitis, NASH cirrhosis, focal steatosis, and transient steatosis2. Discuss the patterns of steatosis including but not limited to diffuse, geographic, focal and multifocal through case examples.3. Illustrate with

case based approach, how steatosis can mimic other pathology.

**TABLE OF CONTENTS/OUTLINE**

Pathophysiology of steatosis1. Hepatic metabolism of fat, alcohol and toxins2. Alterations in perfusion affecting steatosis deposition3. Inflammation and the progression to cirrhosisVariants of Steatosis1. Acute2. Transient3. Chronic4. Focal/multifocalCased based illustration of diagnostic challenges presented by hepatic steatosis1. Incidental indeterminate liver lesions2. Staging of colorectal cancer and other malignancies3. Cholangitis mimicking perivascular steatosisSummary: The incidence of steatosis is increasing and recognizing the subtypes and imaging patterns of steatosis can reduce uncertainty and improve patient management.

## GIEE-26 RADIOLOGY'S ROLE IN THE DIAGNOSIS AND MANAGEMENT OF CONSTIPATION -DETECTION, CLASSIFICATION, COMPLICATIONS AND TREATMENT

Andres R. Ayoob, MD (*Abstract Co-Author*) Nothing to Disclose
Aman Khurana, MD (*Abstract Co-Author*) Nothing to Disclose
Rohan Kulkarni (*Abstract Co-Author*) Nothing to Disclose
James T. Lee, MD (*Abstract Co-Author*) Nothing to Disclose
Joseph W. Owen, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Differentiate and classify different forms of colonic disfunction to distinguish neurogenic, drug-induced, metabolic, functional, and mechanical causes of constipation2. Identify and describe radiological features of constipation and its complications3. Explain the role of abdominal radiographs, CT, fluoroscopic defecography, and MR defecography in detection and classification of constipation.4. Recommend the next appropriate step in management and describe potential image-guided intervention that can contribute to treatment of constipation

**TABLE OF CONTENTS/OUTLINE**

Defining ConstipationDefecatory straining, hard lumpy stools, sensation of incomplete evacuation, sensation of anorectal obstruction or blockage, need for manual maneuvers such as digital evacuation, and or fewer than 3 stools per week.Etiologies of Constipation 1. Neurogenic: Diabetes mellitus, Hirschsprung's Disease, Intestinal Pseudo obstruction 2. Drug-Induced: Anticholinergics, Neutrally active agents 3. Metabolic: Hypokalemia, hypothyroidism 4. Functional: Pelvic floor dysfunction 5. Mechanical: Neoplasm, stricture, volvulusRadiologic features of constipation and its complications on Radiographs, CT, Fluoroscopy and MR 1. Colonic dilation2. Fecaloma or fecal impaction3. Wall thickening4. Pericolic stranding5. Perforation6. AbscessTreatment of Constipation 1. Laxative/enemas2. Manual dis-impaction 3. Water soluble fluoroscopic enema 4. Biofeedback 5. Surgery

## GIEE-27 CEVICHE, TOO SPICY TO HANDLE: OVERVIEW OF UNUSUAL RECTAL TUMORS

Mark Guelfguat, DO (*Abstract Co-Author*) Nothing to Disclose
Yanet Y. Torres Maza (*Abstract Co-Author*) Nothing to Disclose
Jorge L. Huayanay, MD (*Abstract Co-Author*) Nothing to Disclose
Marco Rioja (*Abstract Co-Author*) Nothing to Disclose
Alexander Acevedo, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To emphasize the importance of a comprehensive approach to differential diagnosis for rectal tumors, incorporating imaging features alongside the patient's medical history and clinical context.To educate the audience regarding the growth patterns of the different rectal tumors. To achieve a better understanding of the rectal tumor imaging features through pathological correlation. To propose a thorough differential diagnosis based on clarification of the growth patterns and likely anatomical origin.

**TABLE OF CONTENTS/OUTLINE**

The goals of this exhibit are to:Provide a pictorial review of the diverse imaging appearances of uncommon rectal tumors. Discuss specific imaging and pathological characteristics of uncommon rectal tumors. Familiarize the audience with the imaging features of uncommon rectal tumors, thereby helping in formulation of a complete differential diagnosis.These major featured rectal neoplasms include: rectal gastrointestinal stromal tumors (GIST), anorectal melanoma, rectal neuroendocrine neoplasms (G1-3 and poorly differentiated), primary rectal lymphoma, leiomyoma, lipoma, leiomyosarcoma, Kaposi's Sarcoma, rhabdomyosarcoma, extramammary Paget's disease

## GIEE-28 HYDATID DISEASE ON ULTRASOUND: CORRELATION WITH CT AND MRI, DIFFERENTIAL DIAGNOSIS, AND COMPLICATIONS

Leticia Gutierrez Velasco, MD (*Abstract Co-Author*) Nothing to Disclose
Juan Francisco Sallaberry Vega, MD (*Abstract Co-Author*) Nothing to Disclose
Laura Garcia del Salto, MD (*Abstract Co-Author*) Nothing to Disclose
Patricia Fraga Rivas, MD (*Abstract Co-Author*) Investigator, General Electric Company
Jaime de Miguel Criado, MD (*Abstract Co-Author*) Nothing to Disclose
Beatriz Sastre, MD (*Abstract Co-Author*) Nothing to Disclose
Cristian Rodriguez Robles (*Abstract Co-Author*) Nothing to Disclose
Sandra Robledo (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Describe the different stages of hydatid disease on ultrasound and its correlation with CT and MRI. Show less common alternative locations to the liver.Display the main differential diagnosis of hydatidosis. Review the main complications.

**TABLE OF CONTENTS/OUTLINE**

Hydatid disease, caused by Echinococcus granulosus and less frequently by Echinococcus multilocularis, remains a global health problem. It is characterized by the formation of hydatid cysts with a three-layered structure. Ultrasound is the initial diagnostic tool that allows distinguishing the evolutionary stages. The Gharbi and WHO classifications are the most used, especially in the liver, although they can be applied to other less common locations, such as lung or spleen, among others. They classify hydatid lesions into five main types based on ultrasound findings and, although both are not directly comparable, an approximate comparison based on imaging characteristics is provided. The differential diagnosis includes simple and complex cysts, abscesses, hematomas and tumors. Hydatid cysts, typically asymptomatic, may be incidentally detected on imaging tests or lead to complications such as mass effect, rupture and infection. For a comprehensive evaluation of cysts and their complications, CT and MRI are essential complements to ultrasound, making it important to know how to correlate the findings.

## GIEE-29 CYST ME MORE: ABDOMINAL CYSTIC LESIONS OF THE MESENTERY AND PERITONEUM

Elena Uceda,
MD (*Abstract Co-Author*) Nothing to Disclose
Marta Dominguez Fraga, MD (*Abstract Co-Author*) Nothing to Disclose
Paola Pizano, MD (*Abstract Co-Author*) Nothing to Disclose
Begona Jimenez, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Radiological evaluation of cystic lesions using different imaging techniques.Review of the classification of abdominal cystic lesions that affect the mesentery and peritoneum.Overview the main pathological and radiological features of the entities comprising the differential diagnosis.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction 2. Imaging technique and findings of cystic lesions 3. Benign mesenteric cyst: 3.1 Peritoneal simple mesothelial cyst; 3.2 Chylolymphatic mesenteric cyst; 3.3 Cystic lymphangioma; 3.4 Enteric duplication cyst/enteric cyst 4. Cystic neoplasms: 4.1 Multicystic peritoneal mesothelioma; 4.2 Mucinous cystic neoplasm; 4.3 Pseudomyxoma peritonei; 4.4 Mature cystic teratoma; 4.5 Tumoral degeneration or myxoid component 5. Infectious and inflammatory cyst: 5.1 Abscess; 5.2 Nonpancreatic pseudocyst; 5.3 Peritoneal hydatidosis; 5.4 Necrotic lymph nodes 6. Iatrogenic or traumatic cyst: 6.1 Nonpancreatic pseudocyst; 6.2 Gossypiboma 7. Conclusions

## GIEE-3 LI-RADS V2024: A NEW HOPE FOR HEPATOCELLULAR CARCINOMA TREATMENT RESPONSE

Daniel Lahan-Martins, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Roberto Blasbalg, MD (*Abstract Co-Author*) Nothing to Disclose
Fernanda G. Velloni, MD (*Abstract Co-Author*) Nothing to Disclose
Hilton M. Leao Filho, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Cassia T. Guimaraes, MD (*Abstract Co-Author*) Nothing to Disclose
Alexandre K. Wakote Teruya, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1 - The Liver Imaging Reporting and Data System (LI-RADS) has been updated with a new treatment response algorithm (TRA v2024) including two separate nonradiation and radiation Cores, previously incorporated within a single algorithm. 2 - In the updated version there is a new specific algorithm for internal and external beam radiation-based locoregional therapies (LRT) such as transarterial radioembolization (TARE) and stereotactic beam radiation therapy (SBRT). It also introduced a new treatment response category (LR-TR nonprogressing) for radiation TRA. 3 - This exhibit aims to discuss and describe how to apply the ancillary features enabling the upgrade from LR-TR equivocal to viable or from LR-TR nonprogressing to viable.

**TABLE OF CONTENTS/OUTLINE**

1 - Introduction to the new LI-RADS v2024 CT/MRI treatment response algorithm. 2 - Case-based and illustrative guides applying the ancillary features and the feature of viability. 3 - Provide practical considerations and diagnostic tips to improve accuracy and prevent misinterpretation in applying the updated LI-RADS v2024 TRA.

## GIEE-30 DIAGNOSIS OF HIATAL HERNIAS, POST-SURGICAL CHANGES AND COMPLICATIONS ON FLUOROSCOPY IMAGES: AN EASY GUIDE FOR RESIDENTS

Lourdes M. Avila, MD (*Abstract Co-Author*) Nothing to Disclose
Bethsabel Rodriguez Encinas, MD (*Abstract Co-Author*) Nothing to Disclose
Sofia Renee Acuna Barrera, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Recognize the normal anatomy of the gastroesophageal junction and stomach on barium swallow studies.Identify the main characteristics of different types of hiatal hernias through barium swallow studies. Understand the management of hiatal hernias and recognize the normal post-surgical changes.Explain the complications associated with post-surgical changes in fundoplications according to the Hinder classification.

**TABLE OF CONTENTS/OUTLINE**

Introduction: Normal anatomy of the gastroesophageal junction and stomach on FluoroscopyTypes of hiatal hernias.Anatomical changes and characteristics of hiatal hernias.Hiatal hernias management and treatment: Management according to the type of hiatal hernia.Types of surgical management.Post-surgical complications of fundoplication:Types of complications of fundoplication.Classification based on radiological images.Clinical cases Comparison between fluoroscopy studies before and after surgical management.Description on fluoroscopy images of post-surgical complications according to Hinder classification. Summary Key points.

## GIEE-31 NAVIGATING IPMN MANAGEMENT: INSIGHTS FROM THE 2024 KYOTO GUIDELINES

Yuki Tashiro, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1) Learning about the image evaluation of IPMN, particularly worrisome feature and high risk stigmata, through specific examples as per the latest Kyoto Guidelines, and 2) Understanding the pitfalls and mimickers of worrisome feature and high risk stigmata through specific examples to enhance everyday clinical practice.

**TABLE OF CONTENTS/OUTLINE**

Pancreatic cystic diseases encompass a broad spectrum of conditions, ranging from benign to malignant tumors. Given the difficulty in obtaining tissue samples, imaging plays a crucial role in diagnosis. The most frequently observed cystic tumor is the intraductal papillary mucinous neoplasm (IPMN), which possesses malignant potential. Not only is differentiation from other diseases necessary, but also risk assessment. The Kyoto Guidelines, published in 2024, are a key management strategy for IPMNs, detailing risk assessments and surveillance methods. Imaging criteria are included in worrisome features (WF) and high-risk stigmata (HRS).Following the latest guidelines, this presentation elucidates these findings, and also introduces potential pitfalls and mimicker.Besides IPMN, various other pancreatic cystic diseases require differential diagnosis through imaging due to differing risks and treatment approaches. Although these cystic diseases sometimes present similar imaging findings, making differential diagnosis challenging, the discussion will also cover how to manage such pitfalls while contrasting with IPMN.

## GIEE-32 BUBBLES AND BILE: BENEFITS OF CONTRAST-ENHANCED ULTRASOUND FOR THE GALLBLADDER

David T. Fetzer, MD (*Abstract Co-Author*) Research support, General Electric Company;Research support, Koninklijke Philips NV;Research support, Siemens AG;Consultant, Koninklijke Philips NV;Advisory Board, Koninklijke Philips NV;Consultant, General Electric Company;Advisory Board, General

Electric Company
Kanupriya Vijay, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Razan Noorelahi, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Contrast-enhanced ultrasound (CEUS) has multiple unique advantages including high spatial and temporal resolution, high signal-to-background, and the use of an exclusively intravascular contrast agent. These features result in a powerful tool with impactful applications for the gallbladder.CEUS can help characterize intraluminal filling defects and differentiate vascularized masses from avascular mimickers such as tumefactive sludge.CEUS is useful in interrogating wall abnormalities with characteristics features, such as adenomyomatosis, and atypical or complicated cholecystitis. CEUS may be utilized in interventional procedures such as in the assessment of cystic duct patency via cholecystostomy tube instillation.

**TABLE OF CONTENTS/OUTLINE**

Introduction: CEUS:Structure and pharmacokinetics of ultrasound contrast agents. Administration and safety considerations.Normal GB: Appearance on CEUS.GB Pathology: Bile salt imbalance: Gallstones, biliary precipitate, tumefactive sludge. Inflammation: Adenomyomatosis, acute cholecystitis, chronic cholecystitis, xanthogranulomatous cholecystitis, gangrenous and perforated cholecystitis, nonneoplastic polypoid growths, cholesterol and inflammatory polyps. Neoplastic growths: Adenoma and malignancy.Interventional applications: Assessment of cystic duct patency via cholecystostomy tube and percutaneous image-guided biopsy.

## GIEE-33 ALL ABOUT THE PANCREATIC DUCT: A COMPREHENSIVE REVIEW

Juan Fernando Casanova Barba, MD (*Abstract Co-Author*) Nothing to Disclose
Cesar A. Ortiz-Andrade (*Abstract Co-Author*) Nothing to Disclose
Alex Espinal Colominas, MD (*Abstract Co-Author*) Nothing to Disclose
Javier Arce (*Abstract Co-Author*) Nothing to Disclose
Nuria Roson Gradaille, MD (*Abstract Co-Author*) Nothing to Disclose
Ramon Almodovar, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Anatomical Variants: Discuss the importance of recognizing and reporting anatomical variants of the pancreatic duct system. Pancreatic Disorders: Knowledge of the different forms of involvement of the pancreatic duct system by inflammatory, neoplastic and traumatic conditions is essential for a correct diagnosis. Ductal Signs: Recognition of the different pancreatic ductal signs in imaging studies is crucial for adequate differentiation between inflammatory and neoplastic pathologies. Disconnected pancreatic duct syndrome: Highlight the necessity of suspecting this condition when identifying intra-abdominal collections near the pancreas. MPD involvement: Stress the importance of considering the pancreatic duct's involvement when pancreatic lesions exhibit a morphology that follows its longitudinal axis. Utility of MRCP: Highlight the role of Magnetic Resonance Cholangiopancreatography in evaluating the pancreatic duct system.

**TABLE OF CONTENTS/OUTLINE**

Embryology: Description of the embryonic development of the pancreatic duct system. Normal Anatomy: Description of the normal features of the pancreatic duct system. Congenital Anomalies: Discussion of congenital variants of the pancreas involving the duct system. Inflammatory Conditions: Review of the forms of involvement of the pancreatic duct system due to inflammatory conditions like acute and chronic pancreatitis. Pancreatic Neoplasms: Review of tumors involving the MPD, the branch ducts or both. Traumatic/Iatrogenic: Evaluation of injuries caused by trauma or medical procedures, highlighting lacerations and accidental injuries. Conclusion and Key Points: Synthesis of the key points and the main conclusions of the review.

## GIEE-34 WHAT'S BEHIND THE LIVER- DEMYSTIFYING UNCOMMON LIVER MASSES

Ramy Shoela, MD (*Abstract Co-Author*) Nothing to Disclose
Zeshan Ali (*Abstract Co-Author*) Nothing to Disclose
Lin Gu, MD (*Abstract Co-Author*) Nothing to Disclose
Christopher Dilli (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Review uncommon hepatic masses. Describe their imaging appearance and differences from their differentials. Review important clinical history and laboratory work-up that should raise suspicion for potential less common diagnoses. Discuss pathology of these masses.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction to liver masses Common liver masses and imaging Utility in expanding the differential with unique history, laboratory or radiographic findings 2. Hepatic myeloid sarcoma in patient with AML Case Review of relevant clinical history, imaging, and pathology 3. Hepatic lymphoma in patient with Hep C and no cirrhosis Case Review of relevant clinical history, imaging, and pathology 4. EBV-associated smooth muscle tumor in patient with chronic immunosuppression for renal transplant Case Review of relevant clinical history, imaging, and pathology 5. Combined HCC and cholangiocarcinoma Case Review of relevant laboratory work-up (elevated AFP and CA 19-9), imaging, and pathology 6. Hepatic and renal angiomyolipomas in patient with tuberous sclerosis Case Review of relevant clinical history with tuberous sclerosis, imaging, and pathology 7. Hepatoblastoma in 3 year old patient Case Review of relevant clinical history (such as age), imaging, and pathology 8. Focal carcinoma arising from widespread intraductal papillary neoplasm Case Review of relevant differentials, imaging, and pathology 9. Acute cholangitis presenting as a mass in patient with fever Case Review of relevant clinical history, imaging, and pathology 10. Mucinous cystic neoplasm Case Review of relevant imaging and pathology

## GIEE-35 EXPLORING THE DEPTHS OF DIFFUSION IN RECTAL CANCER MAGNETIC RESONANCE IMAGING: COMPREHENSIVE INSIGHTS FROM THEORY TO PRACTICE

Joao Manoel M. Santos, MD (*Abstract Co-Author*) Nothing to Disclose
Daniel L. Cardoso, MD (*Abstract Co-Author*) Nothing to Disclose
Thiago Jose Pinheiro Lopes, MD (*Abstract Co-Author*) Nothing to Disclose

## GIEE-37 ACUTE SMALL BOWEL DILATATION DECODED: AN ILLUSTRATED RESOURCE FOR RADIOLOGY RESIDENTS

Juan C. Spina JR, MD (*Abstract Co-Author*) Nothing to Disclose
Guadalupe Comadran (*Abstract Co-Author*) Nothing to Disclose
Roy Lopez Grove, MD (*Abstract Co-Author*) Nothing to Disclose
Daniela Soloaga (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Acute abdomen in the context of small bowel dilatation is a frequent consultation in the emergency department. Its evaluation on computed tomography (CT) requires a systematic approach and careful analysis of the characteristics of the intestinal wall.The pattern of small bowel wall thickening and its enhancement characteristics provide important clues to the underlying etiology.Identifying the presence or absence of a transition point on CT is a crucial step in evaluating small bowel dilatation. Awareness of potential complications and their imaging manifestations on CT allows for timely diagnosis and appropriate management to prevent further bowel compromise and systemic sequelae.

**TABLE OF CONTENTS/OUTLINE**

Introduction.Normal findings of the bowel wall.Pathological findings of the small bowel wall.Wall Thickening i) Focal thickening ii) Diffuse thickening iii) Segmental thickeningEnhancement Patternsi) Homogeneous enhancement ii) Stratified enhancement. Target sign. iii) Decreased/absent enhancementEndoluminal Findingsi) Gallstone ileus ii) Foreign bodies and bezoarOther findingsRadiological signs to look for.i) Transition point and small bowel obstruction (SBO) ii) Small bowel feces signExtrinsic causesExtra-intestinal findingsComplications

## GIEE-38 HEPATOCELLULAR CARCINOMA (HCC) AFTER LOCOREGIONAL THERAPIES: WHAT'S NEW IN THE LIRADS TREATMENT RESPONSE ALGORITHM V2024?

Arthur S. Joseph, DO (*Abstract Co-Author*) Nothing to Disclose
Venkata S. Katabathina, MD (*Abstract Co-Author*) Nothing to Disclose
Andrew V. Chesley, MD (*Abstract Co-Author*) Nothing to Disclose
Sriram Jaganathan, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

· Review various locoregional therapies for HCC and discuss their indications and contraindications · Difference between Non-radiation based and Radiation based treatment response algorithm [TRA] core - v2024. · Management options based on the LR TR category in non-radiation-based and radiation-based TRA

**TABLE OF CONTENTS/OUTLINE**

Introduction to HCC and LIRADS applicable population. Various treatment modalities available for HCC - Non-radiation-based therapies Radiation based therapies. Specific indication of different treatment modalities including ablation, Trans arterial chemoembolization [TACE], Tran-arterial Radioembolization [TARE], and Stereotactic Body Radiotherapy [SBRT]. Expected post-procedural changes in different modalities What is New in LIRADS Treatment Response Algorithm v2024? Role of different imaging modalities in treatment assessment Define LR TR categories in Non-radiation based TRA v2024 with imaging appearances Define LR TR categories in Radiation based TRA v2024 with imaging appearances Describe with examples the Mass-like enhancement [any degree in any phase] - the only major criteria as per ACR LR TRA v2024 The difference between radiation-based and non-radiation-based treatment response algorithm version 2024 and the rationale behind the modification.Conclusion LIRADS treatment response algorithm utilizing multiphasic CT or MRI liver helps in clear and uniform communication between the radiologists and other providers involved in the loco regional therapies

of HCC. The current updated version 2024 has two cores - Non-radiation TRA and Radiation TRA. It is imperative to understand the categories for effective and optimal management of patients with HCC.

## GIEE-39 WHEN THE RADIOLOGIST'S STOMACH IS IN KNOTS! A PICTORIAL REVIEW OF ESOPHAGECTOMY TECHNIQUES AND COMPLICATIONS

### TEACHING POINTS

1. To understand the main surgical techniques of esophagectomy.2. To review its normal findings on postoperative CT and fluoroscopy. 3. To recognize the different complications and its management (drainages, endoscopic devices and surgery).

### TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Imaging protocol for postoperative evaluation (CT and fluoroscopy). 3. Surgical techniques, indications, advantages and disadvantages and normal postoperative findings on different imaging techniques (CT, fluoroscopy and endoscopy) : 3.1. Transthoracic esophagectomy: 3.1.1. Ivor Lewis technique. 3.1.2. McKeown's. 3.2. Transhiatal esophagectomy. 3.3. Interposition approach (colon and jejunum). 4. Esophaguectomy complications and management: 4.1. Anastomotic leakage. 4.2. Anastomotic stricture. 4.3. Tracheo-esophageal and broncho-oesophageal fistula. 4.4. Conduit ischaemia or necrosis. 4.5. Chylothorax . 4.6. Pleuro-pulmonary complications. 4.7. Tumor relapse (common sites and complications related to it). 5. Conclusions. 6. Bibliography.

## GIEE-4 MULTIDISCIPLINARY APPROACH TO THE TREATMENT OF GIST: A CASE-BASED REVIEW

**Awards**
**Certificate of Merit**

Noor Fatima Majeed, MD (*Abstract Co-Author*) Nothing to Disclose
Hernan R. Bello Velez, MD (*Abstract Co-Author*) Nothing to Disclose
Aarti Sekhar, MD (*Abstract Co-Author*) Nothing to Disclose
Timothy Arleo, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Gastrointestinal stromal tumors (GISTs), mesenchymal tumors affecting the GI tract and beyond, present with diverse symptoms, disease burden, and aggressiveness. Effective management necessitates a multidisciplinary approach, where radiologists play a pivotal role. With highly variable imaging features, some of which overlap with other abdominal tumors, GIST can present a diagnostic challenge. Moreover, early identification on imaging is crucial in guiding biopsy approach, as percutaneous biopsy risks peritoneal seeding. Additionally, anatomical nuances of GIST tumors impact surgical management. Our educational exhibit aims to: 1. Review the common imaging characteristics of GIST 2. Distinguish GIST from other similar appearing abdominal tumors 3. Overview a multidisciplinary treatment approach, with emphasis placed on the radiologist's role 4. Highlight anatomic considerations that influence surgical candidacy

### TABLE OF CONTENTS/OUTLINE

1. Overview epidemiology and pathogenesis 2. Review a multidisciplinary treatment approach, with emphasis placed on the radiologist's role 3. Case-based review of common imaging findings 4. Discuss the role of medical and surgical treatment 5. Consider common surgical approaches based on involvement of anatomic structures 6. Assess recurrence risk based on size, location, pathologic features, and pseudocapsule rupture7. Case-based review of metastatic and recurrent disease

## GIEE-40 JOURNEY INTO PANCREATIC CARCINOGENESIS WHERE IMAGING MEETS GENOMIC TERRAIN

Diego A. Aguirre, MD (*Abstract Co-Author*) Nothing to Disclose
John L. Torres Castiblanco SR, MD (*Abstract Co-Author*) Nothing to Disclose
Rodrigo Borrero, MD (*Abstract Co-Author*) Nothing to Disclose

Bari Dane, MD (*Abstract Co-Author*) Nothing to Disclose
Safa Hoodeshenas, MD (*Abstract Co-Author*) Nothing to Disclose
Kathryn A. Robinson, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The expanding inflammatory bowel disease (IBD) medication armamentarium has fueled the need for non-invasive, accurate and low-cost disease activity monitoring tools. Bowel ultrasound (US) is an emerging tool, increasingly used by gastroenterologists and radiologists. It is an accurate, noninvasive tool for detecting disease activity and IBD complications. It has been used for many decades in Europe and Canada and is now being utilized in the USA for initial assessment, monitoring disease and treatment response. Our aim is to 1) highlight the clinical utility of bowel US in assessment of IBD and monitoring patients post treatment with Crohn's disease and ulcerative colitis, 2) discuss the benefits of various models of bowel US integration into the clinical practice, 3) highlight collaboration with gastroenterologists to know appropriate escalation of imaging beyond bowel US.

**TABLE OF CONTENTS/OUTLINE**

Introduction 1. Review conventional approach to IBD monitoring in the USA. 2. Discuss limitations of the conventional model of IBD monitoring. 3. Discuss why imaging is important in IBD assessment. 4. Review US features of Crohn's Disease and Ulcerative Colitis 5. Review models of Bowel US integration into the Clinical practice a. Point of Care Ultrasound only i. Grey scale, Doppler b. Clinical Radiology Ultrasound only i. Grey scale, Doppler, elastography, contrast enhanced, microvessel imaging. c. Combined Hybrid model between gastroenterology and radiology 6. Future- Patient Handheld US, US with AI Conclusions

## GIEE-42 BILIARY ANASTOMOSIS IN CENTRAL BILE DUCT INJURY: WHAT INFORMATION IS ESSENTIAL FORASSESSMENT?

Ana C. Gandara, MD (*Abstract Co-Author*) Nothing to Disclose
Pamela L. Mendieta Rodriguez, MD (*Abstract Co-Author*) Nothing to Disclose
Sofia Arizaga, MD (*Abstract Co-Author*) Nothing to Disclose
Karly Cristhelly Garrido Estrella, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To explain the anatomical variations of the intrahepatic bile ducts. To identify the most commonly used classifications for benign biliary tract lesions. To explain the common surgical techniques for biliodigestive anastomosis. To review the expected radiological findings.

**TABLE OF CONTENTS/OUTLINE**

Introduction. Anatomy of the bile duct. Most used classifications of bile duct injuries. Classification and surgical techniques of anastomosis. Imaging of biliodigestive anastomosis. Conclusions. References.

## GIEE-43 BOWEL AND BEYOND IN THE ANGRY GUT: IMAGING OF INTESTINAL AND EXTRA-INTESTINAL MALIGNANCIES IN INFLAMMATORY BOWEL DISEASE

Harshna V. Vadvala, MD (*Abstract Co-Author*) Nothing to Disclose
Rakhee S. Gawande, MD (*Abstract Co-Author*) Nothing to Disclose
Mohammadreza Shaghaghi, MD, MPH (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Inflammatory bowel disease (IBD) with its 2 subtypes, Crohn’s disease (CD) and ulcerative colitis (UC), is characterized by a chronic inflammation of the intestine. In IBD, both, Inflammation and cancer affects intestinal and extra-intestinal sites. Risk factors for cancer development include severe inflammatory activity , prolonged duration of structuring or penetrating disease?, young age of diagnosis, male sex, smoking? and use of steroids and immunomodulators (6-mercaptopurine, azathioprine or anti-TNF drugs). In this educational exhibit we will discuss the incidence, pathologic and imaging features of small bowel, colon, rectal and anal cancers associated with IBD. We will also discuss manifestations of hepatobiliary cancers in IBD. Although imaging surveillance is not routinely recommended in IBD, cross-sectional imaging plays a crucial role for detection of malignancies, staging of cancer, detection of cancer in bowel segments which cannot be assessed by colonoscopy and also for detection of treatment-related neoplasms.

**TABLE OF CONTENTS/OUTLINE**

1. Background 2. Pathogenesis of cancers in IBD 3. Risk and protecting factors 4. Imaging modalities 5. Colon cancer in UC 6. Small bowel adenocarcinoma in CD 7. Other bowel cancers in CD: Neuroendocrine tumors and Lymphoma 8. Peri-anal and vulvovaginal cancers in CD 9. Hepatobiliary cancers in IBD 10. Surveillances of cancers in IBD

## GIEE-44 SPECTRUM OF IMAGING FINDINGS IN SINUSOIDAL OBSTRUCTION SYNDROME (SOS)

**Awards**
**Certificate of Merit**

Manjiri K. Dighe, MD (*Abstract Co-Author*) Research Grant, Koninklijke Philips NV;Research Grant, General Electric Company
Theodore J. Dubinsky, MD (*Abstract Co-Author*) Nothing to Disclose
Guilherme M. Cunha, MD (*Abstract Co-Author*) Nothing to Disclose
Manish Dhyani, MD (*Abstract Co-Author*) Nothing to Disclose
Rajat Bhargava, MD, MBBS (*Abstract Co-Author*) Nothing to Disclose
Saubhagya Srivastava, MBBS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Provide an overview of SOS, previously known as Veno-Occlusive disease (VOD) - definition, epidemiology, pathophysiology and etiologies.2. Briefly discuss the current clinical diagnostic criteria utilized in VOD/SOS - historic and current standards.3. Provide detailed radiological and schematic depictions of imaging findings of VOD/SOS across various imaging modalities.4. Provide a brief note on evaluation of progression and management including Defibrotide.

**TABLE OF CONTENTS/OUTLINE**

1. Veno-occlusive disease (VOD)/ Sinusoidal obstruction syndrome (SOS) a. Definition, Epidemiology, and Pathophysiology. b. Etiology - Detailed discussion of causes of VOD/SOS and common drugs causing VOD/SOS: i. Differential diagnoses including Budd-Chiari syndrome, graft versus host disease, medication-induced and viral hepatitis, mycotic infections, and acute heart failure.2. Clinical diagnostic criteria: a. Modified Seattle criteria. b. Baltimore criteria. c. Currently used European Society for Blood and Marrow Transplantation (EBMT) criteria - adult and pediatric criteria.3. Ultrasound (US) in SOS: a. Role of sonography, advantages, and disadvantages. b. Conventional high-resolution B-mode US findings. c. Color and spectral Doppler

US findings.d. US-Elastography findings - ARFI, SWE, and TE. e. Contrast-enhanced ultrasound (CEUS) findings. f. Lassau's criteria HokUS-10 criteria4. Contrast-enhanced CT (CECT) in SOS: a. CECT findings associated with SOS. b. Role of CT in problem-solving of clinically difficult cases5. MRI in SOS: a. MRI findings associated with SOS. b. Role of MRI in problem-solving of clinically difficult cases6. Grading severity of VOD /SOS and Management - Defibrotide

## GIEE-45 LATERAL PELVIC LYMPH NODES IN RECTAL CANCER: TAKE IT OR LEAVE IT

Joao Manoel M. Santos, MD (*Abstract Co-Author*) Nothing to Disclose
Thiago Jose Pinheiro Lopes, MD (*Abstract Co-Author*) Nothing to Disclose
Guilherme Cotti (*Abstract Co-Author*) Nothing to Disclose
Debora Mayumi Takamune, MD (*Abstract Co-Author*) Nothing to Disclose
Publio C. Viana, MD (*Abstract Co-Author*) Nothing to Disclose
Natally Horvat, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Jose de Arimateia B. Araujo Filho, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Daniel L. Cardoso, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Recognize the anatomy of the rectum on the magnetic resonance imaging (MRI). Understand aspects related to rectal cancer and disease spread. Detailed knowledge on identifying and characterizing lateral pelvic lymph nodes (LPLN) in MRI and their prognostic significance. Insight into the decision-making process for managing LPLN in locally advanced rectal cancer (LARC), balancing oncological outcomes with quality of life considerations.

### TABLE OF CONTENTS/OUTLINE

1. INTRODUCTION: Overview of rectal anatomy and MRI anatomical landmarks. Pathophysiology of LARC and lymphatic dissemination patterns. The pivotal role of LPLN in rectal cancer spread and patient prognosis. 2. DIAGNOSIS AND IMAGING FINDINGS: Criteria for malignant LPLN characterization on MRI. The process of staging and restaging LARC with MRI post-neoadjuvant chemoradiotherapy (nCRT). Prognostic implications of LPLN involvement. Treatment strategies: Evaluating nCRT, lateral pelvic lymph node dissection (LPLND), and selective LPLND. 3. SUMMARY AND SYSTEMATIC APPROACH: A streamlined approach to integrating imaging findings with clinical decision-making. 4. TAKE HOME MESSAGES.

## GIEE-46 HEPATIC ABSCESS: THE TIP OF AN ICEBERG - A STEP BY STEP TO ITS ORIGIN

Marilia A. Tavares, MD (*Abstract Co-Author*) Nothing to Disclose
Lais F. Pimentel, MD (*Abstract Co-Author*) Nothing to Disclose
Isabella Torres de Lima, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Review the main diseases that cause liver abscesses and provide tips for evaluating imaging tests.- Discuss the main causes of a liver abscess and its pathophysiology.- Systematize the search for the etiology of liver abscess.

### TABLE OF CONTENTS/OUTLINE

An abscess is a well-defined, low-attenuation, round mass containing necrotic inflammatory material. The hepatic abscess is the most common of visceral abscesses and is usually a consequence of other changes, such as infections, trauma, or tumors, which must be identified for better patient management.Therefore, when identifying a liver abscess, the radiologist's analysis cannot stop there. They must keep in mind the most common causes and look for the possible origin of the abscess, since the clinical symptoms can be nonspecific and imaging exams play a fundamental role in this investigation.By following three simple steps: firstly, using clinical information; secondly, understanding the main origins of liver abscesses and their pathophysiology; and finally, combining the first two steps to identify findings, it is possible to detect the majority of conditions causing liver abscess, thus assisting the attending physician in the care of the patient.

## GIEE-47 TORSION AND VOLVULUS: A TALE OF TWISTS AND TURNS IN THE BELLY

Sarah K. Oh, MD (*Abstract Co-Author*) Nothing to Disclose
Fernanda S. Mazzariol, MD (*Abstract Co-Author*) Nothing to Disclose
Katherine Eacobacci, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Multiplanar CT review is important in cases of large bowel volvulus to discern the anatomy: “X marks the spot” in mesentero-axial volvulus and “split wall-sign” in organo-axial volvulus. 2. Hyperdense, unenhanced bowel wall with mural hemorrhage is the single best predictor of irreversible ischemia and may be mistaken for wall enhancement on contrast CT. 3. J-pouch torsion can occur as part of afferent limb syndrome due to progressive dilatation of the ileum, or as efferent limb syndrome with a stapled anastomosis. 4. Gastric axis rotation is commonly seen with large hiatal hernias, but is often asymptomatic. Gastric volvulus is rare, but is a surgical emergency. Recognition of Borchardt’s triad along with key imaging findings is critical. 5. Gallbladder torsion is rare, often occurs in elderly women, and simulates cholecystitis on imaging. It requires urgent cholecystectomy and the diagnosis is often made at surgery. 6. Pedunculated uterine fibroid torsion may be confused with adnexal torsion because the pedicle is thin and difficult to visualize. 7. Splenic torsion is rare but can be fatal. Abnormal location of the avascular spleen is a clue. 8. If the abnormal position of the transplanted kidney is not recognized, renal transplant torsion may be mistaken for donor vein obstruction or arterial stenosis.

### TABLE OF CONTENTS/OUTLINE

Illustrated review of pathophysiology and clinical features of abdominal viscera torsion and volvulus while emphasizing pearls and pitfalls of imaging. Multimodality examples of volvulus and torsion including but not restricted to: Gut (sigmoid colon, transverse colon, cecum, small bowel, gastric and J pouch), Renal transplant, Gallbladder, Uterus, Uterine fibroid, Spleen and splenule

## GIEE-48 ESOPHAGEAL STRICTURES: THE KEYS TO DIAGNOSIS BY PNEUMO-CT

**Awards**
**Certificate of Merit**

Mariano Lorea (*Abstract Co-Author*) Nothing to Disclose
Paula Gimena Ortiz Suarez (*Abstract Co-Author*) Nothing to Disclose
Fiorella Conca, MD (*Abstract Co-Author*) Nothing to Disclose
Roy Lopez Grove, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1) Pneumo-CT provides key information by facilitating additional esophageal distension, aiding in the evaluation of esophageal wall thickening and extraesophageal disease in a single examination.2) Benign strictures exhibit reduced esophageal distensibility in pneumo-CT due to fibrotic wall changes. The primary cause is gastroesophageal reflux disease, typically manifesting as concentric, symmetric, soft-edged wall thickening in the distal esophagus associated with a hiatal hernia.3) Personal history is pertinent for diagnosing the underlying cause of a benign stricture.4) Malignant strictures present with rapid onset of symptoms including dysphagia and weight loss. They appear as asymmetric and irregular thickening of the esophageal wall, sometimes accompanied by adenopathy and involvement of surrounding fat planes, depending on the extent of tumor infiltration.5) The differential diagnosis primarily involves esophageal dilatation, predominantly caused by dysmotility.

**TABLE OF CONTENTS/OUTLINE**

1) Introduction.2) Diagnostic algorithm for esophageal strictures: Upper endoscopy, barium esophagogram, pneumo-CT.3) Pneumo-CT technique.4) Key findings in pneumo-CT. Esophageal wall: Margins, narrowing, contour, mucosal surface, enhancement. Extraluminal findings: fat, lymph nodes, metastases.5) Benign strictures: Pathophysiology. Causes.6) Malignant strictures: Pathophysiology. Causes.7) Differential diagnoses.

## GIEE-49 ATYPICAL PANCREATIC MASSES AND TUMOR-LIKE LESIONS - BEYOND DUCTAL ADENOCARCINOMA

**Awards**
**Magna Cum Laude**

Mariano Volpacchio, MD (*Abstract Co-Author*) Nothing to Disclose
German Espil (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- To overview imaging findings of tumors anda tumor-like lesions in the pįncreas according to WHO classification- To review unusual pancreatic masses clinical, pathologic and imaging features with a case-based approach- To provide diagnostic clues useful to assist in proper diagnosis and management

**TABLE OF CONTENTS/OUTLINE**

1. Introduction2. Ephitelial exocrine tumor3. Neuroendocrine neoplasms4. Mesenchimal tumours5. Hematologic tumours6. Secondary tumours7. Tumor - Like lesion8. Summary

## GIEE-5 BELOW THE DIAPHRAGM AND AROUND OF EQUATOR: A PICTORIAL REVIEW ON ABDOMINAL MANIFESTATIONS OF TROPICAL ENDEMIC DISEASES

Giuseppe D'Ippolito, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Daniel Bekhor, MD (*Abstract Co-Author*) Nothing to Disclose
Francisco C. Brasil (*Abstract Co-Author*) Nothing to Disclose
Bruna K. Andreucci, MD (*Abstract Co-Author*) Nothing to Disclose
Ulysses S. Torres, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Eduardo O. Pacheco, MSc, MD (*Abstract Co-Author*) Nothing to Disclose
Andrea L. Dias, MD (*Abstract Co-Author*) Nothing to Disclose
Julia De Toledo Mendes, MD (*Abstract Co-Author*) Nothing to Disclose
Nathalia Goncalves Dias (*Abstract Co-Author*) Nothing to Disclose
Aley Talans, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Present diseases endemic to tropical regions. - Review key epidemiological and clinical features of tropical diseases. - Discuss imaging characteristics of tropical diseases, both common and uncommon. - Emphasize the radiologist's pivotal role in expanding diagnostic considerations and assessing disease extent for improved outcomes.

**TABLE OF CONTENTS/OUTLINE**

Tropical diseases (TDs) impact underserved areas, caused by various pathogens like bacteria, viruses, parasites, and fungi. These diseases have significant health, social, and economic impacts. With increased global travel, recognizing these diseases quickly is vital for radiologists to improve patient care through prompt diagnosis and treatment. This presentation delivers insights into abdominopelvic imaging for major TDs through engaging cases, covering: 1. Demonstrate typical and atypical abdominal imaging manifestations of major tropical diseases via educational cases. 2. Detail epidemiology and imaging findings of abdominopelvic presentations in: a. Parasitic: Helminth infections such as Schistosomiasis, Echinococcosis, Ascariasis, Strongyloidiasis; and Protozoal infections including Leishmaniasis and Chagas disease. b. Bacterial: Specifically, Tuberculosis. c. Fungal: Highlighting Paracoccidiomycosis and Histoplasmosis. d. Viral: Covering Dengue fever. 3. Provide an understanding of the main risk factors, along with the prevalence and incidence of the most encountered endemic tropical infectious diseases.

## GIEE-50 INFLAMMATORY AND NON-INFLAMMATORY ABDOMINAL CONDITIONS: STAY ALERT FOR YOUR NEOPLASTIC COMPLICATIONS

**Awards**
**Certificate of Merit**

Cassia T. Guimaraes, MD (*Abstract Co-Author*) Nothing to Disclose
Daniel Lahan-Martins, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Fernanda G. Velloni, MD (*Abstract Co-Author*) Nothing to Disclose
Glaucy L. Neme, MD (*Abstract Co-Author*) Nothing to Disclose
Roberto Blasbalg, MD (*Abstract Co-Author*) Nothing to Disclose
Renata S. Nascimento, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

• List the main abdominal inflammatory diseases that increase the risk of neoplasms • List the main non-inflammatory abdominal conditions that increase the risk of neoplasms • Illustrate with cases the characteristics of chronic inflammatory diseases and non-inflammatory abdominal conditions that have evolved into neoplasms using computed tomography (CT) and magnetic resonance imaging (MRI) • Enhance the recognition and interpretation of neoplastic complications in patients with pre-malignant inflammatory and non-inflammatory changes • Demonstrate the importance of understanding the neoplastic complications of inflammatory and non-inflammatory abdominal conditions

**TABLE OF CONTENTS/OUTLINE**

Describing the imaging presentations of chronic inflammatory diseases and their neoplastic complications Primary sclerosing cholangitis • Cholangiocarcinoma Inflammatory bowel disease • Adenocarcinoma of the small bowel Hereditary pancreatitis • Pancreatic adenocarcinoma Metabolic dysfunction associated steatotic liver disease (MASLD) • Hepatocellular carcinoma Describing the imaging presentations of non-inflammatory abdominal conditions that increase the risk of neoplasms and their malignant complications Cryptorchidism • Testicular germ cell tumor Urachal remnant • Bladder adenocarcinoma Bladder diverticulum • Urothelial neoplasia Endometriosis• Endometrioid carcinoma or clear cell carcinoma

## GIEE-51 UNVEILING THE DIFFERENT TONES OF CROHNS

Jose A. Lara, MD (*Abstract Co-Author*) Nothing to Disclose
Claudia B. Sotomayor Rivera (*Abstract Co-Author*) Nothing to Disclose
Claudia Muns, MD (*Abstract Co-Author*) Nothing to Disclose
Adriana Perez, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Identify early, chronic, and severe signs of active inflammatory Crohn’s disease and recognize how imaging findings can overlapReview the major gastrointestinal anatomy involved in this pathology and understand its pathophysiologyGo over severity score in active Crohn's disease to provide a complete radiological assessment of the disease.Understand major radiological differences between stricturing and penetrating and highlight the most common complications

**TABLE OF CONTENTS/OUTLINE**

I. IntroductionII. ObjectivesIII. Anatomical diagrams of areas affected by Crohn's disease and pathophysiologyVI. Gastrointestinal features of Crohn's disease on CT and MRI 1. Active versus non-active/chronic disease 2. Penetrating versus stricturing disease 3. Common complications 4. Radiological severity score of active inflammatory diseaseVII. Self-assessment with multiple cases in quiz format VIII. ConclusionHistorically a higher incidence of IBD has been reported in Caucasians and lower rates in Black and Hispanic populations however, during the past decades these differences have decreased. There has been an increase in IBD in blacks, Hispanics, and Asians. With increased incidence among a broader population it is vital for radiologists to be familiar with what was only classically found in a specific population. Through this educational exhibit, we will provide a comprehensive review of classic radiological features of active and non-active Crohn's disease, stricturing versus penetrating disease, and its associated complications as seen on CT and MR. Our aim is to increase awareness of this disease among radiologists in order to assist physicians in early detection and treatment.

## GIEE-52 IBD THERAPEUTICS: MECHANISM OF ACTION, MONITORING, POTENTIAL SIDE EFFECTS AND RISKS

**Awards**
**Certificate of Merit**

Rony Kampalath, MD (*Abstract Co-Author*) Nothing to Disclose
Parakkal Deepak, MBBS (*Abstract Co-Author*) Consultant, Johnson & Johnson;Advisory Board, Johnson & Johnson;Consultant, Pfizer Inc;Advisory Board, Pfizer Inc;Consultant, Prometheus Pharmaceuticals;Advisory Board, Prometheus Pharmaceuticals;Consultant, Boehringer Ingelheim GmbH;Advisory Board, Boehringer Ingelheim GmbH;Grant, Boehringer Ingelheim GmbH;Consultant, Arena Pharmaceuticals;Advisory Board, Arena Pharmaceuticals;Grant, Arena Pharmaceuticals;Grant, Takeda Pharmaceutical Company Limited;Grant, Bristol-Myers Squibb Company;;;
David Bruining, MD (*Abstract Co-Author*) Consultant, Medtronic plc;Research support, Medtronic plc;Research support, Takeda Pharmaceutical Company Limited
Jalpa Devi (*Abstract Co-Author*) Nothing to Disclose
Safa Hoodeshenas, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

• To review briefly recent advancements in therapeutic approaches to inflammatory bowel disease (IBD)• To describe the current understanding of the mechanisms of action of different IBD medications• To highlight the side effect profiles and risks that radiologists need to aware of

**TABLE OF CONTENTS/OUTLINE**

1.Introduction to IBD and the expanding medication armamentarium2.Imaging to guide management decisions3.Mechanisms of Action of IBD Therapeutics and their potential side effects§ Aminosalicylates (5-ASAs)§ Corticosteroids§ Immunomodulators (e.g., Azathioprine, 6-Mercaptopurine, methotrexate)§ Biologic agents: Anti-TNF agents (e.g., Infliximab, Adalimumab, Certolizumab Pegol, and Golimumab),Integrin receptor antagonists (e.g., Vedolizumab, Mirikizumab), Interleukin inhibitors (e.g., Ustekinumab, Risankizumab)§ Small molecule drugs: JAK inhibitors (e.g., Tofacitinib, Upadacitinib) and sphingosine-1-phosphate receptor modulators (Ozanimod, Etrasimod)

## GIEE-53 ACUTE CHOLANGITIS, WHAT THE RADIOLOGIST NEEDS TO KNOW

Israel Vicente Toledo Coronado, MD (*Abstract Co-Author*) Nothing to Disclose
Tania D. Grimaldo Galeana, MD (*Abstract Co-Author*) Nothing to Disclose
Hector Alvarez-Manzo, MD (*Abstract Co-Author*) Nothing to Disclose
Ricardo D. Alpizar, MD,MEd (*Abstract Co-Author*) Nothing to Disclose
Ana C. Gandara, MD (*Abstract Co-Author*) Nothing to Disclose
Elisa De Jesus Ramos, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To describe the anatomy and physiology of the biliary tree. To list the diagnostic criteria of acute cholangitis.To describe the main imaging techniques for the evaluation of the biliary tract.With the help of representative images of acute cholangitis, and acute/chronic complications , to review the typical imaging findings of an abnormal biliary tree.To evaluate the differential diagnosis of cholangitis through representative images of congenital and acquired pathologies, as well as neoplasm that affect the biliary tree.To describe the role of interventional radiology in the treatment of complicated cholangitis.

**TABLE OF CONTENTS/OUTLINE**

-Anatomy and physiology of the biliary tree. -Acute cholangitis: Definition, classification, etiology, epidemiology, pathophysiology, clinical and laboratory findings, diagnostic criteria (Tokyo guidelines) and radiologic diagnosis (ultrasound, computed tomography, magnetic resonance imaging, magnetic cholangioresonance, cholangiography and contrast-enhanced ultrasound (CEUS)). -Acute complications: Pericholangitic and liver abscesses, sepsis, portal vein thrombosis. -Chronic complications: Biliary stricture, secondary sclerosing cholangitis and cholangiocarcinoma. -Differential diagnosis: Choledocholithiasis, gallbladder perforation, primary sclerosing cholangitis, biliary pancreatitis, liver metastases, primary biliary cholangitis, cholangiocarcinoma, periampullary tumors and drug-induced liver injury. -Cholangitis post liver transplantation: Diagnosis with computed tomography and Doppler ultrasound. -Treatment with interventional radiology: Percutaneous transhepatic biliary drainage.

## GIEE-54 IMMUNE-MEDIATED LIVER DISEASE: MULTIMODALITY IMAGING AND PATHOLOGY CORRELATION

Douglas M. Rogers, MD (*Abstract Co-Author*) Royalties, RELX
Akram M. Shaaban, MBBCh (*Abstract Co-Author*) Royalties, RELX
Maryam Rezvani, MD (*Abstract Co-Author*) Nothing to Disclose
Ayman H. Gaballah, MD, FRCR (*Abstract Co-Author*) Nothing to Disclose

Reham M. Ellessy, MBBCh (*Abstract Co-Author*) Nothing to Disclose
Moataz Ahmed Sayed Mohammed Soliman, MD,MSc (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• Understand normal autoimmune regulation mechanisms.• Described different patterns of hepatic involvement in autoimmune diseases.• Imaging features and pathology correlation of common immune-mediated liver disease.

### TABLE OF CONTENTS/OUTLINE

• Introduction- Pathophysiology of immune-mediated disease- Immunocompromised patients• Main regulators of the immune response• Vascular involvement- Autoimmune vasculitis- Autoimmune coagulopathies.• Autoimmune associated biliary disease- Primary biliary cholangitis- Primary sclerosing cholangitis- IgG-4 mediated hepatobiliary disease• Autoimmune mediated liver parenchymal disease- Autoimmune hepatitis• Special groups- Liver transplantation- Acute rejection- Hyper acute rejection- Chronic rejection- Graft versus host disease- The immunocompromised patient- Infections- Malignancies

## GIEE-55 MULTIMODALITY IMAGING OF FOCAL PANCREATIC LESIONS: THE ADDED ADVANTAGE OF ENDOSCOPIC ULTRASOUND

Shrivalli Nandikoor, MBBS (*Abstract Co-Author*) Nothing to Disclose
Halkurike Jayadevappa Vijay Kumar (*Abstract Co-Author*) Nothing to Disclose
Gayathri S Menon, MBBS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Pancreatic focal lesions can be malignant or benign, cystic, solid or solid-cystic, with varying presentations. Multiple imaging modalities are used for diagnosis of pancreatic lesions including MDCT, MRI, USG ,PET-CT and Endoscopic ultrasound(EUS). EUS has the added advantage of high resolution imaging and the possibility of targeted tissue sampling simultaneously. This helps in detailed characterization of lesions with detection of details that can be otherwise missed in other imaging modalities. Aim of this exhibit is multimodality imaging review of spectrum pancreatic focal lesions and special emphasis on the added value of endoscopic ultrasound in characterization and diagnosis of these lesions

### TABLE OF CONTENTS/OUTLINE

Case based multimodality imaging review of pancreatic focal lesions and comparison with endoscopic ultrasound evaluation for characterization and diagnosis. The exhibit will include spectrum of cases including simple cyst, pseudocyst, serous cystadenoma, mucinous cystic neoplasm, IPMN,SPEN, NETs, Adenocarcinoma pancreas, metastatic deposits, focal pancreatitis.

## GIEE-56 INFILTRATIVE HEPATOCELLULAR CARCINOMA: CHALLENGING CASES AND ITS BENIGN MIMICS WITH RAD-PATH CORRELATION

Rashmi T. Nair, MD (*Abstract Co-Author*) Nothing to Disclose

Harit Kapoor, MD, MBBS (*Abstract Co-Author*) Nothing to Disclose
Joseph W. Owen, MD (*Abstract Co-Author*) Nothing to Disclose
Elhamy R. Heba, MD, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Hepatocellular carcinoma is one of the leading causes of cancer related death worldwide. Various histopathologic and morphologic subtypes of HCC are described throughout the literature. Among all these subtypes, infiltrative type HCC is the most challenging to detect clinically and radiographically. Infiltrative HCC is characterized by diffuse infiltrative spread throughout the liver parenchyma, without forming a mass-like lesion, in a way that sometimes it is difficult to detect on a background of already abnormal liver parenchyma. The infiltrative fashion of this disease makes other infiltrative liver diseases mimic the appearance of this malignancy on imaging. This includes confluent fibrosis, diffuse hepatic steatosis or iron deposition, diffuse metastatic disease, cholangiocarcinoma, and hepatic micro abscesses. Distinguishing infiltrative HCC mimics on imaging is crucial due to difference in management and the poor prognosis of this infiltrative malignancy. We will show challenging cases of infiltrative HCC and mimics of infiltrative HCC using a case-based approach with Rad-Path correlation.

### TABLE OF CONTENTS/OUTLINE

1. Incidence and prevalence of infiltrative HCC. 2. Review imaging features of infiltrative HCC, including multimodality case-based review of challenging cases of infiltrative HCC with pathological correlation. 3. Portal vein thrombosis (including tumor thrombus) as a common finding in infiltrative HCC. 4. Case-based review of infiltrative HCC mimics including confluent fibrosis, diffuse hepatic steatosis/iron deposition, diffuse metastatic disease, cholangiocarcinoma, and hepatic micro abscesses. 5. Review of prognosis and management of infiltrative HCC.

## GIEE-57 EXPLORING ESOPHAGOGRAM PATHOLOGIES: BUMPS, DOTS AND BEYOND

Monica Chapa-Ibarguengoitia, MD (*Abstract Co-Author*) Nothing to Disclose
Ricardo D. Alpizar, MD,MEd (*Abstract Co-Author*) Nothing to Disclose
Nicolas Serrano III, MD (*Abstract Co-Author*) Nothing to Disclose
Lourdes M. Avila, MD (*Abstract Co-Author*) Nothing to Disclose

Jonahi S. Serrano Heredia, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Review the classic findings of esophageal pathologyDiscuss the utility of dynamic esophagram studiesIntegrate imaging findings with systemic diseases.

**TABLE OF CONTENTS/OUTLINE**

BackgroundEsophagogram anatomyFunctional diseasesAnatomical defectsVascularTumorsImmunologicalInfectiousCased based review of dynamic studies (Gift and video form) with quiz.

## GIEE-58 DIFFERENTIATING THE COLORECTAL MUCINOUS METASTASIS FROM OTHER HEPATIC LESIONS: TIPS AND TRICKS

Giovanni Morana, MD (*Abstract Co-Author*) Speakers Bureau, Bracco Group
COSTANTINA DAL MAGRO (*Abstract Co-Author*) Nothing to Disclose
Luisa Tomaiuolo, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To illustrate with some interesting cases the appearance of the hepatic mucinous metastasis from colorectal primary malignancy and give some tips and tricks for the achievement of the correct diagnosis.

**TABLE OF CONTENTS/OUTLINE**

The radiological features of mucinous carcinoma metastasis in the liver are sometimes unclear and dependent on the mucinous/fibrosis component proportion. Distinguishing these lesions from cholangiocarcinoma or benign entities such as angioma and solitary necrotic nodules can be challenging for radiologists. This essay discusses with some examples the key characteristics of hepatic mucinous metastasis observed in TC and MR imaging, focusing on the lesion morphology, the vascular pattern and the restriction on the DWI sequences. Finally, we outline the primary differential diagnoses and their imaging behaviors on CT/MRI.CT/MRI imaging features of mucinous colorectal metastasis in the liver could be a challenging diagnosis for radiologists. The patient history and the evolution of the lesion are crucial, especially with small lesions

## GIEE-59 LIVER STORAGE DISEASES: WHAT RADIOLOGISTS NEED TO KNOW

Aldara Naveiras Calvo, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The liver is the fundamental organ for human metabolism. A multitude of factors, from hereditary diseases to alcohol or an unhealthy lifestyle habit, can lead to the accumulation of substances in the liver, eventually leading to the development of chronic liver disease. Radiologists play a crucial role in the early diagnosis of such diseases and knowing how to detect and measure them, and rule out complications is critical. We focus on the two substances most commonly deposited, fat and iron, while also mentioning less frequent causes such as copper, lysosomal storage diseases, and amyloidosis. We emphasize some pitfalls that can arise from such depositions and to what extent they can aid us in diagnosing lesions.

**TABLE OF CONTENTS/OUTLINE**

- Steatosic liver- Liver iron overload- Other causes: copper, lisosomal storage diseases, amyloidosis

## GIEE-6 UPDATE ON NOVEL BIOLOGIC THERAPIES FOR CROHN'S DISEASE AND IMPACT OF IMAGING ON CLINICAL DECISION-MAKING

Kian Keyashian (*Abstract Co-Author*) Nothing to Disclose
Michael S. Gee, MD, PhD (*Abstract Co-Author*) Researcher, General Electric Company Researcher, Siemens AG Researcher, Motilent LLC
Richa D. Patel, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Review novel Crohn's biologic therapies GI perspective on therapy algorithms2. Describe clinical scenarios in which imaging prompts therapy change with case examples3. Discuss imaging features associated with biologic treatment response

**TABLE OF CONTENTS/OUTLINE**

• Intro to Crohn's Disease (CD)• Imaging:§ Rationale for certain studies (CTE, MRE, XR)§ When to image (asymptomatic, symptomatic, coordinate with therapy)§ How imaging integrates with endoscopic findings biomarkers• Treatment algorithm:§ Top-down vs step up• GI rationale for deciding therapy• Flowchart of treatment pathway exceptions§ Agents:• Molecular target, administration route, dose• Indication:o Penetrating stricturing CDo Small bowel vs colonico Perianal CD• Complications prompting therapy change• Imaging CD on biologics:§ Treatment endpoints• Mucosal healing• Deep remission• Radiologic response§ What radiologists look for on imaging• Findings pivotal to affecting management on therapy (switch agents, add agents, endoscopic/surgical therapy)o Fistulizing CDo Perianal CDo Stricturing CD +/- active inflammation§ Radiologic vs non-radiologic assessment of CD response• How biomarkers symptoms correlate with imaging§ Case-based review of scenarios where imaging influences therapy why• Strictures• Enteric perianal fistulas• Resection• Mild CD not requiring therapy• Severe CD requiring immediate surgery vs therapy with agent switch§ Therapy selection (factors affecting therapy selection change):• Clinical factorso Symptomso Endoscopic radiologic signs of healing or progression, biomarkers• Patient factorso Cost/insurance coverageo Administration routeo Social constraints (access, compliance)

## GIEE-60 ALL YOU NEED TO KNOW IN IMAGING OF LIVER INFECTIONS

Sung Yoon Park, MD (*Abstract Co-Author*) Nothing to Disclose
Rajat Bhargava, MD, MBBS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Smooth outline and liquified core either in a single locule or multiple small locules are critical to diagnosis of abscess Double Target appearance is the most specific sign Klebsiella Pneumoniae often produces multilocular pyogenic abscesses Parasitic infections often have peripheral eosinophilia Embroyonal sarcoma, cholangiocarcinoma often mimic Abscesses.

**TABLE OF CONTENTS/OUTLINE**

1. Objectives 2. Imaging spectrum by morphology 3. Imaging signs 4. Imaging spectrum by organism 5. Tumors masquerading as Abscesses

## GIEE-61 SEEING BEYOND THE SURFACE: IMAGING OF ACUTE ABDOMINAL COMPLICATIONS IN ONCOLOGICAL PATIENTS

### TEACHING POINTS

The increasing incidence of neoplasms, has also increased cancer-related complications, including abdominal ones. These complications may be related to the direct effect of the tumor, through compression or infiltration, systemic changes or due to invasive procedures (diagnostic or therapeutic).The purpose of this ehxibit is to: • Highlight signs of acute abdominal complications in patients with known neoplasia on computed tomography (CT) and magnetic resonance imaging (MRI); • Identify possible signs of malignancy in patients with an acute abdominal condition as the initial manifestation of an unknown neoplasia; • Explore acute abdominal manifestations that can affect patients with cancer, including hemorrhage, bowel obstruction, perforation, fistula, ischemia and cholangitis; • Correlate between clinical information, histological studies and imaging findings, in order to refine the differential diagnosis; • Provide practical information and pitfalls in the interpretation of imaging findings.

### TABLE OF CONTENTS/OUTLINE

• Introduction; • Imaging aspects - case based didatic review of the radiological appearance of abdominal complications in oncological patients, including hemorrhage, bowel obstruction, perforation, fistulas, ischemia and cholangitis; • Pearls and Pitfalls; • Conclusion/Take home message; • References.

## GIEE-62 GET INTO THE GROOVE: A PICTORIAL REVIEW OF PANCREATICODUODENAL GROOVE PATHOLOGIES

Cammillo R. Talei Franzesi (*Abstract Co-Author*) Nothing to Disclose
Davide Ippolito, MD (*Abstract Co-Author*) Nothing to Disclose
Rocco Corso, MD (*Abstract Co-Author*) Nothing to Disclose
Cesare Maino, MD (*Abstract Co-Author*) Nothing to Disclose
Paolo N. Franco, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The pancreaticoduodenal groove (PDG) is a space between the second duodenal portion and the head of the pancreas. Superiorly, it’s delimitated by the duodenal bulb, posteriorly by the inferior vena cava, and anteriorly by the third duodenal part. PDG is also traversed by the distal portion of the common bile duct (CBD) and contains fat and nodes. Due to the critical anatomical structures surrounding it, various entities can originate inside or close to this region.Pathologies of PDG may be classified by their origin. Many benign (groove pancreatitis, autoimmune pancreatitis) and malignant (adenocarcinoma, NETs, lymphomas) pancreatic diseases may arise in the PDG. The di"erential diagnosis between groove pancreatitis and pancreatic adenocarcinoma is the most challenging due to similar imaging findings. However, some di"erences can be spotted to aid in the correct diagnosis. Duodenal diseases involving the groove are diverticula, inflammation, and neoplasms (adenocarcinomas, GISTs, and lymphomas). Among CBD pathologies, the most frequent are distal cholangiocarcinoma and choledochal cysts. Finally, ampulla of Water and lymph nodes diseases may also a"ect this space. PDG lesions management encompasses follow- up controls, endoscopic resection, or complex surgical procedures. Consequently, a correct diagnosis and pre-operative imaging assessment are pivotal.

### TABLE OF CONTENTS/OUTLINE

1. PDG anatomy2. Imaging findings of pancreatic pathologies involving the PDG3. Imaging findings of duodenal pathologies involving the PDGG4. Imaging findings of common bile duct pathologies involving the PDG5. Imaging findings of other structures pathologies involving the PDG.

## GIEE-63 UNDERSTANDING PORTAL VEIN THROMBOSIS: CRUCIAL CONSIDERATIONS IN LIVER TRANSPLANTATION

Giovanni G. Cerri, PhD (*Abstract Co-Author*) Nothing to Disclose
Daniel L. Cardoso, MD (*Abstract Co-Author*) Nothing to Disclose
Regis Otaviano Bezerra, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Jose de Arimateia B. Araujo Filho, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Fabio P. Pereira (*Abstract Co-Author*) Nothing to Disclose
Paola Beninca, MD (*Abstract Co-Author*) Nothing to Disclose
Vitor D. Bichuette, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Understanding the classification of portal vein thrombosis (PVT), its epidemiology, and imaging features. - Exploring technical challenges posed by PVT during liver transplantation. - Discussing pre-transplant management strategies for PVT. - Identifying imaging findings that may contraindicate or complicate liver transplantation in the context of PVT.

### TABLE OF CONTENTS/OUTLINE

Introduction:- Overview of portal vein thrombosis and its significance in liver transplantation.- Role of imaging in assessing PVT and its implications for surgery.Portal Vein Thrombosis:- Definition, epidemiology, and clinical presentation.- Imaging features of PVT and differentiation from other vascular conditions.- Surgical considerations and challenges in patients with PVT undergoing liver transplantation.Pre-transplant Management:- Strategies for managing PVT before liver transplantation.- Role of radiological interventions and imaging surveillance in pre-transplant evaluation.Imaging in Liver Transplantation:- Assessment of imaging findings that may contraindicate or complicate liver transplantation in PVT patients.Case-Based Review:- Illustrative cases demonstrating imaging findings of PVT and their impact on liver transplantation.Future Directions:- Emerging techniques and advancements in imaging for PVT evaluation and management.- Potential areas for improving outcomes in liver transplantation for patients with PVT.Conclusion:- Summary of key considerations for radiologists in the context of PVT and liver transplantation.- Importance of multidisciplinary collaboration between radiologists, surgeons, and other specialists in optimizing patient care.

## GIEE-64 BETWEEN DUCTS AND DILATIONS: THE INTRIGUING WORLD OF IPMN

(*Abstract Co-Author*) Nothing to Disclose
Luiz Rodrigues Santos, MD (*Abstract Co-Author*) Nothing to Disclose
Nara Vedoveli (*Abstract Co-Author*) Nothing to Disclose
Viviane B. Amorim, MD (*Abstract Co-Author*) Nothing to Disclose
Barbara De Melo Gedeon, MD (*Abstract Co-Author*) Nothing to Disclose
Igor J N Leite, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Reviewing the radiological anatomy of the pancreas and related structures. - Detailing imaging features of malignant transformation of intraductal papillary mucinous neoplasms (IPMN); - Discuss the characteristics and differences between the possible imaging methods used in the evaluation of the pancreas in the context of IPMN; - Exemplify the main imaging findings, with emphasis on magnetic resonance imaging, used for risk stratification in IPNM; - Describe the management and recommendations for imaging follow-up of diagnosed or presumed IPMN.

**TABLE OF CONTENTS/OUTLINE**

- Anatomy review- What are the cystic lesions of the pancreas and how to find them?- Narrowing the diagnostic.- Stratify the risk.- Guide the conduct.- When, where and how to follow up an IPNM?

## GIEE-65 ULTRASOUND FINDINGS OF COMPLICATIONS IN LIVER TRANSPLANTATION: AN EDUCATIONAL OVERVIEW

Teresa A. Garcia, MD (*Abstract Co-Author*) Nothing to Disclose
Diego Saez, MD (*Abstract Co-Author*) Nothing to Disclose
Sofia Pividori (*Abstract Co-Author*) Nothing to Disclose
Aylen Gonzalez Gonzalez, MD (*Abstract Co-Author*) Nothing to Disclose
Bruno Miguel Manzanares, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Despite advancements in surgical techniques and postoperative care, complications following liver transplantation remain a significant concern. Ultrasound imaging is a pivotal tool due to its non-invasive nature and ability to provide real-time assessment. Radiologists must be acquainted with the imaging findings and complications. In this exhibit we will:Review vascular complications, including hepatic artery thrombosis and stenosis, and portal vein stenosis, manifest as alterations in blood flow patterns and vessel caliber, discernible through Doppler ultrasound.Review biliary complications, such as bile duct strictures and leaks, present as dilatation of the intrahepatic and extrahepatic ducts with associated periductal fluid collections. Discuss parenchymal abnormalities post-liver transplantation, including graft rejection, hepatic steatosis, and infections.Present the most common extra hepatic anomalies found after liver transplant, some of them related to the aforementioned predicaments.Correlate, if needed, the ultrasound findings with complementary methods of evaluation, like magnetic resonance or computed tomography.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction2. Imaging method key points3. Review the strengths and role of Doppler ultrasonography.4. Transitory alterations in the immediate post-transplant5. Classification of complications of liver transplant: Clinical parameters (age, type of transplant, postoperative time, symptoms) and sonographic findings (resistance index, velocity, waveform) are consider.VascularBiliaryParenchymal abnormalitiesGraft rejectionHepatic steatosisInfections6. Summary (table)7. Conclusions

## GIEE-66 PNEUMO PET-CT: ROLE IN ESOPHAGO-GASTRIC CANCER

**Awards**
**Cum Laude**

Pablo E. Biedak, MD (*Abstract Co-Author*) Nothing to Disclose
Roy Lopez Grove, MD (*Abstract Co-Author*) Nothing to Disclose
Fiorella A. Conca, MD (*Abstract Co-Author*) Nothing to Disclose
Valentina Garralda (*Abstract Co-Author*) Nothing to Disclose
Mariano Lorea (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Pneumo PET-CT is a distension-based CT technique combining with PET scan with FDG.Great utility in the staging of esophagogastric cancer in order to plan therapeutic strategy.Gives essential information to oncologists and surgeons about tumor extension, deep wall involvement, lymph node and distant metastasis in a single study, reducing radiation and iodinated-contrast media exposureEvaluates neoadjuvant therapy response on changes in FDG uptake

**TABLE OF CONTENTS/OUTLINE**

1- Introductiona) Epidemiological scenario in gastroesophageal cancerb) Advantages and disadvantages of current staging methods2- Pneumo PET-CT techniquea) Materialsb) Method to assess great lumen distension3- Findings in the staging of esophagus, gastroesophageal junction and gastric cancera) Imagenological key findings in T stagingb) Lymph nodes and distant metastasis (NM)4- Use in pre-surgical assessment and neoadjuvant therapya) Treatment response criteriab) Changes in FDG uptake5- Pitfalls and limitationsa) Insufficient gastric distension simulating an infiltrating tumorb) Overdistention mimicking adjacent organ infiltrationc) Residual liquid or food in the gastric lumen6- Conclusions

## GIEE-67 BENIGN FOCAL HEPATIC LESIONS: SEEKING ASSERTIVENESS AND RECOGNIZING LIMITS

Thais Mussi, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Thiago M. Baraviera, MD (*Abstract Co-Author*) Nothing to Disclose
Lavinia Dias, MD (*Abstract Co-Author*) Nothing to Disclose
Ronaldo H. Baroni, PhD (*Abstract Co-Author*) Nothing to Disclose
Lucas Aquino (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The purposes of this exhibit are:To review the main topics of the differential diagnosis of focal benign hepatic lesions, taking into consideration imaging aspects and clinical context.To discuss, through didactic cases, the limits of assertiveness in the differential diagnosis of the main focal benign hepatic lesions.To alert about the presence of findings that act as pitfalls for the radiologist, potentially simulating benign and malignant lesions, creating doubts and diagnostic challenges.To assist the performance of radiologists as a guide in clinical management in different scenarios related to the theme.

**TABLE OF CONTENTS/OUTLINE**

INTRODUCTION:To expose the existence of situations in which the presence of atypical characteristics and the clinical context may reduce the radiologist's assertiveness in the evaluation of benign focal hepatic lesions.DISCUSSION:To present, by means of a review based on didactic cases, the main points of the differential diagnosis, as well as the limits of assertiveness of imaging studies in the evaluation of benign focal hepatic lesions (cystic lesions; hemangiomas and metastases; hepatocellular lesions; pseudolesions and pitfalls).CONCLUSION:To summarize the main covered topics, reinforcing the importance of the radiologist's role as a guide for clinical management, with a direct impact on patient care pathways.

## GIEE-68 THE ROLE OF IMAGING IN ESOPHAGEAL CANCER: RADIOLOGIC PATTERNS WITH RADIOLOGIC-PATHOLOGIC CORRELATION

Carlo D'Alessandro, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

State of the art treatment for esophageal cancer is multimodal and involves combined surgical and medical therapy. CT has a central role in the staging of esophageal cancer, being the method of choice for this purpose; positron emission tomography (PET) and magnetic resonance imaging (MRI) [MOU1] can help to evaluate the metabolic activity of tumors, identify distant metastases, and assess treatment response. Serial imaging studies, including CT scans and PET scans, allow clinicians to assess the efficacy of therapeutic interventions, identify residual or recurrent disease, and modify treatment strategies accordingly. Emerging techniques, such as radiomics and molecular imaging, hold promise for enhancing the accuracy of diagnosis, predicting treatment response and guiding personalized therapy.

**TABLE OF CONTENTS/OUTLINE**

1. Concepts of normal and pathologic esophageal radiologic anatomy and lymphatic and hematogenous tumor spread pathways are explained.2.Illustrative cases of early-stage, locally advanced and oligometastatic esophageal cancer with clinical staging obtained by CT imaging applying the TNM 8th edition classification. Correlation of CT images with pathologic results is shown by detailed explanation of the findings.3. Emerging techniques: radiomics and molecular imaging for enhancing the accuracy of diagnosis, predicting treatment response, and guiding personalized therapy

## GIEE-69 US OF THE LIVER AND UPPER ABDOMEN FOR BEGINNERS: UNDERSTANDING WHAT TO DO, WHY DO IT, AND HOW TO DO IT

Monica Lucia Lopez Salazar, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Understand why to carry out the study.- Remember liver anatomy.- Understand what structures we are seeing during the study, with anatomical and CT correlation.- Realization technique for adequate characterization and measurement of the liver and upper abdominal structures.-differentiate normal from abnormal findings and most common pathological findings in the liver:Hepatic steatosisChanges due to chronic liver damage (cirrhosis, portal hypertension, portal thrombosis)Focal lesions (Cyst, hemangioma, hepatocellular carcinoma)Data of non-specific inflammatory process (periportal edema, elevated hepatic artery velocity and resistance index)

**TABLE OF CONTENTS/OUTLINE**

Table of Contents: 1. Introduction: - Introduction to ultrasound and importance of liver and upper abdomen ultrasound in medical care. 2. Basic considerations before the study 3. Realization technique for adequate characterization and measurement of the following structures. - Evaluation of the left hepatic lobe. - Evaluation of the right hepatic lobe. - Evaluation of the portal vein. - Evaluation of the hepatic artery. - Evaluation of the hepatic veins. - Evaluation of the gallbladder. - Kidney evaluation. - Evaluation of the spleen. - Evaluation of the pancreas. 4. Most frequent pathological findings in the liver: - Hepatic steatosis - Changes due to chronic liver damage. - Focal lesions. - Data of non-specific inflammatory process. 5. Conclusions.

## GIEE-7 IMAGING FINDINGS FOR HEPATOCELLULAR CARCINOMA ON MAGNETIC RESONANCE IMAGING: PREDICTIVE FEATURES AND FUTURE PERSPECTIVES FOR IMMUNE CHECKPOINT INHIBITOR BASED THERAPY

DARA LOPES DIAS FONSECA (*Abstract Co-Author*) Nothing to Disclose
Haruka Higashibori (*Abstract Co-Author*) Nothing to Disclose
Kazuo Awai, MD (*Abstract Co-Author*) Research Grant, Canon Medical Systems Corporation;Research Grant, Hitachi, Ltd;Research Grant, Fujitsu Limited;Research Grant, Nemoto Kyorindo co, Ltd;Research Grant, FUJIFILM Holdings Corporation
Keigo Narita (*Abstract Co-Author*) Nothing to Disclose
Shogo Maeda, MD (*Abstract Co-Author*) Nothing to Disclose
Yuko Nakamura, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Shota Kondo (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

a. For advanced stage hepatocellular carcinoma (HCC), systemic therapy is the mainstay of treatment, with immune checkpoint inhibitors (ICI) based therapy being the first choice. b. Peritumoral enhancement on arterial phase may indicate proliferative HCCs and peritumoral hypointensity on gadoxetic acid-enhanced hepatobiliary phase (HBP) may indicate PD-L1 positivity of HCCs. Both might be predictive for ICI-based therapy response. c. Hyper HCCs which show high signal intensity at HBP may indicates poor response to ICI monotherapy because both OATP1B3 expression, main uptake transporter of EOB, and immune exclusion class of HCCs are related to Wnt/ß-catenin signaling pathway. However, relationship between combined therapy such as atezolizumab plus bevacizumab and hyper HCCs is controversial and should be determined. d. Steatotic findings of HCCs may predict better therapeutic response to ICI-based therapy. e. Best treatment method may be predicted by integrating findings above, other findings from various modalities and also clinical information. A method that integrates all information is required.

**TABLE OF CONTENTS/OUTLINE**

1. Therapeutic algorism for HCCs 2. Mechanism of ICI-based therapy 3. Promising predictive MR imaging findings for ICI-based therapy 4. Future prospective role of imaging for ICI-based therapy

## GIEE-70 2022 UPDATES IN THE MANAGEMENT OF NON-INFECTIOUS CYSTIC LIVER LESIONS

Margarita V. Revzin, MD, MS (*Abstract Co-Author*) Nothing to Disclose
Yashant Aswani, MD (*Abstract Co-Author*) Nothing to Disclose
Eugenio Zalaquett, MD, MS (*Abstract Co-Author*) Nothing to Disclose
Ryan Bitar, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Review clinical presentation, pathology, and imaging features of major non-infectious hepatic cystic lesions2. Comment on each pathological entity's associated clinical presentation/symptoms, pathology, and prognostic/clinical implications.3. Discuss the 2022 European association study of the liver updates for management of imaging surveillance and management recommendations for each pathological entity.

**TABLE OF CONTENTS/OUTLINE**

1. Relevant imaging modalities for evaluation of hepatic cystic structures a. CT (+/- contrast) b. MRI (T1, T2, MRCP, +/- contrast) c. Ultrasound (gray scale and color Doppler) 2. Simple hepatic cysts a. Imaging features b. Presentation (i.e incidental vs symptomatic) c. Indications for surveillance and management (drainage/sclerotherapy) 3. Complex cystic structures a. Features which infer complexity (i.e. nodularity and enhancement) b. Hemorrhagic/proteinaceous cysts c. Mucinous cystic neoplasms d. Clinical implications and management 4. Biliary hamartomas (Von Meyenburg's complexes) a. Imaging features: (notably on US and MRI) b. Pathology/presentation c. Management: (i.e. indications for follow-up) 5. (Caroli's disease) a. Imaging features: (most notably on US and MRI/MRCP) b. Pathology/presentation: (Caroli syndrome versus disease) c. Management: (surveillance for cholangiocarcinoma) d. Associated complications 6. Peribiliary cysts a. Imaging features b. Pathology/presentation c. Management (indications for follow-up imaging) 7. Polycystic liver disease: a. Imaging features and definition b. Significant genetic/prognostic features c. Management: (associated complications and treatment modalities)

## GIEE-71 PERITONEAL CARCINOMATOSIS INDEX: DIGITAL TOOLS AND STRATEGIES FOR PRECISE AND SUCCESSFUL SURGICAL PLANNING

**TEACHING POINTS**

Peritoneal Carcinomatosis (PC): Advanced secondary cancer, affecting 15-45% of patients with colorectal, gastric, and ovarian cancer, associated with malignant ascites and a median survival of 2-5 months.Peritoneal Cancer Index (PCI): Assesses tumor extent, with PCI > 20 contraindicating cytoreductive surgery.Artificial Intelligence (AI): Assists radiologists in calculating the Peritoneal Carcinomatosis Index (PCI), improving diagnostic accuracy.Integration of CT and MRI: Enhances disease characterization, optimizing surgical planning.

**TABLE OF CONTENTS/OUTLINE**

Peritoneal Carcinomatosis (PC) is an advanced stage of secondary cancer that arises from the spread of tumor cells to the peritoneum. Associated with malignant ascites, it results in compromised quality of life and a grim prognosis, with a median survival of 2 to 5 months. The Peritoneal Cancer Index (PCI) is crucial for assessing tumor extent and dissemination, influencing treatment; patients with PCI > 20 are generally deemed unfit for cytoreductive surgery. Artificial Intelligence (AI) can assist radiologists in evaluating the Peritoneal Carcinomatosis Index (PCI), contributing to more accurate assessment. Imaging methods such as CT, MRI are the methods of choice. Integrating MRI with CT in preoperative evaluations can provide a more precise characterization of peritoneal disease extension, optimizing surgical planning. The study demonstrates the efficacy of combining CT and MRI in predicting surgical PCI, highlighting the complementary role of AI in assessing PCI, aiming to improve efficiency, accuracy, and quality of evaluation, potentially resulting in better clinical outcomes for patients.

## GIEE-72 THE STATE OF THE ART OF SCLEROSING CHOLANGITIS: CLINICAL AND RADIOLOGICAL CHARACTERISTICS, DIFFERENTIATION

**Awards**

**TEACHING POINTS**

A. Primary sclerosing cholangitis (PSC) is a disease with a poor prognosis that leads to liver cirrhosis and liver failure due to persistent cholestasis and an increased risk of hepatobiliary malignancies, mainly cholangiocarcinoma. B. PSC shows characteristic imaging findings on MRCP. MRCP is recommended as the imaging standard for diagnosis and follow-up in patients with PSC by some guidelines, including the International Primary Sclerosing cholangitis Study Group (IPSCSG). C. Some common imaging findings of PSC, such as the appearance of band-like strictures reflecting fibrotic narrowing of the lumen caused by peribiliary inflammatory cell infiltration and fibrosis, and the bead-like appearance that occurs as the disease progresses, are nonspecific, which may be a pitfall. D. Among secondary sclerosing cholangitis, diseases, including IgG4-related sclerosing cholangitis, exhibit images of stricture of the bile duct different from those of PSC, and diseases, including ICI-related sclerosing cholangitis, present imaging findings similar to those of PSC.

**TABLE OF CONTENTS/OUTLINE**

a. Clinical characteristics, prognosis, and complications of PSC. b. MRI characteristics of PSC: sensitivities and specificities. c. MRI characteristics of IgG4-related sclerosing cholangitisd. d. Clinical and MRI characteristics of secondary sclerosing cholangitis that require differentiation from primary sclerosing cholangitis.

## GIEE-73 MULTIMODALITY IMAGING OF HEPATIC HYDATID DISEASE WITH A FOCUS ON ULTRASONOGRAPHIC CHARACTERISTICS

**TEACHING POINTS**

after the exhibit the reader would be able- Identify normal liver enhancement pattern with contrast computed tomography (CT), magnetic resonance imaging and Gadoxetic Acid enhanced MRI.- To differentiate several benign and malignant liver lesions based on their enhancement pattern with CT, MRI and Gadoxetic Acid enhanced MRI.- To review abnormal enhancement of Inflammatory Liver Disease.

**TABLE OF CONTENTS/OUTLINE**

- Introduction- To review normal liver enhancement pattern with computed tomography (CT), magnetic resonance imaging (MRI) and Gadoxetic Acid enhanced MRI.- Characterize the different types of arterial, venous, and late enhancement of benign and malignant liver lesions by computed tomography (CT), magnetic resonance imaging and Gadoxetic Acid enhanced MRI.- To review abnormal enhancement pattern of diffuse liver desease.- To understand the physiologic basis of liver enhancement after administration of Gadoxetic Acid enhanced MRI and the applications of gadoxetic Acid in Hepatobiliary Disorders.- Take home points.

## GIEE-75 SIBLING'S SPECIALTIES: THE BOUNDARIES AND INTERSECTIONS OF RADIOLOGY AND ENDOSCOPY

Jose C. Ardengh (*Abstract Co-Author*) Nothing to Disclose
Thais C. Lima (*Abstract Co-Author*) Nothing to Disclose
Fernanda C. Goncalves, MD (*Abstract Co-Author*) Nothing to Disclose
Roberto Blasbalg, MD (*Abstract Co-Author*) Nothing to Disclose
Pedro Panizza, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Knowledge about the applications, indications and contraindications of endoscopic modalities is vital for the abdominal radiologist.Minimally invasive interventional procedures related to these specialties are growing rapidly due to better results and lower morbidity.

**TABLE OF CONTENTS/OUTLINE**

Radiological and endoscopic imaging modalities play an important role in the diagnosis and treatment of a spectrum of gastrointestinal and respiratory conditions, sometimes with synergy in clinical practice between these sister specialties. Radiology and endoscopy are fundamental in the evaluation of hepatobiliary, pancreatic, small bowel and rectal diseases, each offering unique diagnostic and interventional capabilities. This synergy is critical in conditions such as biliary tree neoplasms, pancreatic disorders and inflammatory bowel disease, guiding management decisions from diagnostic clarity to therapeutic interventions. The summary further explores how advances, especially in artificial intelligence, are poised to improve the accuracy and integration of these modalities. Understanding the indications and contraindications for each method allows clinicians to optimize patient outcomes, illustrating a future where collaborative diagnoses and interventions continue to evolve, driven by technological innovation and improved clinical understanding.

## GIEE-76 GOING WITH THE FLOW: NAVIGATING COLIC PERFUSION FOR OPTIMAL SURGICAL OUTCOMES

Gustavo Yamada, MD (*Abstract Co-Author*) Nothing to Disclose
Daniel Lahan-Martins, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Carlos Augusto Martinez (*Abstract Co-Author*) Nothing to Disclose
Renan D. Turci, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1 - Review the usual anatomy of the main colic vessels it's main branches both arterial and venous presentations. 2 - Assess the most common imaging findings for vascular variations that affect surgical procedures involving colorectal cancer resections, in both CT and Angio CT scans. 3 - Reassure the radiologist's role on identifying vascular abnormalities and communicating them to the surgical team to avoid complications.

**TABLE OF CONTENTS/OUTLINE**

1 - Illustration of normal anatomy 2 - Brief review of the development of the colic vessels 3 - Most common vascular variations of the abdominal vasculature, including the superior and inferior mesenteric arteries and vein, the right, mean and left colic vessels, as well as the Riolan's arch and the Griffit's point, illustrated in CT and Angio CT scans 4 - How abdominal surgical procedures can be affected by vascular variations and the importance of the radiologist report on identifying theses scenarios.

## GIEE-77 ANOTHER BRICK IN THE WALL: IMAGE EVALUATION OF THE POSTOPERATIVE ABDOMINAL WALL

Fabio Lewin, MD (*Abstract Co-Author*) Nothing to Disclose
Priscilla Claudia Raddo Venancio, MD (*Abstract Co-Author*) Nothing to Disclose
Vinicius C. Fiorot, MD (*Abstract Co-Author*) Nothing to Disclose
Leonardo Lopes Fioratti, MD (*Abstract Co-Author*) Nothing to Disclose
Igor R. Oliveira, MD (*Abstract Co-Author*) Nothing to Disclose
Max Yunior Orsi Salazar, MD (*Abstract Co-Author*) Nothing to Disclose
Filipe Chaves, BMedSc (*Abstract Co-Author*) Nothing to Disclose
Manoel Barbosa, MD (*Abstract Co-Author*) Nothing to Disclose
Gabriel Guilherme Nunes Pozzer, MD (*Abstract Co-Author*) Nothing to Disclose
Daniel B. Montel, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

•Normal anatomy of the abdominal wall •Image protocol for evaluation of the postoperative abdominal wall. •Early and late postoperative complications of the abdominal wall •Classification of incisional abdominal wall hernias and important characteristics •Other causes of abdominal wall weakness in the postoperative period •Understanding surgical techniques for hernia and diastasis recti repair, from classic to robotic approaches, and their imaging appearance •Surgical mesh: material differences, surgical techniques, topography in relation to abdominal wall layers, and related complications •Loss of domain in hernia cases •Surgical techniques for repair of large ventral hernias and postoperative imaging appearance •Types of stomas, expected findings, and related complications •Image findings related to cosmetic surgery procedures, myo-adipose graft harvesting surgeries, and abdominal wall bone flap preservation •Essential information for the surgeon in the radiology reports.

**TABLE OF CONTENTS/OUTLINE**

•Understanding of the normal anatomy of the abdominal wall and its potential weaknesses, including incisional hernias, diastasis recti, and other causes of abdominal wall defects. •Become familiar with various surgical techniques for abdominal wall reconstruction and hernia repair, recognizing their specific imaging appearances on different modalities, including the identification of mesh materials and potential complications. •Recognize different types of stomas on imaging studies and identify potential stoma-related complications like hernias, prolapse, and retraction. •Understand the essential information surgeons need from radiology reports.

## GIEE-78 THE FUNDAMENTAL ROLE OF THE RADIOLOGIST IN THE ACUTE CHOLECYSTITIS AND ACUTE CHOLANGITIS (TOKYO GUIDELINES)

Jose A. Cienfuegos Alvear, MD (*Abstract Co-Author*) Nothing to Disclose
Axel A. Torres Monarrez, MD (*Abstract Co-Author*) Nothing to Disclose
Ricardo D. Alpizar, MD,MEd (*Abstract Co-Author*) Nothing to Disclose
Rodolfo De Jesus Martinez Marquez, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Recognize the primary role of the radiologist in diagnosis and treatment of acute cholecystitis and acute cholangitis.2. Identify imaging findings of acute cholecystitis and acute cholangitis in different imaging modalities used in radiology.3. Review the flowchart for the management of acute cholecystitis and the initial response to acute biliary infection.4. Identify common and unusual causes of acute biliary infection. Review clinical cases and treatment.5. Become familiar with indications and techniques of gallbladder and biliary drainage.6. Emphasize on percutaneous gallbladder drainage and percutaneous biliary drainage.7. Analyze potential complications of acute cholecystitis and acute cholangitis percutaneous treatment and how to treat them.

**TABLE OF CONTENTS/OUTLINE**

1. Diagnostic criteria of acute cholecystitis on different imaging modalities.Severity grading.Flowchart for the management of acute cholecystitis.2. Management strategies for gallbladder drainage.Percutaneous transhepatic gallbladder drainage (with videos).Percutaneous transperitoneal gallbladder drainage (with videos).3. Clinical cases of acute cholecystitis and their gallbladder drainage4. Diagnostic criteria of acute biliary infection on different imaging modalities.Severity grading.Flowchart for acute cholangitis.5. Common and unusual causes of acute biliary infection (clinical cases)5. Indications and techniques of biliary drainage.Percutaneous treatment (with videos).6. Complications of percutaneous treatment for acute cholecystitis and cholangitis.7. Conclusions.

## GIEE-79 REVISITING BOWEL DISEASES: AN ALGORITHMIC APPROACH FOR BOWEL WALL THICKENING

Antonio E. Silva JR, BDS (*Abstract Co-Author*) Nothing to Disclose
Heitor Passeri, MD (*Abstract Co-Author*) Nothing to Disclose
Rodrigo P. Polizio, MD (*Abstract Co-Author*) Nothing to Disclose
Yuri C. Neves, PhD (*Abstract Co-Author*) Nothing to Disclose
Gabriel L. Beraldo, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Review normal bowel anatomy on CT and MRI.2. Suggest a radiological algorithmic approach for evaluating bowel diseases, emphasizing key intestinal and extra-intestinal findings.3. Detail each of the algorithmic steps, reviewing the differential diagnosis of bowel wall thickening with illustrative cases.

**TABLE OF CONTENTS/OUTLINE**

1. Normal bowel anatomy, correlating didactic illustrations with CT and MRI.2. Different types of intestinal wall thickening with schematic figures.Algorithmic approach for bowel diseases, based on bowel wall thickening: STEP 1: Assess signs of neoplasia; STEP 2: Assess signs of ischemia;

STEP 3: Assess inflammatory signs.3. Review the different differential diagnoses for intestinal wall thickening, with imaging findings and illustrative cases: a. Intestinal neoplasm; b. Ischemic enteritis and colitis; c. Infectious enterocolitis (highlighting intestinal Tuberculosis, Whipple disease and Pseudomembranous colitis); d. Non-infectious inflammatory intestinal diseases (highlighting Crohn's disease, ulcerative colitis and celiac disease); e. Actinic enterocolitis; f. Portal hypertensive colopathy;g. Intestinal endometriosis.

## GIEE-8 THROUGH CYSTIC LESION TO THE MORPHOLOGICAL ABNORMALITIES: CURRENT FINDINGS AND ISSUES IN EARLY PANCREATIC CANCER

Osamu Abe, MD, PhD (*Abstract Co-Author*) Nothing to Disclose

Moto Nakaya, MD (*Abstract Co-Author*) Nothing to Disclose
Shintaro Kano, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Pancreatic cancer is the third leading cause of cancer death in the United States on its way to be the second. A multidisciplinary approach is crucial in clinical practice, and radiologists play an important role in early detection. In recent years, there has been progress in understanding the radiologic features and pathologic backgrounds of early pancreatic cancer and its precursor lesions. Intraductal papillary mucinous neoplasm (IPMN) is a well-known cystic lesion with malignant potential. Pancreatic ductal adenocarcinoma concomitant with IPMN, distinct from carcinoma that sequentially develops from IPMN itself, is also gathering attention. Morphological abnormalities of the pancreas are considered to precede the development of cancer. Radiologists need to pay attention not only to cystic lesions but also to morphological abnormalities of the pancreas. From a clinical perspective, there remains some controversial issues. In particular, there is no consensus on the follow-up interval for high-risk patients.The purposes of this exhibit are1. To learn the up-to-date radiologic findings and pathologic hypotheses of early pancreatic cancer and its precursor lesions.2. To review literature focusing on three clinical questions: (1) Modality: What is the optimal imaging modality for early pancreatic cancer detection and surveillance? (2) Eligibility: Who should be included in and excluded from routine surveillance? (3) Interval: How should the follow-up interval be determined if no abnormalities or equivocal findings are detected?

### TABLE OF CONTENTS/OUTLINE

1. Pathogenesis of pancreatic cancer2. Radiologic signs of early pancreatic cancer3. Clinical questions4. Conclusion

## GIEE-80 BEYOND MALIGNANCY: A RADIOLOGIST'S GUIDE TO BENIGN PERITONEAL DISEASES

Lucas Bauer Pasqualini (*Abstract Co-Author*) Nothing to Disclose
Lucas Augusto, MD (*Abstract Co-Author*) Nothing to Disclose
Camila C. Lauar, MD (*Abstract Co-Author*) Nothing to Disclose
Rogerio J. de Leao, MD (*Abstract Co-Author*) Nothing to Disclose
Ariel Teixeira Ribeiro (*Abstract Co-Author*) Nothing to Disclose
Pedro Panizza, MD (*Abstract Co-Author*) Nothing to Disclose
Rafaelle M. De Vargas, MD (*Abstract Co-Author*) Nothing to Disclose
Lisa Umeda, MD (*Abstract Co-Author*) Nothing to Disclose
Nicoli T. Yoshimi, MD (*Abstract Co-Author*) Nothing to Disclose
Isabela M. De Freitas, MD (*Abstract Co-Author*) Nothing to Disclose
Irla A. Dantas, MD (*Abstract Co-Author*) Nothing to Disclose
Carolina Maria Rosas, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Elucidate the anatomical relationships and forms of dissemination related to peritoneal diseases, as well as the radiological analysis of the structures involved. Discuss the pathophysiology involved in the spread of each group of benign diseases that affects the peritoneum. Provide a radiological algorithm to the dissemination of benign peritoneal diseases and correlate the clinical history that may help in the diagnosis. Highlight the possible complications related to each benign pathology of peritoneal dissemination. Present the main malignant differential diagnoses related to each benign pathology of peritoneal dissemination.

### TABLE OF CONTENTS/OUTLINE

Classification of benign peritoneal diseases dissemination into subgroups according to the main imaging aspects.Description of the imaging aspects of solid, mixed and cystic diseases.Individual characteristics of each benign lesion of the peritoneum and their main differential diagnoses in relation to malignant peritoneal involvement.

## GIEE-81 ULTRASONOGRAPHY IN ABDOMINAL HERNIAS: A PICTORIAL REVIEW

Eduardo D. Chiovatto, MD (*Abstract Co-Author*) Nothing to Disclose
Leonardo Person de almeida, MMed,MMed (*Abstract Co-Author*) Nothing to Disclose
Matheus Brunetto, MD (*Abstract Co-Author*) Nothing to Disclose

Rafaelle M. De Vargas, MD (*Abstract Co-Author*) Nothing to Disclose
Carolina Maria Rosas, MD (*Abstract Co-Author*) Nothing to Disclose
Lisa Umeda, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Diffuse hepatic diseases are usually non-specific character in the middle of the radiology. Biopsy is known to be the gold standard for many of these pathologies. This presentation aims to presente with the recent technologies of radiological modalities so that the diagnosis can be suggested without being invasive. Provide a radiological overview of diffuse liver diseases, the pathophysiology involved in the dissemination of each group. Highlight the differential diagnoses related to each diseases, with the main findings in the different modalities.

**TABLE OF CONTENTS/OUTLINE**

Main liver diseases of inflammatory and infectious origin and their typical findings. The different aspects of liver storage diseases. Assessment of images in chronic liver disease patients and autoimmune hepatitis. Recognition of liver pathologies of vascular origin. Main findings related to post-transplant liver complications, including vascular, hepatic infartion and rejection.

## GIEE-83 LI-RADS TRA 2024 UPDATE: WHAT RADIOLOGISTS SHOULD KNOW

**Awards**
**Certificate of Merit**

Antonio E. Silva JR, BDS (*Abstract Co-Author*) Nothing to Disclose
Rodrigo P. Polizio, MD (*Abstract Co-Author*) Nothing to Disclose
Yuri C. Neves, PhD (*Abstract Co-Author*) Nothing to Disclose
Luiz T. Siqueira, MD (*Abstract Co-Author*) Nothing to Disclose
Guilherme Naves (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Provide a practical guide to the new LI-RADS TRA guidelines reviewing critical changes and imaging features for each TRA category. - Present the expected imaging features for each locoregional treatment and possible complications. - Highlight possible pitfals when applying LR-TR. - Provide sample reports in clinical cases to highlight key information for oncologists, surgeons and transplant comitees.

**TABLE OF CONTENTS/OUTLINE**

● Introduction ○ Review of modalities for local treatment ○ Overview of LR-TR categories ○ Correct measurement technique ● LR-TR Nonradiation treatment response ○ Review of treatment categories including definition, criteria and examples. ● LR-TR Radiation treatment response ○ Review of treatment categories including definition, criteria and examples. ● Conclusion

## GIEE-84 A NOVEL APPROACH TO CHARACTERISING LIVER LESIONS

Snehal Lapsia, FRCR,MBBS (*Abstract Co-Author*) Nothing to Disclose
Sophie Cheshire, MBChB, FRCR (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Table method for radiology residents to problem solve liver lesion diagnosis on MRI

**TABLE OF CONTENTS/OUTLINE**

We have used this table method at our UK teaching hospital whilst training radiology residents to equip them with a tool which allows for a methodical approach to interpreting liver MRI. It can be quite easy to lose focus with all the details and MR enhancement patterns of the multitude of benign and malignant lesions when evaluating multiple liver MR sequences at once. Therefore, we propose this method which evaluates each sequence in isolation of the others. Formulating a table populating each sequence with what the lesion can be, what it could be (but unlikely) and what it cannot be. In combination with a final review of the background liver, any relevant history and tumour markers allows final diagnosis of the lesion, often providing a close differential. The method can also be utilised as a problem solving tool when evaluating difficult cases. Within this education piece we will present the method with the following examples: HCC, IHC, metastasis, FNH, adenoma, cyst and other rarer lesions.

## GIEE-85 PANCREATIC NEUROENDOCRINE NEOPLASMS: CONCEPTS, CLASSIFICATION, ROLE OF IMAGE AND ANATOMOPATHOLOGICAL CORRELATION

Ana Claudia Vincenzi Raduan Uski (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Pancreatic neuroendocrine neoplasms (panNENs) present characteristic clinical, histomorphological and prognostic features. There have been updates regarding the pathogenesis, classification and staging of these neoplasms and familiarity with the imaging findings is essential for optimal treatment. Therefore, the objectives of this work are: - Demonstrate the radiological findings that favor the diagnosis and evolutionary behavior of panNENs; -

Review changes in the classification system according to WHO (2017) and in staging (TNM of the AJCC 8th edition); - Review the genetic concepts and pathogenesis of sporadic and syndromic tumors.

**TABLE OF CONTENTS/OUTLINE**

• Introduction; • WHO classification and latest AJCC TNM staging system for pancreatic neuroendocrine neoplasms; • Discussion of the pathogenesis of pancreatic tumors and carcinomas and description of genetic mutations that affect prognosis and treatment; • Imaging findings of these tumors and correlation with histological grades; • Curiosities and their main mimiters; • Summary and flowchart of conducts; • References

## GIEE-86 RADIOLOGIST IN THE MULTIDISCIPLINARY TEAM MANAGING GASTROENTEROPANCREATIC NEUROENDOCRINE NEOPLASMS

Nikhil H. Ramaiya, MD (*Abstract Co-Author*) Nothing to Disclose
Rachana Gurudu (*Abstract Co-Author*) Nothing to Disclose
Qiubai Li, MD (*Abstract Co-Author*) Nothing to Disclose
Sreeharsha Tirumani, MD (*Abstract Co-Author*) Nothing to Disclose
Kaustav Bera, MD (*Abstract Co-Author*) Nothing to Disclose
Amr Mohamed (*Abstract Co-Author*) Nothing to Disclose
Sohrab Afshari Mirak, MD (*Abstract Co-Author*) Nothing to Disclose
Jack Zhao, BA (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Radiologist is an integral part of the MDT managing GEP NEN
- Imaging key in every step in the management of GEP-NEN
- Multiphasic CT and MRI are workhorses for anatomic imaging
- Knowledge of immunohistochemistry can help radiologists in challenging cases of GEP-NEN, especially in the setting of unknown primary
- Important to recognize changes of carcinoid heart disease on restaging scans and differentiate NEN from non-NEN entities
- MRI better suited for post therapy response assessment
- Familiarity with response criteria used in GEP-NEN can help in appropriate assessment in day-to-day clinical practice
- Attention should be payed to disease recurrence and treatment related complications on restaging scans

**TABLE OF CONTENTS/OUTLINE**

- Understand the role of radiologist in multi-disciplinary management of GEP-NEN
- Familiarize clinical and pathology clues which can help radiologist in diagnosis and management
- Understand the role of immunohistochemistry in day-today practice of radiologists
- Demonstrate the value of knowing response criteria and complications of GEP- NET therapies

## GIEE-87 COMPREHENSIVE MR IMAGING OF PERIANAL FISTULAS: FROM ANATOMY AND DIAGNOSIS TO PERIANAL CROHN'S TREATMENT MONITORING

Michael H. Lanier, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Mark J. Hoegger, MD, PhD (*Abstract Co-Author*) Nothing to Disclose

David H. Ballard, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The purpose of this exhibit is to:1. Illustrate normal perianal anatomy on MR, provide a search pattern, and discuss types of perianal fistulas2. Provide a case-based review of the appearance of common and complex fistula patterns3. Discuss perianal fistulas in Crohn disease and the role of MR in monitoring response to therapy

**TABLE OF CONTENTS/OUTLINE**

1. Anatomy: Internal and external sphincters, anorectal junction, and intersphincteric spacea. Appearance on diagram vs. MR2. Imaging rationala. MR modality of choiceb. Fistula and abscess on CT3. MR techniquea. Sequences of perianal MR protocol 2. Pairing a perianal MR protocol with MR enterography4. Patterns of perianal fistulasa. What is 'complexity' in perianal fistulasb. Inter-, trans-, supra- and extra-sphincteric perianal fistulasc. Parks and St. James classification systems5. Pitfalls and special considerationsa. Setons tract on MR - is it considered a fistula?b. Fistulizing to adjacent genitourinary structuresc. Hemmoroid mimicking perianal fistula6. Implications of MR findings for patient managementa. Innovations including 3D printing and virtual reality7. Perianal fistula in Crohn diseasea. Prevalence and treatment optionsb. MR imaging as a response to medical therapyc. MR scoring systemsi. Modified Van Assche index, MAGNIFI-CD, and othersii. Practical approach to reporting treatment perianal Crohn responsed. Cases of long-standing (5+ years) perianal Crohn across multiple studies8. Cancer-associated with perianal fistulaa. Perianal Crohn at increased risk for anal and rectal cancerb. Fistula-related mucinous adenocarcinomac. Squamous cell carcinoma Wound or risk factor (HIV/HPV/receptive anal intercourse)

## GIEE-88 PANCREATIC CANCER SCREENING AND EARLY DETECTION: DOES IMAGING MAKE A DIFFERENCE?

**Awards**
**Cum Laude**

Carlos Fernandez-Del Castillo, MD (*Abstract Co-Author*) Nothing to Disclose
Avinash R. Kambadakone, MD, FRCR (*Abstract Co-Author*) Advisory Board, Bayer AG Research Grant, General Electric Company Research Grant, Koninklijke Philips NV Research Grant, PanCAN Research Grant, Bayer
Soumyadeep Ghosh, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Shravya Srinivas Rao, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Background Pancreatic cancer is the third most common cause of cancer-related deaths in the United States. The potential challenges in early detection involve the identification of individuals in the general population who are at risk and would gain from ongoing monitoring programs. Pancreatic cancer

often presents at advanced stages, limiting treatment options and survival rates. Imaging plays a crucial role in early detection, offering opportunities for timely intervention and improved outcomes.Learning Objectives/Aims: • To discuss the necessity of early detection of pancreatic cancer • To recognize the subgroups with higher-than-average risk for pancreatic ductal adenocarcinoma (PDAC) • To evaluate the role of imaging in early diagnosis of pancreatic cancer • To review challenges and future prospects in detection of early pancreatic cancer

**TABLE OF CONTENTS/OUTLINE**

• Introduction to pancreatic ductal adenocarcinoma • Describe modifiable and non-modifiable risk factors • Identify subgroups with higher-than-average risk for PDAC • Discuss precancerous lesions and their imaging surveillance o Mucinous cystic neoplasm o IPMN o Worrisome features and high-risk stigmata according to Tanaka consensus • Role of imaging in early detection of pancreatic cancer • Discuss the rationale of pancreatic protocol CT and MRI • Imaging features of early PDAC o Duct cut-off sign o Double duct sign o Focal abnormal enhancement o Focal parenchymal atrophy o Focal change in duct caliber • Current research on advanced imaging and other biomarkers for early diagnosis of PDAC

## GIEE-9 "FIERY AND IRRITATED BILE DUCTS": CURRENT UPDATE ON PATHOLOGY, IMAGING, AND MANAGEMENT OF ACUTE AND CHRONIC CHOLANGITIS

Venkata S. Katabathina, MD (*Abstract Co-Author*) Nothing to Disclose
John A. Walker, MD, PhD (*Abstract Co-Author*) Speaker, Shionogi & Co, Ltd;Consultant, Shionogi & Co, Ltd
Sriram Jaganathan, MD (*Abstract Co-Author*) Nothing to Disclose
Narayan Lath, MBBS, FRCR (*Abstract Co-Author*) Nothing to Disclose

Anil K. Dasyam, MD (*Abstract Co-Author*) Nothing to Disclose
Alia Nazarullah (*Abstract Co-Author*) Nothing to Disclose
Abdelrahman A. Abusaif, MBBCh (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

• Review the anatomy and physiology of bile ducts pathophysiology of bile duct inflammation. • List obstructive, infectious, inflammatory, immunologic, toxic miscellaneous etiologies of acute and chronic cholangiopathies • Discuss current updates on the pathogenesis of primary sclerosing cholangitis, primary biliary cholangitis other acute/chronic cholangitis, including novel etiologies • Describe MRI/MRCP imaging spectrum role of other imaging modalities • Discuss updates in endoscopic/interventional radiology management of acute/chronic cholangitis

**TABLE OF CONTENTS/OUTLINE**

• Introduction • Anatomy/physiology: Cholangiocytes, Arterial/venous bile production • Current Updates on pathogenesis • Etiology of cholangitis: Acute, chronic acute on chronic • Imaging Techniques: US, CT, MRI/MRCP, MR Elastography, ERCP, PTC, EUS Cholangioscopy • Acute cholangitis: infectious/obstructive; periductal T2 hyperintensity, enhancement, abscesses thrombosis • Primary sclerosing cholangitis associated conditions • Primary Biliary Cholangitis • IgG4-cholangiopathy • Infectious: Recurrent pyogenic cholangitis, AIDS cholangiopathy, bacterial parasites (Fasciola Hydatid) • Covid-19 Cholangiopathy Covid-vaccine induced • Post-liver transplant: Ischemic, anastomotic biliary cast syndrome • Drug-induced: Immune therapy, chemotherapy • Secondary sclerosing cholangitis in critically-ill patients • Miscellaneous: radiation, Mirizzi, Lemmel syndrome congenital • Management: Medical/Endoscopic/IR • Novel therapeutic targets • ConclusionNew etiologies significant updates in pathogenesis acute/chronic cholangitis; imaging is pivotal in timely diagnosis.

## GIEE-90 MULTIMODALITY DIAGNOSTIC IMAGING AND ROLE OF INTERVENTIONAL RADIOLOGY FOR PANCREAS TRANSPLANT

**Awards**
**Certificate of Merit**

Eric Fromke, MD (*Abstract Co-Author*) Nothing to Disclose
Rachita Khot, MD (*Abstract Co-Author*) Nothing to Disclose
John F. Angle, MD (*Abstract Co-Author*) Consultant, Terumo CorporationResearch Grant, Seimens AG
Klaus D. Hagspiel, MD (*Abstract Co-Author*) Research Grant, Siemens AG
Hideyuki Torikai, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Pancreas transplant is performed primarily for patients with type 1 diabetes mellitus who experience difficulties in managing their condition with conventional therapies. This educational exhibit offers the comprehensive review of multimodality diagnostic imaging and interventional radiology. The exhibit aims to: 1. Discuss the indications and epidemiology of pancreas transplant 2. Understand pre-transplant pancreatic anatomy for accurate imaging interpretation, crucial for surgical planning 3. Discuss expected post-transplant imaging findings versus early signs of complications 4. Gain insight into the surgical techniques and their implications for post-operative complications 5. Recognize post-transplant complications, focusing on diagnostic imaging features and the role of Interventional Radiology in management

**TABLE OF CONTENTS/OUTLINE**

Indication and Epidemiology Anatomy: Arterial, venous and enteric anatomy Surgical technique based on the anastomosis Imaging technique: US, contrast-enhanced US, CT, MRI, and Angiography Normal Imaging findings Complications Arterial complications 1. Bleeding/Pseudoaneurysm and embolization 2. Thrombosis and thrombolysis/thrombectomy 3. Stenosis and angioplasty 4. Arteriovenous fistula and embolization Venous complications 1. Thrombosis and thrombolysis/thrombectomy 2. Stenosis and angioplasty Exocrine complications 1. Duodenoenterostomy leak 2. Duodenovesicostomy leak 3. Duodenal stump leak 4. Leak following anastomotic conversion Parenchymal complications 1. Graft rejection and Image-guided biopsy 2. Graft pancreatitis 3. Peripancreatic fluid collection and drainage Other complications 1. PTLD 2. Small bowel obstruction

## GIEE-91 INS AND OUTS: HERNIAS OF THE ABDOMINAL WALL ON CT

Rochelle Lamb, BMBS (*Abstract Co-Author*) Nothing to Disclose
Sathi A. Sukumar, MBBS, FRCR (*Abstract Co-Author*) Nothing to Disclose
Ben Layton, BMBS, FRCR (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

With use of CT imaging and accompanying detailed original illustrations combined with the most up to date literature we will:• Review the myofascial anatomy of the abdominal to provide a foundation for the of assessing hernias and understanding surgical techniques• Provide an approach to reporting hernias on CT with a particular focus on what the surgeon needs to know about large ventral hernias• Highlight what not to miss in hernia reports including the spectrum of complications of hernias specific to their subtype and location, hernia mimics and malignancy within a hernia sac.

**TABLE OF CONTENTS/OUTLINE**

1. Myofascial anatomy of the abdominal wall with an overview of ventral hernia closure techniques 2. What to tell the surgeon on a CT report with case examples interlinking with surgical options. Including important surgical planning information: domain loss, sarcopenia, rectus defect ratio, component separation measurements 3. Abdominal wall hernia classification including midline, lateral and lumbar types with relevance to the surgeon explained 4. Uncommon abdominal wall hernia types and their clinical relevance explained including subtypes of interstitial hernias (with Spigelian and rectus sheath types) 5. Acute and chronic complications with case examples specific to the location such as ureteric obstruction in a lumbar hernia and appendix in Spigelian hernia. 6. Tips and tricks! Including assessment of hernia content for malignancy and sidestepping hernia mimics such as various abdominal wall masses 7. Summary and recommendations

## GIEE-92 ENDOSCOPIC ESOPHAGEAL CANCER PRACTICE: WHAT RADIOLOGISTS NEED TO KNOW

Tatsushi Kobayashi, MD (*Abstract Co-Author*) Support, Canon Medical Systems Corporation
Takashi Hiyama, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Hirofumi Kuno, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Tomohiro Kadota (*Abstract Co-Author*) Nothing to Disclose
Shioto Oda, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Gastrointestinal endoscopy is the mainstay of treatment for upper gastrointestinal treatment, particularly esophageal cancer, and plays a major role in improving patient prognosis and quality of life through a wide variety of procedures. Recent advancements in endoscopic techniques have been remarkable, including new topics such as endoscopic ultrasound (EUS) and photodynamic treatment (PDT) for treating local recurrent lesions after radiotherapy. Familiarity with related CT imaging evaluation is crucial for pre- and post-procedure evaluations, but there are limited comprehensive reports on this topic.The purpose of this presentation is to review the anatomical considerations essential to diagnosing esophageal cancer, provide an overview of radiographic imaging about TNM staging, and discuss the imaging features encountered in the endoscopic practice of esophageal cancer.The purpose of this presentation is:1. To describe key imaging features associated with endoscopic diagnosis for pre-treatment staging2. To review key imaging features after endoscopic treatment

**TABLE OF CONTENTS/OUTLINE**

1. Background.2. Review of Anatomy Related to Endoscopic Esophageal Cancer Practice.3. Case Illustrations of Endoscopic Esophageal Cancer Practice3.1. Pre-treatment Imaging3.2. Post-treatment Imaging3.3. Imaging Associated with Other Endoscopic Procedures.4. Summary

## GIEE-93 DUAL CONTRAST LIVER MRI: ONE-STOP SHOPPING FOR LIVER LESION CHARACTERIZATION

**Awards**
**Certificate of Merit**

Tyler J. Fraum, MD (*Abstract Co-Author*) Research support, Siemens AG ;Speaker, Ultimate Opinions in Medicine LLC
Justin Dumrongkulraksa, MD (*Abstract Co-Author*) Nothing to Disclose
Richard Tsai, MD (*Abstract Co-Author*) Nothing to Disclose
Mark J. Hoegger, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Sayan Manna, MD (*Abstract Co-Author*) Nothing to Disclose
Daniel R. Ludwig, MD (*Abstract Co-Author*) Nothing to Disclose
Mohamed Z. Rajput, MD (*Abstract Co-Author*) Nothing to Disclose
Michael H. Lanier, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Govind Mattay, MD, MBA (*Abstract Co-Author*) Nothing to Disclose
Anup S. Shetty, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The choice of liver MRI contrast agent among extracellular, hepatobiliary (e.g., gadoxetate), or hybrid (e.g., gadobenate) types is a challenge in protocolling liver MRI examinations for focal liver lesion characterization. Each agent has advantages and disadvantages, including the quality of various contrast phases, potential artifacts, and hepatobiliary phase contrast-to-background ratios. A dual-contrast strategy employing initial administration of an extracellular agent followed by subsequent administration of gadoxetate offers high-quality arterial phase imaging, a predictable appearance of hemangiomas in the equilibrium and early delayed (< 5 min) phases, and a high-quality hepatobiliary phase. This exhibit will:1) Discuss liver MRI contrast agents and their strengths and weaknesses2) Provide a framework for characterizing indeterminate liver lesions and how contrast agent choice affects diagnostic certainty3) Describe the dual-contrast protocol and how to construct it efficiently4) Illustrate the advantages of dual-contrast liver MRI compared to single-agent examinations, including examples in which gadobenate as a single hybrid agent can be misleading

**TABLE OF CONTENTS/OUTLINE**

- liver MRI contrast agents: characteristics, strengths, and weaknesses- Indeterminate liver lesion MRI: imaging features and how contrast choice affects diagnostic certainty or uncertainty in various clinical scenarios- dual contrast liver MRI protocol: building blocks, sequence ordering, contrast dosing- case illustrations: depict how the advantages a dual contrast protocol offers compared to single agent extracellular, gadoxetate, and gadobenate exams for focal liver lesion characterization

## GIEE-94 HYPERINTENSE LIVER LESIONS AT HEPATOBILIARY PHASE OF GADOXETIC ACID-ENHANCED MR IMAGING: A CLINICAL APPROACH AND IT'S CLINICAL SIGNIFICANCE

Kumi Ozaki, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The insight of paradoxical hyperintensity at hepatobiliary phase of gadoxetic acid-enhanced MR imaging can help the accurate imaging diagnoses and can provide us additional information as imaging biomarkers such as prognosis and therapeutic effectiveness. The purposes of this presentation are; 1) to review several kinds of tumor showing paradoxical hyperintensity at hepatobiliary phase; 2) to review the role of the imaging biomarkers of hyperintense lesions of hepatobiliary phase images

**TABLE OF CONTENTS/OUTLINE**

1. Introduction 2. What is the gadoxetic acid? 3. The mechanism of uptake and excretion of gadoxetic acid and three types of mechanisms of hyperintensity during hepatobiliary phase 4. Presenting several hyperintense lesions of hepatobiliary phase images. For example, hepatocellular carcinoma (HCC); hyperintense HCC at HB phase, heterogeneous intense HCC at HB phase, nodule in nodule during multi-step hepatocarcinogenesis , peritumoral hyperintensity 5. Hepatocellular adenoma with ß-catenin mutation 6. Focal nodular hyperplasia (FNH) and FNH-like lesion 7. Regenerative nodules in cirrhosis and other benign hepatocellular lesions 8. Cloud sign of intrahepatic cholangiocarcinoma 9. Heterogeneous hyperintensity of liver

metastases of colorectal cancer, pancreatic adenocarcinoma, and breast cancer 10. Peritumoral hyperintensity of neuroendocrine tumor 11. Periportal hyperintensity in porto-sinusoidal vascular diseaseand liver cirrhosis 12. Peritumoral hyperintensity of hypervascular tumors 13. Focusing on the role of the imaging biomarkers of hyperintense lesions of hepatobiliary phase images 14. Conclusion.

### GIEE-95 ESOPHAGOGRAPHY ON THE MOST CHALLENGING PATIENTS: IT CAN BE DONE! (HINTS AND TRICKS TO GET A DIAGNOSTIC STUDY)

Mary A. Turner, MD (*Abstract Co-Author*) Nothing to Disclose
Laura R. Carucci, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

• Esophagography is an increasing proportion of GI fluoroscopy studies performed, providing functional and structural information often not readily obtained with cross-sectional imaging or endoscopy. • Overall trend towards increasing number of complex studies that do not allow for a "traditional esophagram" -more challenging patients with special circumstances (debilitated, elderly, postop, ICU patients). • Need to tailor study to patient's needs and capabilities • Procedural modifications allow for esophagography on even the sickest patients including patients who are debilitated, intubated, postoperative, or aspirating and patients who can't drink. • Challenging cases to perform and interpret• Important for radiologists to be aware of diagnostic challenges and how to best examine patients safely, modifying techniques to obtain necessary diagnostic information.

#### TABLE OF CONTENTS/OUTLINE

• Review GI fluoroscopy trends • Discuss how to perform an esophagram in challenging circumstances including procedural modifications for the sickest patients • Describe detailed techniques, tricks and tips on how to perform an esophagram for: Debilitated patients, Intubated patients, Aspirating patients, Patients who can't swallow on command, Possible tracheoesophageal fistula, Suspected impacted foreign body or food bolus, Post-operative patients including post laryngectomy, esophagectomy, myotomy, and Zenker repair. • Discuss potential pitfalls. • Important pathology can be identified on these studies, often providing information that is not readily obtained with alternative methods.

### GIEE-96 DEEP DIVE IN DIVERTICULA: PICTORIAL REVIEW OF GI TRACT CASES

Jose D. Fernandes SR (*Abstract Co-Author*) Nothing to Disclose
Luana Paschoal, MD (*Abstract Co-Author*) Nothing to Disclose
Ana Carolina Gaetan Afonso, MD (*Abstract Co-Author*) Nothing to Disclose
Cassio G. Reis JR (*Abstract Co-Author*) Nothing to Disclose
Gabriela Lauar, MD (*Abstract Co-Author*) Nothing to Disclose
Arthur H. Godeiro, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Diverticula can be found in various parts of the digestive tract, such as the esophagus, stomach, duodenum, jejunum, ileum, appendix, and colon. Prevalence varies according to each segment, being very common in the colon and rarer in other segments. Their clinical manifestations are generally vague, which makes diagnosis difficult and increases the risk of complications. Radiologists play a fundamental role in detecting and characterizing a wide range of gastrointestinal conditions, including the different types of diverticula in the gastrointestinal tract. Therefore, it is essential for radiology professionals to be familiar with all types of diverticula, from common colon diverticula to rare cases such as Zenker's, Killian-Jamieson's, Meckel's, duodenal, and gastric diverticula.

#### TABLE OF CONTENTS/OUTLINE

Through a pictorial review, we intend to present an overview of the various types of diverticula in the gastrointestinal tract, including rarely described cases in the literature, as well as to discuss the incidence, symptoms, and prognosis of this clinical condition. We aim to highlight the role of various imaging modalities in aiding diagnosis, with emphasis on cases identified in imaging studies of lower technological complexity, such as radiographic contrast studies. We also intend to highlight possible pitfalls in the assessment of exams in this context, especially concerning the differentiation between pseudodiverticula and true diverticula in imaging exams.

### GIEE-97 LIVER INFECTIONS: IMAGING, DIFFERENTIAL DIAGNOSIS, PEARLS, ANDPITFALLS

Mustafa Koc, MD (*Abstract Co-Author*) Nothing to Disclose
Sukru Mehmet Erturk, MD (*Abstract Co-Author*) Speaker, Siemens AG;Speaker, Bayer AG;Speaker, General Electric Company ;Consultant, Siemens AG
Sukru Sahin, MD (*Abstract Co-Author*) Nothing to Disclose
Ali H. Baykan, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To describe imaging findings of infectious liver diseases 2. To discuss the role of cross-sectional imaging in the diagnostic work-up of infectious liver diseases 3. To discuss the imaging differential diagnosis of infectious liver diseases

#### TABLE OF CONTENTS/OUTLINE

• Introduction • Transmission routes of infectious agents, pathophysiology, and effects on the liver • Key imaging findings of infectious liver diseases, including bacterial, viral, parasitic, and fungal infections • Pearls and pitfalls in the differential diagnosis of infectious liver diseases • Conclusion

### GIEE-98 UNCOMMON CT AND MR MANIFESTATIONS OF SOLID PSEUDO-PAPILLARY TUMOR OF THE PANCREAS

Yan Zhou (*Abstract Co-Author*) Nothing to Disclose
Xuhua Gong (*Abstract Co-Author*) Nothing to Disclose
Jianrong Xu (*Abstract Co-Author*) Nothing to Disclose
Hainan Ren, BMedSc (*Abstract Co-Author*) Nothing to Disclose
Li Jun Qian, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To illustrate and review the uncommon CT and MR manifestations of solid pseudo-papillary tumor of the pancreas (SPT)2. Discuss the crucial points for diagnosis of uncommon SPT.Conclusion: The major teaching points of this exhibit are:1. SPT may be associated with a variety of uncommon CT and MR manifestations.2. Knowledge of the uncommon imaging spectrum is useful in identification of the disease.

**TABLE OF CONTENTS/OUTLINE**

1. SPT in male patients2. small SPT3. SPT with minimal solid component 4. SPT with minimal cystic component 5. SPT with dense central calcification6. Extrapancreatic SPT7. Aggressive SPT with metastatic disease8. SPT with dorsal pancreas agenesis9. Technical considerations

## GIEE-99 SPECTRUM OF GASTROINTESTINAL MESENCHYMAL LESIONS: MULTIMODALITY IMAGING AND DIAGNOSTIC APPROACHES

Ba D. Nguyen, MD (*Abstract Co-Author*) Nothing to Disclose
Kenneth N. Huynh, DO (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. To review the common and uncommon mesenchymal lesions of the GI tract with histopathologic findings, differential diagnosis, and prognosis. 2. To characterize imaging features of each GI tract mesenchymal lesion to narrow diagnostic possibilities using CT, MR, PET/CT, and ultrasound.

**TABLE OF CONTENTS/OUTLINE**

Soft tissue mesenchymal lesions are ubiquitously found throughout the body but rarely occur distinctively in the gastrointestinal (GI) tract. Gastrointestinal stromal tumors account for 90% of GI mesenchymal lesions but only less than 1% of overall GI tract tumors. Less common mesenchymal lesions range from benign schwannoma, leiomyoma, inflammatory fibroid polyp, granular cell tumor, and gangliocytic paraganglioma to malignant lesions such as leiomyosarcoma, clear cell sarcoma, inflammatory myofibroblastic tumor, and primary GI melanoma. Radiologic appearances and characteristics of these lesions frequently overlap and lead to a broad differential diagnosis. Accurate diagnosis is crucial as otherwise treatable lesions with malignant potential may be mistaken for benign processes. This exhibit will present the imaging spectrum of GI tract mesenchymal lesions on CT, MR, PET/CT, and ultrasound. These lesions include the benign and malignant entities mentioned in the above paragraph. This exhibit will also review the typical locations of occurrence along the GI tract and discuss a simplified approach to formulate and narrow the differential diagnosis of these lesions.

Bruna G. Busoletto Tripode SR, MD, MD (*Abstract Co-Author*) Nothing to Disclose
Ana Paula Fraga Cintra Gonzaga (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Provide an overview of Frantz tumor (solid pseudopapillary tumor of the pancreas). Discuss typical and atypical cases with an emphasis on image characteristics. Review the main differential diagnoses of Frantz tumor with a didactic approach.Offer helpful tips for challenging cases to improve accurate diagnosis and patient outcomes.Develop a radiological survival guide for the interpretation of pancreatic lesions with solid and cystic components.

### TABLE OF CONTENTS/OUTLINE

This presentation aims to provide a comprehensive overview of the main features of Frantz Tumor, including epidemiology, associations, pathology, radiographic features, prognosis, and treatment. Using case-based presentations, we will explore the classic and uncommon imaging manifestations of Frantz tumor, including multiplicity, ductal obstruction, simulation of other tumors such as neuroendocrine, intratumoral calcification, occurrence in male patients and children, distant metastasis, parenchymal and extracapsular invasion.We will discuss how to differentiate from benign lesions and malignant neoplasms, including pancreatic pseudocyst, mucinous cystadenoma, neuroendocrine tumors, gastrointestinal stromal tumors, and pancreatic adenocarcinoma. Provide tips for challenging cases where the diagnosis may not be apparent from imaging alone, and radiologists can still play a key role in contributing to better patient outcomes.

GIEE-10

## ASSESSMENT PRIOR TO LIVER RESECTION; WHAT A RADIOLOGIST SHOULD KNOW?!

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Sergio Klimkowski, MD (*Abstract Co-Author*) Nothing to Disclose
Imran Ahmed, MD (*Abstract Co-Author*) Nothing to Disclose
Mindy X. Wang, MD (*Abstract Co-Author*) Nothing to Disclose
Ann A. Shi, MD (*Abstract Co-Author*) Nothing to Disclose
Khaled M. Elsayes, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. 1. Introduce the complexity, nature, epidemiology, diagnostic and therapeutic approaches. 2. 2. Discuss the indications of liver resection. 3. 3. Discuss radiologists' roles in detection, proper characterization and staging of the cause. 4. 4. Demonstrate the proper localization. 5. 5. Discuss the criteria for technical resectability. 6. 6. Summarize different types of surgical resection.

### TABLE OF CONTENTS/OUTLINE

1) - Introduction to importance of preresection liver assessment a) Complexity of disease. b) The occult nature of the disease. c) The changing epidemiology. d) The rapidly evolving diagnostic and therapeutic approaches.2) - Indications of liver resection a) Common malignant indications include: - HCC - Cholangiocarcinoma - Metastases (commonly colorectal) b) Liver transplant.3) - Role of Imaging: a) Detection b) Proper characterization c) Localization d) Staging e) Anatomical variants-4) - Resectability criteria a) Technical resectability criteria. b) Future liver remnant volume.5) - Types of surgical resection: a) Anatomic resection. b) Non-anatomic (wedge).

GIEE-101

## INTESTINAL COMPLICATIONS IN THE ONCOLOGIC PATIENT: SPECTRUM OF CT FINDINGS AND IMAGING-BASED DIAGNOSTIC APPROACH

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Eduard Andia Navarro (*Abstract Co-Author*) Nothing to Disclose
Marisol Rodriguez Arias (*Abstract Co-Author*) Nothing to Disclose
ANA SANCHEZ MARQUEZ (*Abstract Co-Author*) Nothing to Disclose
Eva Maria Merino Serra (*Abstract Co-Author*) Nothing to Disclose
Maria Pardo Antunez (*Abstract Co-Author*) Nothing to Disclose
David Martinez De La Haza (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The purpose of this exhibit is:1. To review the variety of symptomatic and potentially serious intestinal complications that may occur in patients with oncologic pathology, many of which might be related to previous or ongoing therapies2. To evaluate CT findings in these patients, emphasizing the signs that might lead us to a correct diagnosis3. To gain an awareness of the importance of the global context of the patient (including clinical manifestations and underlying treatment such as chemotherapy, radiation therapy and immunotherapy) in the diagnostic approach.

### TABLE OF CONTENTS/OUTLINE

- INTRODUCTION- CLINICAL CONTEXT1. Symptoms (diarrhea, obstruction, pseudo-obstruction, other) and blood test parameters2. Oncologic background: primary neoplasm (visceral or hematologic), oncologic therapy- SPECTRUM OF CT FINDINGS1. Mural thickening: type, distribution, extension, severity2. Abnormal enhancement3. Intestinal distension4. Strictures5. Other: pneumoperitoneum, pneumatosis intestinalis, fluid collections- TYPE OF COMPLICATIONSA. Infectious enterocolitis (viral, bacterial, pseudomembranous colitis)B. Neutropenic enterocolitisC. Immunotherapy-mediated enterocolitisD. Radiation-induced enteritisE. Graft vs host diseaseF. Tumor progression-relatedG: Other: ischemic colitis, stercoral colitis, perforation, iatrogenic- TAKE-HOME POINTS

## PORTOSYSTEMIC SHUNTS: ANATOMY, TREATMENT, AND COMPLICATIONS WITH 3D CINEMATIC RENDERING CORRELATES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Shanna A. Matalon, MD (*Abstract Co-Author*) Nothing to Disclose
Khushboo Jhala, MD,MBA (*Abstract Co-Author*) Nothing to Disclose
Bardia Nadim, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Spontaneous portosystemic shunts occur in portal hypertension due to reconstitution of embryonic venous channels in order to act as "release valves."2. Major complications of portal hypertension include acute variceal bleeding and hepatic encephalopathy.3. 3D cinematic rendering is able to show contiguous pathways and highlight complex vascular anatomy related to portosystemic shunts, which can sometimes be difficult to conceptualize on standard CT reformats due to tortuosity.4. Transjugular intrahepatic portosystemic shunt (TIPS) can be used for refractory esophageal variceal bleeding and ascites, and balloon-occluded retrograde transvenous obliteration (BRTO) can be used to treat gastric varices with large gastrorenal or splenorenal shunts.5. CT evident complications of TIPS and BRTO include stent occlusion, and clinical presentation is often similar to the original manifestations of portal hypertension.

### TABLE OF CONTENTS/OUTLINE

1. Normal portal and mesenteric venous anatomy2. Pathophysiology of Portal Hypertensiona. Prehepaticb. Intrahepaticc. Posthepatic3. Anatomic Collateral Pathways Complications4. Interventional Procedures and Complicationsa. Transjugular intrahepatic portosystemic shunt (TIPS): for refractory esophageal variceal bleeding and ascitesi. Anatomyii. Imagingiii. Complicationsb. Transvenous obliteration of varices: for gastric ectopic varices (not esophageal)i. Anatomy1. Gastrorenal shunt 2. Splenorenal shuntii. Imagingiii. Complicationsc. Balloon dilation of hepatic vein (for thrombosis/web in hepatic vein)d. Transhepatic clot thrombolysis (PV thrombosis)e. Splenic artery embolization (sinistral portal hypertension)

## TRUE BEAUTY COMES FROM WITHIN: WHEN INTESTINAL CONTENTS HELP YOU GET THE DIAGNOSIS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Leonardo K. Bittencourt, MD, PhD (*Abstract Co-Author*) Research Consultant, Canon Medical Systems Corporation
Daniel Lahan-Martins, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Fernanda G. Velloni, MD (*Abstract Co-Author*) Nothing to Disclose
Cassia T. Guimaraes, MD (*Abstract Co-Author*) Nothing to Disclose
Roberto Blasbalg, MD (*Abstract Co-Author*) Nothing to Disclose
Martin Horwarth, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

•When assessing for gastrointestinal conditions, while radiologists focus on the patters of distention, wall thickening and enhancement of bowel loops, the assessment of the contents of the involved loops can often be forgotten or neglected, potentially leading to wrong or delayed diagnosis.•Many intestinal and systemic diseases can alter the contents of the small intestine and the colon. The identification of these pathological intestinal contents can assist in the diagnosis of specific pathologies.•Equally important is recognizing luminal intestinal findings that do not correspond to any pathology, but are rather physiological or variants of normality.

### TABLE OF CONTENTS/OUTLINE

1. Introduction.2. Review of the anatomy of the digestive tract, the path of the food bolus and its changes along the way.3. Image of physiological intestinal contents.4. Findings of intestinal contents that have no clinical significance (tablets, contents of different densities, fruit seeds, medical devices, foreign body?).5. Pathological findings of intestinal contents (steatorrhea, gallstones, blood, bezoar, food impactation).6. Assessment of specific pathologies (foreign body ingestion, bezoar, gallstone ileus, Bouveret syndrome, cystic fibrosis?).7. Take home notes.8 .Bibliography.

### TEACHING POINTS

Dual-energy CT (DECT) imaging has broadened the potential of CT imaging by offering multiple types of DECT-derived images. DECT shows profound capabilities to improve diagnosis in gastrointestinal (GI) imaging based on its superior material differentiation, but also on the use of DECT-derived quantitative values that have considerable potential to serve as imaging-based biomarkers in multiple clinical applications.The aim of this exhibit is:-To review physical concepts of DECT and technical parameters influencing image quality and DECT quantification.-To discuss advantages and limitations of quantitative DECT imaging in different clinical scenarios-To provide a comprehensive and practical overview of possible diagnostic pitfalls that may be encountered using quantitative DECT imaging.-To evaluate future perspectives for quantitative DECT imaging and photon-counting technology.

### TABLE OF CONTENTS/OUTLINE

-Basic concepts of DECT: atomic numbers, energy levels, and other physics concepts.-Understanding the different types of DECT-derived images and their use in GI imaging.-Principles of quantitative DECT imaging: iodine, fat, and iron concentrations / extracellular volume, effective atomic number, and electron-density values.-Cutting-edge applications of quantitative DECT in GI imaging: lesion detection and characterization, accurate tumor staging, prognostic and predictive value, therapy planning, treatment response assessment, and body composition.-Pitfalls and artifacts in quantitative DECT imaging: how to avoid them.-Future directions: from quantitative DECT-derived biomarkers (radiomics and radiogenomics) to photon-counting CT in GI imaging.-Conclusions

## LOST ART OF BARIUM SWALLOW

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Amit K. Sahu, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Bharat Aggarwal, MD (*Abstract Co-Author*) Nothing to Disclose
Bhavya Arora, MBBS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Barium swallow is a radiographic exam using contrast to evaluate esophagus's structure and some functions. It helps diagnose conditions like motility disorders, strictures, and perforations, as well as distal issues such as hiatal hernias and reflux. Despite CT imaging, it remains useful. While it can identify common pathologies, more complex swallowing issues may require a modified barium swallow evaluation.

### TABLE OF CONTENTS/OUTLINE

Anatomy of esophagus: The normal course, appearance and constrictions.Indications: Dysphagia, GERD, hiatus hernia, Repeated vomiting, epigastric pain, post-operative leakTechnique: Initial scout film to rule out any foreign body and as control for post-contrast study followed by swallowing barium under video fluoroscopy in upright lateral position for pharynx and to rule out aspiration. Image with patient instructed to say ‘Eeee’ is taken to visualize the hypopharynx. As the patient swallows, frontal and oblique views are taken. Prone in right anterior oblique to assess motility of esophagus and competence of the gastro-esophageal junction. Single contrast versus double contrast barium swallow Clinical significance: Structural: Diverticulum, Stricture, Hiatus herniaNeoplastic: Lipoma, Leiomyoma, AdenocarcinomaMobility: Achalasia, Hypoperistalsis, Diffuse esophageal spasmsTraumatic: Iatrogenic, Perforation, Post caustic injuryPediatric: Tacheo-esophageal fistula, Esophageal atresiaContraindication: Relative contraindications is perforation.Complications: Aspiration, leakage from a perforation

Ana M. Vera-Carmona, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Inflammatory bowel disease (IBD) is a chronic condition affecting the gastrointestinal tract that is comprised of two disorders: Crohn’s disease (CD) and ulcerative colitis (UC). They are relapsing and destructive diseases that can result in progressive bowel damage if not adequately treated, with the resultant impairment of the quality of life of patients.Therefore, clinicians need clear and objective information on disease activity and extent to adequately adapt the treatment in IBD patients (drug change or optimization, endoscopic dilatation or surgical treatment).Magnetic resonance enterography (MRE) and intestinal ultrasonography (IUS) can accurately evaluate these parameters, currently playing a pivotal role in the monitoring and management of IBD patients, while computed tomography (CT) is usually reserved to the emergency setting.

### TABLE OF CONTENTS/OUTLINE

Introduction:- IBD: definition and clinical course- Imaging techniques used for the monitoring of IBD diagnosed patients.- Treatment modalities available in IBD and its indications: pharmacological treatment, endoscopic dilatation and surgery.Review of the role of imaging in the management of IBD patients through a case-series in which different clinical scenarios and outcomes are shown.ConclusionsReferences

### TEACHING POINTS

Rectal cancer (RC) presents significant diagnostic and therapeutic challenges. The introduction of new neoadjuvant therapeutic strategies (total neoadjuvant therapy [TNT], RC treatment without radiation, immunotherapy [IT]), minimally invasive surgery, and non-surgical options (watch and wait [WW] strategy) in RC is mainly based on MRI findings that provide essential information for treatment selection. MRI serves an increasingly pivotal role in the diagnosis, staging, treatment stratification, response assessment, and follow-up of patients with RC. MRI can assess both the anatomical extent of invasion (offering a surgical roadmap) and the pattern of tumor infiltration with factors involved in local spread and tumor relapse and factors involved in systemic dissemination not included in the usual TNM staging.The aim of this exhibit is:-To review the implications for prognosis and choice of treatment of MRI findings of local tumor spread (depth of invasion, mesorectal fascia [MRF] involvement, lymph node metastases, perineural and lymphatic invasion) and systemic dissemination (extramural vascular invasion and tumor deposits).-To evaluate limitations of MRI to assess some key pathological, molecular, and genetic features in RC.-To discuss the role of MRI in the era of new therapeutic strategies in RC.-To review the limitations of MRI in the assessment of RC response.

### TABLE OF CONTENTS/OUTLINE

-Basic concepts of MRI in RC: TNM-staging and MRI-based surgical roadmap.-MR-derived prognostic features in RC.-The changing role of MRI in RC with TNT, IT, WW, and minimally invasive surgery for staging, restaging, and follow up in RC.-Future role of functional MRI and radiomics in RC.-Conclusions

## BUBBLE INSIGHTS: NAVIGATING CEUS LI-RADS AND ITS DISTINCTIONS FROM CT-MRI LI-RADS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Hyun-Jung Jang, MD (*Abstract Co-Author*) Nothing to Disclose
Tae Kyoung Kim, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Vanessa Murad, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Emphasizing the efficacy of contrast-enhanced ultrasound (CEUS) in characterizing hepatic observations among high-risk populations for hepatocellular carcinoma (HCC). 2. Exploring the key differences of CEUS LI-RADS from CT/MRI LI-RADS: - Real-time imaging capabilities.- Purely intravascular contrast agents.- Option for repeated injections and replenishments.- Suitability for patients with renal failure. 3. Presenting illustrative cases to highlight crucial differences between CEUS LI-RADS and CT/MRI LI-RADS.

### TABLE OF CONTENTS/OUTLINE

1. Introduction: - Overview of CEUS LI-RADS and microbubble contrast agents.2. Real-time imaging: - Detection and assessment of arterial phase hyperenhancement (APHE).- Evaluation of APHE patterns.3. Purely intravascular contrast agents:- Significance of the timing and degree of washout.- Consistent demonstration of washout in non-HCC malignancies.- Utilization of CEUS-guided biopsy for small isoechoic malignancies.- Discrepancies in LR-M criteria between CEUS and CT/MRI.4. Availability of repeated injections and replenishments:- Minimization of failed examinations due to timing issues or patient’s motion/breathing.- Utility in the assessment of APHE patterns.5. Suitability for patients with renal failure:- No known renal toxicity of microbubble contrast agents.6. Clinical Applications:- Literature review relevant literature, including recent studies on the utility of CEUS LI-RADS across various indications and prospects.

## ALCOHOL-RELATED PANCREATITIS: PATHOPHYSIOLOGY, NATURAL HISTORY, AND IMAGING CORRELATIONS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Abhijit A. Raut, MD (*Abstract Co-Author*) Nothing to Disclose
Anoushka Maheshwari (*Abstract Co-Author*) Nothing to Disclose
Sachin Kumar, MBBS (*Abstract Co-Author*) Nothing to Disclose
Mukesh G. Harisinghani, MD (*Abstract Co-Author*) Nothing to Disclose
Sharad Maheshwari, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Alcohol abuse imposes a substantial burden on our healthcare system. Addressing this issue with appropriate public health strategies is paramount, given its modifiable nature. Alcohol-induced pancreatitis ranks as the second most common cause following gallstones, contributing to nearly one-third of acute pancreatitis cases in the US. Its spectrum encompasses acute interstitial pancreatitis, acute pancreatic necrosis, recurrent acute pancreatitis, and can progress to chronic pancreatitis with sustained alcohol use, which becomes irreversible. Understanding the unique natural history of alcohol-related pancreatitis aids in diagnosis and guides management effectively. Computed Tomography (CECT) stands as the imaging modality of choice in acute settings. Meanwhile, Magnetic Resonance Imaging (MRI) proves more sensitive for detecting subtle changes and offers both morphological and functional insights in chronic cases. The exhibit will elucidate the imaging implications of this distinctive disease spectrum.

### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Epidemiology 3. Pathophysiology Natural History 4. Patterns of Excessive Drinking: a. Binge drinking b. High-intensity drinking 5. Imaging Techniques 6. Imaging Features: a. Mild Acute Pancreatitis b. Severe Acute Pancreatitis c. Acute Recurrent Pancreatitis d. Early Chronic Pancreatitis e. Late or Irreversible Chronic Pancreatitis

## INSIGHTS INTO SICKLE CELL DISEASE: UNVEILING ABDOMINAL IMAGING FINDINGS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Daniella B. Parente, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Clara Fiorot, MD (*Abstract Co-Author*) Nothing to Disclose
Andre Ferreira, MD (*Abstract Co-Author*) Nothing to Disclose
Paula Castro, MD (*Abstract Co-Author*) Nothing to Disclose
Luiza Ambrozino, MD (*Abstract Co-Author*) Nothing to Disclose
Luana Alves, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Explore the abnormal hemoglobin structure in Sickle Cell Disease (SCD) and its correlation with sickling and red blood cell damage.
- Define the common abdominal and pelvic manifestations of SCD, elucidating their characteristic imaging features using CT scan and MRI, and discuss findings in each organ.
- Understand the role of imaging in diagnosing acute crises, potential complications, and chronic consequences of SCD in the abdomen and pelvis.

### TABLE OF CONTENTS/OUTLINE

I. Introduction
- Understand the basic mechanisms of Sickle Cell Disease (SCD): abnormal hemoglobin causing red blood cell sickling and vaso-occlusion.
- Emphasize the importance of abdominal and pelvic imaging for diagnosing and managing complications arising from SCD. II. Abdominal and Pelvic Manifestations of SCD
- Recognize how SCD leads to abdominal disorders through vaso-occlusion and hemolysis.
- Discuss the potential complications of chronic hemolysis, such as iron overload in the liver:
- Vaso-occlusion and its consequence: tissue and organ ischemia and infarction
- Hemolysis
- Functional asplenia and increased risk of infection III. Imaging Findings of SCD in the Abdomen and Pelvis
- Extramedullary hematopoiesis
- Organ-specific findings based on imaging:
- Liver
- Gallbladder
- Spleen
- Kidneys
- Gastrointestinal tract
- Male reproductive organs IV. Conclusion
- Early recognition of abdominal complications through imaging allows for prompt management and improved patient outcomes.

## BEYOND THE BASICS: UNCOMMON ANORECTAL NEOPLASMS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Maialen Imizcoz, MD (*Abstract Co-Author*) Nothing to Disclose
Jokin Zabalza Unzue (*Abstract Co-Author*) Nothing to Disclose
Laida Etxeberria Kaiuela, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. To describe and illustrate the radiological and histopathological findings of uncommon anorectal neoplasms. 2. To highlight the radiological differentiating features that may prove useful to reach an accurate diagnosis in anorectal mases.

### TABLE OF CONTENTS/OUTLINE

1. Introduction: Why is it important to recognise uncommon anorectal neoplasms by imaging tests? 2. Essential anatomy of the anorectum. 3. Uncommon anorectal neoplasms: radiological and histopathological findings. • Rectal gastrointestinal stromal tumor • Anorectal malignant melanoma • Rectal neuroendocrine tumor • Rectal lymphoma • Rectum sarcoma • Carcinoma arising from anal fistula • Linitis plastica of the rectum 4. Review of differentiating radiological features of uncommon anorectal neoplasms on CT/MRI. 5.Conclusion

## NAVIGATING POST-LOCOREGIONAL THERAPY IMAGING IN HCC: INSIGHTS AND UPDATES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Ozerk Turan (*Abstract Co-Author*) Nothing to Disclose
Jade J. Wong-You-Cheong, MD (*Abstract Co-Author*) Author, Reed Elsevier
Barton F. Lane, MD (*Abstract Co-Author*) Research support, Siemens AG;License agreement, Siemens AG
Izzet Altun, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1- Locoregional treatment (LRT) is widely used for hepatocellular carcinoma (HCC), with radiologists playing a critical role in assessing treatment response. 2-The LI-RADS Treatment Response Algorithm (LR-TRA) is a standardized system for evaluating treatment response after LRT for HCC, introducing a new approach in 2024 based on radiation and non-radiation therapies. 3-This educational exhibit will focus on imaging techniques and features of post-LRT HCC, incorporating updates on LR-TRA v2024.

### TABLE OF CONTENTS/OUTLINE

1-Indications, role, and basic concepts of locoregional therapies, including radiofrequency ablation, microwave ablation, cryoablation, stereotactic radiation, transarterial chemoembolization, and radioembolization. 2-CT and MRI study protocols for HCC. 3- Review of CT and MRI imaging features after LRT for HCC. 4- Case-based overview of the 2024 LI-RADS non-radiation and radiation TRA. 5- Discussion on the role of contrast-enhanced ultrasound in monitoring treatment response after LRT. 5- Summarization of LRT techniques and imaging features for HCC with LR-TRA v2024 updates.

## CANCER-ASSOCIATED FIBROSIS: WHAT RADIOLOGISTS NEED TO KNOW

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Mariko Irizato (*Abstract Co-Author*) Nothing to Disclose
Toshihiro Tanaka (*Abstract Co-Author*) Nothing to Disclose
Kiyoyuki Minamiguchi (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The purpose of this exhibit is to review the components and role of fibrous extracellular matrix (ECM) in cancer, to understand representative cases of abdominal cancer with abundant fibrosis (e.g., gastrointestinal, hepatobiliary, and pancreatic) in multimodality imaging, and to focus on imaging feature of cancer-associated fibrosis that are relevant to clinical outcomes.

### TABLE OF CONTENTS/OUTLINE

ECM plays an important role in cancer progression. Cancer-associated fibrosis (e.g., fibrous capsule and fibrous stroma) is excessive accumulation of fibrous proteins such as collagen and laminin in the ECM, dramatically altering the biological properties of the cancer. The impact of the cancer-associated fibrosis on clinical prognosis is a matter of interest, but controversial for each cancer: fibrous capsule in colorectal liver metastases is involved in a favorable prognosis by physiologically confining cancer cells, whereas fibrous stroma in cholangiocarcinoma in poor prognosis by promoting cancer growth. Multimodality imaging to infer cancer-associated fibrosis is useful not only for diagnosis but also for predicting clinical prognosis such as overall survival, recurrence free survival, and treatment response. Table of contents is as follows;1) Overview of cancer-associated fibrosis2) Representative case presentation 3) Clinical application of multimodality imaging reflecting cancer-associated fibrosis

Venkata S. Katabathina, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Discuss the increasing incidence, risk factors and unique characteristics of early-onset colorectal cancer (EOCRC)
- Review genetic features, molecular biology, prognosis natural history of EOCRC
- Describe salient imaging findings of primary/metastatic EOCRC discuss role of CT/MRI/PET-CT in management.
- Discuss current screening guidelines, targeted therapeutics future directions in early diagnosis treatment

### TABLE OF CONTENTS/OUTLINE

; EOCRC: Cancer in younger than 50 years old. ; Epidemiology ; Risk factors: genetics, obesity, sedentary lifestyle, sweetened beverages, westernized lifestyle, inflammation gut microbiome ; Comparing EOCRC vs. late-onset CRC in pathogenesis, genetics, pathology, molecular biology, clinical features, treatment, prognosis natural history ; Genetics molecular biology: 30% are genetic; Microsatellite Instability-High, TP53, CTNNB1 ; Grading and Staging ; Imaging Techniques: Radiography, Contrast enema, CT, MRI PET/CT ; Salient imaging findings ; Radiogenomics ; Management Prognosis ; Current screening guidelines and the role of CT Colonography ; Lifestyle modifications ; Future screening directions (new screening modalities and ways to identify at-risk population) ; Targeted Therapeutics ; Conclusion EOCRC is an emerging clinical problem that affects an increasing number of young patients. Salient features of EOCRC include left colon/rectal distribution, mucinous/signet ring histology, higher pathologic grade, poorer cell differentiation, more advanced stage poor prognosis. Radiologists play a pivotal role in timely diagnosis, screening, and management of EOCRC. Imaging helps in surveillance testing efficacy of novel drugs.

## ESOPHAGRAM REGAINING STRENGTH IN ACHALASIA

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Manuel Alejandro Garrido, MD (*Abstract Co-Author*) Nothing to Disclose
Mildreth Juliana Acuna Rojas, MEd (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Achalasia is an esophageal motility disorder, characterized by impaired relaxation of the lower esophageal sphincter.The global incidence ranging from 0.03 to 1.63 per 100,000 persons per year and the prevalence its 1.8 to 12.6 per 100,000 persons per year.Exists functional loss of myenteric plexus ganglion cells in the distal esophagus and lower esophageal sphincter. The diagnosis started with clinical suspiction, the syntoms are dysphagia to solids and liquids, regurgitation, occasional chest pain with or without weight loss, perform high resolution manometry, endoscopic and esophagram.The achalasia is relacionated with systemic diseases, tumors and others esophagus trastorns.The radiological technique consists of a series of fluoroscopy images of the pacient, specifically to esophagus while ingesting contrast medium.It is important to keep in mind that the esophagram is a study with greater accessibility, fewer risks and lower cost compared to endoscopy, which is why it represents a great option for diagnosis.

### TEACHING POINTS

In the context of inflammatory pseudotumors (IPT) of the liver, there exists a dichotomy between pathologically well-defined disease entities and those clinically employed with ambiguity. This educational exhibit aims to categorize these into narrow-sense IPT and broad-sense IPT, consolidating the clinical and radiographic hallmarks of the various diseases within each classification to enhance the diagnostician’s comprehension.

### TABLE OF CONTENTS/OUTLINE

1. Narrow-sense Inflammatory Pseudotumor of the Liver (Specifically defined entities at the view point of pathology)To resolve the confusion regarding IPT of the liver, we will explain the histopathological classification and imaging findings. This includes an explanation of the fibrohistiocytosis type and lymphoplasmacytosis type (IgG4 related IPT of the liver), as well as pseudolymphoma.2. Broad-sense Inflammatory Pseudotumor of the Liver (Broad Definition of IPT, including liver abscess) We will focus on the changes in imaging findings at wide spectrum of Inflammatory Pseudotumors.3. Differential Diagnosis and Miscellaneous lesions: We will discuss intrahepatic cholangiocarcinoma, inflammatory myofibroblastic tumors (including those related to Epstein-Barr virus), atypical forms of hepatocellular carcinoma, and other conditions such as iatrogenic IPT and recurrent liver masses of unknown etiology.

## INSIDE OUT: NAVIGATING LYMPH NODES IN RECTAL ADENOCARCINOMA WITH MRI - FROM ANATOMY TO NEOADJUVANT THERAPY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Cum Laude**

Mona H. Hassan, MBBS, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Provide short overview of rectal adenocarcinoma and its significance. Gain a deep understanding of lymph node anatomy draining the rectal area. Learn how MRI provides a detailed roadmap for assessing lymph nodes in rectal adenocarcinoma and how it is superior over the other imaging modalities. Discover the telltale signs that help differentiate between benign and malignant lymph nodes. Explain the normal lymph node characteristics: size, shape and signal intensity features indicating the abnormal lymph nodes as morphology and signal changes. Decoding lymph node status and learn when they are loco-regional and when they are distant metastasis. Uncover insights into treatment response through a comparison of pre and post therapy MRI images. Discuss the changes observed in lymph nodes after neoadjuvant therapy and their implication for treatment. Identify common traps in lymph node assessment with MRI and learn how to avoid these traps. Explore real life case studies and discover how accurate MRI lymph node assessment improves patient outcomes. Understand the important key elements of an MRI report.

### TABLE OF CONTENTS/OUTLINE

Introduction Lymph node stations for rectal adenocarcinoma MRI technique Role of MRI in primary L.N staging and important anatomic landmarks Detection of suspicious lymph node at MRI: benign vs. malignant lymph nodes Criteria of diagnosis: lymph node size, signal and morphology, what is more important and when? Is it loco-regional or distant metastatic lymph node? Role of MRI in lymph node assessment after therapy The effect of proper staging on clinical implication and treatment planning Common traps in lymph node assessment How to avoid pitfalls and traps Key elements of an MRI report Conclusion

### TEACHING POINTS

1. In addition to iatrogenic devices, biologic material may form in the duct or extend into the duct with potentially deleterious short-term and long-term clinical consequences. 2. Several premalignant and malignant neoplasms can arise in or grow into the pancreatic duct (PD) lumen. Imaging manifestations can sometimes be challenging.

### TABLE OF CONTENTS/OUTLINE

1. Embryology, histology and normal anatomy of PD 2. Role of imaging modalities in assessment of pancreatic duct - advantages and limitations of each 3. Congenital anomalies of pancreatic duct, acquired PD disruption and their clinical implications 4. Alterations in normal composition of pancreatic juice - clinical implications and relevant imaging manifestations - Alterations in pH, enzymes (exocrine pancreatic insufficiency) and DNA 5. Expected and unexpected Iatrogenic devices /foreign material in the PD 6. Non-neoplastic pathologic biologic material in the pancreatic ducal lumen a. Formed in the PD lumen - Protein plugs, calculi and mucin b. Extraneous elements extending into the PD lumen - Blood (hemosuccus pancreaticus), pus (abscess), bile (pancreatobiliary fistula), urine (pancreaticoureteral fistula) and enteric contents/gas from pancreato-enteric fistula 7. Neoplastic entities in the PD lumen a. Primary intraductal neoplastic entities i. Pancreatic intraepithelial neoplasia ii. Intraductal papillary mucinous neoplasm iii. Intraductal oncocytic papillary neoplasm iv. Intraductal tubulopapillary neoplasm v. Colloid carcinoma b. Neoplastic entities growing into PD lumen i. NET ii. PDAC 8. Summary

## BURSTING THE BUBBLE: A REVIEW OF PNEUMATOSIS INTESTINALIS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Manjiri K. Dighe, MD (*Abstract Co-Author*) Research Grant, Koninklijke Philips NV;Research Grant, General Electric Company
Rajat Bhargava, MD, MBBS (*Abstract Co-Author*) Nothing to Disclose
Minal C. Jagtiani, FRCR,MBBS (*Abstract Co-Author*) Nothing to Disclose
Saubhagya Srivastava, MBBS (*Abstract Co-Author*) Nothing to Disclose
Karthika Devi D S, MBBS (*Abstract Co-Author*) Nothing to Disclose
Thomas Perez, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Discuss the causes and hypothesis of pneumatosis intestinalis (PI) 2. Types of PI: Benign and life-threatening 3. Elaborate the hypotheses for development of PI and discuss the causes for rising incidence 4. Discuss the available treatment options

### TABLE OF CONTENTS/OUTLINE

1. Pneumatosis Intestinalis (PI) - Prevalence and overview 2. Clinical scenarios encountered: ischemia related to thromboembolic events, hypoperfusion, abdominal trauma, post-surgical intervention, pulmonary disease (COPD), systemic disease (autoimmune myositis, SLE), immunocompromised states, post solid organ transplantation 3. Current hypotheses for the development of pneumatosis intestinalis: benign or pathological: Commonly discussed theories: mechanical and bacteria. Mechanical theory proposes that pressurized intraluminal air dissects through the mucosa of compromised bowel and tracks along mesenteric vessels, propagated by peristalsis. Bacterial theory states that gas-producing bacteria invade intramural compartments and congregate in small gas cysts, which is supported by improvement following antibiotic use 4. Pneumatosis post-solid organ transplant- what additional factors do we need to consider? Benign/ life threatening, clinical indicators, immunosuppression and predisposition to PI 5. Current treatment options for pneumatosis intestinalis: emergent survival intervention and revascularization versus medical management (antibiotics, elemental diet and oxygen therapy) 6. Post-surgical pneumatosis: commonly discussed outcomes

### TEACHING POINTS

1) illustrate where pancreatic tumor imaging pitfalls may arise 2) approaches to overcome/avoid pitfalls for a variety of pancreatic tumor types

### TABLE OF CONTENTS/OUTLINE

Pitfalls of imaging technique and how to avoid them. Pitfalls of management/interpretation. For pancreatic cancer (PDAC), staging issues including pancreatitis and use of short term follow-up, hepatic steatosis and the use of MRI, and strategies for postop monitoring to detect subtle recurrence including careful use of postop baseline, common and uncommon recurrence sites including pancreatic remnant, and use of PET/CT. Will also address pancreatic cancer mimics including metastases from other primaries (e.g. renal cell carcinoma), tumors near pancreas, inflammatory conditions, post-surgical changes, and normal fatty changes. For pancreatic neuroendocrine tumors (PNET), tools for staging (DOTATATE vs FDG PET), treatment response (MR imaging including T2 and delayed gadoxetate for following liver metastases), and for differential diagnosis (heat-damaged Tc-99m RBC SPECT CT to identify accessory splenic tissue). For pancreatic cystic lesions, monitoring for solid lesions developing in pancreas remote from cysts, need for history as abscesses and pseudocysts can mimic cystic neoplasms, and review of old studies e.g. given possible cystic evolution of PNETs. In screening populations at high risk for PDAC, inspecting also for primary cancers outside pancreas, i.e. BRCA (e.g. breast, ovarian, prostate and melanoma).

## WHEN RADIOLOGISTS JOIN THE FBI: FOREIGN BODY INVESTIGATION; AN IMAGING REVIEW OF GASTROINTESTINAL FOREIGN BODIES AND THEIR CLINICAL SIGNIFICANCE, MANAGEMENT, AND COMPLICATIONS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Frank J. Santisi, MD (*Abstract Co-Author*) Nothing to Disclose
Veniamin Barshay, MD (*Abstract Co-Author*) Nothing to Disclose
Sunil Jeph, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Mary M. Woodruff, DO (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Foreign bodies in the gastrointestinal tract, while infrequently encountered, provide memorable cases. In this case based review, we aim to provide the clinical significance and medical management of these foreign bodies. Recognizing and identifying the location and potential complications of a foreign body in the gastrointestinal tract provides a key role in the clinical patient management. We aim to provide a comprehensive review of gastrointestinal foreign bodies using highlighted cases of common and more uncommon complications. Selected cases focus on foreign bodies below the diaphragm.

### TABLE OF CONTENTS/OUTLINE

Identifying different materials of foreign bodies on imaging.Clinical management and interventions based on type and location of foreign body.Case based review of complications from foreign bodies with key imaging findings and management. Sample cases include:Bowel perforation with liver abscess from ingested plastic spoonBowel and bladder perforation from ingested penBowel obstruction from ingested rubber toyBowel perforation with abdominal wall involvement from ingested penFocal inflammatory reaction from unknown foreign bodyHighlighted teaching cases with key imaging findings and clinical management. Sample cases include:Ingested materials including nail clippers, pen, pencil, pulse ox probe, glass, coins Migrated iatrogenic foreign bodies, various malpositioned gastrointestinal stents and surgical clipsBezoarAttempted overdose with ingested pills

## A PRACTICAL GUIDE TO CROHN'S IMAGING, THE GOOD, THE BAD AND THE UGLY: TIPS FROM TWO CONTINENTS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Arun Gupta, MBChB (*Abstract Co-Author*) Nothing to Disclose
Alex Fitzhugh, MBBS (*Abstract Co-Author*) Nothing to Disclose
Saubhagya Srivastava, MBBS (*Abstract Co-Author*) Nothing to Disclose
Karthika Devi D S, MBBS (*Abstract Co-Author*) Nothing to Disclose
Minal C. Jagtiani, FRCR,MBBS (*Abstract Co-Author*) Nothing to Disclose
Palveer Bhogal, MBBS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Provide a brief overview of Crohn's disease (CD) with epidemiology, phenotype classification, pathophysiology 2. Compare the spectrum of findings in CD with US, CT and MR Enterography - discussing the strengths, limitations and practical problems faced in daily practice 3. Discuss standardized acquisition protocol for MRE and the significance of sequences used: Europe vs North American protocols (including anti-peristaltic agents) 4. To provide a schematic description of how imaging findings can affect the clinical management strategy

### TABLE OF CONTENTS/OUTLINE

1. Crohn's disease - Overview and epidemiology 2. US small bowel (SB) preparation and benefits: High resolution and dynamic imaging, practical/economic efficiencies 3. US SB findings: Mural, extraluminal, doppler and motility assessment 4. MR Enterography protocol a. Contrast agents - oral and IV b. Role of antiperistaltic agents: specific differences in two continents c. Sequences utilized and their significance: delayed post contrast imaging in detecting fibrotic stricturing, diffusion-weighted imaging (DWI) d. Role of fluoroscopic sequences 5. MRE/ CTE mural findings: Intramural edema, segmental mural hyperenhancement, bowel wall thickening, ulcerations, sacculations and fibrosis 6. MRE/ CTE mesenteric and extraintestinal findings: Perienteric edema, fibrofatty proliferation, reactive lymphadenopathy, "comb sign", penetrating and perianal CD 7. Signs of active vs chronic inflammation, utility of MRE activity scores 8. Structured reporting: Updated terminology 9. How do imaging findings affect clinical management strategies in CD?

## OOPS I DROPPED IT AGAIN: MULTI-MODALITY REVIEW OF DROPPED GALLSTONE EVOLUTION, IMAGING APPEARANCE, AND RELEVANT MANAGEMENT

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Tasmia Amjad (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Dropped gallstones exhibit a highly variable appearance based on imaging modality, extent of calcification, and scaring or active inflammation. Apparent growth is often due to edema, fibrosis, or shifting calculi. Complications are uncommon. However, they are important to recognize as abscesses and fistulae involving dropped gallstones usually require surgical management.

### TABLE OF CONTENTS/OUTLINE

Brief discussion of epidemiology and clinical relevance of dropped gallstones. Discussion of the relevant anatomy and both expected and less common locations of dropped gallstone pathology. Examples of variable appearance of dropped gallstones across multiple modalities and changes that occur with time. Discussion of drop gallstone induced complications. Case based review of key learning points and potential pitfalls.

### TEACHING POINTS

; Review LI-RADS® CEUS NONRADIATION TRA v2024.; Discuss a standardized CEUS imaging protocol for post-treatment assessment of HCC.; Describe typical CEUS enhancement patterns of HCC following nonradiation locoregional therapy, including Transarterial chemoembolization (TACE), Transarterial bland embolization (TAE), Radiofrequency ablation (RFA), Microwave ablation (MWA) or Percutaneous ethanol ablation (PEA).; Discuss diagnostic criteria for tumor viability using CEUS after non-radiation locoregional therapy of HCC.; Identify possible pitfalls of CEUS categorization of treated HCC and explore scenarios where CEUS is not appropriate for post-treatment assessment.; Explore future directions for post-treatment CEUS of liver lesions and the importance of individualised patient care.

### TABLE OF CONTENTS/OUTLINE

Overview of LI-RADS® CEUS Nonradiation TRA v2024 algorithm; Treated lesion definitions.; CEUS Imaging criteria for intralesional and perilesional tumor viability.; Case-based review of CEUS LR-Viable, LR-TR Nonviable and LR-TR Equivocal after different locoregional treatment modalities, including TACE, TAE, RFA, MWA or PEA.; Suggested imaging workup options time intervals for different treatment modalities. Limiting factors for CEUS only post-treatment assessment; Location, depth and size of treatment cavity.; Time required to assess multiple lesions.; Detection of new lesions.; US artifacts typically seen with treatment cavities. Research Gaps and future studies• Individualized patient care with CEUS- To identify ideal patient cohort based on tumor characteristics and guide in recommending most appropriate follow up imaging modality amongst CEUS, MRI and CT.

## HIATAL HERNIAE: FILLING IN THE INFORMATION HIATUS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Alberto Martinez-Isla (*Abstract Co-Author*) Nothing to Disclose
Philip J. Shorvon, FRCR, FRCPC (*Abstract Co-Author*) Nothing to Disclose
Minal C. Jagtiani, FRCR,MBBS (*Abstract Co-Author*) Nothing to Disclose
Palveer Bhogal, MBBS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Define a hiatal hernia (HH). Describe prevalence, types and variants 2. Discuss the imaging modalities with pictorial review 3. Outline the imaging findings in HH 4. Discuss the available surgical and endoscopic options for correction and discuss the relevance of imaging findings 5. Discuss the complications of surgery and available imaging investigations used post operatively

### TABLE OF CONTENTS/OUTLINE

1. Definition - herniation of stomach through the esophageal hiatus. Other organs can also herniate 2. Prevalence: Natural incidence increases with age: 60% people over 60 years. High prevalence in GERD patients; exact mechanism discussed 3. Clinical importance: Prevalence and health impact. About 6% of all primary care prescriptions are for proton pump inhibitors, many for reflux associated with hiatal herniae 4. Types • 1 Sliding • 2 Paraesophageal • 3 Mixed • 4 Additional herniation of other viscera • Paracrural: Rare and not true hiatal hernia but must be differentiated 5. Complications Cameron lesions, ischemia, strictures, Barrett's esophagus, volvulus, throat symptoms 6. Investigative imaging modalities and findings 7. Presurgical planning: what information does the surgeon need from a radiology report? 8. Surgical (and endoscopic) options • Surgical repair (Mostly laparoscopic. Other options included open repair - transabdominal or transthoracic approach. Use of fundoplication, mesh and gastropexy discussed) • Endoscopic suturing / plication 9. Complications and their imaging: Pneumothorax, infection, bleeding, perforation/ leak, recurrence 10. Post op investigation/prognosis: plain film, fluoroscopy, CT

## PANCREATIC CYSTIC LESIONS: CT, MR AND ECHO-ENDOSCOPIC CORRELATION

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Lourdes del Campo, PhD (*Abstract Co-Author*) Nothing to Disclose
Itxaso Galan-Gonzalez (*Abstract Co-Author*) Nothing to Disclose
Silvia Cayon Somacarrera, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- To depict the different types of pancreatic cystic lesions with their corresponding image characteristics on CT, MR and echo-endoscopy - To identify the image characteristics that help to evaluate the potencial degree of aggressiveness of each one of them

### TABLE OF CONTENTS/OUTLINE

The term pancreatic cystic lesion encompasses a wide range of lesions that range from completely benign to potentially malignant entities. Given the increasing incidental detection of pancreatic cystic lesions, it is important for radiologists to know the characteristics of each of them and the radiological signs suspicious of malignancy, thus avoiding surgical interventions and unnecessary healthcare costs. In addition, it is also important to determine the need for follow-up. We have reviewed all pancreatic cystic neoplasms detected in our center since 2005. Their radiological characteristics are shown through the use of CT, MR and echo-endoscopy when available. We also describe the signs that lead to suspicion of malignancy and the follow-up diagnostic algorithm developed by the multidisciplinary committee of our center.

## PHYSICS INSIGHTS INTO LIVER MRI: EDUCATIONAL GUIDANCE FOR PROTOCOL OPTIMIZATION

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Simon Gauvin, MD (*Abstract Co-Author*) Nothing to Disclose
Evan McNabb (*Abstract Co-Author*) Nothing to Disclose
Khaled Alanazi (*Abstract Co-Author*) Nothing to Disclose
Veronique Fortier (*Abstract Co-Author*) Nothing to Disclose
Caroline Reinhold, MD, MSc (*Abstract Co-Author*) Research Grant, Imagia Cybernetics Inc
Jeremy Dana, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

MRI quality can be defined by the signal-to-noise ratio, contrast-to-noise ratio, and spatial resolution. - Signal-to-noise ratio is inversely proportional to spatial resolution and proportional to scan time, leading to necessary clinically relevant compromises. - Field-of-view should be adjusted to the patient's width to improve spatial resolution, e.g. conspicuity of the biliary tree, while maintaining the matrix size and being time neutral. - Conventional TSE should be preferred over radial TSE or HASTE/SSFSE to achieve optimal liver contrast-to-noise ratio, especially for tumoral characterization or detection. - Multi-shot echo planar diffusion-weighted imaging is more robust than single-shot to distortion artifacts from air-filled structures but more time-consuming.

### TABLE OF CONTENTS/OUTLINE

1. MRI quality: signal-to-noise ratio, contrast-to-noise ratio, spatial resolution. 2. Understanding the impact of key technical parameters (field-of-view, matrix size, slice thickness, averages, etc.) on MRI quality and scan time. 3. Understanding tissue contrast (T1 T2) and how to image it (TR, TE, Flip angle). 4. Understanding different types of pulse sequence and their applications in liver imaging in the perspective of their strengths and limitations: TSE (conventional, radial, driven equilibrium, single-shot), DWI/ADC (acquisition modes, etc.), MRCP, fat suppression techniques, contrast agent (dynamic acquisition and impact on other pulse sequences). 5. Insight into quantitative liver MRI: fat and iron quantification, MR Elastography. 6. Insight into acceleration techniques and deep learning reconstructions. 7. Revelling the hidden companions of MRI: respiration, quality control.

Ghaneh Fananapazir, MD (*Abstract Co-Author*) Nothing to Disclose
Benjamin Carney, MS, MD (*Abstract Co-Author*) Nothing to Disclose
Chirag Govardhan, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1) To discuss the imaging findings and management recommendations for common incidental findings seen on imaging studies of the abdomen and pelvis that are not covered by the existing ACR White Papers. 2) To review up-to-date evidence regarding incidental findings that support or contradict existing White Paper recommendations.

### TABLE OF CONTENTS/OUTLINE

1) The importance of incidental findings. 2) What are the White Papers? 3) Hepatic: Topics not covered by the White Papers include hyperechoic lesions and solid hypoechoic lesions on ultrasound. Updates on hepatic topics include hyperenhancing lesions on contrast-enhanced CT. 4) Biliary: Updates on biliary topics include extrahepatic biliary ductal dilatation, focal fundal gallbladder wall thickening, and gallbladder polyps. 5) Renal: Topics not covered by the White Papers include hyperechoic lesions on ultrasound and T1-hyperintense lesions on MRI. Updates on renal topics include indeterminate homogeneous renal masses on contrast-enhanced CT (21-39 HU range). 6) Bowel: Topics not covered by the White Papers include incidental intussusception of the small bowel and colon. 7) Mesentery: Topics not covered by the White Papers include misty mesentery/sclerosing mesenteritis. 8) Testicular: Topics not covered by the White Papers include microlithiasis and isolated right-sided varicoceles. 9) Spleen: Updates on splenic topics include cystic lesions and solid lesions.

### TEACHING POINTS

- Recognize known prognostic markers in hepatocellular carcinoma (HCC);
- Understand imaging features associated with HCC prognosis;
- Identify these features on CT and MRI.

### TABLE OF CONTENTS/OUTLINE

1) Introduction distinction between prognostic markers (predict natural history or outcome) vs. predictive features (predict responsiveness or lack of response to therapy before the therapy is applied), novel imaging markers of HCC to improve patient management. 2) Prognostic pathologic features epidemiology, histologic classification, associated prognosis. 3) Prognostic molecular features proliferative versus non-proliferative HCC, molecular subclasses, genetic features, main signaling pathways, epigenetic features. 4) Emerging prognostic imaging features radiologic characteristics associated with proliferative and non-proliferative HCC, LI-RADS categories, case examples, biologic rationale, predictors of microvascular invasion, limitations of discussed imaging features. 5) Management and predictive features medical and interventional or surgical therapies, current role of biomarkers, considerations for specific pathologic and molecular subtypes. 6) Future directions validation of prognostic and predictive markers, integration of such markers into the radiology LI-RADS report.

## MULTI-PHASE CT OR SPLIT BOLUS CT: SPLIT BOLUS CT CAN REDUCE RADIATION DOSE AND IMPROVE DIAGNOSTIC ACCURACY IN ABDOMINAL CONTRAST-ENHANCED CT

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Koji Muroga (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To learn the reduction of radiation exposure in the abdominal multi-phase CT.To learn the advantages of decreasing the number of scans.To learn the methods for decreasing the number of scans.To learn split bolus CT to acquire the images with combined dual-contrast phases.To learn the advantages of split bolus CT.

### TABLE OF CONTENTS/OUTLINE

A. Reduction of radiation exposure in abdominal contrast-enhanced CT. B. Advantages of reducing number of scans. C. Images with combined dual-contrast phases. D. Method of obtaining images combined arterial and venous phases. E. Advantages of split-bolus CT. / Split-bolus CT can obtain the images combined arterial and venous phases by a single-phase scanning in abdominal contrast-enhancement CT. As a result, split-bolus CT can reduce the radiation dose by 46% by reducing the number of scans compared to multi-phase CT. In addition, Split-bolus CT can obtain the CT images without misregistration. This allows simultaneous and accurate assessment of the position and size of vessels, organs, and tumors, improving diagnostic accuracy, and is particularly beneficial before gastrointestinal laparoscopic surgery. High diagnostic accuracy on reduced CT images can improve efficiency and reduce the workload for radiologists and surgeons.

### TEACHING POINTS

1. Delineate the specific pathways of first nodal metastasis corresponding to tumor sites within the esophagus, stomach, liver, gallbladder, small bowel, and colorectum. 2. Explore pertinent clinical and radiological data for assessing adenopathies in patients diagnosed with these tumor types, alongside the staging classification systems employed for their evaluation, illustrated with clinical radiological examples. 3. Analysis of the functions and constraints of imaging methods, focusing on CT and MRI.

### TABLE OF CONTENTS/OUTLINE

1.Global burden from the major cancers of the gastrointestinal tract. 2. Common Pathways of first nodal metastasis of the gastrointestinal tract. 3. Illustrations of common pathways. 4. The TNM Classification of gastrointestinal malignancies and its key clinical value in guiding patient management decision-making. 5.Case-based presentation of the main gastrointestinal malignancies with first nodal metastasis in MRI and CT imaging, encompassing conditions such as gastric, gallbladder, distal ileum, right colon, rectal, and anal neoplasms. 6.Outlining key take-home messages.

### TEACHING POINTS

1. Provide a comprehensive review of the sonographic features of the normal pancreas, anatomical variants, common and uncommon pathologies including their mimics. 2. Illustrate and discuss potential errors/misdiagnosis on ultrasound pancreas based on lessons learnt from quality assurance rounds. 3. Discuss tips and tricks that can help prevent these errors and improve diagnostic accuracy.

### TABLE OF CONTENTS/OUTLINE

1. Review anatomy and anatomical variants on ultrasound 2. Scanning techniques 3. Case-based review of a wide variety of diagnostic errors encountered in pancreatic ultrasound, which include: (i) Perceptual errors, such as false negatives involving neoplasms and intrapancreatic splenunculus. (ii) Interpretive errors, including mimics of neoplasms, inflammatory conditions and focal fatty sparing. (iii) Errors related to information transfer, involving inaccurate interpretation of neoplasms, pseudocyst and splenosis due inadequate correlation with clinical history. (iv) Errors related to processes, encompassing undetected malignancy attributed to incomplete assessment, and inadequate assessment of cystic neoplasms. 4.Correlative imaging studies and illustrations will be reviewed. 5. Tips to mitigate these potential errors will be highlighted.

### TEACHING POINTS

1. To illustrate the anatomy and embryology of the retrorectal-presacral space.2. To propose a stepwise-based imaging approach to facilitate the differential diagnosis of retrorectal-presacral masses and review its related lesions.

### TABLE OF CONTENTS/OUTLINE

1. Review the anatomy and embryology of the retrorectal-presacral space through illustrations, MRI images, and cadaveric correlation. 2. Classification of the spectrum of masses from a histopathological perspective to globally assess the heterogeneity of lesions in this location. 3. Imaging evaluation. 3.1 Diagnostic clues for assessing posterior pelvic-space dependency. 3.2 Morphological evaluation of the lesion. 3.2.1 Learn to identify red flags indicative of malignancy. 3.2.2 Stratify the lesions into cystic or solid-complex, and into the presence or absence of fat content. 4. Develop an algorithm approach that facilitates the differential diagnosis for retrorectal-presacral masses grouping the lesions according to the descriptors mentioned previously into: 4.1 Non-fat containing cystic masses. 4.2 Fat containing cystic masses. 4.3 Non-fat containing solid-complex masses. 4.4 Fat-containing solid-complex masses. 5. Present multimodality imaging of these lesions following this approach with radio-pathologic correlation. 6. Review of the management of retrorectal-presacral lesions. Focus on indications for biopsy and access route. 7. Take home points.

## "MISS ME NOT"- THE MANY FACES OF MECKEL'S DIVERTICULUM

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Cum Laude**

Yashant Aswani, MD (*Abstract Co-Author*) Nothing to Disclose
Ahmad I. Farah, MBBS (*Abstract Co-Author*) Nothing to Disclose
Ananya Panda, MD, MBBS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• Review the embryology and anatomy of Meckel's Diverticulum (MD) • Review role of radiology and normal appearances of MD • Discuss multimodality imaging of complications of MD

### TABLE OF CONTENTS/OUTLINE

I. Embryology and Anatomy of Meckel's Diverticulum (MD) II. Normal MD on different imaging modalities III. Role of Radiology IV. Complications of MD 1. MD with heterotopic gastric /pancreatic mucosa 2. MD with enteroliths/ foreign bodies 3. Meckel's diverticulitis a) Uncomplicated Meckel's diverticulitis b) Meckel's diverticulitis with Perforation c) Meckel's diverticulitis with Abscess 4. MD with small bowel obstruction a). Due to Volvulus b). Due to Inverted MD c). Due to Internal hernia d). Littre's Hernia e). Intussusception 5. MD with active GI bleeding 6. MD associated with malignancy (neuroendocrine tumor, gastrointestinal stromal tumor, etc.) V. Common Differential Diagnosis and Imaging Pearls.

Alba Fernandez-Rodriguez, MD (*Abstract Co-Author*) Nothing to Disclose
Ana M. Vera-Carmona, MD (*Abstract Co-Author*) Nothing to Disclose
Lucia Martinez De Vega, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Brief description of the current situation, epidemiology and therapeutic options for rectal cancer. Watch and Wait strategy. Review of anorectal anatomy in MRI and semiology of rectal adenocarcinoma.Review of the study acquisition protocol: need for oblique sequences to the tumor.Review of imaging findings after radio-chemotherapy treatment by using illustrative cases. Degree of response and main false positives.Proposal of structured report and simple conceptual classification.

### TABLE OF CONTENTS/OUTLINE

Colorectal cancer represents the second most frequent tumor diagnosed in the population after breast and prostate. Given its high prevalence and the fact that its incidence is increasing in young patients, an "organ-preserving" therapeutic management is currently preferred after achieving a complete tumor response with effective neoadjuvant chemoradiotherapy; thus, avoiding the harmful effects and morbidity of surgery. This strategy is known as "Watch Wait" and consists of a close follow-up where MRI plays a leading role. Therefore, correct acquisition of the study is essential, using high-resolution T2 morphological and diffusion sequences angled to the tumor, which allow us to accurately assess and rule out tumor remnants or recurrences. In addition, it is necessary to have a deep knowledge of the imaging findings in response after treatment, both of the primary tumor and lymph node involvement, as well as to identify the main pitfalls. All this with the aim of providing useful and accurate information to the clinician.

## TECHNIQUES FOR OPTIMIZING SONOGRAPHIC ANALYSIS OF GALLBLADDER POLYPS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Malak Itani, MD (*Abstract Co-Author*) Nothing to Disclose
Katerina Konstantinoff, MD (*Abstract Co-Author*) Nothing to Disclose
William D. Middleton, MD (*Abstract Co-Author*) Nothing to Disclose
Aya Kamaya, MD (*Abstract Co-Author*) Royalties, RELX;Research Grant, Canon Medical Systems Corporation
Christopher I. Fung, MD (*Abstract Co-Author*) Stockholder, Mikata Health
Sharlene A. Teefey, MD (*Abstract Co-Author*) Nothing to Disclose
Katharina Feister, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

In 2022, the Society of Radiologists in Ultrasound (SRU) Consensus Conference updated the risk-stratification and management guidelines for gallbladder polyps (GBP) based on their shape size. Optimizing sonographic diagnosis analysis of a GBP is important as it allows appropriate classification clinical decision making. This exhibit will:1. Review the SRU GBP management guidelines 2. Discuss sonographic techniques for optimizing gray scale Doppler parameters useful in diagnosing analyzing GBPs

### TABLE OF CONTENTS/OUTLINE

1. General techniques for evaluating the GB: fasting state, subcostal intercostal scans, tips if GB is difficult to identify2. Techniques to diagnose GBPs: a. Exclude shadowing: highest transmit frequency, single focal zone at the level of interest, turn off real time compounding b. Exclude mobility: scan in different positions (upright, prone, RPO) c. Document internal vascularity: optimize Doppler parameters with low pulse repetition frequency wall filter, high gain color threshold, adjust transmit frequency based on depth d. Exclude signs of adenomyomatosis: Comet tail/Twinkle artifacts, cystic spaces3. Techniques for analyzing polyps: a. Measurement: largest diameter of largest GBP, round to nearest mm b. Shape (pedunculated vs sessile): increase transmit frequency, decrease depth image width, magnify image, cine clips to show wiggle c. Other signs: adjacent wall thickening, liver invasion/metastasis, adenopathy4. Alternative/further imaging: a. Follow up US: poor exam, contracted GB, can't distinguish sludge vs GBP b. CEUS for sludge vs GBP analysis of GBP enhancement c. CT vs MRI

## OPTIMIZING SONOGRAPHIC ANALYSIS OF SUPERFICIAL SOFT TISSUE MASSES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Sharlene A. Teefey, MD (*Abstract Co-Author*) Nothing to Disclose
Malak Itani, MD (*Abstract Co-Author*) Nothing to Disclose
William D. Middleton, MD (*Abstract Co-Author*) Nothing to Disclose
Katharina Feister, MD (*Abstract Co-Author*) Nothing to Disclose
Katerina Konstantinoff, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The Society of Radiologists in Ultrasound (SRU) recently published a consensus conference statement that provided guidelines for categorization management of superficial soft tissue masses (SSTM). This included an unillustrated review of techniques for optimizing the examination.This exhibit aims to: Expand elaborate on optimal US techniques for imaging SSTMs and provide an illustrated review. Provide abundant examples of how optimal technique leads to improved diagnosis. Summarize SRU guidelines for SSTMs.

### TABLE OF CONTENTS/OUTLINE

1. Required equipment - Essential: Multiple linear probes of varying frequency, grayscale with harmonic imaging spatial compounding, color, power spectral Doppler. Useful but non-essential: Bedside table adjustable stool, panoramic scans, dual screen grayscale/Doppler, advanced techniques (e.g. contrast enhanced US)2. Generic imaging protocol - Longitudinal transverse grayscale images, static images cine clips at rest with dynamic maneuvers, measurement in 3 orthogonal planes, Doppler3. Optimizing imaging techniques with case examples - Adjusting transmit frequency to match the depth of lesion, comparison to surrounding tissues contralateral side when applicable, dynamic maneuvers - compression, muscle contraction, Valsalva etc., Doppler settings - scale, frequency, gain etc.4. Characterize lesions based on sonographic appearance - Composition (solid, cystic, mixed), echogenicity, margins, internal architecture, location/relationship to adjacent structures, vascularity, classic benign lesions5. Summarize SRU consensus guidelines for categorization management of SSTMs

## SIMPLE MUCINOUS CYST OF PANCREAS: IS IT REALLY A BENIGN LESION?

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Bengi Gurses (*Abstract Co-Author*) Nothing to Disclose
Duygu Atasoy, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Develop an understanding of simple mucinous cysts (SMC)
- Understand difference of SMC from other mucinous cysts in pancreas
- Learn imaging features of SMC
- Compare SMC to other similar cystic lesions to make differential diagnosis.
- Discuss relation of SMC and PDAC

### TABLE OF CONTENTS/OUTLINE

- Cystic Lesions of Pancreas
- Mucinous Cysts of Pancreas
- Definition of Simple Mucinous Cysts
- Pathologic Definition of SMC
- Imaging Features of SMC
- Differential Diagnosis of SMC
- Misnomer or Not: Are SMCs Truly Simple?
- Malignancy Potential of SMC
- SMC and PDAC: Is There a Relationship?

## RARE CYSTIC LESIONS OF PANCREAS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Bengi Gurses (*Abstract Co-Author*) Nothing to Disclose
Duygu Atasoy, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Learn classification of pancreatic cystic lesions
- Develop an awareness of rare pancreatic cystic lesions
- Learn imaging features of retention cysts, squamoid cysts of pancreatic ducts, simple mucinous cysts
- Learn to make differential diagnosis.
- Discuss malignancy potential of rare pancreatic cysts

### TABLE OF CONTENTS/OUTLINE

- Cystic Lesions of Pancreas
- Classification of Cystic Lesions
- Neoplastic Cysts of Pancreas
- Non-neoplastic Cysts of Pancreas
- Retention Cysts
- Simple Mucinous Cysts
- Squamoid Cyst of Pancreatic Ducts
- Lymphoepithelial Cysts
- Awareness: Radiologic Differentiation of Rare Cystic Lesions from Other Pancreatic Lesions
- Attention: Clinical Importance of Rare Cystic Lesions
- Fear: Malignancy Potential of Rare Pancreatic Cystic Lesions

## JOURNEY EXPLORING THE VALUABLE IMAGING QUANTITATIVE PARAMETERS IN HEPATOCELLULAR CARCINOMA: CURRENT USE AND POTENTIAL APPLICATIONS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Tetsuya Tachiiri (*Abstract Co-Author*) Nothing to Disclose
Nagaaki Marugami (*Abstract Co-Author*) Nothing to Disclose
Kiyoyuki Minamiguchi (*Abstract Co-Author*) Nothing to Disclose
Toshihiro Tanaka (*Abstract Co-Author*) Nothing to Disclose
Mariko Irizato (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The purpose of this exhibit is to review various quantitative values (e.g.,tumor steatosis, stiffness, vascularity, etc.) of multimodality imaging reported in hepatocellular carcinoma (HCC), to clarify the background that these quantitative values reflect (e.g., histopathology and immunopathology), and to discuss the potential application of these quantitative values in the coming era of personalized therapy for HCC.

### TABLE OF CONTENTS/OUTLINE

In HCC, there have been many reports of quantitative parameters using MRI, perfusion-CT, PET-CT, etc. with the aim of improved clinical prognosis and clarification of the tumor biology. However, no report has summarized these parameters previously reported, resulting in a sporadic situation. Additionally, in recent years, there has been an exponential increase in reports on radiomics, an emerging field in image analysis for characterizing HCC. Understanding these quantitative parameters as well as the background they represent will help clinicians consider about treatment strategy based on these values.Table of contents is as follows.1) Overview of quantitative values reported in HCC2) Association of the quantitative values with their background through representative case3) Potential application of these quantitative values to current treatment strategy in HCC

## THE REAL QUESTION- IS IT RESECTABLE? RESPONSE EVALUATION AFTER NEOADJUVANT THERAPY IN PANCREATIC CARCINOMA: A GREEN SIGNAL FOR SURGERY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Jitin Goyal, MBBS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Neoadjuvant treatment (NAT) aims to downstage borderline resectable and locally advanced pancreatic adenocarcinomas to make patients amenable to surgery with R0 resection and prolongation of overall survival.Contrast Enhanced Computed tomography (CT) remains the primary imaging tool for assessing treatment response after neoadjuvant therapy due to higher spatial resolution and multiplanar reconstruction. Nevertheless, the interpretation of imaging findings remains challenging, due to similarity between viable tumor and treatment-related changes following NAT. In various studies ,changes in tumor size or volume following neoadjuvant therapy were not significantly associated with R0 resection or survival outcomes. Increased tumor attenuation in the arterial and venous phases after neoadjuvant therapy was associated with R0 resection in patients with locally advanced and borderline resectable tumors. Partial regression of tumor-vessel contact after neoadjuvant therapy had 100% positive predictive value for R0 resection, regardless of the degree of either reduction in tumor size or residual vascular involvement.Decreased venous stenosis or decreased contour deformation indicates improved venous involvement after NAT.

### TABLE OF CONTENTS/OUTLINE

Favorable imaging findings on Contrast Enhanced Computed tomography after neoadjuvant therapy include partial regression of tumor contact with peripancreatic vessels, a mild fat-stranding perivascular halo in place of solid tumor contact with a vessel, and reduction in tumor size according to RECIST 1.1 guidelines.

Ryan J. Smith, MD (*Abstract Co-Author*) Nothing to Disclose
Zachary B. Hoskins, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Hepatocellular carcinoma (HCC) is a high mortality malignancy, with imaging playing a crucial role in early detection. 2. Recognize the typical imaging features of hepatocellular carcinoma. 3. Infiltrative HCC can have features which overlap with typical HCC, or can look markedly abnormal with features including tumor-in-vein. 4. Identify features found in biphenotypic tumors and their overlap with HCC and cholangiocarcinoma. 5. Infiltrative HCC and biphenotypic tumors do not behave like typical HCC, therefore a radiologist should have a high index of suspicion for these entities in patients with chronic liver disease.

### TABLE OF CONTENTS/OUTLINE

I. Introduction a. Mortality of HCC b. Imaging utilization in the pre-operative evaluation II. Typical HCC a. Arterial phase hyperenhancement and washout i. Physiology ii. CT iii. MRI b. Ancillary features c. Ultrasound III. Infiltrative HCC, on a spectrum of cases that resemble typical HCC to more atypical. a. Mimickers b. Cases which retain features of typical HCC c. Cases which are difficult to characterize d. Cases with tumor-in-vein i. MRI appearance ii. Ultrasound 1. Spectral Doppler 2. Differentiation from bland thrombus IV. Combined HCC/cholangiocarcinoma a. Statistics in chronic liver disease b. Imaging findings of typical cholangiocarcinoma c. Imaging characteristics i. Cases that resemble HCC ii. Cases that resemble cholangiocarcinoma

## BEYOND THE BULGE: A FOUNDATIONAL REVIEW OF DYNAMIC ULTRAOUND OF THE ABDOMINAL WALL

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Young H. Kim, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Aniket Pandya, MD (*Abstract Co-Author*) Nothing to Disclose
Patrick Svrcek, MD (*Abstract Co-Author*) Nothing to Disclose
Christine Yao, BA, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Our educational exhibit aims to provide a foundation for the ultrasound (US) evaluation of abdominal wall "bulges" or hernias, particularly with the use of dynamic maneuvers. First, a comprehensive understanding of the variations in abdominal wall anatomy to the level of the inguinal region is crucial to the diagnostic process. Using both positional changes (upright, supine) and manipulation of intra-abdominal pressure (Valsalva, coughing) during ultrasound examination will allow for real-time assessment of the behaviors and movement of herniated contents. Effective use of dynamic maneuvers can increase sensitivity and accuracy of US, which can eliminate the need for more costly cross-sectional imaging with CT or MRI. When assessing a hernia, we will highlight the importance of documenting features such as size, sac contents, and estimated fascial defect. Additionally, we will review post-operatively imaging such as expected and unexpected surgical changes. Finally, we will also cover both common and rare differential diagnoses or mimics of hernias when evaluating for an abdominal wall palpable complaint.

### TABLE OF CONTENTS/OUTLINE

1. Learn overview of anterior abdominal anatomy with specific attention to ultrasound appearance and the common locations for abdominal wall hernias to arise. 2. Recognize classic imaging features of abdominal wall hernias and hernia sac contents. ?3. Understand how dynamic imaging maneuvers such as (positional changes, Valsalva, etc.) is key to the evaluation of an abdominal hernia. 4. Review the expected post-operative appearance of a hernia repair and common post-operative complications. 5. Appreciate imaging features of common and rare mimics of abdominal wall hernias.

Victor Arthur Ohannesian (*Abstract Co-Author*) Nothing to Disclose
Pedro Carani (*Abstract Co-Author*) Nothing to Disclose
Marcelo R. Silva, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Ultrasound elastography was described for the first time in 2003 as a novel method for assessing and staging liver fibrosis.- Together with B-mode and Doppler study evaluation, both able to be performed simultaneously with elastography, a complete liver profile is created with a single exam.- Adequate interpretation of elastography results requires the patient’s clinical condition and laboratory exams to be taken into context by the radiologist.- Multiple factors, such as high-intensity physical activity, beta-blocker use, and recent excessive alcohol consumption, can affect elastography results.- It is fundamental that the radiologist has knowledge to not only perform the elastography exam but also interpret results considering each patient’s clinical context.

### TABLE OF CONTENTS/OUTLINE

- Introduction on hepatic ultrasound elastography- Confounding factors that increase liver stiffness- Interpretation of elastography on patients with viral hepatitis and non-alcoholic fatty liver disease- Clinical cases and discussion

## PANCREATIC NEUROENDOCRINE TUMORS: CT FEATURES TO HELP PREDICT TUMOR GRADE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Elliot K. Fishman, MD (*Abstract Co-Author*) Co-founder, HipGraphics, Inc Stockholder, HipGraphics, Inc Institutional Grant support, Siemens AG Institutional Grant support, General Electric Company Consultant, Exact Sciences Corporation Consultant, Imaging Endpoints II LLC
Linda C. Chu, MD (*Abstract Co-Author*) Nothing to Disclose
Satomi Kawamoto, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Pancreatic neuroendocrine tumors (PanNETs) are increasingly diagnosed in the recent decades, and treatment strategy of PanNETs have been evolved due to better understanding of tumor biology 2. Tumor stage and grade are critical for guide treatment and predict prognosis. 3. CT features to help predict histological tumors grade are presented and discussed. However, accurate prediction of tumor grade is difficult on imaging alone. 4. Radiomics has emerged as a valuable tool and applied to predict grading of PanNET. Review and discuss pros and cons of this technique in predicting tumor grade.

### TABLE OF CONTENTS/OUTLINE

1. Review pathological tumor grade according to WHO classification. 2. CT features to suggest low grade PanNETs. (a) Tumor size: small PanNETs are typically low grade, but not all tumors. (b) Tumor vascularity/enhancement: low grade PanNETs are typically hypervascular with intense homogeneous enhancement, but not all tumors. (c) Cystic/necrotic tumors: Small cystic PanNETs are often low grade, and necrosis are often associated with high grade PanNET, but they may be difficult to differentiate on CT. (d) Presence of calcification: Calcifications are more often associated with higher grade PanNETs but can be seen in low grade PanNETs. (e) Biliary duct, pancreatic duct, vascular and adjacent organ involvement are more commonly associated with higher grade PanNETs, though there are exceptions. 3. Review and discuss recent advances of radiomics technique and current limitations in predicting PanNET tumor grade compared to CT imaging features alone.

Levi B. Oliveira, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- To overview the pathophysiology and clinical manifestations of lymphomas. - To highlight the main radiological aspects and sites of involvement. - To alert about less common manifestations and unusual sites of involvement and discuss differential diagnoses.

### TABLE OF CONTENTS/OUTLINE

This presentation will overview the classics findings in abdominal lymphomas, that frequently involve nodal and extranodal structures, for knowledge of the usual presentation of the disease. The most classical findings include nodal disease, with solitary or multiple enlarged nodes, with a huge round mass or a lobular homogeneous density with uniform enhancement. When in extranodal involvement, the studies describe the spleen, liver, gastrointestinal tract, pancreas, abdominal wall, genitourinary tract, adrenal, peritoneal cavity, and biliary tract, in decreasing order of frequency. We describe and illustrate with schematic figures and imagens, rare cases of lymphoma with lymph nodes necrosis in patients without treatment, primary commitment of liver, pancreas, bilateral adrenal, non-Hodgkin peritoneum involvement, ovary, testicle, kidney, stomach, and bowel. A brief literature review of these rare manifestations and discuss why they are unusual, bringing frequency and epidemiological data for the radiology community keep in mind these unusual aspects to suspect when faced with challenging cases.

### TEACHING POINTS

Provide an overview of Extramedullary Hematopoiesis (EMH).Define the profile of patients with EMH from a clinical and laboratory point of view. Review typical and atypical presentations of EMH with emphasis on abdominal imaging. Present the main differential diagnoses.

### TABLE OF CONTENTS/OUTLINE

Review of the pathophysiology of EMH, with an understanding of the emergence of lesions made up of erythroid precursors (generally irregular aggregates of erythroblasts, immature granulocytes, and occasional megakaryocytes), as well as their usual and unusual distribution in the abdomen. Presentation of the patient’s epidemiological profile through real cases with clinical and laboratory data, facilitating the understanding of the disease, and revealing in which situations EMH should be considered as a diagnostic possibility and in which its probability becomes remote. As well as the presentation of image stigmas that may reveal that the patient evaluated has sickle cell anemia, thalassemia, myelofibrosis, or chronic myeloid leukemia, among the most common causes. Exposure of a series of cases with typical and atypical presentation of EMH, with emphasis on the usual findings of the disease, which involve paraspinal nodules, expansion of the ribs, organomegaly, focal masses in the liver or spleen, renal involvement (parenchymal, intrapelvic or perirenal), lymphnode involvement, nodules or peritoneal masses and masses at sites of splenectomy or nephrectomies. Presentation of differential diagnoses from an imaging point of view, highlighting the importance of clinical and epidemiological knowledge for a correct diagnostic approach.

### TEACHING POINTS

To present the intestinal surgical approach techniques for endometriosis and the indication of each approach according to the degree and site of the lesions. Expose the imaging aspects after laparoscopic resections and anastomoses of intestinal endometriosis lesions. Correlate post-surgical MRI findings, transvaginal ultrasound, and colonoscopy. Distinguish usual post-surgical findings from complications and residual disease.

### TABLE OF CONTENTS/OUTLINE

Bowel involvement is one the most severe forms of deep endometriosis, present in up to 30-40% of patients with deep endometriosis, and many of them will require surgical intervention.Several types of surgery have been used for the management of bowel endometriosis. Most of resection techniques are unknow for the radiologists, and the postoperative findings following bowel resection will depend on the surgical technique applied. To present the surgical techniques currently used to treat intestinal endometriosis through didactic drawings and illustrations of surgical steps depending on the characteristics of the lesion and its location in the rectosigmoid, cecum, appendix or ileum, proposing a clinical reasoning flowchart for choosing the most appropriate surgical procedure.Case-based review in a multimodality approach (US, MRI, colonoscopy and surgical specimens), following a timeline, with positive outcomes, demonstrating usual postoperative findings as well related complications. Practical tips illustrated by cases to assist radiologists in the differential diagnosis of post-surgical changes and residual endometriotic disease.

## SHIFTING PERSPECTIVE: EFFECTIVELY INCORPORATING THE DIXON METHOD INTO ABDOMINAL AND PELVIC MRI INTERPRETATIONS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Andres R. Ayoob, MD (*Abstract Co-Author*) Nothing to Disclose
Kyle Kleiman (*Abstract Co-Author*) Nothing to Disclose
James T. Lee, MD (*Abstract Co-Author*) Nothing to Disclose
Ronak Patel, BS (*Abstract Co-Author*) Nothing to Disclose
Joseph W. Owen, MD (*Abstract Co-Author*) Nothing to Disclose
Elhamy R. Heba, MD, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The Dixon method creates four image sets from a single acquisition: in-phase and out-of-phase images, acquired via a dual-echo technique, and fat-only and water-only images, reconstructed created from dual-phase source data, showing fat or water T1-signal intensity, respectively. These images provide information to allow confident identification of: (1) Macroscopic (adipocytes) and microscopic fat (or small volume) through India ink artifact and signal loss on out-phase images and (2) substances causing magnetic susceptibility (e.g. gas, iron, blood products, and metal) through signal loss on out-of-phase images. Fat-only images provide an alternative sequence for identifying fat while water-only images yield a T1-weighted fat suppressed sequence. These sequences can be integrated into imaging protocols for the abdomen and pelvis and incorporated in radiologist's search patterns. Knowledge of basic physics principles behind image generation can facilitate understanding of imaging appearances and improve diagnostic confidence.

### TABLE OF CONTENTS/OUTLINE

1. Review of physics principles underlying Dixon chemical-shift imaging 2. Case-based approach using the Dixon method to characterize diffuse and focal abnormalities in the abdomen and pelvis on MRI: Use of dual-phase gradient echo imaging to identify lipid through use of signal loss and India ink artifact Use of T2* effects/magnetic susceptibility artifact to identify gas, iron, blood products, and metal Use of fat-only images as an alternative sequence for identifying fat Use of water-only images as a fat-suppressed sequence 3. Discussion of integration into imaging protocols and search patterns to maximize benefits and limiting image overload

## EVALUATION AND MANAGEMENT OF COMPLICATIONS AFTER LIVING DONOR LIVER TRANSPLANTS REQUIRING COMPLEX BILIARY ANASTOMOSES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Karthik M. Sundaram, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Richard D. Shlansky-Goldberg, MD (*Abstract Co-Author*) Nothing to Disclose
Ann T. Foran, MBBCh (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1) Due to the limited availability of deceased donor liver transplants (DDLTs), living donor liver transplants (LDLTs) are becoming more common. 2) However, variant intrahepatic ductal anatomy, can increase risk of complications and exclusion of optimal donors. 3) New surgical techniques has allowed for the creation of complex biliary anastomoses, increasing the number of successful LDLTs. 4) Biliary complications following LDLT requiring multiple biliary anastomoses are higher compared to DDLTs. 5) Post-operative imaging allows for identifying the variant reconstructed biliary anatomy complications to ensure timely treatment. 6) In this exhibit, we illustrate pre- post-operative magnetic resonance imaging/ magnetic resonance cholangiopancreatography (MRI/MRCP) of donors recipients after LDLTs requiring complex biliary anastomoses. 7) We focus on recognizing the most common biliary complications mimics as well as management approaches.

### TABLE OF CONTENTS/OUTLINE

1) Discuss surgical techniques including ductoplasty, creation of a single orifice containing multiple ducts in a Roux limb, the presence of multiple separate anastomoses. 2) Evaluation of the pre-operative variant intrahepatic ductal anatomy and post-operative imaging appearances of LDLTs after multiple anastomoses by MRCP and hepatobiliary phase MRI. 3) Review complications and mimics following LDLT including anastomotic and non-anastomotic strictures, cholestasis, anastomotic leak, biliary cast syndrome, cholangitis, and biliary sepsis. 4) Management options for biliary complications including medical, ERCP in the cases of hepaticojejunostomy, placement of external/internal drains, the need for retransplant.

## ACR LI-RADS ULTRASOUND SURVEILLANCE V2024: UPDATE OF ULTRASOUND LI-RADS V2017

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Aya Kamaya, MD (*Abstract Co-Author*) Royalties, RELX;Research Grant, Canon Medical Systems Corporation
David T. Fetzer, MD (*Abstract Co-Author*) Research support, General Electric Company;Research support, Koninklijke Philips NV;Research support, Siemens AG;Consultant, Koninklijke Philips NV;Advisory Board, Koninklijke Philips NV;Consultant, General Electric Company;Advisory Board, General Electric Company
Shuchi K. Rodgers, MD (*Presenter*) Royalties, RELX

### TEACHING POINTS

1. ACR LI-RADS and the American Association for the Study of Liver Disease (AASLD) recommend hepatocellular cancer surveillance in at-risk individuals with ultrasound and serum alpha-fetoprotein (AFP) every six months. 2. LI-RADS Ultrasound Surveillance is a framework for performance, interpretation, and reporting of HCC surveillance US and is composed of an US Category (US-1, US-2, or US-3) and a Visualization Score (VIS A, VIS B, or VIS C). 3. The LI-RADS Ultrasound Surveillance v2024 offers a pathway for alternative surveillance modalities in cases of VIS C-scored exams and elevated AFP without sonographic correlate. 4. Due to the low likelihood of malignancy, there is a reduced surveillance interval for US-2 Subthreshold observations in v2024.

### TABLE OF CONTENTS/OUTLINE

1. Offer rationale for hepatocellular cancer surveillance 2. Review evidence and published literature on US LI-RADS v2017 3. Discuss rationale for LI-RADS US Surveillance v2024 updates 4. Present updated LI-RADS US Surveillance v2024 algorithm 5. Compare AASLD and ACR LI-RADS US Surveillance recommendations 6. Highlight tips and tricks for implementing LI-RADS US Surveillance 7. Present case examples

## AGE-RELATED PANCREATIC HYPERINTENSITY A PROMISING INDICATOR FOR LOCALIZED AUTOIMMUNE PANCREATITIS SUBTITLE ABDOMINAL ULTRASONOGRAPHY AS A VALUABLE TOOL FOR EARLY DETECTION OF AUTOIMMUNE PANCREATITIS DISEASE WITH LESIONS SMALLER THAN 20MM

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Norifumi Nishi (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Adjustments to the settings of the ultrasound device, including magnification, filtering, gain, and sensitivity time control, are necessary to depict localized lesions accurately. Autoimmune pancreatitis tends to occur more frequently in the elderly population, typically around the age of 65, with a higher incidence in middle-aged to elderly individuals. In ultrasound images of the pancreas, aging-related effects often result in increased brightness, making localized lesions easier to detect. Autoimmune pancreatitis typically exhibits irregular contours and internal patchy or punctate hyperechoic spots in localized lesions of approximately 20 mm in size. Early detection via ultrasound examination not only facilitates prompt diagnosis but also makes differentiation from other modalities easier.

### TABLE OF CONTENTS/OUTLINE

Adjustments of ultrasound device settings to confirm the contours and internal structure of localized lesions. Age-related changes in pancreatic brightness enhancing the detectability of localized lesions, particularly in the middle-aged to elderly population. Characteristics of autoimmune pancreatitis with localized lesions of approximately 20 mm, including contour and internal features. Facilitation of evaluation of lesions of approximately 20 mm identified via ultrasound examination using other diagnostic modalities. Early diagnosis enables treatment to progress before the condition worsens.

## TOTAL PANCREATECTOMY AND ISLET AUTOTRANSPLANTATION (TPIAT): IMAGING OF EXPECTED FINDINGS AND COMPLICATIONS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Laura R. Carucci, MD (*Abstract Co-Author*) Nothing to Disclose
Ryan D. Clayton, MD (*Abstract Co-Author*) Nothing to Disclose
Jill Bruno, DO (*Presenter*) Nothing to Disclose

### TEACHING POINTS

TPIAT is performed throughout the US, with increasing prevalence over the last two decades. Goals of TPIAT are to alleviate pain due to debilitating chronic or acute recurrent pancreatitis and to prevent development of brittle diabetes by infusion of pancreatic islet cells. Imaging plays a key role in evaluating patients who have undergone TPIAT. Radiologists must be aware of the surgical procedure, expected post-operative findings on imaging studies, complications and role of imaging, and potential imaging pitfalls.

### TABLE OF CONTENTS/OUTLINE

Review TPIAT background, indications and goals. Discuss surgical procedure and expected imaging findings of TPIAT. Describe expected post-surgical anatomy following TPIAT. Demonstrate imaging of post-operative complications and sequelae of TPIAT. Complications may include: leak (bowel, bile), abscess, hematoma, biliary stricture, bowel obstruction (anastomotic stricture, adhesions, incisional or internal hernia), delayed gastric emptying, bezoar, vascular abnormalities (thrombosis, pseudoaneurysm), omental infarcts, nodular hepatic steatosis. Show imaging of expected post-surgical findings and pitfalls.

## IT'S PERITONEUM O'CLOCK! A PRACTICAL APPROACH ON PERITONEAL DISSEMINATION OF MALIGNANT DISEASES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Mauricio Zapparoli, MD, MSc (*Abstract Co-Author*) Nothing to Disclose
Vitor L. Vieira, MD (*Abstract Co-Author*) Nothing to Disclose
Oscar Orozco (*Abstract Co-Author*) Nothing to Disclose
Fabio Costa, MD (*Abstract Co-Author*) Nothing to Disclose
Gabriel Da Silva Eli, MD (*Abstract Co-Author*) Nothing to Disclose
Matheus Taborda, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Peritoneum dissemination of malignant diseases is common, and its imaging assessment may be challenging.CT is still the workhorse of peritoneal evaluation, and in experienced hands has similar accuracy compared to MRI.PCI is an important tool in the preoperative setting to evaluate the extent of peritoneal disease.Standardized PCI evaluation methods can improve accuracy and reduce misdiagnosis. MRI evaluation should include high-resolution T2 non-fat sat, DWI, and T1 fat sat contrast-enhanced sequences.Coronal DWI gives a wider panorama of the abdominal cavity and reduces the chance of missing lesions in the abdominopelvic transition.

### TABLE OF CONTENTS/OUTLINE

IntroductionReview the diseases that can potentially disseminate through the peritoneumMain location and pathophysiology of peritoneal lesions.Pros and cons of different imaging methods used to evaluate the peritoneum.Peritoneal Cancer Index (PCI)Use and indications of Radiological PCI assessment in the preoperative settingExamples of different PCI scores.Suggested standardized methodology to calculate PCI - Peritoneum O'Clock.Post-treatment evaluationImportance of baseline studies performed immediately after CRS and HIPEC.Remission and relapse cases.Standard protocolSuggestion of standard MRI protocol with optimal sequences to evaluate the peritoneum.

## THE ROLE OF ABDOMINAL IMAGING IN EVALUATING PATIENT SUITABILITY FOR HIPEC

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Leonardo K. Bittencourt, MD, PhD (*Abstract Co-Author*) Research Consultant, Canon Medical Systems Corporation
Ifeanyi Ekpunobi, BS (*Abstract Co-Author*) Nothing to Disclose
Michaela Cooley, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Cytoreduction with hyperthermic intraperitoneal chemotherapy (HIPEC) has been developed and become more prominent over the last 20 years. Due to its use at primarily high volume and specialized institutions, important imaging findings, especially those related to prediction of patient outcomes after HIPEC, are not widely known. This educational exhibit takes the reader through learning about the cytoreduction/HIPEC procedure, opt-in criteria, and common imaging findings before and after treatment.

### TABLE OF CONTENTS/OUTLINE

1. What is hyperthermic intraperitoneal chemotherapy (HIPEC)? a. Definition; b. Benefits over traditional chemotherapy; c. Candidacy requirements; d. Origins of cancers typically treated with HIPEC2. Opt-in criteria for HIPEC. a. Patient factors for candidacy; b. Imaging modalities used in evaluation; c. Highlight on why CT is the preferred modality3. Common CT imaging findings of carcinomatosis. a. Common imaging findings discussed and shown on CT; b. Discussion of the pathophysiology of each imaging finding; c. Discussion on how to evaluate each imaging finding4. CT findings that relate to prognosis if HIPEC is performed. a. Imaging findings related to worsening prognosi; b. Pathophysiology of why some imaging findings correlate to worse outcomes; c. Discussion on who should be excluded from HIPEC treatment5. Disease burden and complications post-HIPEC; a. Possible outcomes after HIPEC and cytoreduction surgery; b. Complications of HIPEC and cytoreduction; c. How imaging plays a role in surveillance of disease; d. Discussion on frequency of imaging and notable findings

## DON’T RELY ON LUCK - HAVE A PROPER LOOK! POST OPERATIVE COLORECTAL CANCER IMAGING: A GUIDE TO HELPING YOUR SEARCH PATTERN

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Snehal Lapsia, FRCR,MBBS (*Abstract Co-Author*) Nothing to Disclose
Sophie Cheshire, MBChB, FRCR (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Common post operative colorectal cancer surgeries highlighting anatomy Tips and tricks including where to look for subtle recurrence Mimics of recurrent disease

### TABLE OF CONTENTS/OUTLINE

This multimodality pictorial review aims to enhance the skills of the radiologist when reviewing colorectal cancer follow up imaging. Knowledge of surgical technique and post operative anatomy is crucial when identifying residual, recurrent or metastatic disease on post treatment imaging. It is vital to have a focused search pattern of key review areas to identify early recurrence in a timely manner to allow appropriate treatment or reintervention. We present an overview of post surgical anatomy for common colorectal surgeries with an emphasis on the draining vascular and lymph node pathways. Early disease recurrence based on these pathways is demonstrated on an array of imaging including CT, PET CT and MRI. Tips and tricks are provided to overcome common blindspots and potential errors. Examples include: mesocolic nodal recurrence post right hemicolectomy, rectal stump recurrence post anterior resection, IMA suture recurrence vs suture granuloma at the IMA division, presacral recurrence post abdominal perineal resection and detection of mucinous nodal disease on MR.

## A PREVALENT HEALTH PROBLEM: CASE-BASED REVIEW OF THE PATHOPHYSIOLOGY, IMAGING FEATURES, AND CONFOUNDING IMPACT OF HEPATIC STEATOSIS IN DIAGNOSTIC IMAGING

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Andres R. Ayoob, MD (*Abstract Co-Author*) Nothing to Disclose
James T. Lee, MD (*Abstract Co-Author*) Nothing to Disclose
Amanda C. Gibson, DO (*Abstract Co-Author*) Nothing to Disclose
Joseph W. Owen, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Review the pathophysiology of hepatic steatosis including alcoholic and non-alcoholic steatohepatitis, NASH cirrhosis, focal steatosis, and transient steatosis2. Discuss the patterns of steatosis including but not limited to diffuse, geographic, focal and multifocal through case examples.3. Illustrate with case based approach, how steatosis can mimic other pathology.

### TABLE OF CONTENTS/OUTLINE

Pathophysiology of steatosis1. Hepatic metabolism of fat, alcohol and toxins2. Alterations in perfusion affecting steatosis deposition3. Inflammation and the progression to cirrhosisVariants of Steatosis1. Acute2. Transient3. Chronic4. Focal/multifocalCased based illustration of diagnostic challenges presented by hepatic steatosis1. Incidental indeterminate liver lesions2. Staging of colorectal cancer and other malignancies3. Cholangitis mimicking perivascular steatosisSummary: The incidence of steatosis is increasing and recognizing the subtypes and imaging patterns of steatosis can reduce uncertainty and improve patient management.

### TEACHING POINTS

To emphasize the importance of a comprehensive approach to differential diagnosis for rectal tumors, incorporating imaging features alongside the patient's medical history and clinical context.To educate the audience regarding the growth patterns of the different rectal tumors. To achieve a better understanding of the rectal tumor imaging features through pathological correlation. To propose a thorough differential diagnosis based on clarification of the growth patterns and likely anatomical origin.

### TABLE OF CONTENTS/OUTLINE

The goals of this exhibit are to:Provide a pictorial review of the diverse imaging appearances of uncommon rectal tumors. Discuss specific imaging and pathological characteristics of uncommon rectal tumors. Familiarize the audience with the imaging features of uncommon rectal tumors, thereby helping in formulation of a complete differential diagnosis.These major featured rectal neoplasms include: rectal gastrointestinal stromal tumors (GIST), anorectal melanoma, rectal neuroendocrine neoplasms (G1-3 and poorly differentiated), primary rectal lymphoma, leiomyoma, lipoma, leiomyosarcoma, Kaposi’s Sarcoma, rhabdomyosarcoma, extramammary Paget’s disease

### TEACHING POINTS

Describe the different stages of hydatid disease on ultrasound and its correlation with CT and MRI. Show less common alternative locations to the liver.Display the main differential diagnosis of hydatidosis. Review the main complications.

### TABLE OF CONTENTS/OUTLINE

Hydatid disease, caused by Echinococcus granulosus and less frequently by Echinococcus multilocularis, remains a global health problem. It is characterized by the formation of hydatid cysts with a three-layered structure. Ultrasound is the initial diagnostic tool that allows distinguishing the evolutionary stages. The Gharbi and WHO classifications are the most used, especially in the liver, although they can be applied to other less common locations, such as lung or spleen, among others. They classify hydatid lesions into five main types based on ultrasound findings and, although both are not directly comparable, an approximate comparison based on imaging characteristics is provided. The differential diagnosis includes simple and complex cysts, abscesses, hematomas and tumors. Hydatid cysts, typically asymptomatic, may be incidentally detected on imaging tests or lead to complications such as mass effect, rupture and infection. For a comprehensive evaluation of cysts and their complications, CT and MRI are essential complements to ultrasound, making it important to know how to correlate the findings.

Alexandre K. Wakote Teruya, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1 - The Liver Imaging Reporting and Data System (LI-RADS) has been updated with a new treatment response algorithm (TRA v2024) including two separate nonradiation and radiation Cores, previously incorporated within a single algorithm. 2 - In the updated version there is a new specific algorithm for internal and external beam radiation-based locoregional therapies (LRT) such as transarterial radioembolization (TARE) and stereotactic beam radiation therapy (SBRT). It also introduced a new treatment response category (LR-TR nonprogressing) for radiation TRA. 3 - This exhibit aims to discuss and describe how to apply the ancillary features enabling the upgrade from LR-TR equivocal to viable or from LR-TR nonprogressing to viable.

### TABLE OF CONTENTS/OUTLINE

1 - Introduction to the new LI-RADS v2024 CT/MRI treatment response algorithm. 2 - Case-based and illustrative guides applying the ancillary features and the feature of viability. 3 - Provide practical considerations and diagnostic tips to improve accuracy and prevent misinterpretation in applying the updated LI-RADS v2024 TRA.

Yuki Tashiro, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1) Learning about the image evaluation of IPMN, particularly worrisome feature and high risk stigmata, through specific examples as per the latest Kyoto Guidelines, and 2) Understanding the pitfalls and mimickers of worrisome feature and high risk stigmata through specific examples to enhance everyday clinical practice.

### TABLE OF CONTENTS/OUTLINE

Pancreatic cystic diseases encompass a broad spectrum of conditions, ranging from benign to malignant tumors. Given the difficulty in obtaining tissue samples, imaging plays a crucial role in diagnosis. The most frequently observed cystic tumor is the intraductal papillary mucinous neoplasm (IPMN), which possesses malignant potential. Not only is differentiation from other diseases necessary, but also risk assessment. The Kyoto Guidelines, published in 2024, are a key management strategy for IPMNs, detailing risk assessments and surveillance methods. Imaging criteria are included in worrisome features (WF) and high-risk stigmata (HRS).Following the latest guidelines, this presentation elucidates these findings, and also introduces potential pitfalls and mimicker.Besides IPMN, various other pancreatic cystic diseases require differential diagnosis through imaging due to differing risks and treatment approaches. Although these cystic diseases sometimes present similar imaging findings, making differential diagnosis challenging, the discussion will also cover how to manage such pitfalls while contrasting with IPMN.

## BUBBLES AND BILE: BENEFITS OF CONTRAST-ENHANCED ULTRASOUND FOR THE GALLBLADDER

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

David T. Fetzer, MD (*Abstract Co-Author*) Research support, General Electric Company;Research support, Koninklijke Philips NV;Research support, Siemens AG;Consultant, Koninklijke Philips NV;Advisory Board, Koninklijke Philips NV;Consultant, General Electric Company;Advisory Board, General Electric Company
Kanupriya Vijay, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Razan Noorelahi, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Contrast-enhanced ultrasound (CEUS) has multiple unique advantages including high spatial and temporal resolution, high signal-to-background, and the use of an exclusively intravascular contrast agent. These features result in a powerful tool with impactful applications for the gallbladder.CEUS can help characterize intraluminal filling defects and differentiate vascularized masses from avascular mimickers such as tumefactive sludge.CEUS is useful in interrogating wall abnormalities with characteristics features, such as adenomyomatosis, and atypical or complicated cholecystitis. CEUS may be utilized in interventional procedures such as in the assessment of cystic duct patency via cholecystostomy tube instillation.

### TABLE OF CONTENTS/OUTLINE

Introduction: CEUS:Structure and pharmacokinetics of ultrasound contrast agents. Administration and safety considerations.Normal GB: Appearance on CEUS.GB Pathology: Bile salt imbalance: Gallstones, biliary precipitate, tumefactive sludge. Inflammation: Adenomyomatosis, acute cholecystitis, chronic cholecystitis, xanthogranulomatous cholecystitis, gangrenous and perforated cholecystitis, nonneoplastic polypoid growths, cholesterol and inflammatory polyps. Neoplastic growths: Adenoma and malignancy.Interventional applications: Assessment of cystic duct patency via cholecystostomy tube and percutaneous image-guided biopsy.

### TEACHING POINTS

Anatomical Variants: Discuss the importance of recognizing and reporting anatomical variants of the pancreatic duct system. Pancreatic Disorders: Knowledge of the different forms of involvement of the pancreatic duct system by inflammatory, neoplastic and traumatic conditions is essential for a correct diagnosis. Ductal Signs: Recognition of the different pancreatic ductal signs in imaging studies is crucial for adequate differentiation between inflammatory and neoplastic pathologies. Disconnected pancreatic duct syndrome: Highlight the necessity of suspecting this condition when identifying intra-abdominal collections near the pancreas. MPD involvement: Stress the importance of considering the pancreatic duct's involvement when pancreatic lesions exhibit a morphology that follows its longitudinal axis. Utility of MRCP: Highlight the role of Magnetic Resonance Cholangiopancreatography in evaluating the pancreatic duct system.

### TABLE OF CONTENTS/OUTLINE

Embryology: Description of the embryonic development of the pancreatic duct system. Normal Anatomy: Description of the normal features of the pancreatic duct system. Congenital Anomalies: Discussion of congenital variants of the pancreas involving the duct system. Inflammatory Conditions: Review of the forms of involvement of the pancreatic duct system due to inflammatory conditions like acute and chronic pancreatitis. Pancreatic Neoplasms: Review of tumors involving the MPD, the branch ducts or both. Traumatic/Iatrogenic: Evaluation of injuries caused by trauma or medical procedures, highlighting lacerations and accidental injuries. Conclusion and Key Points: Synthesis of the key points and the main conclusions of the review.

## WHAT'S BEHIND THE LIVER- DEMYSTIFYING UNCOMMON LIVER MASSES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Ramy Shoela, MD (*Abstract Co-Author*) Nothing to Disclose
Zeshan Ali (*Abstract Co-Author*) Nothing to Disclose
Lin Gu, MD (*Abstract Co-Author*) Nothing to Disclose
Christopher Dilli (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Review uncommon hepatic masses. Describe their imaging appearance and differences from their differentials. Review important clinical history and laboratory work-up that should raise suspicion for potential less common diagnoses. Discuss pathology of these masses.

### TABLE OF CONTENTS/OUTLINE

1. Introduction to liver masses Common liver masses and imaging Utility in expanding the differential with unique history, laboratory or radiographic findings 2. Hepatic myeloid sarcoma in patient with AML Case Review of relevant clinical history, imaging, and pathology 3. Hepatic lymphoma in patient with Hep C and no cirrhosis Case Review of relevant clinical history, imaging, and pathology 4. EBV-associated smooth muscle tumor in patient with chronic immunosuppression for renal transplant Case Review of relevant clinical history, imaging, and pathology 5. Combined HCC and cholangiocarcinoma Case Review of relevant laboratory work-up (elevated AFP and CA 19-9), imaging, and pathology 6. Hepatic and renal angiomyolipomas in patient with tuberous sclerosis Case Review of relevant clinical history with tuberous sclerosis, imaging, and pathology 7. Hepatoblastoma in 3 year old patient Case Review of relevant clinical history (such as age), imaging, and pathology 8. Focal carcinoma arising from widespread intraductal papillary neoplasm Case Review of relevant differentials, imaging, and pathology 9. Acute cholangitis presenting as a mass in patient with fever Case Review of relevant clinical history, imaging, and pathology 10. Mucinous cystic neoplasm Case Review of relevant imaging and pathology

### TEACHING POINTS

Acute abdomen in the context of small bowel dilatation is a frequent consultation in the emergency department. Its evaluation on computed tomography (CT) requires a systematic approach and careful analysis of the characteristics of the intestinal wall.The pattern of small bowel wall thickening and its enhancement characteristics provide important clues to the underlying etiology.Identifying the presence or absence of a transition point on CT is a crucial step in evaluating small bowel dilatation. Awareness of potential complications and their imaging manifestations on CT allows for timely diagnosis and appropriate management to prevent further bowel compromise and systemic sequelae.

### TABLE OF CONTENTS/OUTLINE

Introduction.Normal findings of the bowel wall.Pathological findings of the small bowel wall.Wall Thickening i) Focal thickening ii) Diffuse thickening iii) Segmental thickeningEnhancement Patternsi) Homogeneous enhancement ii) Stratified enhancement. ## HEPATOCELLULAR CARCINOMA (HCC) AFTER LOCOREGIONAL THERAPIES: WHAT'S NEW IN THE LIRADS TREATMENT RESPONSE ALGORITHM V2024?

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Arthur S. Joseph, DO (*Abstract Co-Author*) Nothing to Disclose
Venkata S. Katabathina, MD (*Abstract Co-Author*) Nothing to Disclose
Andrew V. Chesley, MD (*Abstract Co-Author*) Nothing to Disclose
Sriram Jaganathan, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

· Review various locoregional therapies for HCC and discuss their indications and contraindications · Difference between Non-radiation based and Radiation based treatment response algorithm [TRA] core - v2024. · Management options based on the LR TR category in non-radiation-based and radiation-based TRA

### TABLE OF CONTENTS/OUTLINE

Introduction to HCC and LIRADS applicable population. Various treatment modalities available for HCC - Non-radiation-based therapies Radiation based therapies. Specific indication of different treatment modalities including ablation, Trans arterial chemoembolization [TACE], Tran-arterial Radioembolization [TARE], and Stereotactic Body Radiotherapy [SBRT]. Expected post-procedural changes in different modalities What is New in LIRADS Treatment Response Algorithm v2024? Role of different imaging modalities in treatment assessment Define LR TR categories in Non-radiation based TRA v2024 with imaging appearances Define LR TR categories in Radiation based TRA v2024 with imaging appearances Describe with examples the Mass-like enhancement [any degree in any phase] - the only major criteria as per ACR LR TRA v2024 The difference between radiation-based and non-radiation-based treatment response algorithm version 2024 and the rationale behind the modification.Conclusion LIRADS treatment response algorithm utilizing multiphasic CT or MRI liver helps in clear and uniform communication between the radiologists and other providers involved in the loco regional therapies of HCC. The current updated version 2024 has two cores - Non-radiation TRA and Radiation TRA. It is imperative to understand the categories for effective and optimal management of patients with HCC.

### TEACHING POINTS

Gastrointestinal stromal tumors (GISTs), mesenchymal tumors affecting the GI tract and beyond, present with diverse symptoms, disease burden, and aggressiveness. Effective management necessitates a multidisciplinary approach, where radiologists play a pivotal role. With highly variable imaging features, some of which overlap with other abdominal tumors, GIST can present a diagnostic challenge. Moreover, early identification on imaging is crucial in guiding biopsy approach, as percutaneous biopsy risks peritoneal seeding. Additionally, anatomical nuances of GIST tumors impact surgical management. Our educational exhibit aims to: 1. Review the common imaging characteristics of GIST 2. Distinguish GIST from other similar appearing abdominal tumors 3. Overview a multidisciplinary treatment approach, with emphasis placed on the radiologist's role 4. Highlight anatomic considerations that influence surgical candidacy

### TABLE OF CONTENTS/OUTLINE

1. Overview epidemiology and pathogenesis 2. Review a multidisciplinary treatment approach, with emphasis placed on the radiologist's role 3. Case-based review of common imaging findings 4. Discuss the role of medical and surgical treatment 5. Consider common surgical approaches based on involvement of anatomic structures 6. Assess recurrence risk based on size, location, pathologic features, and pseudocapsule rupture7. Case-based review of metastatic and recurrent disease

### TEACHING POINTS

The expanding inflammatory bowel disease (IBD) medication armamentarium has fueled the need for non-invasive, accurate and low-cost disease activity monitoring tools. Bowel ultrasound (US) is an emerging tool, increasingly used by gastroenterologists and radiologists. It is an accurate, noninvasive tool for detecting disease activity and IBD complications. It has been used for many decades in Europe and Canada and is now being utilized in the USA for initial assessment, monitoring disease and treatment response. Our aim is to 1) highlight the clinical utility of bowel US in assessment of IBD and monitoring patients post treatment with Crohn's disease and ulcerative colitis, 2) discuss the benefits of various models of bowel US integration into the clinical practice, 3) highlight collaboration with gastroenterologists to know appropriate escalation of imaging beyond bowel US.

### TABLE OF CONTENTS/OUTLINE

Introduction 1. Review conventional approach to IBD monitoring in the USA. 2. Discuss limitations of the conventional model of IBD monitoring. 3. Discuss why imaging is important in IBD assessment. 4. Review US features of Crohn's Disease and Ulcerative Colitis 5. Review models of Bowel US integration into the Clinical practice a. Point of Care Ultrasound only i. Grey scale, Doppler b. Clinical Radiology Ultrasound only i. Grey scale, Doppler, elastography, contrast enhanced, microvessel imaging. c. Combined Hybrid model between gastroenterology and radiology 6. Future- Patient Handheld US, US with AI Conclusions

## BOWEL AND BEYOND IN THE ANGRY GUT: IMAGING OF INTESTINAL AND EXTRA-INTESTINAL MALIGNANCIES IN INFLAMMATORY BOWEL DISEASE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Harshna V. Vadvala, MD (*Abstract Co-Author*) Nothing to Disclose
Rakhee S. Gawande, MD (*Abstract Co-Author*) Nothing to Disclose
Mohammadreza Shaghaghi, MD, MPH (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Inflammatory bowel disease (IBD) with its 2 subtypes, Crohn's disease (CD) and ulcerative colitis (UC), is characterized by a chronic inflammation of the intestine. In IBD, both, Inflammation and cancer affects intestinal and extra-intestinal sites. Risk factors for cancer development include severe inflammatory activity , prolonged duration of structuring or penetrating disease?, young age of diagnosis, male sex, smoking? and use of steroids and immunomodulators (6-mercaptopurine, azathioprine or anti-TNF drugs). In this educational exhibit we will discuss the incidence, pathologic and imaging features of small bowel, colon, rectal and anal cancers associated with IBD. We will also discuss manifestations of hepatobiliary cancers in IBD. Although imaging surveillance is not routinely recommended in IBD, cross-sectional imaging plays a crucial role for detection of malignancies, staging of cancer, detection of cancer in bowel segments which cannot be assessed by colonoscopy and also for detection of treatment-related neoplasms.

### TABLE OF CONTENTS/OUTLINE

1. Background 2. Pathogenesis of cancers in IBD 3. Risk and protecting factors 4. Imaging modalities 5. Colon cancer in UC 6. Small bowel adenocarcinoma in CD 7. Other bowel cancers in CD: Neuroendocrine tumors and Lymphoma 8. Peri-anal and vulvovaginal cancers in CD 9. Hepatobiliary cancers in IBD 10. Surveillances of cancers in IBD

### TEACHING POINTS

1. Provide an overview of SOS, previously known as Veno-Occlusive disease (VOD) - definition, epidemiology, pathophysiology and etiologies.2. Briefly discuss the current clinical diagnostic criteria utilized in VOD/SOS - historic and current standards.3. Provide detailed radiological and schematic depictions of imaging findings of VOD/SOS across various imaging modalities.4. Provide a brief note on evaluation of progression and management including Defibrotide.

### TABLE OF CONTENTS/OUTLINE

1. Veno-occlusive disease (VOD)/ Sinusoidal obstruction syndrome (SOS) a. Definition, Epidemiology, and Pathophysiology. b. Etiology - Detailed discussion of causes of VOD/SOS and common drugs causing VOD/SOS: i. Differential diagnoses including Budd-Chiari syndrome, graft versus host disease, medication-induced and viral hepatitis, mycotic infections, and acute heart failure.2. Clinical diagnostic criteria: a. Modified Seattle criteria. b. Baltimore criteria. c. Currently used European Society for Blood and Marrow Transplantation (EBMT) criteria - adult and pediatric criteria.3. Ultrasound (US) in SOS: a. Role of sonography, advantages, and disadvantages. b. Conventional high-resolution B-mode US findings. c. Color and spectral Doppler US findings.d. US-Elastography findings - ARFI, SWE, and TE. e. Contrast-enhanced ultrasound (CEUS) findings. f. Lassau's criteria HokUS-10 criteria4. Contrast-enhanced CT (CECT) in SOS: a. CECT findings associated with SOS. b. Role of CT in problem-solving of clinically difficult cases5. MRI in SOS: a. MRI findings associated with SOS. b. Role of MRI in problem-solving of clinically difficult cases6. Grading severity of VOD /SOS and Management - Defibrotide

Daniel L. Cardoso, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Recognize the anatomy of the rectum on the magnetic resonance imaging (MRI). Understand aspects related to rectal cancer and disease spread. Detailed knowledge on identifying and characterizing lateral pelvic lymph nodes (LPLN) in MRI and their prognostic significance. Insight into the decision-making process for managing LPLN in locally advanced rectal cancer (LARC), balancing oncological outcomes with quality of life considerations.

### TABLE OF CONTENTS/OUTLINE

1. INTRODUCTION: Overview of rectal anatomy and MRI anatomical landmarks. Pathophysiology of LARC and lymphatic dissemination patterns. The pivotal role of LPLN in rectal cancer spread and patient prognosis. 2. DIAGNOSIS AND IMAGING FINDINGS: Criteria for malignant LPLN characterization on MRI. The process of staging and restaging LARC with MRI post-neoadjuvant chemoradiotherapy (nCRT). Prognostic implications of LPLN involvement. Treatment strategies: Evaluating nCRT, lateral pelvic lymph node dissection (LPLND), and selective LPLND. 3. SUMMARY AND SYSTEMATIC APPROACH: A streamlined approach to integrating imaging findings with clinical decision-making. 4. TAKE HOME MESSAGES.

## HEPATIC ABSCESS: THE TIP OF AN ICEBERG - A STEP BY STEP TO ITS ORIGIN

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Marilia A. Tavares, MD (*Abstract Co-Author*) Nothing to Disclose
Lais F. Pimentel, MD (*Abstract Co-Author*) Nothing to Disclose
Isabella Torres de Lima, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Review the main diseases that cause liver abscesses and provide tips for evaluating imaging tests.- Discuss the main causes of a liver abscess and its pathophysiology.- Systematize the search for the etiology of liver abscess.

### TABLE OF CONTENTS/OUTLINE

An abscess is a well-defined, low-attenuation, round mass containing necrotic inflammatory material. The hepatic abscess is the most common of visceral abscesses and is usually a consequence of other changes, such as infections, trauma, or tumors, which must be identified for better patient management.Therefore, when identifying a liver abscess, the radiologist's analysis cannot stop there. They must keep in mind the most common causes and look for the possible origin of the abscess, since the clinical symptoms can be nonspecific and imaging exams play a fundamental role in this investigation.By following three simple steps: firstly, using clinical information; secondly, understanding the main origins of liver abscesses and their pathophysiology; and finally, combining the first two steps to identify findings, it is possible to detect the majority of conditions causing liver abscess, thus assisting the attending physician in the care of the patient.

## TORSION AND VOLVULUS: A TALE OF TWISTS AND TURNS IN THE BELLY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Sarah K. Oh, MD (*Abstract Co-Author*) Nothing to Disclose
Fernanda S. Mazzariol, MD (*Abstract Co-Author*) Nothing to Disclose
Katherine Eacobacci, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Multiplanar CT review is important in cases of large bowel volvulus to discern the anatomy: "X marks the spot" in mesentero-axial volvulus and "split wall-sign" in organo-axial volvulus. 2. Hyperdense, unenhanced bowel wall with mural hemorrhage is the single best predictor of irreversible ischemia and may be mistaken for wall enhancement on contrast CT. 3. J-pouch torsion can occur as part of afferent limb syndrome due to progressive dilatation of the ileum, or as efferent limb syndrome with a stapled anastomosis. 4. Gastric axis rotation is commonly seen with large hiatal hernias, but is often asymptomatic. Gastric volvulus is rare, but is a surgical emergency. Recognition of Borchardt's triad along with key imaging findings is critical. 5. Gallbladder torsion is rare, often occurs in elderly women, and simulates cholecystitis on imaging. It requires urgent cholecystectomy and the diagnosis is often made at surgery. 6. Pedunculated uterine fibroid torsion may be confused with adnexal torsion because the pedicle is thin and difficult to visualize. 7. Splenic torsion is rare but can be fatal. Abnormal location of the avascular spleen is a clue. 8. If the abnormal position of the transplanted kidney is not recognized, renal transplant torsion may be mistaken for donor vein obstruction or arterial stenosis.

### TABLE OF CONTENTS/OUTLINE

Illustrated review of pathophysiology and clinical features of abdominal viscera torsion and volvulus while emphasizing pearls and pitfalls of imaging. Multimodality examples of volvulus and torsion including but not restricted to: Gut (sigmoid colon, transverse colon, cecum, small bowel, gastric and J pouch), Renal transplant, Gallbladder, Uterus, Uterine fibroid, Spleen and splenule

## ESOPHAGEAL STRICTURES: THE KEYS TO DIAGNOSIS BY PNEUMO-CT

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Mariano Lorea (*Abstract Co-Author*) Nothing to Disclose
Paula Gimena Ortiz Suarez (*Abstract Co-Author*) Nothing to Disclose
Fiorella Conca, MD (*Abstract Co-Author*) Nothing to Disclose
Roy Lopez Grove, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1) Pneumo-CT provides key information by facilitating additional esophageal distension, aiding in the evaluation of esophageal wall thickening and extraesophageal disease in a single examination.2) Benign strictures exhibit reduced esophageal distensibility in pneumo-CT due to fibrotic wall changes. The primary cause is gastroesophageal reflux disease, typically manifesting as concentric, symmetric, soft-edged wall thickening in the distal esophagus associated with a hiatal hernia.3) Personal history is pertinent for diagnosing the underlying cause of a benign stricture.4) Malignant strictures present with rapid onset of symptoms including dysphagia and weight loss. They appear as asymmetric and irregular thickening of the esophageal wall, sometimes accompanied by adenopathy and involvement of surrounding fat planes, depending on the extent of tumor infiltration.5) The differential diagnosis primarily involves esophageal dilatation, predominantly caused by dysmotility.

### TABLE OF CONTENTS/OUTLINE

1) Introduction.2) Diagnostic algorithm for esophageal strictures: Upper endoscopy, barium esophagogram, pneumo-CT.3) Pneumo-CT technique.4) Key findings in pneumo-CT. Esophageal wall: Margins, narrowing, contour, mucosal surface, enhancement. Extraluminal findings: fat, lymph nodes, metastases.5) Benign strictures: Pathophysiology. Causes.6) Malignant strictures: Pathophysiology. Causes.7) Differential diagnoses.

### TEACHING POINTS

- Present diseases endemic to tropical regions. - Review key epidemiological and clinical features of tropical diseases. - Discuss imaging characteristics of tropical diseases, both common and uncommon. - Emphasize the radiologist's pivotal role in expanding diagnostic considerations and assessing disease extent for improved outcomes.

### TABLE OF CONTENTS/OUTLINE

Tropical diseases (TDs) impact underserved areas, caused by various pathogens like bacteria, viruses, parasites, and fungi. These diseases have significant health, social, and economic impacts. With increased global travel, recognizing these diseases quickly is vital for radiologists to improve patient care through prompt diagnosis and treatment. This presentation delivers insights into abdominopelvic imaging for major TDs through engaging cases, covering: 1. Demonstrate typical and atypical abdominal imaging manifestations of major tropical diseases via educational cases. 2. Detail epidemiology and imaging findings of abdominopelvic presentations in: a. Parasitic: Helminth infections such as Schistosomiasis, Echinococcosis, Ascariasis, Strongyloidiasis; and Protozoal infections including Leishmaniasis and Chagas disease. b. Bacterial: Specifically, Tuberculosis. c. Fungal: Highlighting Paracoccidiomycosis and Histoplasmosis. d. Viral: Covering Dengue fever. 3. Provide an understanding of the main risk factors, along with the prevalence and incidence of the most encountered endemic tropical infectious diseases.

### TEACHING POINTS

Identify early, chronic, and severe signs of active inflammatory Crohn’s disease and recognize how imaging findings can overlapReview the major gastrointestinal anatomy involved in this pathology and understand its pathophysiologyGo over severity score in active Crohn's disease to provide a complete radiological assessment of the disease.Understand major radiological differences between stricturing and penetrating and highlight the most common complications

### TABLE OF CONTENTS/OUTLINE

I. IntroductionII. ObjectivesIII. Anatomical diagrams of areas affected by Crohn's disease and pathophysiologyVI. Gastrointestinal features of Crohn's disease on CT and MRI 1. Active versus non-active/chronic disease 2. Penetrating versus stricturing disease 3. Common complications 4. Radiological severity score of active inflammatory diseaseVII. Self-assessment with multiple cases in quiz format VIII. ConclusionHistorically a higher incidence of IBD has been reported in Caucasians and lower rates in Black and Hispanic populations however, during the past decades these differences have decreased. There has been an increase in IBD in blacks, Hispanics, and Asians. With increased incidence among a broader population it is vital for radiologists to be familiar with what was only classically found in a specific population. Through this educational exhibit, we will provide a comprehensive review of classic radiological features of active and non-active Crohn's disease, stricturing versus penetrating disease, and its associated complications as seen on CT and MR. Our aim is to increase awareness of this disease among radiologists in order to assist physicians in early detection and treatment.

## MULTIMODALITY IMAGING OF FOCAL PANCREATIC LESIONS: THE ADDED ADVANTAGE OF ENDOSCOPIC ULTRASOUND

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Shrivalli Nandikoor, MBBS (*Abstract Co-Author*) Nothing to Disclose
Halkurike Jayadevappa Vijay Kumar (*Abstract Co-Author*) Nothing to Disclose
Gayathri S Menon, MBBS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Pancreatic focal lesions can be malignant or benign, cystic, solid or solid-cystic, with varying presentations. Multiple imaging modalities are used for diagnosis of pancreatic lesions including MDCT, MRI, USG ,PET-CT and Endoscopic ultrasound(EUS). EUS has the added advantage of high resolution imaging and the possibility of targeted tissue sampling simultaneously. This helps in detailed characterization of lesions with detection of details that can be otherwise missed in other imaging modalities. Aim of this exhibit is multimodality imaging review of spectrum pancreatic focal lesions and special emphasis on the added value of endoscopic ultrasound in characterization and diagnosis of these lesions

### TABLE OF CONTENTS/OUTLINE

Case based multimodality imaging review of pancreatic focal lesions and comparison with endoscopic ultrasound evaluation for characterization and diagnosis. The exhibit will include spectrum of cases including simple cyst, pseudocyst, serous cystadenoma, mucinous cystic neoplasm, IPMN,SPEN, NETs, Adenocarcinoma pancreas, metastatic deposits, focal pancreatitis.

### TEACHING POINTS

Hepatocellular carcinoma is one of the leading causes of cancer related death worldwide. Various histopathologic and morphologic subtypes of HCC are described throughout the literature. Among all these subtypes, infiltrative type HCC is the most challenging to detect clinically and radiographically. Infiltrative HCC is characterized by diffuse infiltrative spread throughout the liver parenchyma, without forming a mass-like lesion, in a way that sometimes it is difficult to detect on a background of already abnormal liver parenchyma. The infiltrative fashion of this disease makes other infiltrative liver diseases mimic the appearance of this malignancy on imaging. This includes confluent fibrosis, diffuse hepatic steatosis or iron deposition, diffuse metastatic disease, cholangiocarcinoma, and hepatic micro abscesses. Distinguishing infiltrative HCC mimics on imaging is crucial due to difference in management and the poor prognosis of this infiltrative malignancy. We will show challenging cases of infiltrative HCC and mimics of infiltrative HCC using a case-based approach with Rad-Path correlation.

### TABLE OF CONTENTS/OUTLINE

1. Incidence and prevalence of infiltrative HCC. 2. Review imaging features of infiltrative HCC, including multimodality case-based review of challenging cases of infiltrative HCC with pathological correlation. 3. Portal vein thrombosis (including tumor thrombus) as a common finding in infiltrative HCC. 4. Case-based review of infiltrative HCC mimics including confluent fibrosis, diffuse hepatic steatosis/iron deposition, diffuse metastatic disease, cholangiocarcinoma, and hepatic micro abscesses. 5. Review of prognosis and management of infiltrative HCC.

## DIFFERENTIATING THE COLORECTAL MUCINOUS METASTASIS FROM OTHER HEPATIC LESIONS: TIPS AND TRICKS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Giovanni Morana, MD (*Abstract Co-Author*) Speakers Bureau, Bracco Group
COSTANTINA DAL MAGRO (*Abstract Co-Author*) Nothing to Disclose
Luisa Tomaiuolo, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To illustrate with some interesting cases the appearance of the hepatic mucinous metastasis from colorectal primary malignancy and give some tips and tricks for the achievement of the correct diagnosis.

### TABLE OF CONTENTS/OUTLINE

The radiological features of mucinous carcinoma metastasis in the liver are sometimes unclear and dependent on the mucinous/fibrosis component proportion. Distinguishing these lesions from cholangiocarcinoma or benign entities such as angioma and solitary necrotic nodules can be challenging for radiologists. This essay discusses with some examples the key characteristics of hepatic mucinous metastasis observed in TC and MR imaging, focusing on the lesion morphology, the vascular pattern and the restriction on the DWI sequences. Finally, we outline the primary differential diagnoses and their imaging behaviors on CT/MRI.CT/MRI imaging features of mucinous colorectal metastasis in the liver could be a challenging diagnosis for radiologists. The patient history and the evolution of the lesion are crucial, especially with small lesions

## LIVER STORAGE DISEASES: WHAT RADIOLOGISTS NEED TO KNOW

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Aldara Naveiras Calvo, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The liver is the fundamental organ for human metabolism. A multitude of factors, from hereditary diseases to alcohol or an unhealthy lifestyle habit, can lead to the accumulation of substances in the liver, eventually leading to the development of chronic liver disease. Radiologists play a crucial role in the early diagnosis of such diseases and knowing how to detect and measure them, and rule out complications is critical. We focus on the two substances most commonly deposited, fat and iron, while also mentioning less frequent causes such as copper, lysosomal storage diseases, and amyloidosis. We emphasize some pitfalls that can arise from such depositions and to what extent they can aid us in diagnosing lesions.

### TABLE OF CONTENTS/OUTLINE

- Steatosic liver- Liver iron overload- Other causes: copper, lisosomal storage diseases, amyloidosis

### TEACHING POINTS

The increasing incidence of neoplasms, has also increased cancer-related complications, including abdominal ones. These complications may be related to the direct effect of the tumor, through compression or infiltration, systemic changes or due to invasive procedures (diagnostic or therapeutic).The purpose of this ehxibit is to: • Highlight signs of acute abdominal complications in patients with known neoplasia on computed tomography (CT) and magnetic resonance imaging (MRI); • Identify possible signs of malignancy in patients with an acute abdominal condition as the initial manifestation of an unknown neoplasia; • Explore acute abdominal manifestations that can affect patients with cancer, including hemorrhage, bowel obstruction, perforation, fistula, ischemia and cholangitis; • Correlate between clinical information, histological studies and imaging findings, in order to refine the differential diagnosis; • Provide practical information and pitfalls in the interpretation of imaging findings.

### TABLE OF CONTENTS/OUTLINE

• Introduction; • Imaging aspects - case based didatic review of the radiological appearance of abdominal complications in oncological patients, including hemorrhage, bowel obstruction, perforation, fistulas, ischemia and cholangitis; • Pearls and Pitfalls; • Conclusion/Take home message; • References.

## GET INTO THE GROOVE: A PICTORIAL REVIEW OF PANCREATICODUODENAL GROOVE PATHOLOGIES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Cammillo R. Talei Franzesi (*Abstract Co-Author*) Nothing to Disclose
Davide Ippolito, MD (*Abstract Co-Author*) Nothing to Disclose
Rocco Corso, MD (*Abstract Co-Author*) Nothing to Disclose
Cesare Maino, MD (*Abstract Co-Author*) Nothing to Disclose
Paolo N. Franco, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The pancreaticoduodenal groove (PDG) is a space between the second duodenal portion and the head of the pancreas. Superiorly, it’s delimitated by the duodenal bulb, posteriorly by the inferior vena cava, and anteriorly by the third duodenal part. PDG is also traversed by the distal portion of the common bile duct (CBD) and contains fat and nodes. Due to the critical anatomical structures surrounding it, various entities can originate inside or close to this region.Pathologies of PDG may be classified by their origin. Many benign (groove pancreatitis, autoimmune pancreatitis) and malignant (adenocarcinoma, NETs, lymphomas) pancreatic diseases may arise in the PDG. The di"erential diagnosis between groove pancreatitis and pancreatic adenocarcinoma is the most challenging due to similar imaging findings. However, some di"erences can be spotted to aid in the correct diagnosis. Duodenal diseases involving the groove are diverticula, inflammation, and neoplasms (adenocarcinomas, GISTs, and lymphomas). Among CBD pathologies, the most frequent are distal cholangiocarcinoma and choledochal cysts. Finally, ampulla of Water and lymph nodes diseases may also a"ect this space. PDG lesions management encompasses follow- up controls, endoscopic resection, or complex surgical procedures. Consequently, a correct diagnosis and pre-operative imaging assessment are pivotal.

### TABLE OF CONTENTS/OUTLINE

1. PDG anatomy2. Imaging findings of pancreatic pathologies involving the PDG3. Imaging findings of duodenal pathologies involving the PDGG4. Imaging findings of common bile duct pathologies involving the PDG5. Imaging findings of other structures pathologies involving the PDG.

## BETWEEN DUCTS AND DILATIONS: THE INTRIGUING WORLD OF IPMN

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Luiz Lima, MD (*Abstract Co-Author*) Nothing to Disclose
Luiz Rodrigues Santos, MD (*Abstract Co-Author*) Nothing to Disclose
Nara Vedoveli (*Abstract Co-Author*) Nothing to Disclose
Viviane B. Amorim, MD (*Abstract Co-Author*) Nothing to Disclose
Barbara De Melo Gedeon, MD (*Abstract Co-Author*) Nothing to Disclose
Igor J N Leite, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Reviewing the radiological anatomy of the pancreas and related structures. - Detailing imaging features of malignant transformation of intraductal papillary mucinous neoplasms (IPMN); - Discuss the characteristics and differences between the possible imaging methods used in the evaluation of the pancreas in the context of IPMN; - Exemplify the main imaging findings, with emphasis on magnetic resonance imaging, used for risk stratification in IPNM; - Describe the management and recommendations for imaging follow-up of diagnosed or presumed IPMN.

### TABLE OF CONTENTS/OUTLINE

- Anatomy review- What are the cystic lesions of the pancreas and how to find them?- Narrowing the diagnostic.- Stratify the risk.- Guide the conduct.- When, where and how to follow up an IPNM?

## ULTRASOUND FINDINGS OF COMPLICATIONS IN LIVER TRANSPLANTATION: AN EDUCATIONAL OVERVIEW

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Teresa A. Garcia, MD (*Abstract Co-Author*) Nothing to Disclose
Diego Saez, MD (*Abstract Co-Author*) Nothing to Disclose
Sofia Pividori (*Abstract Co-Author*) Nothing to Disclose
Aylen Gonzalez Gonzalez, MD (*Abstract Co-Author*) Nothing to Disclose
Bruno Miguel Manzanares, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Despite advancements in surgical techniques and postoperative care, complications following liver transplantation remain a significant concern. Ultrasound imaging is a pivotal tool due to its non-invasive nature and ability to provide real-time assessment. Radiologists must be acquainted with the imaging findings and complications. In this exhibit we will:Review vascular complications, including hepatic artery thrombosis and stenosis, and portal vein stenosis, manifest as alterations in blood flow patterns and vessel caliber, discernible through Doppler ultrasound.Review biliary complications, such as bile duct strictures and leaks, present as dilatation of the intrahepatic and extrahepatic ducts with associated periductal fluid collections. Discuss parenchymal abnormalities post-liver transplantation, including graft rejection, hepatic steatosis, and infections.Present the most common extra hepatic anomalies found after liver transplant, some of them related to the aforementioned predicaments.Correlate, if needed, the ultrasound findings with complementary methods of evaluation, like magnetic resonance or computed tomography.

### TABLE OF CONTENTS/OUTLINE

1. Introduction2. Imaging method key points3. Review the strengths and role of Doppler ultrasonography.4. Transitory alterations in the immediate post-transplant5. Classification of complications of liver transplant: Clinical parameters (age, type of transplant, postoperative time, symptoms) and sonographic findings (resistance index, velocity, waveform) are consider.VascularBiliaryParenchymal abnormalitiesGraft rejectionHepatic steatosisInfections6. Summary (table)7. Conclusions

Roy Lopez Grove, MD (*Abstract Co-Author*) Nothing to Disclose
Fiorella A. Conca, MD (*Abstract Co-Author*) Nothing to Disclose
Valentina Garralda (*Abstract Co-Author*) Nothing to Disclose
Mariano Lorea (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Pneumo PET-CT is a distension-based CT technique combining with PET scan with FDG.Great utility in the staging of esophagogastric cancer in order to plan therapeutic strategy.Gives essential information to oncologists and surgeons about tumor extension, deep wall involvement, lymph node and distant metastasis in a single study, reducing radiation and iodinated-contrast media exposureEvaluates neoadjuvant therapy response on changes in FDG uptake

### TABLE OF CONTENTS/OUTLINE

1- Introductiona) Epidemiological scenario in gastroesophageal cancerb) Advantages and disadvantages of current staging methods2- Pneumo PET-CT techniquea) Materialsb) Method to assess great lumen distension3- Findings in the staging of esophagus, gastroesophageal junction and gastric cancera) Imagenological key findings in T stagingb) Lymph nodes and distant metastasis (NM)4- Use in pre-surgical assessment and neoadjuvant therapya) Treatment response criteriab) Changes in FDG uptake5- Pitfalls and limitationsa) Insufficient gastric distension simulating an infiltrating tumorb) Overdistention mimicking adjacent organ infiltrationc) Residual liquid or food in the gastric lumen6- Conclusions

## BENIGN FOCAL HEPATIC LESIONS: SEEKING ASSERTIVENESS AND RECOGNIZING LIMITS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Thais Mussi, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Thiago M. Baraviera, MD (*Abstract Co-Author*) Nothing to Disclose
Lavinia Dias, MD (*Abstract Co-Author*) Nothing to Disclose
Ronaldo H. Baroni, PhD (*Abstract Co-Author*) Nothing to Disclose
Lucas Aquino (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The purposes of this exhibit are:To review the main topics of the differential diagnosis of focal benign hepatic lesions, taking into consideration imaging aspects and clinical context.To discuss, through didactic cases, the limits of assertiveness in the differential diagnosis of the main focal benign hepatic lesions.To alert about the presence of findings that act as pitfalls for the radiologist, potentially simulating benign and malignant lesions, creating doubts and diagnostic challenges.To assist the performance of radiologists as a guide in clinical management in different scenarios related to the theme.

### TABLE OF CONTENTS/OUTLINE

INTRODUCTION:To expose the existence of situations in which the presence of atypical characteristics and the clinical context may reduce the radiologist's assertiveness in the evaluation of benign focal hepatic lesions.DISCUSSION:To present, by means of a review based on didactic cases, the main points of the differential diagnosis, as well as the limits of assertiveness of imaging studies in the evaluation of benign focal hepatic lesions (cystic lesions; hemangiomas and metastases; hepatocellular lesions; pseudolesions and pitfalls).CONCLUSION:To summarize the main covered topics, reinforcing the importance of the radiologist's role as a guide for clinical management, with a direct impact on patient care pathways.

### TEACHING POINTS

State of the art treatment for esophageal cancer is multimodal and involves combined surgical and medical therapy. CT has a central role in the staging of esophageal cancer, being the method of choice for this purpose; positron emission tomography (PET) and magnetic resonance imaging (MRI) [MOU1] can help to evaluate the metabolic activity of tumors, identify distant metastases, and assess treatment response. Serial imaging studies, including CT scans and PET scans, allow clinicians to assess the efficacy of therapeutic interventions, identify residual or recurrent disease, and modify treatment strategies accordingly. Emerging techniques, such as radiomics and molecular imaging, hold promise for enhancing the accuracy of diagnosis, predicting treatment response and guiding personalized therapy.

### TABLE OF CONTENTS/OUTLINE

1. Concepts of normal and pathologic esophageal radiologic anatomy and lymphatic and hematogenous tumor spread pathways are explained.2.Illustrative cases of early-stage, locally advanced and oligometastatic esophageal cancer with clinical staging obtained by CT imaging applying the TNM 8th edition classification. Correlation of CT images with pathologic results is shown by detailed explanation of the findings.3. Emerging techniques: radiomics and molecular imaging for enhancing the accuracy of diagnosis, predicting treatment response, and guiding personalized therapy

## US OF THE LIVER AND UPPER ABDOMEN FOR BEGINNERS: UNDERSTANDING WHAT TO DO, WHY DO IT, AND HOW TO DO IT

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Monica Lucia Lopez Salazar, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Understand why to carry out the study.- Remember liver anatomy.- Understand what structures we are seeing during the study, with anatomical and CT correlation.- Realization technique for adequate characterization and measurement of the liver and upper abdominal structures.-differentiate normal from abnormal findings and most common pathological findings in the liver:Hepatic steatosisChanges due to chronic liver damage (cirrhosis, portal hypertension, portal thrombosis)Focal lesions (Cyst, hemangioma, hepatocellular carcinoma)Data of non-specific inflammatory process (periportal edema, elevated hepatic artery velocity and resistance index)

### TABLE OF CONTENTS/OUTLINE

Table of Contents: 1. Introduction: - Introduction to ultrasound and importance of liver and upper abdomen ultrasound in medical care. 2. Basic considerations before the study 3. Realization technique for adequate characterization and measurement of the following structures. - Evaluation of the left hepatic lobe. - Evaluation of the right hepatic lobe. - Evaluation of the portal vein. - Evaluation of the hepatic artery. - Evaluation of the hepatic veins. - Evaluation of the gallbladder. - Kidney evaluation. - Evaluation of the spleen. - Evaluation of the pancreas. 4. Most frequent pathological findings in the liver: - Hepatic steatosis - Changes due to chronic liver damage. - Focal lesions. - Data of non-specific inflammatory process. 5. Conclusions.

## IMAGING FINDINGS FOR HEPATOCELLULAR CARCINOMA ON MAGNETIC RESONANCE IMAGING: PREDICTIVE FEATURES AND FUTURE PERSPECTIVES FOR IMMUNE CHECKPOINT INHIBITOR BASED THERAPY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

DARA LOPES DIAS FONSECA (*Abstract Co-Author*) Nothing to Disclose
Haruka Higashibori (*Abstract Co-Author*) Nothing to Disclose
Kazuo Awai, MD (*Abstract Co-Author*) Research Grant, Canon Medical Systems Corporation;Research Grant, Hitachi, Ltd;Research Grant, Fujitsu Limited;Research Grant, Nemoto Kyorindo co, Ltd;Research Grant, FUJIFILM Holdings Corporation
Keigo Narita (*Abstract Co-Author*) Nothing to Disclose
Shogo Maeda, MD (*Abstract Co-Author*) Nothing to Disclose
Yuko Nakamura, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Shota Kondo (*Presenter*) Nothing to Disclose

### TEACHING POINTS

a. For advanced stage hepatocellular carcinoma (HCC), systemic therapy is the mainstay of treatment, with immune checkpoint inhibitors (ICI) based therapy being the first choice. b. Peritumoral enhancement on arterial phase may indicate proliferative HCCs and peritumoral hypointensity on gadoxetic acid-enhanced hepatobiliary phase (HBP) may indicate PD-L1 positivity of HCCs. Both might be predictive for ICI-based therapy response. c. Hyper HCCs which show high signal intensity at HBP may indicates poor response to ICI monotherapy because both OATP1B3 expression, main uptake transporter of EOB, and immune exclusion class of HCCs are related to Wnt/ß-catenin signaling pathway. However, relationship between combined therapy such as atezolizumab plus bevacizumab and hyper HCCs is controversial and should be determined. d. Steatotic findings of HCCs may predict better therapeutic response to ICI-based therapy. e. Best treatment method may be predicted by integrating findings above, other findings from various modalities and also clinical information. A method that integrates all information is required.

### TABLE OF CONTENTS/OUTLINE

1. Therapeutic algorism for HCCs 2. Mechanism of ICI-based therapy 3. Promising predictive MR imaging findings for ICI-based therapy 4. Future prospective role of imaging for ICI-based therapy

## 2022 UPDATES IN THE MANAGEMENT OF NON-INFECTIOUS CYSTIC LIVER LESIONS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Margarita V. Revzin, MD, MS (*Abstract Co-Author*) Nothing to Disclose
Yashant Aswani, MD (*Abstract Co-Author*) Nothing to Disclose
Eugenio Zalaquett, MD, MS (*Abstract Co-Author*) Nothing to Disclose
Ryan Bitar, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Review clinical presentation, pathology, and imaging features of major non-infectious hepatic cystic lesions2. Comment on each pathological entity's associated clinical presentation/symptoms, pathology, and prognostic/clinical implications.3. Discuss the 2022 European association study of the liver updates for management of imaging surveillance and management recommendations for each pathological entity.

### TABLE OF CONTENTS/OUTLINE

1. Relevant imaging modalities for evaluation of hepatic cystic structures a. CT (+/- contrast) b. MRI (T1, T2, MRCP, +/- contrast) c. Ultrasound (gray scale and color Doppler) 2. Simple hepatic cysts a. Imaging features b. Presentation (i.e incidental vs symptomatic) c. Indications for surveillance and management (drainage/sclerotherapy) 3. Complex cystic structures a. Features which infer complexity (i.e. nodularity and enhancement) b. Hemorrhagic/proteinaceous cysts c. Mucinous cystic neoplasms d. Clinical implications and management 4. Biliary hamartomas (Von Meyenburg's complexes) a. Imaging features: (notably on US and MRI) b. Pathology/presentation c. Management: (i.e. indications for follow-up) 5. (Caroli's disease) a. Imaging features: (most notably on US and MRI/MRCP) b. Pathology/presentation: (Caroli syndrome versus disease) c. Management: (surveillance for cholangiocarcinoma) d. Associated complications 6. Peribiliary cysts a. Imaging features b. Pathology/presentation c. Management (indications for follow-up imaging) 7. Polycystic liver disease: a. Imaging features and definition b. Significant genetic/prognostic features c. Management: (associated complications and treatment modalities)

### TEACHING POINTS

Peritoneal Carcinomatosis (PC): Advanced secondary cancer, affecting 15-45% of patients with colorectal, gastric, and ovarian cancer, associated with malignant ascites and a median survival of 2-5 months.Peritoneal Cancer Index (PCI): Assesses tumor extent, with PCI > 20 contraindicating cytoreductive surgery.Artificial Intelligence (AI): Assists radiologists in calculating the Peritoneal Carcinomatosis Index (PCI), improving diagnostic accuracy.Integration of CT and MRI: Enhances disease characterization, optimizing surgical planning.

### TABLE OF CONTENTS/OUTLINE

Peritoneal Carcinomatosis (PC) is an advanced stage of secondary cancer that arises from the spread of tumor cells to the peritoneum. Associated with malignant ascites, it results in compromised quality of life and a grim prognosis, with a median survival of 2 to 5 months. The Peritoneal Cancer Index (PCI) is crucial for assessing tumor extent and dissemination, influencing treatment; patients with PCI > 20 are generally deemed unfit for cytoreductive surgery. Artificial Intelligence (AI) can assist radiologists in evaluating the Peritoneal Carcinomatosis Index (PCI), contributing to more accurate assessment. Imaging methods such as CT, MRI are the methods of choice. Integrating MRI with CT in preoperative evaluations can provide a more precise characterization of peritoneal disease extension, optimizing surgical planning. The study demonstrates the efficacy of combining CT and MRI in predicting surgical PCI, highlighting the complementary role of AI in assessing PCI, aiming to improve efficiency, accuracy, and quality of evaluation, potentially resulting in better clinical outcomes for patients.

### TEACHING POINTS

A. Primary sclerosing cholangitis (PSC) is a disease with a poor prognosis that leads to liver cirrhosis and liver failure due to persistent cholestasis and an increased risk of hepatobiliary malignancies, mainly cholangiocarcinoma. B. PSC shows characteristic imaging findings on MRCP. MRCP is recommended as the imaging standard for diagnosis and follow-up in patients with PSC by some guidelines, including the International Primary Sclerosing cholangitis Study Group (IPSCSG). C. Some common imaging findings of PSC, such as the appearance of band-like strictures reflecting fibrotic narrowing of the lumen caused by peribiliary inflammatory cell infiltration and fibrosis, and the bead-like appearance that occurs as the disease progresses, are nonspecific, which may be a pitfall. D. Among secondary sclerosing cholangitis, diseases, including IgG4-related sclerosing cholangitis, exhibit images of stricture of the bile duct different from those of PSC, and diseases, including ICI-related sclerosing cholangitis, present imaging findings similar to those of PSC.

### TABLE OF CONTENTS/OUTLINE

a. Clinical characteristics, prognosis, and complications of PSC. b. MRI characteristics of PSC: sensitivities and specificities. c. MRI characteristics of IgG4-related sclerosing cholangitisd. d. Clinical and MRI characteristics of secondary sclerosing cholangitis that require differentiation from primary sclerosing cholangitis.

### TEACHING POINTS

Knowledge about the applications, indications and contraindications of endoscopic modalities is vital for the abdominal radiologist.Minimally invasive interventional procedures related to these specialties are growing rapidly due to better results and lower morbidity.

### TABLE OF CONTENTS/OUTLINE

Radiological and endoscopic imaging modalities play an important role in the diagnosis and treatment of a spectrum of gastrointestinal and respiratory conditions, sometimes with synergy in clinical practice between these sister specialties. Radiology and endoscopy are fundamental in the evaluation of hepatobiliary, pancreatic, small bowel and rectal diseases, each offering unique diagnostic and interventional capabilities. This synergy is critical in conditions such as biliary tree neoplasms, pancreatic disorders and inflammatory bowel disease, guiding management decisions from diagnostic clarity to therapeutic interventions. The summary further explores how advances, especially in artificial intelligence, are poised to improve the accuracy and integration of these modalities. Understanding the indications and contraindications for each method allows clinicians to optimize patient outcomes, illustrating a future where collaborative diagnoses and interventions continue to evolve, driven by technological innovation and improved clinical understanding.

### TEACHING POINTS

1. Recognize the primary role of the radiologist in diagnosis and treatment of acute cholecystitis and acute cholangitis.2. Identify imaging findings of acute cholecystitis and acute cholangitis in different imaging modalities used in radiology.3. Review the flowchart for the management of acute cholecystitis and the initial response to acute biliary infection.4. Identify common and unusual causes of acute biliary infection. Review clinical cases and treatment.5. Become familiar with indications and techniques of gallbladder and biliary drainage.6. Emphasize on percutaneous gallbladder drainage and percutaneous biliary drainage.7. Analyze potential complications of acute cholecystitis and acute cholangitis percutaneous treatment and how to treat them.

### TABLE OF CONTENTS/OUTLINE

1. Diagnostic criteria of acute cholecystitis on different imaging modalities.Severity grading.Flowchart for the management of acute cholecystitis.2. Management strategies for gallbladder drainage.Percutaneous transhepatic gallbladder drainage (with videos).Percutaneous transperitoneal gallbladder drainage (with videos).3. Clinical cases of acute cholecystitis and their gallbladder drainage4. Diagnostic criteria of acute biliary infection on different imaging modalities.Severity grading.Flowchart for acute cholangitis.5. Common and unusual causes of acute biliary infection (clinical cases)5. Indications and techniques of biliary drainage.Percutaneous treatment (with videos).6. Complications of percutaneous treatment for acute cholecystitis and cholangitis.7. Conclusions.

### TEACHING POINTS

1. Review normal bowel anatomy on CT and MRI.2. Suggest a radiological algorithmic approach for evaluating bowel diseases, emphasizing key intestinal and extra-intestinal findings.3. Detail each of the algorithmic steps, reviewing the differential diagnosis of bowel wall thickening with illustrative cases.

### TABLE OF CONTENTS/OUTLINE

1. Normal bowel anatomy, correlating didactic illustrations with CT and MRI.2. Different types of intestinal wall thickening with schematic figures.Algorithmic approach for bowel diseases, based on bowel wall thickening: STEP 1: Assess signs of neoplasia; STEP 2: Assess signs of ischemia; STEP 3: Assess inflammatory signs.3. Review the different differential diagnoses for intestinal wall thickening, with imaging findings and illustrative cases: a. Intestinal neoplasm; b. Ischemic enteritis and colitis; c. Infectious enterocolitis (highlighting intestinal Tuberculosis, Whipple disease and Pseudomembranous colitis); d. Non-infectious inflammatory intestinal diseases (highlighting Crohn's disease, ulcerative colitis and celiac disease); e. Actinic enterocolitis; f. Portal hypertensive colopathy;g. Intestinal endometriosis.

### TEACHING POINTS

Pancreatic cancer is the third leading cause of cancer death in the United States on its way to be the second. A multidisciplinary approach is crucial in clinical practice, and radiologists play an important role in early detection. In recent years, there has been progress in understanding the radiologic features and pathologic backgrounds of early pancreatic cancer and its precursor lesions. Intraductal papillary mucinous neoplasm (IPMN) is a well-known cystic lesion with malignant potential. Pancreatic ductal adenocarcinoma concomitant with IPMN, distinct from carcinoma that sequentially develops from IPMN itself, is also gathering attention. Morphological abnormalities of the pancreas are considered to precede the development of cancer. Radiologists need to pay attention not only to cystic lesions but also to morphological abnormalities of the pancreas. From a clinical perspective, there remains some controversial issues. In particular, there is no consensus on the follow-up interval for high-risk patients.The purposes of this exhibit are1. To learn the up-to-date radiologic findings and pathologic hypotheses of early pancreatic cancer and its precursor lesions.2. To review literature focusing on three clinical questions: (1) Modality: What is the optimal imaging modality for early pancreatic cancer detection and surveillance? (2) Eligibility: Who should be included in and excluded from routine surveillance? (3) Interval: How should the follow-up interval be determined if no abnormalities or equivocal findings are detected?

### TABLE OF CONTENTS/OUTLINE

1. Pathogenesis of pancreatic cancer2. Radiologic signs of early pancreatic cancer3. Clinical questions4. Conclusion

### TEACHING POINTS

Elucidate the anatomical relationships and forms of dissemination related to peritoneal diseases, as well as the radiological analysis of the structures involved. Discuss the pathophysiology involved in the spread of each group of benign diseases that affects the peritoneum. Provide a radiological algorithm to the dissemination of benign peritoneal diseases and correlate the clinical history that may help in the diagnosis. Highlight the possible complications related to each benign pathology of peritoneal dissemination. Present the main malignant differential diagnoses related to each benign pathology of peritoneal dissemination.

### TABLE OF CONTENTS/OUTLINE

Classification of benign peritoneal diseases dissemination into subgroups according to the main imaging aspects.Description of the imaging aspects of solid, mixed and cystic diseases.Individual characteristics of each benign lesion of the peritoneum and their main differential diagnoses in relation to malignant peritoneal involvement.

### TEACHING POINTS

Diffuse hepatic diseases are usually non-specific character in the middle of the radiology. Biopsy is known to be the gold standard for many of these pathologies. This presentation aims to presente with the recent technologies of radiological modalities so that the diagnosis can be suggested without being invasive. Provide a radiological overview of diffuse liver diseases, the pathophysiology involved in the dissemination of each group. Highlight the differential diagnoses related to each diseases, with the main findings in the different modalities.

### TABLE OF CONTENTS/OUTLINE

Main liver diseases of inflammatory and infectious origin and their typical findings. The different aspects of liver storage diseases. Assessment of images in chronic liver disease patients and autoimmune hepatitis. Recognition of liver pathologies of vascular origin. Main findings related to post-transplant liver complications, including vascular, hepatic infartion and rejection.

## A NOVEL APPROACH TO CHARACTERISING LIVER LESIONS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Snehal Lapsia, FRCR,MBBS (*Abstract Co-Author*) Nothing to Disclose
Sophie Cheshire, MBChB, FRCR (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Table method for radiology residents to problem solve liver lesion diagnosis on MRI

### TABLE OF CONTENTS/OUTLINE

We have used this table method at our UK teaching hospital whilst training radiology residents to equip them with a tool which allows for a methodical approach to interpreting liver MRI. It can be quite easy to lose focus with all the details and MR enhancement patterns of the multitude of benign and malignant lesions when evaluating multiple liver MR sequences at once. Therefore, we propose this method which evaluates each sequence in isolation of the others. Formulating a table populating each sequence with what the lesion can be, what it could be (but unlikely) and what it cannot be. In combination with a final review of the background liver, any relevant history and tumour markers allows final diagnosis of the lesion, often providing a close differential. The method can also be utilised as a problem solving tool when evaluating difficult cases. Within this education piece we will present the method with the following examples: HCC, IHC, metastasis, FNH, adenoma, cyst and other rarer lesions.

## PANCREATIC NEUROENDOCRINE NEOPLASMS: CONCEPTS, CLASSIFICATION, ROLE OF IMAGE AND ANATOMOPATHOLOGICAL CORRELATION

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Ana Claudia Vincenzi Raduan Uski (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Pancreatic neuroendocrine neoplasms (panNENs) present characteristic clinical, histomorphological and prognostic features. There have been updates regarding the pathogenesis, classification and staging of these neoplasms and familiarity with the imaging findings is essential for optimal treatment. Therefore, the objectives of this work are: - Demonstrate the radiological findings that favor the diagnosis and evolutionary behavior of panNENs; - Review changes in the classification system according to WHO (2017) and in staging (TNM of the AJCC 8th edition); - Review the genetic concepts and pathogenesis of sporadic and syndromic tumors.

### TABLE OF CONTENTS/OUTLINE

• Introduction; • WHO classification and latest AJCC TNM staging system for pancreatic neuroendocrine neoplasms; • Discussion of the pathogenesis of pancreatic tumors and carcinomas and description of genetic mutations that affect prognosis and treatment; • Imaging findings of these tumors and correlation with histological grades; • Curiosities and their main mimiters; • Summary and flowchart of conducts; • References

Amr Mohamed (*Abstract Co-Author*) Nothing to Disclose
Sohrab Afshari Mirak, MD (*Abstract Co-Author*) Nothing to Disclose
Jack Zhao, BA (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Radiologist is an integral part of the MDT managing GEP NEN
- Imaging key in every step in the management of GEP-NEN
- Multiphasic CT and MRI are workhorses for anatomic imaging
- Knowledge of immunohistochemistry can help radiologists in challenging cases of GEP-NEN, especially in the setting of unknown primary
- Important to recognize changes of carcinoid heart disease on restaging scans and differentiate NEN from non-NEN entities
- MRI better suited for post therapy response assessment
- Familiarity with response criteria used in GEP-NEN can help in appropriate assessment in day-to-day clinical practice
- Attention should be payed to disease recurrence and treatment related complications on restaging scans

### TABLE OF CONTENTS/OUTLINE

- Understand the role of radiologist in multi-disciplinary management of GEP-NEN
- Familiarize clinical and pathology clues which can help radiologist in diagnosis and management
- Understand the role of immunohistochemistry in day-today practice of radiologists
- Demonstrate the value of knowing response criteria and complications of GEP- NET therapies

David H. Ballard, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The purpose of this exhibit is to:1. Illustrate normal perianal anatomy on MR, provide a search pattern, and discuss types of perianal fistulas2. Provide a case-based review of the appearance of common and complex fistula patterns3. Discuss perianal fistulas in Crohn disease and the role of MR in monitoring response to therapy

### TABLE OF CONTENTS/OUTLINE

1. Anatomy: Internal and external sphincters, anorectal junction, and intersphincteric spacea. Appearance on diagram vs. MR2. Imaging rationala. MR modality of choiceb. Fistula and abscess on CT3. MR techniquea. Sequences of perianal MR protocol 2. Pairing a perianal MR protocol with MR enterography4. Patterns of perianal fistulasa. What is 'complexity' in perianal fistulasb. Inter-, trans-, supra- and extra-sphincteric perianal fistulasc. Parks and St. James classification systems5. Pitfalls and special considerationsa. Setons tract on MR - is it considered a fistula?b. Fistulizing to adjacent genitourinary structuresc. Hemmoroid mimicking perianal fistula6. Implications of MR findings for patient managementa. Innovations including 3D printing and virtual reality7. Perianal fistula in Crohn diseasea. Prevalence and treatment optionsb. MR imaging as a response to medical therapyc. MR scoring systemsi. Modified Van Assche index, MAGNIFI-CD, and othersii. Practical approach to reporting treatment perianal Crohn responsed. Cases of long-standing (5+ years) perianal Crohn across multiple studies8. Cancer-associated with perianal fistulaa. Perianal Crohn at increased risk for anal and rectal cancerb. Fistula-related mucinous adenocarcinomac. Squamous cell carcinoma Wound or risk factor (HIV/HPV/receptive anal intercourse)

Soumyadeep Ghosh, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Shravya Srinivas Rao, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Background Pancreatic cancer is the third most common cause of cancer-related deaths in the United States. The potential challenges in early detection involve the identification of individuals in the general population who are at risk and would gain from ongoing monitoring programs. Pancreatic cancer often presents at advanced stages, limiting treatment options and survival rates. Imaging plays a crucial role in early detection, offering opportunities for timely intervention and improved outcomes.Learning Objectives/Aims: • To discuss the necessity of early detection of pancreatic cancer • To recognize the subgroups with higher-than-average risk for pancreatic ductal adenocarcinoma (PDAC) • To evaluate the role of imaging in early diagnosis of pancreatic cancer • To review challenges and future prospects in detection of early pancreatic cancer

### TABLE OF CONTENTS/OUTLINE

• Introduction to pancreatic ductal adenocarcinoma • Describe modifiable and non-modifiable risk factors • Identify subgroups with higher-than-average risk for PDAC • Discuss precancerous lesions and their imaging surveillance o Mucinous cystic neoplasm o IPMN o Worrisome features and high-risk stigmata according to Tanaka consensus • Role of imaging in early detection of pancreatic cancer • Discuss the rationale of pancreatic protocol CT and MRI • Imaging features of early PDAC o Duct cut-off sign o Double duct sign o Focal abnormal enhancement o Focal parenchymal atrophy o Focal change in duct caliber • Current research on advanced imaging and other biomarkers for early diagnosis of PDAC

### TEACHING POINTS

Pancreas transplant is performed primarily for patients with type 1 diabetes mellitus who experience difficulties in managing their condition with conventional therapies. This educational exhibit offers the comprehensive review of multimodality diagnostic imaging and interventional radiology. The exhibit aims to: 1. Discuss the indications and epidemiology of pancreas transplant 2. Understand pre-transplant pancreatic anatomy for accurate imaging interpretation, crucial for surgical planning 3. Discuss expected post-transplant imaging findings versus early signs of complications 4. Gain insight into the surgical techniques and their implications for post-operative complications 5. Recognize post-transplant complications, focusing on diagnostic imaging features and the role of Interventional Radiology in management

### TABLE OF CONTENTS/OUTLINE

Indication and Epidemiology Anatomy: Arterial, venous and enteric anatomy Surgical technique based on the anastomosis Imaging technique: US, contrast-enhanced US, CT, MRI, and Angiography Normal Imaging findings Complications Arterial complications 1. Bleeding/Pseudoaneurysm and embolization 2. Thrombosis and thrombolysis/thrombectomy 3. Stenosis and angioplasty 4. Arteriovenous fistula and embolization Venous complications 1. Thrombosis and thrombolysis/thrombectomy 2. Stenosis and angioplasty Exocrine complications 1. Duodenoenterostomy leak 2. Duodenovesicostomy leak 3. Duodenal stump leak 4. Leak following anastomotic conversion Parenchymal complications 1. Graft rejection and Image-guided biopsy 2. Graft pancreatitis 3. Peripancreatic fluid collection and drainage Other complications 1. PTLD 2. Small bowel obstruction

## INS AND OUTS: HERNIAS OF THE ABDOMINAL WALL ON CT

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Rochelle Lamb, BMBS (*Abstract Co-Author*) Nothing to Disclose
Sathi A. Sukumar, MBBS, FRCR (*Abstract Co-Author*) Nothing to Disclose
Ben Layton, BMBS, FRCR (*Presenter*) Nothing to Disclose

### TEACHING POINTS

With use of CT imaging and accompanying detailed original illustrations combined with the most up to date literature we will:• Review the myofascial anatomy of the abdominal to provide a foundation for the of assessing hernias and understanding surgical techniques• Provide an approach to reporting hernias on CT with a particular focus on what the surgeon needs to know about large ventral hernias• Highlight what not to miss in hernia reports including the spectrum of complications of hernias specific to their subtype and location, hernia mimics and malignancy within a hernia sac.

### TABLE OF CONTENTS/OUTLINE

1. Myofascial anatomy of the abdominal wall with an overview of ventral hernia closure techniques 2. What to tell the surgeon on a CT report with case examples interlinking with surgical options. Including important surgical planning information: domain loss, sarcopenia, rectus defect ratio, component separation measurements 3. Abdominal wall hernia classification including midline, lateral and lumbar types with relevance to the surgeon explained 4. Uncommon abdominal wall hernia types and their clinical relevance explained including subtypes of interstitial hernias (with Spigelian and rectus sheath types) 5. Acute and chronic complications with case examples specific to the location such as ureteric obstruction in a lumbar hernia and appendix in Spigelian hernia. 6. Tips and tricks! Including assessment of hernia content for malignancy and sidestepping hernia mimics such as various abdominal wall masses 7. Summary and recommendations

Shioto Oda, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Gastrointestinal endoscopy is the mainstay of treatment for upper gastrointestinal treatment, particularly esophageal cancer, and plays a major role in improving patient prognosis and quality of life through a wide variety of procedures. Recent advancements in endoscopic techniques have been remarkable, including new topics such as endoscopic ultrasound (EUS) and photodynamic treatment (PDT) for treating local recurrent lesions after radiotherapy. Familiarity with related CT imaging evaluation is crucial for pre- and post-procedure evaluations, but there are limited comprehensive reports on this topic.The purpose of this presentation is to review the anatomical considerations essential to diagnosing esophageal cancer, provide an overview of radiographic imaging about TNM staging, and discuss the imaging features encountered in the endoscopic practice of esophageal cancer.The purpose of this presentation is:1. To describe key imaging features associated with endoscopic diagnosis for pre-treatment staging2. To review key imaging features after endoscopic treatment

### TABLE OF CONTENTS/OUTLINE

1. Background.2. Review of Anatomy Related to Endoscopic Esophageal Cancer Practice.3. Case Illustrations of Endoscopic Esophageal Cancer Practice3.1. Pre-treatment Imaging3.2. Post-treatment Imaging3.3. Imaging Associated with Other Endoscopic Procedures.4. Summary

### TEACHING POINTS

The choice of liver MRI contrast agent among extracellular, hepatobiliary (e.g., gadoxetate), or hybrid (e.g., gadobenate) types is a challenge in protocolling liver MRI examinations for focal liver lesion characterization. Each agent has advantages and disadvantages, including the quality of various contrast phases, potential artifacts, and hepatobiliary phase contrast-to-background ratios. A dual-contrast strategy employing initial administration of an extracellular agent followed by subsequent administration of gadoxetate offers high-quality arterial phase imaging, a predictable appearance of hemangiomas in the equilibrium and early delayed (< 5 min) phases, and a high-quality hepatobiliary phase. This exhibit will:1) Discuss liver MRI contrast agents and their strengths and weaknesses2) Provide a framework for characterizing indeterminate liver lesions and how contrast agent choice affects diagnostic certainty3) Describe the dual-contrast protocol and how to construct it efficiently4) Illustrate the advantages of dual-contrast liver MRI compared to single-agent examinations, including examples in which gadobenate as a single hybrid agent can be misleading

### TABLE OF CONTENTS/OUTLINE

- liver MRI contrast agents: characteristics, strengths, and weaknesses- Indeterminate liver lesion MRI: imaging features and how contrast choice affects diagnostic certainty or uncertainty in various clinical scenarios- dual contrast liver MRI protocol: building blocks, sequence ordering, contrast dosing- case illustrations: depict how the advantages a dual contrast protocol offers compared to single agent extracellular, gadoxetate, and gadobenate exams for focal liver lesion characterization

## HYPERINTENSE LIVER LESIONS AT HEPATOBILIARY PHASE OF GADOXETIC ACID-ENHANCED MR IMAGING: A CLINICAL APPROACH AND IT'S CLINICAL SIGNIFICANCE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Kumi Ozaki, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The insight of paradoxical hyperintensity at hepatobiliary phase of gadoxetic acid-enhanced MR imaging can help the accurate imaging diagnoses and can provide us additional information as imaging biomarkers such as prognosis and therapeutic effectiveness. The purposes of this presentation are; 1) to review several kinds of tumor showing paradoxical hyperintensity at hepatobiliary phase; 2) to review the role of the imaging biomarkers of hyperintense lesions of hepatobiliary phase images

### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. What is the gadoxetic acid? 3. The mechanism of uptake and excretion of gadoxetic acid and three types of mechanisms of hyperintensity during hepatobiliary phase 4. Presenting several hyperintense lesions of hepatobiliary phase images. For example, hepatocellular carcinoma (HCC); hyperintense HCC at HB phase, heterogeneous intense HCC at HB phase, nodule in nodule during multi-step hepatocarcinogenesis , peritumoral hyperintensity 5. Hepatocellular adenoma with ß-catenin mutation 6. Focal nodular hyperplasia (FNH) and FNH-like lesion 7. Regenerative nodules in cirrhosis and other benign hepatocellular lesions 8. Cloud sign of intrahepatic cholangiocarcinoma 9. Heterogeneous hyperintensity of liver metastases of colorectal cancer, pancreatic adenocarcinoma, and breast cancer 10. Peritumoral hyperintensity of neuroendocrine tumor 11. Periportal hyperintensity in porto-sinusoidal vascular diseaseand liver cirrhosis 12. Peritumoral hyperintensity of hypervascular tumors 13. Focusing on the role of the imaging biomarkers of hyperintense lesions of hepatobiliary phase images 14. Conclusion.

## ESOPHAGOGRAPHY ON THE MOST CHALLENGING PATIENTS: IT CAN BE DONE! (HINTS AND TRICKS TO GET A DIAGNOSTIC STUDY)

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Mary A. Turner, MD (*Abstract Co-Author*) Nothing to Disclose
Laura R. Carucci, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• Esophagography is an increasing proportion of GI fluoroscopy studies performed, providing functional and structural information often not readily obtained with cross-sectional imaging or endoscopy. • Overall trend towards increasing number of complex studies that do not allow for a "traditional esophagram" -more challenging patients with special circumstances (debilitated, elderly, postop, ICU patients). • Need to tailor study to patient's needs and capabilities • Procedural modifications allow for esophagography on even the sickest patients including patients who are debilitated, intubated, postoperative, or aspirating and patients who can't drink. • Challenging cases to perform and interpret• Important for radiologists to be aware of diagnostic challenges and how to best examine patients safely, modifying techniques to obtain necessary diagnostic information.

### TABLE OF CONTENTS/OUTLINE

• Review GI fluoroscopy trends • Discuss how to perform an esophagram in challenging circumstances including procedural modifications for the sickest patients • Describe detailed techniques, tricks and tips on how to perform an esophagram for: Debilitated patients, Intubated patients, Aspirating patients, Patients who can't swallow on command, Possible tracheoesophageal fistula, Suspected impacted foreign body or food bolus, Post-operative patients including post laryngectomy, esophagectomy, myotomy, and Zenker repair. • Discuss potential pitfalls. • Important pathology can be identified on these studies, often providing information that is not readily obtained with alternative methods.

Arthur H. Godeiro, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Diverticula can be found in various parts of the digestive tract, such as the esophagus, stomach, duodenum, jejunum, ileum, appendix, and colon. Prevalence varies according to each segment, being very common in the colon and rarer in other segments. Their clinical manifestations are generally vague, which makes diagnosis difficult and increases the risk of complications. Radiologists play a fundamental role in detecting and characterizing a wide range of gastrointestinal conditions, including the different types of diverticula in the gastrointestinal tract. Therefore, it is essential for radiology professionals to be familiar with all types of diverticula, from common colon diverticula to rare cases such as Zenker's, Killian-Jamieson's, Meckel's, duodenal, and gastric diverticula.

### TABLE OF CONTENTS/OUTLINE

Through a pictorial review, we intend to present an overview of the various types of diverticula in the gastrointestinal tract, including rarely described cases in the literature, as well as to discuss the incidence, symptoms, and prognosis of this clinical condition. We aim to highlight the role of various imaging modalities in aiding diagnosis, with emphasis on cases identified in imaging studies of lower technological complexity, such as radiographic contrast studies. We also intend to highlight possible pitfalls in the assessment of exams in this context, especially concerning the differentiation between pseudodiverticula and true diverticula in imaging exams.

## UNCOMMON CT AND MR MANIFESTATIONS OF SOLID PSEUDO-PAPILLARY TUMOR OF THE PANCREAS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Yan Zhou (*Abstract Co-Author*) Nothing to Disclose
Xuhua Gong (*Abstract Co-Author*) Nothing to Disclose
Jianrong Xu (*Abstract Co-Author*) Nothing to Disclose
Hainan Ren, BMedSc (*Abstract Co-Author*) Nothing to Disclose
Li Jun Qian, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. To illustrate and review the uncommon CT and MR manifestations of solid pseudo-papillary tumor of the pancreas (SPT)2. Discuss the crucial points for diagnosis of uncommon SPT.Conclusion: The major teaching points of this exhibit are:1. SPT may be associated with a variety of uncommon CT and MR manifestations.2. Knowledge of the uncommon imaging spectrum is useful in identification of the disease.

### TABLE OF CONTENTS/OUTLINE

1. SPT in male patients2. small SPT3. SPT with minimal solid component 4. SPT with minimal cystic component 5. SPT with dense central calcification6. Extrapancreatic SPT7. Aggressive SPT with metastatic disease8. SPT with dorsal pancreas agenesis9. Technical considerations

## SPECTRUM OF GASTROINTESTINAL MESENCHYMAL LESIONS: MULTIMODALITY IMAGING AND DIAGNOSTIC APPROACHES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Ba D. Nguyen, MD (*Abstract Co-Author*) Nothing to Disclose
Kenneth N. Huynh, DO (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. To review the common and uncommon mesenchymal lesions of the GI tract with histopathologic findings, differential diagnosis, and prognosis. 2. To characterize imaging features of each GI tract mesenchymal lesion to narrow diagnostic possibilities using CT, MR, PET/CT, and ultrasound.

### TABLE OF CONTENTS/OUTLINE

Soft tissue mesenchymal lesions are ubiquitously found throughout the body but rarely occur distinctively in the gastrointestinal (GI) tract. Gastrointestinal stromal tumors account for 90% of GI mesenchymal lesions but only less than 1% of overall GI tract tumors. Less common mesenchymal lesions range from benign schwannoma, leiomyoma, inflammatory fibroid polyp, granular cell tumor, and gangliocytic paraganglioma to malignant lesions such as leiomyosarcoma, clear cell sarcoma, inflammatory myofibroblastic tumor, and primary GI melanoma. Radiologic appearances and characteristics of these lesions frequently overlap and lead to a broad differential diagnosis. Accurate diagnosis is crucial as otherwise treatable lesions with malignant potential may be mistaken for benign processes. This exhibit will present the imaging spectrum of GI tract mesenchymal lesions on CT, MR, PET/CT, and ultrasound. These lesions include the benign and malignant entities mentioned in the above paragraph. This exhibit will also review the typical locations of occurrence along the GI tract and discuss a simplified approach to formulate and narrow the differential diagnosis of these lesions.

GUEE

## Genitourinary Imaging Education Exhibits

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Sub-Events**

### GUEE-1 MASS LESIONS OF TRANSPLANTED KIDNEYS

Kumaresan Sandrasegaran, MD (*Abstract Co-Author*) Nothing to Disclose
Mark D. Sugi, MD (*Abstract Co-Author*) Consultant, Nextrast, Inc;Author with royalties, RELX
Alecio F. Lombardi, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

• 1. Masses of transplanted kidneys include benign and malignant tumors, infections and inflammatory pseudotumors • 2. Some lesions seen in transplant kidneys, such as mycobacterial abscess, are not usually seen in native kidneys • 3. Benign lesions, such as infiltrative fungal infection, may mimic malignant tumors on imaging

**TABLE OF CONTENTS/OUTLINE**

1. 1. Optimal imaging of transplant (Tx) kidney tumors 2. Malignant tumors of transplant kidneys a. Differences in frequency of renal cell cancers in native and transplant kidneys b. Treatment of Renal Cell Cancer (RCC) in transplant kidneys 3. Hematologic tumors: PTLD, extra-osseous myeloma 4. Sarcomas and mesenchymal tumors 5. Infection of transplant kidneys: bacterial, mycobacterial and fungal 6. Unusual lesions of transplant kidneys: perinephric myxoid pseudotumor, amyloidoma 7. Value of image guided biopsy

### GUEE-10 PENILE DOPPLER WITH DRUG-DIRECTED DIAGNOSIS OF ERECTILE DYSFUNCTION, WHAT THE RADIOLOGIST SHOULD KNOW

Mildreth Juliana Acuna Rojas, MEd (*Abstract Co-Author*) Nothing to Disclose
Manuel Alejandro Garrido, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Introduction to the generalities of color Doppler in the diagnosis of erectile dysfunction, precise definition of erectile dysfunction, the correct indications to apply the study and when to apply them. Carry out an anatomical review of the penis, and physiological mechanism of the erection, that subsequently allows a diagnosis that adequately guides the doctor for a correct treatment. Know the radiological technique of the Doppler of the penis, a close look at each of the steps to elucidate and correctly present its findings. Learn criteria to think about the erectile dysfunction, taking into consideration patient signs and symptoms, clinical background, and ultrasonographic classification. Present two clinical cases of patients with erectile dysfunction, with their intrinsic repercussions in quality of life, each with independent risk factors and variable causes

**TABLE OF CONTENTS/OUTLINE**

Introduction, Epidemiology, Etiology, Anatomic review, Physiology, Pathophysiology, Diagnosis, Radiological technique, Clinical cases, Conclusions, References.

- Review the past and current concepts of adrenal incidentalomas.- Describe the main imaging findings of typical adrenal disorders.- Review the current adrenal imaging literature focusing on indeterminate lesions.- Explore the European Society of Endocrinology (ESE) guideline for adrenal lesions based on didactic clinical-radiological-pathological correlation.- Brief review of the American College of Radiology (ACR) White Paper guideline: Is it time to change?

**TABLE OF CONTENTS/OUTLINE**

INTRODUCTION- Epidemiology- Anatomy- Histology- Overview of adrenal incidentalomasIMAGING FEATURES ASSESSMENT - Adenoma- Myelolipoma- Neural orign tumor- Pheochromocytoma- Adrenocortical carcinoma- Miscellaneous- Critical review of indeterminate adrenal lesions literatureESE GUIDELINE- Explore the updated concepts and guidance- Perform a didactic clinical-radiological-pathological correlation.ACR GUIDELINE- Brief overview of the White Paper document- Are there gaps in improving the radiological approach for adrenal incidentaloma?

## GUEE-12 ADRENAL LESIONS - NOT ALWAYS AN ADRENAL ADENOMA

Anju Sahdev, FRCR (*Abstract Co-Author*) Nothing to Disclose
Katherine Ordidge, FRCR,MBBS (*Abstract Co-Author*) Nothing to Disclose
Michael Thomas, MBBS (*Abstract Co-Author*) Nothing to Disclose
James Fish, MBBS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Adrenal incidentalomas are commonly found in routine practice on up to 5% of all abdominal CT imaging.Clear guidelines exist as to the management of adrenal incidentalomas; including their initial characterisation on imaging (CT, MRI and PET-CT).Confident imaging characterisation of adrenal lesions helps ensure that patients follow the correct clinical management pathways and avoid expensive and unnecessary follow-up, including adrenal biopsy.

**TABLE OF CONTENTS/OUTLINE**

Case based educational exhibit with examples of both benign and malignant adrenal conditions and their associations with referenced teaching points to include: Benign Adrenal lesions:Evaluation of classical imaging characteristics of adrenal adenomas on CT and MRI imaging including lipid-rich and lipid-poor subtypes with cross-correlation to functional status. Wide range of benign adrenal pathology distinct from adrenal adenomas including paragangliomas, adrenal rests, myelolipomas, angiomyolipomas, congenital adrenal hyperplasia (CAH), adrenal cysts and ganglioneuromas. Malignant Adrenal lesions: Delineate imaging characteristics which raise the suspicion of adrenal malignancy; both primary and secondary malignancy and in turn avoid unnecessary investigations or upstaging of patients. Array of malignant adrenal pathology including phaeochromocytomas, adrenocortical carcinomas, metastases to the adrenal gland, malignant neuroendocrine tumors and composite tumors.Indeterminate Adrenal lesions: What to do when lesions remain indeterminate including correlation with biochemical status, clinical assessment and further imaging modalities, e.g. nuclear medicine investigations

## GUEE-13 WHO IS THAT INCIDENTALOMA? A PICTORIAL REVIEW OF AN ADRENAL MASS

Alejandro Sanchez, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

• Review the anatomy, embryology, and function of the adrenal gland.• Describe de role of different imaging modalities techniques (CT, MRI, PET-CT) in the diagnosis of adrenal lesions. • Discuss clinical-radiological-histopathological key findings to help differentiate adrenal gland lesions (benign vs malignant). • Analyze what treatment and follow-up is necessary for each adrenal mass.• Treatment and follow-up of adrenal lesions.• How to do a good report of an adrenal mass.

**TABLE OF CONTENTS/OUTLINE**

Description of general characteristics of adrenal gland and adrenal mass. Adrenal gland anatomy and physiology. Review multimodality adrenal protocols ( MRI, CT, PET-CT) Review of MRI and CT cases, common findings, imaging tips and pitfalls.Typical and atypical adrenal lesions. Adenoma, pheochromocytoma, lymphoma, myelolipoma, metastasis, carcinoma, neuroblastoma, nodular hyperplasia and neuroblastoma.- Histopathological findingsSummary Pearls and take home points.

## GUEE-14 THE URETER: THE UNLOVED CONDUIT BETWEEN THE KIDNEY AND BLADDER

**Awards**
**Cum Laude**

Cary L. Siegel, MD (*Abstract Co-Author*) Nothing to Disclose
Matthew T. Simpson, MD (*Abstract Co-Author*) Nothing to Disclose
Bogdana Schmidt (*Abstract Co-Author*) Nothing to Disclose
Mark J. Hoegger, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Douglas M. Rogers, MD (*Abstract Co-Author*) Royalties, RELX
Grace G. Zhu, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The purpose of this exhibit is to:1) Describe ureteral anatomy and function with a discussion of the imaging strategies to evaluate for ureteral pathology.2) Provide a review of ureteral pathology and divide the different processes into broad categories of congenital, intrinsic, and extrinsic pathology.

**TABLE OF CONTENTS/OUTLINE**

1) Introduction/Backgrounda. Ureteral anatomyb. Imaging modalities2) Congenitala. Duplicated Ectopic Uretersb. Ureteral budc. Ureteroceled. Retrocaval ureter3) Intrinsic Ureteral Processesa. Ureteral strictureb. Ureteral neoplasmsi. Fibrovascular polypii. Urothelial carcinomac. Inflammatoryi. Ureteritis cystica ii. Infectiond. Other/Miscellaneousi. Post-operative complicationsii. Pseudodiverticulosis4) Extrinsic Ureteral Processesa. Pregnancy Pelviectasisb. Local mass effectc. Local inflammatory process

## GUEE-15 THE ROLE OF IMAGING IN EVALUATING PROSTATE CANCER AND ITS NATURAL HISTORY OVER TIME

Leonardo K. Bittencourt, MD, PhD (*Abstract Co-Author*) Research Consultant, Canon Medical Systems Corporation
Eduardo Thadeu De Oliveira Correia, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Michaela Cooley, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Prostate cancer is the second leading cause of cancer death in men in the US. Despite this, there is debate about the utility of prostate cancer screening markers and the optimal treatment course. This educational exhibit takes the reader through diagnosing prostate cancer, evaluating risk for metastasis, surveillance imaging, and treatment options. All discussion points relate back to the imaging markers that are essential to look out for or are important in prognosis.

**TABLE OF CONTENTS/OUTLINE**

1. Epidemiology of prostate cancer. a. Demographics; b. Incidence, prevalence; c. Role of screening. 2. Natural history of prostate cancer. a. How prostate cancer grows and metastasizes; b. Development of treatment resistance (e.g., androgen insensitivity); c. Gleason score; d. Percentages of patients with disease progression and death after diagnosis. 3. Evaluating risk though medical imaging. a. Imaging modalities used for initial diagnosis (e.g., MRI, US); b. Advantages and disadvantages of each imaging modality; c. Typical and atypical features of prostate cancer; d. Imaging characteristics used to differentiate local cancer from extracapsular extension.4. Surveillance imaging, metastasis, and whole-body imaging. a. Surveillance imaging modalities and timeline after initial treatment; b. Imaging markers indicating metastasis and what characteristics to look for; c. Indications for whole body imaging.5. Treatment options and selection. a. Local disease traditional treatment options; b. Discussion on new treatment options for local disease; c. Metastatic disease traditional and recent treatment options; d. How imaging plays a role in treatment selection.

## GUEE-16 JOURNEY INTO THE SCROTAL ULTRASOUND DEPTHS: ANDROLOGISTS' PERSPECTIVES

Silvia Martinez Cruz, MD (*Abstract Co-Author*) Nothing to Disclose
Yady V. Hurtado Burbano, MD (*Abstract Co-Author*) Nothing to Disclose
Andres Guillermo Tarra Romero, MD (*Abstract Co-Author*) Nothing to Disclose
Laura M. Garcia Ramirez, BMedSc, BMedSc (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Spermatogenesis is the process in which spermatogonia give rise to spermatocytes, while spermiogenesis is the stage in which spermatids mature into spermatozoa, forming part of the overall process of spermatogenesis.
- In patients with fertility disorders, while a semen analysis is crucial, it is essential to complement this with the evaluation of testicular volume and the use of ultrasound to detect abnormalities. This comprehensive approach is vital for accurately assessing male infertility, identifying potential underlying causes, and guiding appropriate treatment to improve male fertility rates.
- When predisposing risk factors are present, there is a clear association between testicular cancer and microlithiasis, emphasizing the need for a thorough evaluation.
- Sequelae of surgical manipulation, orchidopexy, or biopsies can be detected as alterations in the echogenicity of the parenchyma.
- Recent studies have revealed that a correction factor of 0.71 is likely the most accurate for estimating calculated testicular volume.
- A variation greater than 25% between the volumes of the two testes is considered significant.
- Ultrasound abnormalities, such as ectasia of the rete testis, dilation of epididymal ductules, and intratesticular cysts, are correlated with seminal parameters. These findings clearly indicate an obstructive etiology of infertility.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction 2. Embryology 3. Functional Anatomy 4. Workup of Male Infertility 5. Ultrasound Findings
- Echogenicity
- Volume
- Epididymis
- Vascularity
- Spermatic Cord
- Inguinal Canal 6. Take-Home Messages 7. Conclusions 8. Bibliography

## GUEE-17 DIAGNOSTIC IMAGING TECHNIQUES IN RENAL TRANSPLANTATION

Steven S. Raman, MD (*Abstract Co-Author*) Consultant, Johnson & Johnson;Consultant, Bayer AG;Consultant, Merck & Co, Inc;Consultant, Amgen Inc;Consultant, Profound Medical Inc
Alex Chung, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Imaging evaluation of the living kidney donor involves detailed evaluation of vascular anatomic information for surgical planning via CT Angiogram (CTA) or MR angiogram (MRA).Evaluation of renal allograft in the early posttransplant period involves evaluating for allograft size, collecting system dilation, periallograft fluid collection, signs of rejection and vascular flow via ultrasound, CT, MRI and nuclear medicine scintigraphy.Core needle biopsy of the transplanted kidney help determine the etiology of graft dysfunction when clinical evaluation and noninvasive diagnostic tests are nonspecific and commonly is performed to distinguish ATN from acute rejection and nephritis.Investigational MRI techniques that can eventually applied in post-transplant renal imaging include blood oxygenation level-dependent (BOLD) imaging, diffusion weighted imaging (DWI), diffusion tensor imaging (DTI), ferumoxytol enhanced MRA, Inflow Inversion Recovery, Arterial spin labeling, Phase contrast MRI, T1 relaxometry, MR Elastography and Magnetization Transfer Imaging.

**TABLE OF CONTENTS/OUTLINE**

1. Imaging evaluation of living kidney donor.1a. CTA evaluation.1b. MRA evaluation.2. Imaging evaluation in early post-transplant period.2a. US evaluation2b. CT evaluation.2c. MRI evaluation2d. Scintigraphy evaluation.3. Core needle biopsy of the transplanted kidney: Indication, technique and complications.4. Investigational MRI techniques.

## GUEE-18 ROLE OF IMAGING IN MANAGING SURGICAL BED COMPLICATIONS AFTER PROSTATECTOMY

**Awards**
**Cum Laude**

Bohyun Kim, MD (*Abstract Co-Author*) Nothing to Disclose
Adam T. Froemming, MD (*Abstract Co-Author*) Nothing to Disclose
Ashish R. Khandelwal, MD (*Abstract Co-Author*) Nothing to Disclose
Garima Suman, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Imaging is increasingly being utilized to evaluate post-prostatectomy complications and guide treatment decisions. These include early complications, such as infection, hematoma, urine leak; and late complications, such as anastomotic strictures, urinary fistula, lymphocele. 2. MRI has become the gold standard for detection and characterization of urosymphyseal fistula due to high failure rate and complications associated with cystoscopy. 3. Incorporating Dynamic Voiding MRI enhances insights into urethral adhesions, mobility, strictures and improves detection of urinary fistula. 4. MRI enables precise characterization of the fistula defect relative to the urinary sphincter complex and rectum, that are critical considerations for surgical planning.

**TABLE OF CONTENTS/OUTLINE**

1. Case-based review of surgical bed complications and spectrum of imaging findings, including : a) Urethral stricture; b) Urosymphyseal fistula; c) Rectourethral fistula; d) urine leak ; e)Soft tissue and osseous infections such as myositis and osteomyelitis 2. MRI protocol including Dynamic Voiding sequences for urethral strictures and fistula post-prostatectomy. 3. Role of CT angiography for presurgical vascular assessment and CT-guided bone biopsy for antimicrobial management prior to urethral reconstructive surgery. 4. How do MRI findings correlate with cystoscopy and influence surgical decision-making in urethral strictures and fistula (conservative management vs urethral reconstruction vs pelvic exenteration). 5. Limitations and pitfalls in MR interpretation, such as urethral recess mimicking fistula, infected urinoma mimicking recurrent cancer, and reactive osteitis resembling osteomyelitis.

## GUEE-19 DEMYSTIFYING THE CONGENITAL, ACUTE, CHRONIC, AND NEOPLASTIC MANIFESTATIONS OF THE BLADDER. WHAT A GENERAL RADIOLOGIST NEEDS TO KNOW

Eduardo J. Matta, MD (*Abstract Co-Author*) Nothing to Disclose
Akilan Gopal, MD (*Abstract Co-Author*) Nothing to Disclose
Kaustubh Shiralkar, MD (*Abstract Co-Author*) Nothing to Disclose
Steven S. Chua, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Ryan Molina, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Outline the most common bladder pathologies in both the adult and pediatric population. Delineate bladder pathologies into four broad categories: congenital, acute non-neoplastic acquired, chronic non-neoplastic acquired, and neoplastic. List the common pathologies within each category, provide imaging correlates for each pathology, recognize the salient imaging features including more complex topics including the urachal abnormalities and malignancy.

**TABLE OF CONTENTS/OUTLINE**

The bladder is often underemphasized in radiology training and can be a confusing organ . In this exhibit, we aim to demystify the myriad of bladder pathologies. We provide a flowchart separating bladder pathologies into four broad categories: congenital, acute, chronic, and neoplastic and highlight the salient imaging features to improve diagnostic acumen of trainees and the general radiologists and facilitate optimal treatment to improve the outcome of patients. Congenital pathologies described will include posterior urethral valves, prune belly syndrome, cloaca, exstrophy of the bladder, urachal abnormalities, reflux, and ureterocele. Acute pathologies will detail rupture (intraperitoneal, extraperitoneal), cystitis, and bladder stones. Chronic pathologies will involve bladder outlet obstruction, bladder diverticulum, and fistulization from chronic inflammatory conditions. Neoplastic pathologies will describe urothelial cell carcinoma, transitional cell carcinoma adenocarcinoma, squamous cell carcinoma, and metastases.

**TEACHING POINTS**

Renal cell carcinoma is the most common kidney cancer, with various subtypes presenting distinct imaging characteristics. Clear cell RCC appears as a hypervascular mass with ‘halo’ on contrast-enchanced CT/MRI. Papillary RCC exhibits heterogeneous enhancement with cystic components. Chromophobe RCC presents as a hypovascular mass with peripheral enhancement. Collecting duct carcinoma is agressive, showing infiltrative growth and low attenuation. Multilocular cystic neoplasm of a low malignant potential is a benign tumor with multilocular cysts and thin septa. Sarcomatoid RCC is agressive, often with hemorrhage or necrosis. Unclassified RCC requires detailed histopathological evaluation. Other renal tumors include angiomyolipoma with macroscopic fat, oncocytoma with central scarring, and rare primary renal lymphoma. Renal metastases show variable characteristis. Transitional cell carcinoma appears as a filling defect. Retroperitoneal tumors include liposarcoma, pleomorphic sarcoma and leiomyosarcoma. Renal pseudotumors, like xantogranulomatous pyelonephritis, mimic tumors on imaging, requiring differentiation.

**TABLE OF CONTENTS/OUTLINE**

Renal cell carcinoma Subtypes
- Clear cell RCC
- Papillary RCC
- Chromophobe RCC
- Collecting duct (Bellini)
- Multilocular cystic neoplasm of low malignant potential
- Sarcomatoid RCC
- Unclassified RCC Others renal tumors
- Angiomyolipoma
- Oncocytoma

- Renal lymphoma
- Renal metastasis Direct extension of neighboring tumors
- Transitional cell carcinoma / Urothelial cancer
- Retroperitoneal tumors Pseudotumors
- Xanthogranulomatous pyelonephritis

## GUEE-20 RETROPERITONEAL INFECTIONS: ANATOMY, PATHOGENESIS, SPREAD, IMAGING FEATURES AND IMPACT ON MANAGEMENT

**Awards**
**Certificate of Merit**

Corey T. Jensen, MD (*Abstract Co-Author*) Research Grant, General Electric Company
Muhammad O. Awiwi, MD (*Abstract Co-Author*) Nothing to Disclose
James M. Jing, MD (*Abstract Co-Author*) Nothing to Disclose

### TEACHING POINTS

-To review the anatomy of the retroperitoneum. - To illustrate the pathways of disease spread in the retroperitoneal spaces. -To localize and describe the spectrum of imaging appearances of various retroperitoeneal infections - To discuss the impact of imaging findings on management.

### TABLE OF CONTENTS/OUTLINE

- Introduction - Pathophysiology and pathways of disease spread - Relevant clinical picture - Correlation of findings on imaging with anatomical background, locatization based on the primary disease process - Review of a spectrum of imaging findings with pathologic correlation (including pancreatic abscesses, duodonal perforation, duodenal diverticulitis, colon perforation into the retroperitoneum, different types of pyelonephritis, adrenal infections, puerperal septic thrombophlebitis, mycotic aortic aneurysm, retroperitoneal abscesses related to Pott's disease or osteomyelitis/spondylodiscitis, and hematogenously disseminated infections such as hydatid/echinococcal cyst, tuberculosis, histoplasmosis, coccidiomycosis, cat scratch disease, and disseminated Mucor). - Differential diagnoses - Mimics and clues to correct diagnosis - Impact of imaging features on management options

## GUEE-21 KIDNEY TRANSPLANT COMPLICATIONS

Terri A. Williams-Weekes, MD (*Abstract Co-Author*) Nothing to Disclose
Rita Maria Lahoud, MD (*Abstract Co-Author*) Nothing to Disclose
Andrew Dippre, MD (*Abstract Co-Author*) Nothing to Disclose
Hillary Bui, DO (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Understand the modalities used to evaluate renal transplants.Understand typically seen anatomy and ultrasound findings for renal transplants.Understand the timeline of expected non-infectious renal transplant complications.Understand expected imaging findings for common renal transplant complications.

### TABLE OF CONTENTS/OUTLINE

1. Renal Transplant Anatomy2. Modalities for Assessment of Renal Transplant3. Normal Renal Transplant Imaging Findings4. Timeline of Expected Non-Infectious Complications5. Early Complications (Pseudoaneurysm, Hematoma, Renal Artery Thrombosis)6. Intermediate Complications (Ureteral Stricture, Renal Calculi, Renal Artery Stenosis)7. Late Complications (PTLD, Abdominal/Pelvic Complications)8. Anytime Post Transplantation Complications (Abscess, Post-Biopsy AV Fistula)

## GUEE-22 NEPHRON-SPARING TECHNIQUES IN THE TREATMENT OF SMALL RENAL MASSES: A PRIMER FOR RADIOLOGISTS

Amr Kalander, MD (*Abstract Co-Author*) Nothing to Disclose
Joao S. Pais, MD (*Abstract Co-Author*) Nothing to Disclose
Marcos R. Menezes, MD (*Abstract Co-Author*) Nothing to Disclose
Regis Otaviano Bezerra, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Jose de Arimateia B. Araujo Filho, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Rodrigo Vivas Cardoso, MD (*Abstract Co-Author*) Nothing to Disclose

Guilherme L. Martins, MD (*Abstract Co-Author*) Nothing to Disclose
Vitor Nascimento, MD (*Abstract Co-Author*) Nothing to Disclose
Jose G. Maluf, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• Understand key concepts about small renal masses and their potential treatment options; • Learn about the main indications of partial nephrectomy and thermal ablation in that context; • Understand the tumor characteristics that influence their management and treatment; • Recognize expected imaging features related to each kind of treatment; • Identify unexpected imaging findings and the main complications of these procedures, highlighting pearls and pitfalls for this assessment.

### TABLE OF CONTENTS/OUTLINE

• Introduction - General concepts about small renal masses and their different approaches o Current context and definitions o Treatment options o Partial nephrectomy o Thermal ablation o Active surveillance o Indications and contraindications o Advantages and disadvantages • Imaging features o Partial nephrectomy o Pre-procedural planning o Post-procedural imaging features o Thermal ablation o Pre-procedural planning o Post-procedural imaging features • Case- based review, with pearls and pitfalls o Complications related to partial nephrectomy o Complications related to thermal ablation • Future perspectives • Conclusions and key takeaways

## GUEE-23 DON'T PANIC, IT'S JUST A PEEK: A COMPREHENSIVE LOOK AT MALE URETHRAL IMAGING

LOUISE FATIMA GOMES DE ALMEIDA (*Abstract Co-Author*) Nothing to Disclose
Clara Fiorot, MD (*Abstract Co-Author*) Nothing to Disclose
Paula Castro, MD (*Abstract Co-Author*) Nothing to Disclose
Luiza Ambrozino, MD (*Abstract Co-Author*) Nothing to Disclose

Eleonora Silva (*Abstract Co-Author*) Nothing to Disclose
Andre Ferreira, MD (*Abstract Co-Author*) Nothing to Disclose
Daniella Braz Parente (*Abstract Co-Author*) Nothing to Disclose
Luana Alves, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Compare Conventional Voiding Cystourethrography (VCUG) Retrograde Urethrography (RUG) vs. Magnetic Resonance Urethrography (MRU) to evaluate the male urethra.- Review the step-by-step procedures for each imaging method.- Analyze the advantages and limitations of VCUG/RUG and MRU.- Recognize key findings in urethral images for each technique.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction: Understanding the Urethra- Briefly explore anatomy, urination function, and common issues (strictures, injuries, infections).2. Imaging TechniquesA) Fluoroscopic Techniques: 1. VCUG:- Protocol: Step-by-step explanation of the VCUG procedure.- Patient Preparation: Instructions for patients before undergoing VCUG.2. RUG:- Protocol- Patient PreparationB) MRU- Protocol- Patient PreparationC) Comparison among Urethral Imaging: strengths and weaknesses of each techniqueD) Overcoming Difficulties Addressing challenges associated with each imaging method and solutions for optimal results.3. Choosing Wisely
- Visualization strengths (VCUG/RUG vs. MRU)
- Radiation exposure (VCUG/RUG vs. MRU)
- Cost
- Patient comfort4. Interpreting the Images
- Key Findings Pitfalls Recognize crucial details and avoid misinterpretations.
- Surgical Considerations Ensure imaging reports provide what surgeons need.5. Common Urethral Surgeries brief descriptions of procedures like urethroplasty for strictures.6. Interactive Case Studies solidify image interpretation skills.7. Conclusions summary of key points and the importance of accurate urethral imaging for diagnosis and treatment planning.

## GUEE-24 DEVELOPMENT OF A DEEP PELVIC ENDOMETRIOSIS REPORTING AND DATA SYSTEM (ENDO-RADS) USING MRI

Vlad V. Simianu, MD (*Abstract Co-Author*) Nothing to Disclose
Megan Loring (*Abstract Co-Author*) Nothing to Disclose
Achille Mileto, MD (*Abstract Co-Author*) Consultant, Bayer AG
Bahar Mansoori, MD (*Abstract Co-Author*) Nothing to Disclose
Karisma Gupta, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

We developed and herein present a Reporting and Data System for deep pelvic endometriosis (Endo-RADS). Endo-RADS is a scoring system determined by appearance and MRI signal characteristics of endometriotic lesions (lesion type) and location in the deep pelvis. The greater the Endo-RADS cumulative score, the higher the stage of deep pelvic endometriosis. While Endo-RADS is based on MRI findings, it also takes into account prior demonstration of deep pelvic endometriosis by laparoscopy or ultrasound. Endo-RADS can provide simplified and standardized terminology to solve complex narrative endometriosis reports.Learning Objectives:- To discuss shortcomings of previously proposed classifications for deep pelvic endometriosis.- To illustrate currently unmet needs and limitations of reporting systems for deep pelvic endometriosis.- To introduce Endo-RADS (Endometriosis Reporting and Data System).- To showcase how Endo-RADS scores are assigned based on MRI signal characteristics and location of the lesions.

**TABLE OF CONTENTS/OUTLINE**

- To review epidemiology, clinical significance, and morbidity of deep pelvic endometriosis.- To highlight commonly encountered imaging findings of deep pelvic endometriosis at MRI.- To introduce the Endo-RADS scoring system.- To discuss anticipated imitations of Endo-RADS.- To illustrate future directions for Endo-RADS.

## GUEE-25 ADNEXAL AGONY: A DIAGNOSTIC ODYSSEY IN EMERGENCY SCENARIOS

Guillermo P. Sangster, MD (*Abstract Co-Author*) Nothing to Disclose
Joshua Strobel, MD (*Abstract Co-Author*) Nothing to Disclose
Carlos H. Previgliano, MD (*Abstract Co-Author*) Nothing to Disclose
Meghna Chadha, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Mariana Marrero-Castillo (*Abstract Co-Author*) Nothing to Disclose
Carolina Soto-Davila, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Review the acute clinical presentation of various adnexal disorders and subsequent abdominal complications.2. Describe the multi-modality imaging findings of adnexal emergencies such as ovarian torsion, massive ovarian edema (MOE), isolated fallopian tube torsion, rupture of cystic teratoma, and rupture of endometrioma.3. Review clinicopathologic follow-up to establish a final diagnosis.

**TABLE OF CONTENTS/OUTLINE**

1. To outline common and uncommon acute pathologies of the adnexa.2. To depict typical and atypical imaging appearances on ultrasound (US), computed tomography (CT), and magnetic resonance (MRI) exams.3. To discuss the most relevant differential diagnosis.Due to ambiguous and overlapping physical and laboratory findings, early and accurate diagnosis of acute adnexal pathology will help initiate appropriate management and fertility preservation. This educational exhibit will aid the radiologist in accurately and timely diagnose adnexal findings.

## GUEE-26 SYSTEMIC STAGING AND RESTAGING ON TESTICULAR CANCER: WHAT RADIOLOGIST SHOULD KNOW

Gustavo C. Lemos, MD (*Abstract Co-Author*) Nothing to Disclose
Ronaldo H. Baroni, PhD (*Abstract Co-Author*) Nothing to Disclose
Willy Baccaglini, MD (*Abstract Co-Author*) Nothing to Disclose
Arie Carneiro, MD (*Abstract Co-Author*) Nothing to Disclose

Fernando M. Coelho, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

. Briefly review testicular tumor management. Describe sites of lymphatic and hematogenous cancer spread. Discuss the role of imaging in staging and restaging testicular cancer. Demonstrate didactic cases of testicular cancer through cross-sectional imaging

**TABLE OF CONTENTS/OUTLINE**

INTRODUCTION- Testicular cancer epidemiology- General concepts of the role of imaging in staging and restagingTESTICULAR CANCER MANAGEMENT - Overview based on main guidelines- Role of imaging on systemic oncological assessmentTESTICULAR CANCER SPREAD ROUTES- Lymphatic- HematogenicIMAGING ASSESSMENT Staging- Lymph nodes- Distant metastasesRestaging - Residual disease after first-line chemotherapy (seminoma vs. non-seminoma)- Teratoma challenge on non-seminoma neoplasm- Role of PET/CT- Imaging findings after surgical managementDIDACTIC CASE-BASED REVIEW

## GUEE-27 PI-QUAL SCORE: A CASE-BASED USER GUIDE FOR OBJECTIVE ASSESSMENT OF PROSTATE MRI IMAGE QUALITY

Khyrul A. Khan (*Abstract Co-Author*) Nothing to Disclose
Leonardo K. Bittencourt, MD, PhD (*Abstract Co-Author*) Research Consultant, Canon Medical Systems Corporation
Eduardo Thadeu De Oliveira Correia, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Raphael Lanz (*Abstract Co-Author*) Nothing to Disclose
Andres Hernandez (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The Prostate Imaging Quality (PI-QUAL) scoring system has been increasingly adopted for the objective assessment and reporting of prostate MRI image quality. PI-QUAL consists of scores ranging from 1 to 5 based on technical parameters and the visual assessment of prostate MRI, with higher scores denoting superior imaging quality and enhanced diagnostic certainty. However, many radiologists are still unfamiliar with the PI-QUAL scoring system, which hinders its integration into prostate MRI reports, especially at non-academic centers. This exhibit provides a case-based user guide to facilitate the understanding of key rules of the PI-QUAL scoring system, to promote its widespread adoption into practice.

**TABLE OF CONTENTS/OUTLINE**

1. Why should you include the PI-QUAL scoring system in your report? 2. Main components of the PI-QUAL scoring system: a. Technical parameters b. Visual assessment c. How is image quality scored? 3. A Case-Based User Guide: a. PI-QUAL Score 1 b. PI-QUAL Score 2 c. PI-QUAL Score 3 d. PI-QUAL Score 4 e. PI-QUAL Score 5 4. Test your knowledge! a. Case 1 b. Case 2

## GUEE-28 APPLICATIONS OF DECT IN RENAL IMAGING

Pablo G. Verdu, MD (*Abstract Co-Author*) Nothing to Disclose
Ana Puig (*Abstract Co-Author*) Nothing to Disclose
Polina Rudenko, MD (*Abstract Co-Author*) Nothing to Disclose
Celia Monton Gomez, MD (*Abstract Co-Author*) Nothing to Disclose
Monica Santos Blasco, MD (*Abstract Co-Author*) Nothing to Disclose
Claudia Fontenla Martinez (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Describe the basic physical principles of DECT.- Explain the post-processed DECT maps.- Exhibit the main applications of DECT in renal imaging.

**TABLE OF CONTENTS/OUTLINE**

Imaging is key in the diagnosis of urological pathology, from incidental neoplasms to acute renal colic or hematuria. The introduction of dual-energy computed tomography (DECT) has significantly expanded diagnostic possibilities in radiology, impacting the field of urology as well.While conventional CT provides limited information by overlaying all data into a single CT sequence, DETC enables the analysis of the continuous energy spectrum of X-rays. This facilitates better tissue characterization through the analysis of the post-processing maps.Imaging Findings 1. Focal Lesions: Differentiate between cystic and solid lesions and guide the histological subtype and aggressiveness.2. Renal Vascularization: Better vascular evaluation prior to treatment procedures and distinguish tumor thrombus from soft thrombus.3. Follow-up of Treated Lesions: Distinguish between post-treatment intralesional changes and residual tumor after percutaneous treatments.4. Inflammatory Diseases: Detection of inflamed kidney foci in acute pyelonephritis.5. Lithiasis: Characterization lithiasis composition. 6. Staging: Low energy monoenergetic maps facilitate the detection of metastases, whether hyper- or hypovascular, due to increased contrast between structures.Conclusion:DECT offers multiple advantages in renal imaging, from lesion characterization to vascular evaluation and treatment monitoring. Knowing their applications is crucial for its effective application in daily practice.

## GUEE-29 CYSTIC GENITOURINARY LESIONS IN THE PELVIS: PEARLS AND PITFALLS

Margarita V. Revzin, MD, MS (*Abstract Co-Author*) Nothing to Disclose
Mark J. Hoegger, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Mahdi Hamade (*Abstract Co-Author*) Nothing to Disclose

David H. Ballard, MD (*Abstract Co-Author*) Nothing to Disclose
Yashant Aswani, MD (*Abstract Co-Author*) Nothing to Disclose
Malak Itani, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Cystic lesions in the male and female pelvis have a wide differential. This exhibit will present cystic lesions of the lower genitourinary (GU) tract along with their mimics and highlight important pearls and pitfalls. The focus of this exhibit will be on the bladder, urethra, and deep pelvis excluding adnexal lesions given existing imaging guidelines. The goal of this exhibit is to: (1) Provide a detailed review of cystic lesions of the bladder and urethra; (2) Showcase variable etiologies of periurethral cystic lesions in the female pelvis, including uterine, cervical, vaginal, and vulvar lesions, with an algorithmic approach to differential considerations; (3) Present variable cystic lesions in the male pelvis with focus on genitourinary lesions

**TABLE OF CONTENTS/OUTLINE**

A. Cystic lesions of the bladder and urethra: Diverticula Urachal abnormalities Infectious lesions Mimics and less common lesions (simple cyst, Brunn’s cyst, cloacal cyst, everted ureterocele, cystitis cystica, obturator hernia, implantable devices and injectables) B. Cystic lesions in the female pelvis: Uterine and cervical origin lesions: endosalpingiosis, cystic fibroids, adenomyomas, Nabothian cysts, tunnel cluster, cervicitis, adenoma malignum,

endocervicosis. Vaginal lesions: Gartner's duct cyst, vaginal cuff cyst, inclusion cysts. Vulvar and perineal lesions: Bartholin gland cyst or abscess, Skene duct cyst, canal of Nuck cyst. C. Cystic lesions in the male pelvis Utricle cyst Mullerian duct cyst Seminal vesicle cyst Ejaculatory duct cyst Cowper duct syringocele Mimics and other lesions (cystic BPH nodules, prostate retention cysts, hindgut cyst, angiomyxoma)

## GUEE-3 DISEASES WITH THORACIC AND GENITOURINARY INVOLVEMENT: A REVIEW FOR THE GENERAL RADIOLOGIST

### TEACHING POINTS

Various pathologies can affect thoracic organs and the genitourinary system. Syndromes like Birt-Hogg-Dubé and tuberous sclerosis, with characteristic pulmonary changes, can predispose to renal lesions, including carcinomas.Granulomatous diseases such as tuberculosis have primary pulmonary forms, but can also involve genitourinary organs, including the kidneys, adrenals, seminal vesicles and testes.Similarly, various pulmonary neoplasms can metastasize to the genitourinary system, with adrenal involvement, for example. Lungs are also a common site for renal metastases, among others.Thus, the general radiologist who interprets chest and abdomen exams may encounter conditions that affect both systems, and knowing how to recognize them is crucial for reaching the correct diagnosis and recommending additional tests if necessary.The aim of this pictorial essay is to review the main pathologies with thoracic and genitourinary involvement, familiarizing the general radiologist who might encounter them in their daily work.

### TABLE OF CONTENTS/OUTLINE

A literature review was conducted under the guidance of radiologists specialized in thoracic and genitourinary imaging.Pathologies involving both the pulmonary and genitourinary systems were included, covering conditions affecting the lungs, kidneys, adrenals, bladder, prostate, testicles and vascular structures.

## GUEE-30 RETROPERITONEUM AND PELVIC EXTRAPERITONEUM: ANATOMIC LANDMARKS, IMAGING FEATURES, AND PATTERNS OF DISEASE SPREAD

Khaled M. Elsayes, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Jennifer Sammon, MBBCh (*Abstract Co-Author*) Nothing to Disclose
Mohamed Badawy, MD (*Abstract Co-Author*) Nothing to Disclose
Maged Algazzar, MD (*Abstract Co-Author*) Nothing to Disclose
Moataz Ahmed Sayed Mohammed Soliman, MD,MSc (*Abstract Co-Author*) Nothing to Disclose
Peter S. Liu, MD (*Abstract Co-Author*) Nothing to Disclose
Kazi A. Irfan, MD, FRCR (*Abstract Co-Author*) Nothing to Disclose
Ayman H. Gaballah, MD, FRCR (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Review anatomy and anatomic landmarks of retroperitoneal (RP) and pelvic extraperitoneal spaces2. Illustrate the intercommunications among different spaces and their impact on spread of related diseases3. Discuss imaging workup and imaging features of different pathologic entities and pathways of disease spread4. Provide algorithmic approach to differential considerations5. Highlight management options

### TABLE OF CONTENTS/OUTLINE

1- Introduction2- Anatomy of retroperitoneal (RP) and pelvic extraperitoneal spaces with diagrammatic illustrations3- Differentiation of intraperitoneal from extraperitoneal pathology4- Imaging features of different pathologic entities including, extraluminal gas, fluid collections, and masses5- Pathways of disease spread6. Case presentation6- Algorithmic approach to differential considerations7- Summary and conclusion

## GUEE-31 THE CHALLENGES IN THE DETECTION AND DIAGNOSIS OF TRANSITIONAL CELL CARCINOMA OF THE KIDNEY: HOW TO OPTIMIZE LESION DETECTION

Elliot K. Fishman, MD (*Presenter*) Co-founder, HipGraphics, Inc Stockholder, HipGraphics, Inc Institutional Grant support, Siemens AG Institutional Grant support, General Electric Company Consultant, Exact Sciences Corporation Consultant, Imaging Endpoints II LLC

### TEACHING POINTS

1. Transitional Cell Carcinoma of the kidney is often a challenging diagnosis because lesions are often small and can mimic otherPathologies2. Detection of Transitional Cell Carcinoma of the kidney is dependent on proper scan protocols as well as scan display (MPR, MIP, VRT)3.Transitional Cell Carcinoma of the kidney have a range of CT appearances from infiltration of a calycx, to infiltration of the kidney, to focal fillingdefects to calyceal amputation4. Transitional Cell Carcinoma of the kidney can also be confused with other renal tumors as well as renal inflammatoryDisease5. early detection is critical for outcome and attention to spread of disease including multifocal disease will be addressed

### TABLE OF CONTENTS/OUTLINE

1. Demographics of Transitional Cell Carcinoma of the kidney including staging2. scan protocols and display protocols for the detection of Transitional Cell Carcinoma of the kidney3. case studies showing the various appearances of Transitional Cell Carcinoma of thekidney including infiltrative form (focal or diffuse), focal masses in the renal pelvis, and mass like appearance4. case studies illustrating the pitfalls in the diagnosis of Transitional Cell Carcinoma of the kidney including both neoplastic and inflammatory mimickers.5. pearls and pitfalls in the diagnosis of Transitional Cell Carcinoma of the kidney will be addressed with case examples

## GUEE-33 MRI FOR PENILE TRAUMA AND TUMORS: WHAT THE RADIOLOGIST SHOULD KNOW

Diana Murcia, MD (*Abstract Co-Author*) Nothing to Disclose
Noor Fatima Majeed, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

MRI is increasingly being used for evaluation of penile conditions, including post-traumatic and neoplastic etiologies. Previously used as a problem-solving tool in patients who had undergone ultrasound for penile trauma or neoplasm, it is now increasingly being used as a primary modality for evaluation of these conditions and is a useful adjunct to physical examination. With its excellent contrast resolution, MRI can be used evaluate the integrity of the tunica albuginea, urethra, and vasculature and thereby differentiate a contusion from a fracture, helping direct management (surgical versus non-surgical). It can also be used for accurate tumor staging - including assessment of local extent, nodal and distant metastatic disease - and for surveillance following resection.

**TABLE OF CONTENTS/OUTLINE**

Review of penile anatomyPenile MRI protocol, including protocol challengesCase-based review of penile trauma on MRIPenile cancer types and staging of penile squamous cell carcinomaCase-based review of penile cancer stages on MRIPostoperative appearance following penectomy (partial/total), including tumor recurrence

## GUEE-34 VARIANTS OF UTERINE FIBROIDS: LET'S TALK ABOUT THEM

Silvia E. Gimenez, MS (*Abstract Co-Author*) Nothing to Disclose
Teresa A. Garcia, MD (*Abstract Co-Author*) Nothing to Disclose
Diego Saez, MD (*Abstract Co-Author*) Nothing to Disclose
Maria Toscano, MD (*Abstract Co-Author*) Nothing to Disclose
MARIA BELEN DASS CORREA (*Abstract Co-Author*) Nothing to Disclose
Maria N. Napoli, MD (*Abstract Co-Author*) Nothing to Disclose
Leonela Panaccio (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Leiomyomas are the most common gynecological neoplasm.- Uterine leiomyomas and leiomyosarcomas are the two extremes within smooth muscle tumors, with diverse histological variants in the middle, including cellular histology, bizarre or atypical nuclei, mitotically active fibroids, and uterine smooth muscle tumor (STUM) lesions.- These variants present a distinctive histological profile and the characteristics may generate uncertainty in diagnostic interpretation.- There are no clear significant findings that can reliably distinguish fibroid variants, however there are some characteristics suggestive of non-typical or ordinary leiomyomas.- It´s essential for the radiologist to be aware of both the typical and atypical findings to best guide for diagnosis and management decisions- The definitive diagnosis of a leiomyoma variant is through post-surgical pathological examination.

**TABLE OF CONTENTS/OUTLINE**

- Comprehensive description in imaging findings of leiomyoma variants and their pathologic features.- Comparative analysis of the features of uterine leiomyomas in ultrasound and magnetic resonance imaging that may be suggestive of one of the variants.- Demonstrate the significance of imaging findings in facilitating early detection, informing treatment strategies, and guiding patient monitoring for individuals affected by uterine leiomyomas.- Exemplify with cases.

## GUEE-35 COMPREHENSIVE IMAGING AND DIAGNOSTIC APPROACH TO UPPER TRACT UROTHELIAL CANCERS: INSTITUTIONAL INSIGHTS AND CLINICAL IMPLICATIONS

Refky Nicola, MSc, DO (*Abstract Co-Author*) Royalties, RELX
Sravani Gampala, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Understand the distribution of upper tract urothelial cancers (UTUC) and their most common locations and presentations.2. Explore various clinical scenarios to raise the possibility of UTUC by interpreting radiologists.3. Discuss the best imaging modalities and optimal protocols for the diagnoses of UTUC based on our institutional experience.4. Recognize papillary, flat and infiltrative types and sub-types of the UTUC with relevant imaging from our institution. Differentiate tumors from pseudo tumors based on imaging to appropriately guide clinical management.5. Discuss the sequential involvement of UTUC and bladder cancer; educate trainees to carefully evaluate the urinary tract and bladder if they find any one of the cancers.

**TABLE OF CONTENTS/OUTLINE**

1. Discuss the epidemiology, risk factors, and clinical presentation of the UTUC.2. Explore the distribution and association with concomitant or recurrent bladder cancer and contralateral urinary tract cancer.3. Discuss the optimal imaging protocols will be outlined in general and used at our institution for better evaluation of tumors from pseudo tumors.4. Present a case-based review of different types of UTUCs, including papillary, flat, and infiltrative types. Present a unique case of histologically different but synchronous UTUC involving the renal pelvis and ureter.5. Discuss various differential diagnoses, which mimic UTUC including blood clots, hypertrophied papilla, renal papillary necrosis (ball on tee sign), inflammation, retroperitoneal fibrosis, renal cell carcinomas, and renal lymphomas. Review of different imaging findings will be presentedusing a multimodality case-based approach.

## GUEE-36 POST-ABLATION IMAGING CHANGES ON PROSTATE CANCER AND PI-FAB SCORE SYSTEM: CASE-BASED REVIEW

Thais Mussi, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Fernando M. Coelho, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Gustavo C. Lemos, MD (*Abstract Co-Author*) Nothing to Disclose
Ivan Duarte (*Abstract Co-Author*) Nothing to Disclose
Ronaldo H. Baroni, PhD (*Abstract Co-Author*) Nothing to Disclose
Rodrigo G. Garcia, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Guilherme C. Mariotti, MD (*Abstract Co-Author*) Nothing to Disclose
Arie Carneiro, MD (*Abstract Co-Author*) Nothing to Disclose
Aline Pasquarelli, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Briefly review the prostate cancer focal treatment options.- Understand the current indications of high-intensity focused ultrasound (HIFU) and irreversible electroporation (IRE) and its technique procedures.- Review the prostate multiparametric MR imaging technique and zonal anatomy of the prostate.- Discuss the expected and unexpected post-ablation MR imaging findings.- Recognize the importance of DCE and DWI MRI sequences to detect prostate cancer recurrence afterablation.- Comprehend the new proposal PI-FAB score system and its role in patient follow-up.

**TABLE OF CONTENTS/OUTLINE**

INTRODUCTION

● Overview of prostate cancer and focal therapy options
● New guidelines for HIFU for prostate cancer
HIFU AND IRE FOR PROSTATE CANCER
● What: Current concepts
● When: Potential candidates
● Where: Procedure description
● How: Tissue effects and limitations
PROSTATE IMAGING EVALUATION
● MRI protocol
● Prostate zonal anatomy at MRI
● The new scoring system for focal ablation (PI-FAB)
○ General concepts and rationale for using PI-FAB score system
○ When and how apply PI-FAB score system, correlating didactic cases.
○ Clinical management based on PI-FAB score
CASE-BASED REVIEW
● Expect and unexpected post-ablation MRI findings
● Normal temporal changes
● Residual or recurrent prostate cancer
● Pitfalls

## GUEE-37 CRACKING THE CYSTS: MASTERING THE V2019 BOSNIAK CLASSIFICATION WITH A QUIZ-BASED APPROACH

Leonardo K. Bittencourt, MD, PhD (*Abstract Co-Author*) Research Consultant, Canon Medical Systems Corporation
Eduardo Thadeu De Oliveira Correia, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Khyrul A. Khan (*Abstract Co-Author*) Nothing to Disclose
Ifeanyi Ekpunobi, BS (*Abstract Co-Author*) Nothing to Disclose
Andres Hernandez (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The Bosniak Classification v2019 provides a framework for classifying cystic lesions based on their complexity and likelihood of malignancy, with Bosniak classifications ranging from I to IV. Examination questions regarding focal renal lesions is a recurrent theme in medical training, such as in the US Medical Licensing Examination (USMLE). However, students often lack sufficient exposure to the principles of renal cyst imaging throughout their training. This exhibit aims to enhance the training of medical students and radiology residents by offering a quiz-based approach to the Bosniak Classification system in the form of a question bank, a popular exam preparation tool used by medical trainees.

### TABLE OF CONTENTS/OUTLINE

1. Main components of the Bosniak Classification system a. Separate CT and MRI criteria in the Bosniak Classification v2019 b. Overview of Bosniak classes I through IV 2. Cracking the cysts questions: translating imaging features into simple language for trainees a. Bosniak classification of a small, well-defined cystic lesion with no septa or calcifications i. Q1: Bosniak class I criteria ii. Q2: Follow-up for Bosniak I b. Bosniak classification of a small, well-defined cystic lesion with thin, non-enhancing septa i. Q3: Bosniak class II criteria ii. Q4: Follow-up for Bosniak II c. Bosniak classification of a cystic lesion with a minimally thickened enhancing wall i. Q5: Bosniak class IIF criteria ii. Q6: Follow-up for Bosniak IIF d. Bosniak classification of a cystic lesion with enhancing thick septa i. Q7: Bosniak class III criteria ii. Q8: Follow-up for Bosniak III e. Bosniak classification of a cystic lesion with enhancing nodules i. Q9: Bosniak class IV criteria ii. Q10: Follow-up for Bosniak IV

## GUEE-38 RADIOLOGIST ROLE IN MR GUIDED FOCAL LASER ABLATION FOR LOCALIZED PROSTATE CANCER: LESSONS LEARNED AND ADVANCEMENTS IN PATIENT CARE

Sangeet Ghai, MD (*Abstract Co-Author*) Research Grant, INSIGHTEC Ltd
Nathan Perlis (*Abstract Co-Author*) Nothing to Disclose
Vanessa Murad, MD (*Abstract Co-Author*) Nothing to Disclose
Adriano Basso Dias, MD, MSc (*Abstract Co-Author*) Nothing to Disclose
Jorge A. Abreu Gomez, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Radiologist leadership enhances Focal Laser Ablation (FLA) performance and promotes procedure standardization through a systematic approach focused on safety and technical consistency.- MRI guidance enables precise lesion localization enhancing delineation of lesion boundaries and facilitating the planning of ablation volumes. Real-time MRI thermal monitoring facilitates intra-procedural optimization of ablation temperatures and treatment margins.- FLA is acknowledged as a safe and efficient method for executing targeted therapy, controlling disease target while preserving healthy prostatic tissue and reducing the likelihood of adverse effects.- Patient related factors such as motion or anatomical distortion resulting from the insertion and repositioning of the treatment device may hinder the achievement of a successful ablation.

### TABLE OF CONTENTS/OUTLINE

1. Introduction2. Benefits and Constraints of MRI Guidance3. MRI-Guided Focal Laser Ablation (FLA) Technique4. Essential Components for MRI-Guided FLA4.1 Personnel Requirements4.2 Scheduling and Duration of Procedure4.3 Patient Preparation4.4 Necessary Equipment4.5 Patient Positioning and Anesthesia Protocol5. Intraprocedural steps5.1 Insertion of Laser Fiber5.2 Baseline Position Verification with MRI5.3 Lesion Identification5.4 Positioning and Advancement of Laser Fiber - verification of lesion localization5.5 Intraprocedural Monitoring - MR Thermography and Verification of Ablated Margins5.6 Patient Recovery6. Complex Cases and Insights6.1 Learning Curve and Motion-related Challenges6.2 Prostate Distortion6.3 Complex Target Locations7. Radiologist Leadership and standardization8. Take home messages

## GUEE-39 UROLOGIC APPLICATIONS OF DUAL-ENERGY CT: WHAT THE RADIOLOGIST AND UROLOGIST NEED TO KNOW

Isao Tanaka (*Abstract Co-Author*) Nothing to Disclose
Rika Fukui (*Abstract Co-Author*) Nothing to Disclose
Etsuko Tate, MD (*Abstract Co-Author*) Nothing to Disclose
Hidenori Yamaguchi (*Abstract Co-Author*) Nothing to Disclose

Yun Shen, PhD (*Abstract Co-Author*) Employee, General Electric CompanyResearcher, General Electric Company
Makiko Nishikawa, MD (*Abstract Co-Author*) Nothing to Disclose
Haruhiko Machida, MD (*Abstract Co-Author*) Nothing to Disclose
Wakana Samejima (*Abstract Co-Author*) Nothing to Disclose
Hitoshi Takeuchi, MD (*Abstract Co-Author*) Nothing to Disclose

Toshiya Kariyasu (*Abstract Co-Author*) Nothing to Disclose
Shingo Harashima (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. To introduce current limitations in urologic applications of single-energy CT (SECT) 2. To describe basic principles and various imaging/analyzing techniques of dual-energy CT (DECT) 3. To illustrate clinical utilities of DECT over SECT in urologic applications by presenting various clinical images

**TABLE OF CONTENTS/OUTLINE**

1. Current limitations in urologic applications of SECT a) Limited image quality assessment of urinary tumor/stone composition b) Greater radiation/contrast media (CM) dose 2. Basic principles imaging/analyzing techniques of DECT a) Virtual monochromatic (VMI)/material decomposition imaging (MDI) b) Spectral HU (keV-HU) curve/effective Z analysis c) Metallic artifact reduction software (MARS) d) Iterative (IR)/deep-learning reconstruction (DLR) 3. Clinical utilities of DECT over SECT in urologic applications a) Improved image contrast/reduced CM dose: low-keV VMI/IR/DLR b) Reduced beam-hardening/metallic artifact: high-keV VMI/MARS c) Differentiation of cystic solid masses (e.g., complicated cysts): iodine-enhanced MDI d) Assessment of tumor grade/viability/response to chemotherapy: iodine-enhanced MDI e) Virtual non-contrast CT/reduced radiation dose: iodine-suppressed MDI/IR/DLR f) Bone metastasis detection: hydroxyapatite/calcium-suppressed MDI g) Lipid-rich lesion (e.g., renal angiomyolipoma) detection: fat-enhanced MDI/spectral HU curve/effective Z analysis h) Urinary stone composition analysis: uric acid/calcium MDI effective Z analysis

## GUEE-4 WHICH KIDNEY TO EXTRACT, SECTIONAL CT OF LIVING RENAL DONORS. WE TELL YOU

**Awards**
**Certificate of Merit**

Carlos M. Campana SR, MD (*Abstract Co-Author*) Nothing to Disclose
Mary E. Arevalo Molina, MD (*Abstract Co-Author*) Nothing to Disclose
Omar A. Gamboa Abundis, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Kidney failure is a major health problem that affects approximately 7.2% of the world's population. There are multiple kidney replacement therapies; however, the only definitive one is kidney transplant, which offers a better quality of life. It is important for the resident physician and radiologist to develop a radiological reporting system with the necessary pre-surgical information for the surgeon and to specify the exclusion criteria for a probable kidney donor. The left kidney is preferred for donation due to the greater length of the renal vein. Presence of more than two arteries within a kidney exclude the donor. Unilateral agenesis, horseshoe kidney, cortical atrophy, polycystic kidney disease, medullary sponge kidney, and necrosis exclude the donor. A gonadal vein greater than 5mm in diameter should be reported as it alters the surgical technique.

**TABLE OF CONTENTS/OUTLINE**

1. Objectives and introduction to renal insufficiency. 2. Low-dose radiation protocol for tomographic acquisition of the potential donor. 3. Checklist of key points to consider in the radiological report of the living kidney donor. 4. Location and size of the kidneys. 5. Number of renal arteries and veins. 6. Type and diameter of accessory renal arteries. 7. Location and distance of the first segmental arterial bifurcation. 8. Type and diameter of renal veins. 9. Frequent and infrequent vascular anatomical variants. 10. Perinephric fat and urinary tract11. Exclusion criteria for living kidney donors. 11. Common pathology. 12. Development of a radiological reporting system with the necessary preoperative information. 13. Conclusion and teaching points

## GUEE-40 BLADDER INJURY: WHAT TO LOOK FOR AND HOW TO FIND IT

**Awards**
**Certificate of Merit**

Pablo Penalver Calero, MD (*Abstract Co-Author*) Nothing to Disclose
Ramiro Mendez (*Abstract Co-Author*) Nothing to Disclose
Jeronimo Barrera Ortega, MD (*Abstract Co-Author*) Nothing to Disclose
Jose Manuel Espejo Dominguez (*Abstract Co-Author*) Nothing to Disclose
Sebastian M. Gill, MD (*Abstract Co-Author*) Nothing to Disclose
Alvaro Rueda-de-Eusebio, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

-To review the techniques and protocols used for the study of bladder injury, emphasizing the correlation between different imaging modalities. - To explain the anatomical basis and mechanisms of injury that determine the different types of bladder rupture. - To illustrate the different existing classifications that can be used to describe bladder injury.

**TABLE OF CONTENTS/OUTLINE**

Introduction: Bladder perforation, rupture or trauma is the laceration of the bladder wall, whether full-thickness or incomplete. These can be very subtle injuries, which can be easily overlooked in the setting of trauma patients. If this happens, complications such as urinary tract infections, incontinence or fistulas may occur. Therefore, it is important for radiologists to be aware of this entity and the methods available for its study. Imaging techniques: In this presentation we explain the different imaging modalities that can be used when bladder injury is suspected. Not only conventional cystography and CT-cystography, but also covering US, non-contrast CT and MRI. We will explain protocols, advantages and disadvantages of each technique and provide details that, in our experience, make the difference. Mechanism of injury: We review the anatomy and the possible mechanisms of injury (spontaneous and traumatic, whether closed, penetrating or iatrogenic). Classifications: We will cover both Sandler and AAST classifications. Sandler's is the most used one and divides ruptures into intramural hematoma or contusion, intraperitoneal rupture, extraperitoneal rupture and intra- and extraperitoneal rupture. For all of the above, we will use representative images from our series of more than 50 cases.

## GUEE-41 DEMYSTIFYING MRI PENILE PROSTHESIS EVALUATION: INTRODUCTION FOR NOVICES

Noor Fatima Majeed, MD (*Abstract Co-Author*) Nothing to Disclose
Diana Murcia, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Penile prosthesis is the ultimate treatment for erectile dysfunction. Dedicated penile MR protocol is the imaging of choice for evaluation of penile prostheses as it allows a three-in-one assessment of position, functionality, and penile anatomy. The currently most common prostheses include the 3-piece inflatable penile prosthesis (IPP), followed by the 2-piece IPP, and the malleable or semi-rigid penile prosthesis (MPP). Complications of any type and any component include fracture, infection, malposition, hematoma, and encapsulation. Inflatable type specific complications include kinking or buckling resulting in floppy glans syndrome, aneurysmal dilatation, and leakage. Knowledge of penile MR anatomical structures is crucial for the appropriate diagnosis of these complications.

**TABLE OF CONTENTS/OUTLINE**

Penile MR protocol specific pre and post inflation sequences for IPP. Penile MR anatomy review. Types of penile prostheses: 2-piece Inflatable (IPP), 3-piece IPP, Malleable or semi rigid (MPP). Evaluation of anatomic location and functionality. Common complications.

## GUEE-42 VIRADS: OUR WEAKNESS IN THE FACE OF HONEST MISTAKES

German Ramos Rubio, MD (*Abstract Co-Author*) Nothing to Disclose
Richard Mast Vilaseca (*Abstract Co-Author*) Nothing to Disclose
Nuria Roson Gradaille, MD (*Abstract Co-Author*) Nothing to Disclose
Anna Alberti Sancho, MD (*Abstract Co-Author*) Nothing to Disclose
Carlos Serrano Burgos (*Abstract Co-Author*) Nothing to Disclose
Ramon Almodovar, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1.- Be careful when you look at the T2 sequences to avoid overdiagnosis when slightly hyperintense signal is present. 2.- Some bladder and patient conditions may complicate the accuracy of the VIRADS system. 3.- All sequences should be considered globally to assign a final VIRADS score.

**TABLE OF CONTENTS/OUTLINE**

1.- Introduction to the VIRADS System: Overview, Importance, and Applications in Clinical Practice. 2.- Our Initial Results in Implementing VIRADS: Early Findings and Statistical Outcomes. 3.- Learning from Practical Cases: - Technical Aspects Related to VIRADS and MRI. - Issues Related to the Patient Variability. - Tumor Characteristics. 4.- Conclusions: Summary of Key Findings with Final Thoughts on Improving VIRADS Implementation

## GUEE-43 PROSTATE CANCER ACTIVE SURVEILLANCE PRECISE V2: WHAT HAS CHANGED AND CLINICAL IMPLICATIONS

Pamela Grazielle Correa De Oliveira (*Abstract Co-Author*) Nothing to Disclose
Jorge Elias JR, MD, PhD (*Abstract Co-Author*) Nothing to Disclose

Thalyne Lima (*Abstract Co-Author*) Nothing to Disclose
Valdair F. Muglia, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Active surveillance for prostate cancer is a management strategy employed in cases of low-risk and favorable intermediate-risk cancer. Its goal is to avoid invasive treatment options while maintaining a curative perspective. Several studies have highlighted the promising role of MRI in these cases, directly influencing clinical decisions and aiding urologists in providing optimal patient care.In 2016, the European School of Oncology established an international task force of experts, resulting in the publication of the PRECISE version 1 guidelines. These guidelines aimed to standardize the description of serial MRIs in both research studies and clinical practice. In 2024, Precise version 2 was released, with significant improvements discussed by an international panel comprising experts from various countries.The purpose of this educational exhibit is to explore the key differences between the first and current versions of PRECISE, emphasizing areas of improvement. Additionally, we aim to illustrate the clinical application of the current PRECISE classification using real cases from our institution.Finally, we will engage in a discussion about the current version of PRECISE, particularly discussing the areas for potential improvement.

**TABLE OF CONTENTS/OUTLINE**

Introduction; Objetives; Main updates in PRECISE version 2; Illustration base on clinical cases of the applicability of PRECISE V2; Discuss its limitations and areas of improvement; Conclusion.

## GUEE-44 LET THE BUBBLES BURST!: ROLE OF CONTRAST ENHANCED US IN THE RENAL CYSTIC AND SOLID MASSES. FROM DIAGNOSIS TO TREATMENT.

**Awards**
**Certificate of Merit**

Ana Berasategui Criado, MD (*Abstract Co-Author*) Nothing to Disclose
Marta Barrios Lopez, MD (*Abstract Co-Author*) Nothing to Disclose
Sofia Bretos Azcona, MD (*Abstract Co-Author*) Nothing to Disclose
Alejandro Fernandez Florez, MD (*Abstract Co-Author*) Nothing to Disclose
Aranzazu Sanchez Gabin, MD (*Abstract Co-Author*) Nothing to Disclose
Elena Julian Gomez, MD (*Abstract Co-Author*) Nothing to Disclose
Celia Cantolla Nates (*Abstract Co-Author*) Nothing to Disclose
Marina Arroyo Olmedo, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. To understand the usefulness of contrast-enhanced ultrasound for the characterisation of renal cystic lesions and other renal masses. 2. To review the main differences that should be made when using the Bosniak classification in CEUS compared to the existing one for CT and MRI and when not to use this classification. 3. To analyse the role of CEUS in the context of pre- and post-ablative treatments.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction. In the USA, the use of contrast-enhanced ultrasound is only approved by the FDA for liver indications. Therefore, for kidney and other organs it is used off-label. CEUS has significant differences from CT and MRI in terms of contrast and temporal resolution (among others), so the characterisation of cystic renal masses requires certain specifications. It also provides greater sensitivity in the characterisation of enhancement in papillary tumours. 2. General considerations on renal contrast-enhanced ultrasonography. 3. Renal cystic lesions: 3.1. Definition. 3.2. Evaluation by CEUS (compared to CT) based on the Bosniak classification (pictorial review): 3.2.1. Bosniak I. 3.2.2. Bosniak II and IIF. 3.2.3. Bosniak III. 3.2.4. Bosniak IV. 3.3. When not to use the Bosniak classification: 3.3.1. Inflammatory-infectious. 3.3.2. Masses with cystic-necrotic component. 3.3.3. Vascular. 4. Problem solving: cysts and other renal masses. Limitations of CEUS. 5. Analyze the different type of treatments: multidisciplinary committees. 6. Usefulness of

CEUS in local treatments. 6.1. Planning of ablation treatments. 6.2. Detection of early complications post-ablation. 6.3. Surveillance after ablative treatment (proposal of treatment and follow-up algorithm). 7. Conclusions.

## GUEE-45 HOW TO CRACK THE NUT: WHAT RADIOLOGISTS NEED TO KNOW ABOUT BENIGN TESTICULAR LESIONS

Felippe D. Garcia, MD (*Abstract Co-Author*) Nothing to Disclose
Isabela Ribeiro (*Abstract Co-Author*) Nothing to Disclose
Caio P. Martinel, MD (*Abstract Co-Author*) Nothing to Disclose
Janaina Moreira (*Abstract Co-Author*) Nothing to Disclose

Roberto Froeder Oliveira, MD (*Abstract Co-Author*) Nothing to Disclose
Luana Paschoal, MD (*Abstract Co-Author*) Nothing to Disclose
Ana Gomes, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Ultrasonography of the scrotum is a very important tool for evaluating the testicles as well as their adjacent structures, providing important anatomical details with the possibility of real-time assessment of vascularization through the Color Doppler feature in a non-invasive way.Testicular pouch changes encompass a spectrum from benign to serious conditions. In relation to benign changes, acute scrotum refers to sudden onset scrotal pain and swelling, often due to serious conditions like testicular torsion, epididymitis, or trauma. US is crucial for accurate diagnosis and timely intervention to prevent complications and preserve testicular function. In pediatrics, cryptorchidism refers to undescended testicles, where one or both testes fail to descend into the scrotum. US is valuable for diagnosing, visualizing the testicles position and assessing any associated abnormalities. Retractable testicles, on the other hand, can retract into the inguinal canal but are otherwise normal. The method helps differentiate between these two pathologies.Ultrasound of the testicular sac is vital for evaluating various chronic disorders such as hydrocele, scrotal lithiasis, and epididymal cysts. Overall, US provides crucial imaging information for precise diagnosis, treatment planning, and monitoring of these conditions, ensuring optimal patient care.

### TABLE OF CONTENTS/OUTLINE

This work aims to differentiate the main benign testicular lesions as well as the main ultrasound findings.

## GUEE-46 NON-TRAUMATIC GENITOURINARY EMERGENCIES: WHAT RESIDENTS SHOULD KNOW

Refky Nicola, MSc, DO (*Abstract Co-Author*) Royalties, RELX
Antonio Santana Veliz, MD, BSN (*Abstract Co-Author*) Nothing to Disclose
Sukrita Menon, MD (*Abstract Co-Author*) Nothing to Disclose
Gilberto J. Aquino, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• Guide residents through different emergencies involving the genitourinary system in a non-traumatic setting.• Recognize multiple patterns of renal parenchymal pathologies that may require immediate action. • Review time-sensitive pathologies of the male and female genital systems.

### TABLE OF CONTENTS/OUTLINE

Kidneys/ureters• Renal Infarction • Renal vein thrombosis• Renal Hemorrhage (non-traumatic causes)• Renal Abscess• Acute Pyelonephritis• Emphysematous pyelonephritis• Pyonephrosis• Renal Cortical necrosis• Renal Papillary Necrosis• Obstructive Uropathy Bladder• Emphysematous cystitis Adrenals• Adrenal Hemorrhage (non-traumatic causes) Male Genital• Testicular Infarction• Testicular Torsion• Epididymo-orchitis• Testicular Abscess• Prostatitis and Abscess• Fournier's gangreneFemale Genital • Pelvic Inflammatory Disease• Acute Adnexal Torsion • Ovarian Infarction• Ovarian Vein Thrombosis• Pyomyoma

## GUEE-47 BALLS TO THE WALLS: A JOURNEY THROUGH TESTICULAR MRI PROTOCOLS AND CLINICAL APPLICATIONS

Raphael Lanz (*Abstract Co-Author*) Nothing to Disclose
Leonardo K. Bittencourt, MD, PhD (*Abstract Co-Author*) Research Consultant, Canon Medical Systems Corporation
Khyrul A. Khan (*Abstract Co-Author*) Nothing to Disclose
Eduardo Thadeu De Oliveira Correia, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Ultrasound is the most common imaging modality for the evaluation of the testicles. However, testicular MRI plays a crucial role in the diagnosis and characterization of various testicular conditions, encompassing non-neoplastic, benign neoplastic, and neoplastic entities. Despite its significance, this imaging technique is relatively unfamiliar to a considerable portion of the radiology community. This exhibit offers a comprehensive overview, exploring testicular MRI protocols, their clinical applications, common cases encountered in practice, and a glimpse into the evolving future of this diagnostic tool.

### TABLE OF CONTENTS/OUTLINE

1. Navigating Testicular MRI Clinical Indications, a. Non-neoplastic conditions, b. Benign neoplastic conditions, c. Neoplastic conditions. 2. How to structure a testicular MRI protocol in your institution, a. Patient preparation and positioning, b. Technical protocols for non-contrast and contrast-enhanced examinations. 3. How to read a testicular MRI? 4. Learning with cases, a. Case 1: a normal-appearing testicular MRI, b. Case 2: a benign condition, c. Case 3: a neoplastic condition. 5. Future perspectives for testicular MRI, a. The emergence of quantitative imaging techniques for the testicles, b. Potential future clinical applications of testicular MRI.

## GUEE-48 PEEKING INSIDE THE ADRENAL GLAND: A RADIOLOGICAL JOURNEY THROUGH UNUSUAL AND RARE ADRENAL TUMORS AND TUMORLIKE CONDITIONS WITH PATHOLOGICAL CORRELATION"

James T. Lee, MD (*Abstract Co-Author*) Nothing to Disclose
Joanie M. Garratt, MD (*Abstract Co-Author*) Nothing to Disclose
Ahmed Taher, MD (*Abstract Co-Author*) Nothing to Disclose
Khaled M. Elsayes, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• Describe the imaging approach for evaluating unusual and rare adrenal tumors.• Illustrate imaging manifestations of a spectrum of rare adrenal tumors and tumorlike conditions.• Correlate the imaging features with pathological findings.• Identify potential pitfalls in imaging of unusual and rare adrenal tumors and tumorlike conditions. • Discuss the impact of imaging features on management.

**TABLE OF CONTENTS/OUTLINE**

• Introduction • Epidemiology, pathological classification and pathogenesis of unusual and rare adrenal tumors • Epidemiology, pathological classification of Tumorlike conditions involving the adrenal gland. • Multimodality imaging features of unusual and rare adrenal tumors o Primary bening tumors: § Hemangioma § Lymphangioma § Schwannoma § Oncocytoma § Ganglioneuroma § Teratoma § Lipoma § Mason's Tumor § Lipomatous metaplasia/degeneration o Primary malignant tumors: § Angiosarcoma § Pleomorphic sarcoma. § Lymphoma (could be primary or secondary) § Neuroblastoma/Ganglioneuroblastoma § Malignant nerve sheath tumor o Tumorlike conditions involving the adrenal gland § Extramedullary Hematopoiesis § Mucinous cyst § Pseudocyst § Hematoma § Adrenalitis § Histoplasmosis § Abscess • Differential diagnosis, diagnostic approach, and management • Summary and conclusion

## GUEE-49 UPPER TRACT UROTHELIAL CANCER AND ITS MIMICS: A PRIMER FOR TRAINEES

Avinash R. Kambadakone, MD, FRCR (*Abstract Co-Author*) Advisory Board, Bayer AG Research Grant, General Electric Company Research Grant, Koninklijke Philips NV Research Grant, PanCAN Research Grant, Bayer

Shravya Srinivas Rao, MD (*Abstract Co-Author*) Nothing to Disclose
Soumyadeep Ghosh, MBBS, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. CT Urogram is considered the imaging modality of choice for diagnosis; staging and follow-up of upper tract urothelial cancers.2. Spontaneous sub-urothelial hemorrhage can appear as hyperdense urothelial thickening on the non-enhanced phase with no or minimal enhancement. Follow-up imaging showing complete resolution should be obtained to avoid missing an underlying tumor that may have caused the hemorrhage.3. Pitfalls related to CTU and MRU techniques can mimic urothelial malignancy, and Radiologists should be aware of these while interpreting these studies.4. Radiologists should be cognizant of multimodality imaging appearances, ureteroscopy, and histopathology findings to accurately diagnose upper tract urothelial cancers and differentiate them from their mimics, to guide appropriate treatment.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction to Urothelial Cancer with pertinent anatomy2. Imaging: Role of CT and MR urography in identifying upper urinary tract urothelial cancer3. Role of ureteroscopy and histopathology 4. Mimics and their imaging appearances

## GUEE-5 IMAGING OF RENAL TUMORS BASED ON WHO CLASSIFICATION OF TUMORS (2022), 5TH EDITION

Toyonori Tsuzuki (*Abstract Co-Author*) Nothing to Disclose
Athina Tsili, MD (*Abstract Co-Author*) Nothing to Disclose
Refky Nicola, MSc, DO (*Abstract Co-Author*) Royalties, RELX
Akira Yamamoto, MD, PhD (*Abstract Co-Author*) Nothing to Disclose

Samuel J. Withey, MBBS (*Abstract Co-Author*) Nothing to Disclose
Masahiro Jinzaki, MD, PhD (*Presenter*) Support, Canon Medical Systems Corporation;Support, General Electric Company

**TEACHING POINTS**

The WHO Classification of Tumors is published to standardize tumor names and diagnostic criteria to promote international comparative research on malignant tumors. Renal tumors are included in the volume titled "Urinary Male Genital Tumors," which was revised for the first time in six years as the 5th edition in 2022. From this edition, both pathologists and radiologists have joined as contributors, considering the extent to which diverse pathological classifications can be reflected in images. In the future, as the presence of genetic mutations becomes increasingly reflected in diagnostic names alongside histological features, radiologists will find it increasingly important to consider imaging findings from the perspective of imaging-genetic correlations, not just as a position of radiologic-pathologic correlation. In this paper, we will discuss the key points of this revision compared to the 4th edition, and we will also present how this classification can be reflected in imaging. (1) To introduce the WHO Classification of Renal Tumors 5th edition (WHO 2022)(2) To present imaging findings of major subtypes based on the WHO 2022(3) To present imaging features of relatively rare renal tumors following the WHO 2022 classification.

**TABLE OF CONTENTS/OUTLINE**

(1) Introduction (the points of revision of WHO 2022) (2) Protocols and Useful findings of US, CT or MRI (3) Diagnosis of major subtypes of renal tumors (Expansile growth and Invasive growth)(including Bosniak classification update 2019 and Clear Cell Likelihood Score) (4) Diagnosis of other renal tumors (Mucinous tubular and spindle cell carcinoma, etc) (5) Diagnosis of molecularly defined renal carcinoma (FH deficient RCC, etc)

## GUEE-50 ADVANCES IN PROSTATE CANCER IMAGING (FROM DETECTION TO POST-TREATMENT): A PICTORIAL REVIEW OF SCORING AND REPORTING SYSTEMS BEYOND PI-RADS

## GUEE-51 PENILE ANATOMY AND PATHOLOGIES UNDER THE MRI: AN ACADEMIC SHOWCASE

Fernando Gonzalez (*Abstract Co-Author*) Nothing to Disclose
Rolando Alfonso Cocio Arcos, MD (*Abstract Co-Author*) Nothing to Disclose
Giancarlo Schiappacasse, MD (*Abstract Co-Author*) Nothing to Disclose
Andres Labra, MD (*Abstract Co-Author*) Nothing to Disclose
Nicolas G. Molina Vasquez, MD (*Abstract Co-Author*) Nothing to Disclose
Fernando Vivanco, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Magnetic Resonance Imaging (MRI) offers a detailed anatomical assessment of penile structures, including the corpus spongiosum, cavernosum, and tunica albuginea, with specific signal characteristics on various sequences. A standardized acquisition protocol is necessary to ensure optimal imaging quality for evaluating penile pathologies. MRI is useful in the context of neoplasms, Peyronie's disease, trauma, and vascular pathology.

**TABLE OF CONTENTS/OUTLINE**

Anatomic review on MRI: Both corpus spongiosum (CS) and cavernosum (CC) show high signal on T2-weighted imaging (T2WI) and intermediate signal on T1-weighted imaging (T1WI). Urethral musculature appears hypointense compared to CS on T2WI. Tunica albuginea (TU) demonstrates low signal on both T1WI and T2WI. Contrast-enhanced MRI reveals gradual/centrifugal enhancement in CC and early enhancement in CS.The acquisition protocol requires patient supine with the penis flexed over the scrotum, small FOV (160 mm) and thin slices (2-3 mm). Sequences obtained are T2WI in three orthogonal planes, coronal/sagittal T1WI, axial small field of view diffusion-weighted imaging (DWI), dynamic contrast-enhanced sequences with fat saturation, and subtraction.Among the most frequent pathologies where MRI proves invaluable is in the characterization of primary and secondary neoplasms. Another spectrum of conditions in which MRI demonstrates utility includes Peyronie's disease, playing a crucial preoperative role. MRI shows remarkable sensitivity (99%) and specificity (87%) in trauma cases. Furthermore, in vascular pathology, notably cavernous body thrombosis, MRI offers crucial insights into thrombosis extension and associated findings.

## GUEE-52 THE STRANGE WORLD OF RENAL AND URINARY VARIATIONS

Victor R. Oliveira, MD (*Abstract Co-Author*) Nothing to Disclose
Rafael Rocha, MD (*Abstract Co-Author*) Nothing to Disclose
Thais De Castro Barboza (*Abstract Co-Author*) Nothing to Disclose
Brainner Campos Barbosa Januzzi, MD,PhD (*Abstract Co-Author*) Nothing to Disclose
Thiago O. Costa, MD (*Abstract Co-Author*) Nothing to Disclose
Felipe De Paula (*Abstract Co-Author*) Nothing to Disclose
Danilo Goncalves Filho, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

I. Emphasize the uncommon nature and the unique associated conditions of congenital anomalies in the urinary tract. This accentuates the critical need for a detailed and comprehensive imaging approach, aiming to ensure the early and accurate identification of these rare anomalies. Such a focused strategy is essential for optimizing patient outcomes and guiding effective management plans. II. Review advanced imaging techniques and their application in diagnosing congenital urinary tract anomalies, focusing on the benefits of 3D reconstruction and contrast-enhanced studies in understanding the anatomical complexities and functional implications of these conditions. III. Underline the indispensable role of the radiologist in multidisciplinary teams managing congenital urinary tract anomalies, from prenatal imaging to postoperative assessment, emphasizing how radiologic expertise contributes to tailored treatment plans and optimizes patient prognoses.

**TABLE OF CONTENTS/OUTLINE**

1. Embriology of urinary tract formation. 2. The role of computed tomography (CT) in evaluating congenital anomalies affecting the urinary tract. 3. Different presentations and examples of congenital anomalies affecting the urinary tract. a) Pancake kidney (discoid kidney) b) Renal cell carcinoma in a horseshoe kidney c) Supernumerary kidney d) Crossed renal ectopia e) Zinner Syndrome

## GUEE-53 MALE PELVIS NON-NEOPLASTIC LESIONS - WHAT RADIOLOGISTS NEEDS TO KNOW

**TEACHING POINTS**

Review the normal anatomy of the male pelvis.Illustrate the most prevalent non-neoplastic lesions of the prostate, seminal vesicle, duct deferens, urethra, testicles and penis.

**TABLE OF CONTENTS/OUTLINE**

1) Introduction:Review normal anatomy2)Prostate:Acute prostatitisChronic prostatitisGranulomatous prostatitisAbscess3)Seminal vesicle:Inflammation / infectionHemorrhage4)Deferens duct:Vasitis5)Urethra:Posterior urethral valveHypospadiaEpyspadia6)Testicle:TorsionSegmental infarctionInfectionLymphedema6)Penis:Peyronie DiseasePriapismPartial thrombosis of the corpus cavernosumSpontaneous hematoma7)Conclusion and "take-home messages"

## GUEE-54 ULTRASOUND OF TESTICULAR MASSES IN A "CEC"

Alejandra Valenzuela (*Abstract Co-Author*) Nothing to Disclose
Carlos F. Guardado Martinez, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

remember the different types of testicular tumors and the demographic and ultrasonographic characteristics that help in their identification

**TABLE OF CONTENTS/OUTLINE**

GERM CELL TUMORS:¬ Seminomas: This is the most common pure tumor and is associated with TCG¬NS in older patients, around 40 years of age. Non-seminomatous germ cell tumors (NSGCT): These are often heterogeneous in echotexture, and the presence of cystic spaces and calcifications is much more common in this group.Mixed germ cell tumor: This is much more common than pure forms. The average age of presentation is around 30 years, and its ultrasound appearance varies depending on the histological types that compose it.•Embryonal carcinoma: Ultrasound shows it as a heterogeneous lesion with poorly defined borders.•Yolk sac tumors or endodermal sinus tumors: These represent 80% of testicular tumors in children, with most cases appearing before 2 years of age. In adults, the pure form is rare and is present in approximately half of mixed tumor cases.• Teratoma: This is the second most common type in children and appears before 4 years of age. The pure form in adults is very rare and is found in half of mixed tumors. Ultrasound shows it as a well-defined complex mass that may have cysts, calcifications, and areas of fibrosis.STROMAL TUMORS OF THE SEX CORDS:These represent about 5% of testicular tumors, with a prevalence of 10¬-30% in the pediatric age group. 90% of them are benign, but there are no specific radiological criteria to differentiate them.

## GUEE-55 HYPOVASCULAR RENAL LESIONS: CAN WE HIT THE TARGET?

Anton Aubanell, MD (*Abstract Co-Author*) Nothing to Disclose
German Ramos Rubio, MD (*Abstract Co-Author*) Nothing to Disclose
Carlos Serrano Burgos (*Abstract Co-Author*) Nothing to Disclose

Richard Mast Vilaseca (*Abstract Co-Author*) Nothing to Disclose
Sandra Lopez Coello, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Renal tumors comprise a spectrum of hypovascular lesions, including papillary and chromophobe renal carcinoma, alongside rare entities with diverse imaging presentations.- Distinguishing subtypes remains challenging due to overlapping imaging features, especially in small lesions.- Certain features like small size, regular margins, and angular interface sign lean towards benignity in renal lesions.- Low fat content angiomyolipomas resemble RCC, while cystic masses with calcifications and fat should raise suspicion of atypical papillary carcinoma.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction- Overview of hypovascular renal tumors and their diagnostic challenges.2. Imaging modalities in renal mass assessment- CT and MRI protocols for evaluating renal masses.3. Benign lesions- Angiomyolipomas: classic and fat-poor variants.- Tubulocystic oncocytoma: Mimicking chromophobe or papillary RCC.- Inflammatory conditions and pseudotumors: tuberculosis mimicking solid renal masses.4. Malignant lesions- Papillary RCC: Imaging characteristics and atypical presentations.- Chromophobe RCC: homogeneous or heterogeneous appearance.- Rare malignant tumors: metanephric adenoma, mucinous tubular and spindle cell carcinoma, and tubulocystic RCC.- Hematopoietic and lymphoid tumors: renal involvement in lymphoma and leukemia.5. Diagnostic algorithm6. ConclusionsImportance of recognizing diverse renal tumor types for prognosis and management decisions.

## GUEE-56 MULTIMODALITY IMAGING MANIFESTATIONS OF SURGICAL COMPLICATIONS AFTER PROSTATIC INTERVENTIONS

**Awards**
**Certificate of Merit**

Akira Kawashima, MD (*Abstract Co-Author*) Nothing to Disclose
Stephen M. Broski, MD (*Abstract Co-Author*) Nothing to Disclose
Naoki Takahashi, MD (*Abstract Co-Author*) Nothing to Disclose
David A. Woodrum, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Adam T. Froemming, MD (*Abstract Co-Author*) Nothing to Disclose
Hiroaki Takahashi, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Cole P. Thompson, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

A wide range of interventions are employed in the management of benign prostatic hyperplasia (BPH) and prostate cancer (PCa). In BPH, recent innovations in minimally invasive procedures have expanded the options for treatment of lower urinary tract symptoms beyond transurethral resection of the prostate. Common interventions for PCa include ablation, radiation therapy, and surgery. On imaging, differentiation between the normal post-interventional appearance of the prostate and various complications has important implications for clinical management. These complications include those related to vascular injury; injury to the surrounding structures, including the urethra, bladder, and rectum; anastomotic leak; urethral stricture and bladder outlet obstruction; infection, including musculoskeletal involvement; and radiation injury to the pelvic organs. Radiologists should be familiar with the appearance of these complications on CT, MR, US, fluoroscopy and PET to ensure prompt identification and treatment. This educational exhibit will serve as a comprehensive multimodality review of the imaging manifestations of surgical complications after prostatic interventions.

**TABLE OF CONTENTS/OUTLINE**

- Review of the different types of interventions available for management of BPH and PCa.
- Normal post-interventional appearance of the prostate.
- Multimodality imaging findings of complications, including those related to BPH interventions; prostate biopsy; placement of fiducial markers and SpaceOAR hydrogel for radiotherapy planning; and ablation, surgery, and radiation therapy for prostate cancer.
- Common pitfalls in post-procedural imaging interpretation.
- Summary.

Akram M. Shaaban, MBBCh (*Presenter*) Royalties, RELX

**TEACHING POINTS**

1. Recognize the different entities that can present as a retroperitoneal cystic lesions2. Discuss how to reach a reasonable differential diagnosis based on imaging appearance, demographics, and location of the lesion

**TABLE OF CONTENTS/OUTLINE**

I. Neoplastic1.Cystic lymphangioma2.Mucinous cystadenoma/cystadenocarcinoma3.Cystic teratoma4. Cystic mesothelioma5. Mullerian cyst6. Epidermoid cyst7. Tailgut cyst8. Bronchogenic cyst9. Cystic change in solid neoplasm10. Pseudomyxoma retroperitoneiII. Non-neoplastic1. Pancreatic pseudocyst2. Lymphocele3. Urinoma4. Hematoma

## GUEE-58 THE IMPORTANT CONSIDERATIONS IN PERMANENT PROSTATE BRACHYTHERAPY WITH A FOCUS ON IMAGING DIAGNOSTICS

Chiyoko Tsuji (*Abstract Co-Author*) Nothing to Disclose
Yusaku Miyata (*Abstract Co-Author*) Nothing to Disclose
Shuichi Tanoue, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Ryosuke Akeda (*Abstract Co-Author*) Nothing to Disclose
Shiori Edamitsu (*Abstract Co-Author*) Nothing to Disclose
Chikayuki Hattori (*Abstract Co-Author*) Nothing to Disclose
Koichiro Muraki, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Iodine-125 (I-125) seeds, measuring 970 μm in diameter and 4.5 mm in length, are commonly used in low dose rate brachytherapy (LDR-BT) for prostate cancer. Due to their small size, these seeds can occasionally migrate through the venous system and lodge in peripheral blood vessels of various organs. Consequently, incidental findings of migrated seeds on plain radiographs or CT scans are not uncommon in patients with a history of LDR-BT.The development of hydrogel spacers, inserted between the prostate and rectum, has contributed to a decrease in the risk of grade 3 or higher rectal toxicity.The purpose of this presentation is to outline the imaging considerations for I-125 permanent seed placement for prostate cancer, focusing on two important aspects: (1) seed placement and migration; and (2) imaging changes and complications associated with hydrogel spacers. By understanding these imaging features, radiologists can better interpret post-treatment findings and guide patient management.1. Discuss the importance of Modified Peripheral Loading in Low Dose Rate Brachytherapy (LDR-BT) for prostate cancer.2. Highlight key points in imaging diagnostics for seed migration.3. Explore the effectiveness and precautions of using a Hydrogel Spacer in brachytherapy.4. By the end of this course, participants will: Understand the role of postoperative Xp/CT/MRI in LDR-BT. Grasp key concepts related to seed migration, spacers, and complications.

**TABLE OF CONTENTS/OUTLINE**

1. Concept and technique of Modified Peripheral Loading in LDR-BT. 2. Key points in postoperative imaging evaluation. 3. Imaging diagnostics for postoperative complications. 4. Summary.

## GUEE-59 MULTIPARAMETRIC MRI PRE AND POST FOCAL CRYOABLATION FOR PROSTATE CANCER: PEARLS AND PITFALLS FOR THE REPORTING RADIOLOGIST

**Awards**
**Certificate of Merit**

Jyothirmayi Velaga, MBBS, FRCR (*Abstract Co-Author*) Nothing to Disclose
Narayan Lath, MBBS, FRCR (*Abstract Co-Author*) Nothing to Disclose
Yan Mee Law, MBBS, FRCR (*Abstract Co-Author*) Nothing to Disclose
Kae Jack Tay, MBBS, MRCS (*Abstract Co-Author*) Nothing to Disclose
Chooi Yan Anna Lois Lai, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

A. Review aspects of focal therapy (FT) in treatment of localised prostate cancer B. Discuss pretreatment considerations on multiparametric MRI (mpMRI) C. Review expected post FT changes in the prostate D. Review in- and out-field tumor recurrence using case review E. Discuss pearls and pitfalls in mpMRI detection of post FT tumor recurrence F. Review aspects in surveillance of the post FT prostate

**TABLE OF CONTENTS/OUTLINE**

Focal therapy (FT) is an emerging middle ground between active surveillance and radical whole gland therapy for treatment of localized prostate cancer in the era of precision medicine. Pretreatment considerations on mpMRI for appropriate patient selection include accurate risk stratification through tumor detection and staging as well as determination of tumor location and volume through judicious use of DCE. Low volume clinically significant cancer and MRI-occult cancers present challenges in pretreatment mpMRI.Post FT surveillance with mpMRI is critical for assessing oncologic efficacy. Post FT mpMRI is challenging as treatment changes distort the prostate gland and alter the signal intensity of treated and untreated parenchyma. DCE is the dominant sequence for assessing recurrent cancer post FT. With histology proven case reviews, we showcase the use of PI-FAB score for in-field and PI-RADS v2.1 for out-field recurrences in medium and long term surveillance. We discuss the pearls and pitfalls of mpMRI in post FT surveillance including tumor mimics and the use of ADC in guiding post treatment biopsy decisions. Limitations of mpMRI staging post FT recurrence are discussed including management of post FT tumor recurrence.

## GUEE-6 PENILE ULTRASOUND, EVERYTHING THE RADIOLOGIST SHOULD KNOW

Sandro C. Mandaloufas (*Abstract Co-Author*) Nothing to Disclose
Miguel J. Neto (*Abstract Co-Author*) Nothing to Disclose
Guilherme C. del Guerra, MD (*Abstract Co-Author*) Nothing to Disclose

Daniel N. Costa, MD (*Abstract Co-Author*) Research support, Bayer AG
Robert C. Sibley III, MD (*Abstract Co-Author*) Nothing to Disclose
Michael D. Bass, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Prostate cancer (PCa) care is rapidly evolving with multi-modality imaging, particularly multiparametric MRI, new ultrasound technologies, and molecular imaging now playing a key role in diagnosis, staging and treatment.2. Multiple reporting systems have been proposed to help standardize multi-modality image assessment and to facilitate communication with patients and referring physicians.3. We provide an illustrated, case-based review of the several proposed criteria used for assessment of MR image quality, detection and risk stratification of primary PCa, staging metastatic disease, and recurrence after conventional or focal therapy.

**TABLE OF CONTENTS/OUTLINE**

1.Quality and Structured ReportingA. Pillars of Quality in Prostate Imaging: Image, Interpretation and BiopsyB. Advantages and Disadvantages2.Rationale, basic principles and illustrated review of standardized frameworks for reporting prostate imaging findings beyond PI-RADS A. MR image quality (PI-QUAL v1 and v2)B. Active surveillance (PRECISE)C. Post-treatment follow-up (PI-RR and PI-FAB)D. Micro-ultrasound (PRI-MUS)E. Molecular imaging (PSMA-RADS, PRIMARY)3.Implementation of multiple standardized frameworks in clinical practice - Practical RecommendationsA. Detection of primary PCaB. Characterization and risk assessment in primary PCaC. Detection of metastatic PCaD. Evaluation disease recurrence after conventional or focal therapy4.Challenges and OpportunitiesA. Use of Templates (picklists, references)B. Role of physician lead(s) (updates, radiologist training/feedback, communication with referring physicians) C. Integration of data from different systems and imaging-pathology data reconciliation

## GUEE-61 PSMA RADS VERSION 2.0: AN INSTITUTIONAL CASE BASED REVIEW OF THE UTILITY OF UPDATED PSMA RADS IN CLINICAL PROBLEM SOLVING

Refky Nicola, MSc, DO (*Abstract Co-Author*) Royalties, RELX
Sravani Gampala, MD (*Abstract Co-Author*) Nothing to Disclose
Arwa Elsamny, MBBCh (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Knowledge of the different radiotracers used for PSMA PET and the definition of physiological versus pathological uptake. 2. Review the PSMA RADS categories with emphasis on changes made to categories in PSMA-RADS 2.0. 3. Recognize the importance of the use of the updated PSMA RADS 2.0 for standardized reporting. 4. Understand how the application of PSMA RADS has helped direct management in clinically challenging situations.5. Acknowledge the limitations of the PSMA RADS classification and areas for reform.

**TABLE OF CONTENTS/OUTLINE**

1. Introductory about the history of the PSMA RADS classification.2. Different radiotracers /Ligands for PSMA PET (Ga 68 and F18) at the molecular level.3. Definition of physiologic Vs pathologic uptake of the radiotracers. Definition of increased uptake. 4. Navigating the New Frontier: Key Updates in PSMA-RADS version 2.0.5. Examples of PSMA RADS1, 2, 3A, 3B, 3C, 3D, 4, and 5 lesions with emphasis on management recommendations and changes to categories in PSMA RADS 2.0. 6. Example of a timeline for a patient followed by PSMA PET and an example of post-treatment changes. 7. Limitations of the current PSMA RADS 2.0. and suggestions for reform.

## GUEE-62 MAGNETIC RESONANCE UROGRAPHY (MRU): TECHNIQUE MASTERY AND ILLUSTRATIVE CASE REVIEWS

Mohamed Elbanan, MD (*Abstract Co-Author*) Nothing to Disclose
Nourel Hoda M. Tahon, MD, MSc (*Abstract Co-Author*) Nothing to Disclose
Kazi A. Irfan, MD, FRCR (*Abstract Co-Author*) Nothing to Disclose
Azfar Siddiqui, MD (*Abstract Co-Author*) Nothing to Disclose
David L. Raj, MD (*Abstract Co-Author*) Nothing to Disclose
Amr S. Abdelaziz, MD (*Abstract Co-Author*) Nothing to Disclose
Ayesha Nasrullah, MD,FRCR (*Abstract Co-Author*) Nothing to Disclose
Nanda Deepa Thimmappa, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Understand the unique roles of different imaging sequences used in MR Urography (MRU), including T2-weighted, T1-weighted, diffusion-weighted imaging (DWI), and dynamic contrast-enhanced (DCE) imaging for the diagnosis of various urological pathologies. 2. Explore how both contrast-enhanced and non-contrast MRU can effectively diagnose a wide range of urological conditions including pediatric anomalies, obstructive pathologies, and tumors within the urinary tract. Learn how the Vesical Imaging Reporting and Data System (VI-RADS) can be utilized by adding dedicated bladder sequences.3. Enhance diagnostic skills through review of illustrative cases that showcase the practical application of MRU in clinical practice. 4. Learn to identify and

manage common pitfalls in MRU, including imaging and technique-related artifacts. Learn optimizing MRU protocols and adjusting imaging parameters to reduce artifacts and enhance image quality. Gain knowledge on managing patients with contraindications to MRI contrast agents or renal impairment.

**TABLE OF CONTENTS/OUTLINE**

1. Technical Overview - Patient preparation and positioning for MRU. - Optimization of imaging sequences: T2-weighted, T1-weighted, DWI, and DCE. 2. Case Gallery - Pediatric Urology: Examples of congenital anomalies and their management, obstructive pathologies, urinary Tract Tumors: Identification and differentiation of benign versus malignant lesions. - Additional cases covering a range of common and rare conditions diagnosed via MRU. 3. Best Practices and Troubleshooting - Common imaging challenges and solutions. - Strategies for improving image quality. - Safety considerations with contrast-enhanced MRU.

## GUEE-63 CARCINOMA OF THE VULVA: WHAT RADIOLOGISTS NEED TO KNOW

Sanaz Behnia, MD (*Abstract Co-Author*) Nothing to Disclose
Bahar Mansoori, MD (*Abstract Co-Author*) Nothing to Disclose
Elham Taheri, MD (*Abstract Co-Author*) Nothing to Disclose
Priya O. Pathak, MBBS, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Highlight the clinical features, prognostic factors and routes of spread of vulvar malignancies. 2. Review the multimodality imaging features of vulvar malignancies (multi-parametric MRI, F18-FDG PET-CT and PET-MRI) in conjunction with International Federation of Gynecology and Obstetrics (FIGO) guidelines. 3. Review the role of imaging in treatment planning: assessment for resectability, radiotherapy, chemotherapy. 4. Review the role of imaging in post treatment evaluation: treatment response evaluation, post-treatment complications and detection of recurrent disease.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction (a) Epidemiology and risk factors. (b) Normal perineal and vulvar anatomy. (c) Review pathological subtypes.2. 2021 Revised FIGO staging system: Stage I: Tumor confined to the vulva. Stage II: Tumor of any size with extension to lower 1/3rd of urethra, vagina and anus with negative nodes. Stage III: Tumor of any size with extension to upper part of perineal structures or with nonfixed, nonulcerated nodes. Stage IV: Tumor of any size fixed to the bone or with fixed/ulcerated nodes, or distant metastasis.3. Sentinel lymph node mapping (a) Tracer: 99mTc-Filtered sulfur colloid or Tilamanocept. (b) Planar imaging and SPECT-CT is performed of the pelvis to localize the sentinel node.4. Role of MRI (technique and review of cases).5. Role of FDG-PET (technique and review of cases).6. Role of PET-MRI (technique and review of cases).

## GUEE-64 NAVIGATING THE RADIOLOGICAL SPECTRUM OF HEMATURIA: FROM COMMON TO RARE CAUSES

Luciano B. Lovotti, MD (*Abstract Co-Author*) Nothing to Disclose
Leandro J. Pacini (*Abstract Co-Author*) Nothing to Disclose
Martin M. Pesce, MD (*Abstract Co-Author*) Nothing to Disclose
Victorio Del Casale, MD (*Abstract Co-Author*) Nothing to Disclose
Rodrigo S. Loto, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- It’s always important to review the embryology, anatomy, pathophysiology, and radiological signs of the urinary tract. - Review of urinary tract imaging protocols. This presentation highlights the pivotal role of MDCTU (Multidetector computed tomography urography) in the imaging of the patient with hematuria. - Recognize the important role of radiologists in the multidisciplinary setting to communicate and collaborate findings in emergent cases.

**TABLE OF CONTENTS/OUTLINE**

Hematuria has a wide range of causes:Causes of Hematuria:1. Kidney Stones: The presence of stones in the kidneys or urinary tract can lead to hematuria. We will emphasize some features (number, location, size, density, complications, post-op) to be able to carry out a detailed report.2. Urinary Tract Infections (UTIs): Many microorganisms can affect the urinary tract, and some of them can cause hematuria. An update: The urinary tract can be affected by numerous acute and chronic inflammatory processes that may be infectious or autoimmune.3. Trauma: Injuries to the urinary tract due to accidents, trauma, or medical procedures can cause hematuria. Grading injuries.4. Vascular: We will describe our most relevant cases that result in vascular-related hematuria.5. Neoplasm: Imaging features of urinary tract neoplasms. Tumor mimics.5. Miscellaneous: all those causes that we do not consider to be included in the previous ones.6. Take home points.In those most interesting and rare cases, we will review their pathophysiology and update the topic.

## GUEE-65 AN IN DEPTH REVIEW OF SOLID RENAL MASSES AND HEREDITARY RENAL CANCER SYNDROMES

Henry H. Tam, FRCR (*Abstract Co-Author*) Nothing to Disclose
Leila Kafaei, MBBS,BSC (*Abstract Co-Author*) Nothing to Disclose
Kavita Shapriya, MBBS, FRCR (*Abstract Co-Author*) Nothing to Disclose
Andrea L. da Silva, MBBCh (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To review the commonly encountered solid renal masses, both benign and malignant, and describe the imaging findings which could assist in identifying the type of mass. To describe limitations of current imaging modalities in characterising the various renal masses due to overlapping imaging features and to review potential imaging techniques to achieve better prediction. To review clinical syndromes that are associated with an increased risk of renal masses or renal cell carcinomas, in terms clinical features genetics and imaging findings (both renal and extra-renal, where applicable)To understand the best pathway for patients with these syndromes which would assist in guiding imaging follow-up, treatment and genetic counselling.

**TABLE OF CONTENTS/OUTLINE**

Solid renal masses Angiomyolipoma, oncocytoma, lobar nephronia, infarct, RCC, UCC, lymphoma, metastases Clinical features HistopathologyManagement Imaging features of solid renal masses Characteristic imaging findings of the above masses on CT, MRI and contrast ultrasound Other less common imaging techniques such as MIBI SPECT/CT, PSMA PET/ CT Inherited syndromes associated with an increased risk of solid renal masses, including von Hippel Landau, Birt-Hogg Dube syndrome, tuberous sclerosis, hereditary leiomyomatosis and renal cell carcinoma (HLRCC), hereditary papillary renal cell carcinoma (HPRCC), succinate dehydrogenase mutations, BAP1 mutation and sickle cell disease Review the clinical features and genetic mutations associated with these syndromes Imaging findings of the kidneys and extrarenal findings where applicable Role of screening in these patient

## GUEE-66 WHEN THINGS GO WRONG: UNEXPECTED FINDINGS AFTER URINARY SYSTEM INTERVENTIONS

German Ramos Rubio, MD (*Abstract Co-Author*) Nothing to Disclose
Anna Alberti Sancho, MD (*Abstract Co-Author*) Nothing to Disclose

Ramon Almodovar, MD (*Abstract Co-Author*) Nothing to Disclose
Elisa Merino, MD (*Abstract Co-Author*) Nothing to Disclose
Eva Castella-Fierro (*Abstract Co-Author*) Nothing to Disclose
Juan Fernando Casanova Barba, MD (*Abstract Co-Author*) Nothing to Disclose
Mar Castillo, MD (*Abstract Co-Author*) Nothing to Disclose
Alex Espinal Colominas, MD (*Abstract Co-Author*) Nothing to Disclose
Pablo Gilabert (*Abstract Co-Author*) Nothing to Disclose
Sandra Lopez Coello, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Various medical, minimally invasive, surgical, and radiation treatments may lead to iatrogenic complications affecting the urinary tract.- Multidetector CT is the preferred imaging modality for evaluating urinary tract injuries, offering detailed visualization of cortical, vascular, and collecting system injuries.- Imaging findings associated with specific procedures like extracorporeal shock wave lithotripsy (ESWL), nephron-sparing surgery, and percutaneous renal interventions are discussed, highlighting potential complications and their management.- Post-surgical CT scans revealing fluid accumulation and hydronephrosis should raise suspicion of ureteral injury, warranting additional delayed imaging.- Urinary catheter migration and misplacement cause significant morbidity, necessitating prompt detection.

**TABLE OF CONTENTS/OUTLINE**

- Imaging Technique:- Role of Multidetector CT in evaluating urinary tract injuries- Optimal CT imaging protocols for suspected urinary tract injuries- Iatrogenic injuries:- Renal complications:- Minimally invasive procedures: ESWL, surgery-related complications- Renal infection and vascular Injuries- Ureteral injuries:- Causes, presentation, and imaging FindingsUreterovaginal fistulas- Bladder Injuries:- Causes and postoperative evaluation with CT cystography- Catheters malposition/migration- Conclusions:- Importance of radiologists' awareness of Iatrogenic Urinary Tract Injuries- Role of imaging in prompt diagnosis and treatment planning- Overview of interventional radiologic procedures and their potential complications.

## GUEE-67 LOCALLY ADVANCED RENAL CELL CARCINOMA: DEVIL IS IN THE DETAILS

Angelica Patino, MD (*Abstract Co-Author*) Nothing to Disclose
Long Nguyen, MD (*Abstract Co-Author*) Nothing to Disclose
Eric Li, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

-Limitations exist in cross-sectional imaging characterization of renal cell carcinoma (RCC), particularly for locally advanced cancer (Stage 3), and more specifically, T3a tumors. Availability of treatment options is predicated on accurate staging.-Surgical interventions involving nephron-sparing techniques are typically not advisable for Stage =T3a renal cancers. Therefore, suggesting locally advanced cancer stage by imaging features before surgery is paramount, particularly for central renal masses.-Review of salient imaging features crucial for staging during evaluation of renal masses suspicious for RCC (e.g. renal sinus fat invasion, perirenal fascia thickening, venous invasion, etc.).-Review of management guidelines (National Comprehensive Cancer Network [NCCN], American Urologic Association [AUA]) and surgical interventions (e.g. nephron-sparing surgery, radical nephrectomy).-Operative feasibility can be assessed using imaging-based supplementary scoring systems (e.g. RENAL Nephrometry Score).

**TABLE OF CONTENTS/OUTLINE**

1. Generala. Epidemiology of kidney cancer2. The Kidneya. Organb. Vascular and lymphatics3. Pathologya. The incidental renal mass and differential diagnosesb. Renal cell carcinoma and subtypes4. Imaginga. Imaging modalities (ultrasound, CT, MRI) and advantages/limitationsb. TNM classificationc. Stages 1-4 RCC with emphasis on Stage 3 and associated pearls/pitfalls5. Implicationsa. Management and guidelines (NCCN, AUA)b. Supplemental scoring systems: RENAL Nephrometry Score, Preoperative Aspects and Dimensions Used for an Anatomical Classification, Centrality index, and renal tumor contact surface area

## GUEE-68 THE EVALUATION METHOD OF CONVENTIONAL < AND > FUNCTIONAL MR IMAGING FOR CHRONIC KIDNEY DISEASE

Keita Nagawa (*Abstract Co-Author*) Nothing to Disclose
Kaiji Inoue, MD (*Abstract Co-Author*) Nothing to Disclose
Tsutomu Inoue (*Abstract Co-Author*) Nothing to Disclose
Yuki Hara (*Abstract Co-Author*) Nothing to Disclose
EITO KOZAWA, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The major teaching points have been modified as follows:1. Traditional morphological assessment criteria and renal functional MR imaging techniques are promising methods for utilizing the kidney as a biomarker.2. In the evaluation of chronic kidney disease, there are limitations to both conventional MR imaging methods < and > functional MR imaging methods, highlighting the need for a more comprehensive diagnostic approach < and > further advancements.

**TABLE OF CONTENTS/OUTLINE**

This exhibit aims to:1. Highlight the role of conventional MRI in assessing the kidney's structure (medulla-cortex ratio, cortical size) for grading chronic kidney disease (CKD).2. Introduce the basic principles of functional kidney MRI techniques, including blood oxygen level-dependent (BOLD) diffusion-weighted MR imaging (DWI), diffusion-tensor imaging (DTI), < and > Intravoxel incoherent motion (IVIM), for CKD.3. Discuss the benefits < and > the added value of functional MR imaging in managing chronic kidney disease.Content Organization:1. Depiction of normal and diseased kidneys in conventional MRI.The effectiveness < and > limitations of conventional MRI in diagnosing CKD.Presentation of CKD through functional MR imaging modalities (BOLD, DWI, DTI, IVIM).2. Evaluation of the utility < and > constraints of functional MR imaging in CKD.3. Future directions for enhancing the diagnostic capabilities of functional kidney MR imaging such as twelve-layer concentric objects method, texture analysis, deep learning < and > auto segmentation.

## GUEE-69 ARE YOU SURE YOUR PROSTATE MPMRI REPORT IS COMPLETE?. LOOK FOR EXTRAPROSTATIC FINDINGS

Diana Romero Mayorga I, MD (*Abstract Co-Author*) Nothing to Disclose
Rodrigo Borrero, MD (*Abstract Co-Author*) Nothing to Disclose
Diego A. Aguirre, MD (*Abstract Co-Author*) Nothing to Disclose
Jorge A. Abreu Gomez, MD (*Abstract Co-Author*) Nothing to Disclose
John L. Torres Castiblanco SR, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The use of Prostate mpMRI has extended beyond detection of clinically significant prostate cancer, and is currently used for staging and treatment planning, active surveillance and post-treatment evaluation.Obtained MR images have a field of view centered on the prostate; however, adjacent extraprostatic and pelvic structures are included.The role of the radiologist must go beyond the search for extraprostatic extension and we must include in our report other relevant findings in neighboring organs included in the images.In order to achieve this objective, it is necessary that the radiologist systematically evaluates other extraprostatic structures, which we suggest: 1. Abdominal wall, 2. Bowel. 3. Musculoskeletal and 4. Genitourinary. The objectives of the following presentation are as follows:• Describe the frequency of the different extraprostatic findings on prostate mpMRI.• To provide an anatomic landmark to look for extraprostatic findings on prostate mpMRI.• To demonstrate the most frequent extraprostatic findings, per suggested anatomic segmentation, its relevance and clinical impact• To propose a structured report and follow up recommendations to improve communication and management of incidental findings to referring clinicians

### TABLE OF CONTENTS/OUTLINE

• Introduction: current recommended protocol for multiparametric Prostate mpMRI• Extraprostatic anatomical sites included in multiparametric Prostate mpMRI• Where to look for extraprostatic findings; bowel, genitourinary, abdominal wall, musculoskeletal.• A pictoral review of incidental findings on prostate mpMRI

## GUEE-7 EXPLORING PERIRENAL PATHOLOGY: A CASE-BASED REVIEW INTO MULTIMODAL DIAGNOSIS

Inmaculada Ansio Vazquez (*Abstract Co-Author*) Nothing to Disclose
Mariano Jose Parada-Blazquez, MD (*Abstract Co-Author*) Nothing to Disclose
Ana Rus, MD (*Abstract Co-Author*) Nothing to Disclose
Mario Sanchez, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The objective of this poster is to provide a review of pathological conditions involving the perinephric space and to describe their key imaging characteristics, with a case-based approach using cross-sectional imaging.

### TABLE OF CONTENTS/OUTLINE

The perirenal space is the middle retroperitoneal space, sits between the anterior and posterior renal fascia and contains the kidney and adrenal glands. A variety of differential diagnoses can cause pathology within this space, often without specific clinical signs or symptoms. Sometimes it is not possible to differentiate the subcapsular or perinephric origin of a lesion, and these processes may be overlapping, so the differential diagnosis includes subcapsular disease. An understanding of commonly encountered conditions affecting the perirenal space, along with its main characteristics, can help narrow the potential diagnosis, however in some cases the diagnosis can only be done by histopathologic analysis.Pathology may be classified by their location and distribution as solitary or multifocal masses or rindlike soft-tissue lesions, as well as based on their etiology as neoplastic (sarcoma, renal or adrenal mases, lymphoma, metastasis) or non-neoplastic lesions (fluido colections, retroperitoneal fibrosis, systemic disease, extramedullary hematopoiesis).

## GUEE-70 INDETERMINATE RENAL LESIONS: THE ROLE OF CONTRAST ENHANCED ULTRASOUND IN ASSESSMENT AND FOLLOW UP

Henry H. Tam, FRCR (*Abstract Co-Author*) Nothing to Disclose
Christopher J. Harvey, MBBS (*Abstract Co-Author*) Nothing to Disclose
Andrea L. da Silva, MBBCh (*Presenter*) Nothing to Disclose

### TEACHING POINTS

renal lesions (both cystic and solid) are often encountered incidentally in radiology practice (especially at ultrasound). They can create more expense to the department with regards to further evaluation and/or follow up by use of CT/MRI. Contrast enhanced ultrasound provides a real-time assessment of renal lesions and their complexity. It can be used to classify cystic lesions, according to the Bosniak classification, and for follow up on non-surgical cystic renal lesions. Furthermore, it can assist in evaluation of indeterminate lesions - streaming patients into a management pathway sooner than should they be followed up with interval CT/MRI, as greater detail can be assessed. Aims: 1. Understand the classification of renal cysts with regards to the Bosniak classification of 2005 and proposed updates of version of 2019 with follow up recommendations. 2. Gain an understanding of solid renal lesions and imaging characteristics. 3. Review the currently used imaging modalities and protocols in the assessment of renal lesions and their costs, compared to contrast enhanced ultrasound: risk and benefits. 4. Review ultrasound contrast agents compared to CT/MR contrast agents. 5. The role of contrast enhanced ultrasound in assessment and follow up of renal lesions and case examples.

### TABLE OF CONTENTS/OUTLINE

Renal cysts - Bosniak classification system - review v2005 and updates proposed by v2019 Overview of solid renal lesions Current imaging techniques used in assessment of renal cystic lesions protocols and cost to department Introduction to contrast enhanced ultrasound: History Benefits and risks Costs Considerations when planning contrast enhanced ultrasound list Case examples of contrast enhanced ultrasound

## GUEE-71 THE TYPICAL AND PECULIAR PERINEAL TEARS: EMPHASIS ON MRI

**Awards**
**Certificate of Merit**

Toqa El-Gohary, MD (*Abstract Co-Author*) Nothing to Disclose
Rania F. Elsayed, MD,PhD (*Abstract Co-Author*) Nothing to Disclose
Ahmed W. Ali, MSc,MBBS (*Abstract Co-Author*) Nothing to Disclose
Asmaa Yahia (*Abstract Co-Author*) Nothing to Disclose
Hebatallah M. Azzam (*Abstract Co-Author*) Nothing to Disclose
Asmaa Abdelzaher, MD (*Abstract Co-Author*) Nothing to Disclose
Hadeer Radwan (*Abstract Co-Author*) Nothing to Disclose
Mohamed A. Abdelatty, MD,MSc,MBBCh (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Understand the complex anatomy of the perineum with emphasis on MRI imaging.2. Appreciate the differences in perineal anatomy between males and females.3. Understand the mode of injury in obstetric/childbirth-related traumas.4. Understand the mode of injury in non-obstetric injuries, including iatrogenic causes.5. Provide practical reporting tips for simple and complex perineal tears on MRI.

**TABLE OF CONTENTS/OUTLINE**

1. MR Anatomical considerations in female and male perineum. 2. Perineal trauma according to mode of injury Obstetric/childbirth-related trauma.• Other:Blunt trauma, Stab injuries, Fall from height, Road traffic accidents, Iatrogenic.3. Perineal trauma according to involved parts Superficial perineal tears, Perineal muscles, Anal sphincter injury, Ano-vaginal fistula, penile fractures, scrotal injuries. 4. Quick review of associated pelvic structures injury: Urethral injury, Urinary bladder injury, Bowel injury, Vascular injury, Pelvic bone fractures.

## GUEE-72 NAVIGATING THE MAZE OF PI-RADS 3 LESIONS

Lauren Fane, BEng (*Abstract Co-Author*) Nothing to Disclose
Anna Luu (*Abstract Co-Author*) Nothing to Disclose
Leonardo K. Bittencourt, MD, PhD (*Abstract Co-Author*) Research Consultant, Canon Medical Systems Corporation
Michaela Cooley, PhD (*Abstract Co-Author*) Nothing to Disclose
Refky Nicola, MSc, DO (*Abstract Co-Author*) Royalties, RELX
Eduardo Thadeu De Oliveira Correia, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Prostate MRI adhering to PI-RADS v2.1 guidelines has been increasingly adopted for the detection and characterization of prostate cancer. Nonetheless, suboptimal reproducibility and the relatively high number of false-positive MRIs are still challenges, limiting the impact of MRI in prostate cancer diagnostic workflows worldwide. One of the key factors associated with these limitations is PI-RADS 3 ("equivocal") lesions. This exhibit explores the nature of PI-RADS 3 lesions, their clinical implications, and strategies for their management.

**TABLE OF CONTENTS/OUTLINE**

1. What's a PI-RADS 3 lesion? a. PI-RADS 3 lesions in the peripheral zone b. PI-RADS 3 lesions in the transition zone 2. Do you know how to identify a PI-RADS 3 lesion? Learn with cases! a. Case 1: PI-RADS 3 lesion in the peripheral zone and a negative prostate biopsy b. Case 2: PI-RADS 3 lesion in the peripheral zone and a positive prostate biopsy c. Case 3: PI-RADS 3 lesion in the transition zone and a negative prostate biopsy d. Case 4: PI-RADS 3 lesion in the transition zone and a positive prostate biopsy 3. Understanding the challenges and implications of PI-RADS 3 a. Factors contributing to higher prevalence of PI-RADS 3 Scores b. Implications of a higher prevalence of PI-RADS 3 Scores c. Strategies to mitigate the prevalence of PI-RADS 3 Scores in your practice 4. Dealing with PI-RADS 3 a. The role of MRI in Diagnostic Pathways of Prostate Cancer b. Dealing with PI-RADS 3 in MRI-Based Diagnostic Pathways c. Dealing with PI-RADS 3 in Risk-Based Diagnostic Pathways 5. What does the future hold for PI-RADS 3? a. MRI innovations b. Ancillary biomarkers c. Upgrading rules and Diagnostic Pathways

## GUEE-73 IMAGING OF THREE-PIECE INFLATABLE PENILE PROSTHESIS

**Awards**
**Magna Cum Laude**

Yashant Aswani, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Erectile dysfunction (ED) is the inability to achieve or maintain erection sufficient for satisfactory sexual performance. It has a prevalence of 26/100 men in the age group of 40-70 years. ED unresponsive to pharmacotherapy or presence of penile fibrosis, are some of the many indications for penile prosthesis. Three-piece inflatable penile prosthesis (IPP) comprises paired cylinders, reservoir and pump. At the conclusion of this exhibit, the readers will be able to:1) Enumerate indications of penile prosthesis2) Describe imaging in three-piece inflatable penile prosthesis (IPP)3) Discuss complications of three-piece IPP

**TABLE OF CONTENTS/OUTLINE**

1) Erectile dysfunction and 2018 American Urological association guidelines for management 2) Indications and contraindications for penile prosthesis 3) Types of penile prostheses 4) Role of Imaging 5) MRI protocol 6) Normal imaging appearance of 3-piece inflatable penile prosthesis 7) Complications of cylinder (mal positioning and mechanical failure) 8) Complications of rear tip extender (migration, extrusion) 9) Complications of reservoir (migration, leakage, collapse of low-profile reservoir, bowel obstruction, vascular compression) 10) Complications of pump (migration, stiction syndrome) 11) Complications of tubing (fracture, leakage, tail pipe penis) 12) Common complications (infection, hematoma, capsule formation) 13) Proposed template for reporting

## GUEE-74 THE EPIDIDYMIS - WHO SAYS SIZE MATTERS

Sharon Gordon, MD (*Abstract Co-Author*) Nothing to Disclose
Rona J. Orentlicher, MD (*Abstract Co-Author*) Nothing to Disclose
Barak Friedman, MD (*Abstract Co-Author*) Nothing to Disclose
Monika Misra, MD (*Abstract Co-Author*) Nothing to Disclose
Kamran Ali, MD (*Abstract Co-Author*) Nothing to Disclose
Melody W. Lin, MD, MS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- The epididymis plays an essential role in sperm production and transport.- Ultrasound is the primary modality to evaluate the epididymis, with problem solving using CT and MRI.- Infection is the most common pathology in the epididymis, often presenting with concurrent orchitis, funiculitis, and cellulitis. Imaging is helpful to assess for secondary abscess or testicular torsion.- Appendix epididymis, the most common congenital variant, can present with sudden pain from torsion.- Cystic and solid epididymal masses are often benign. The majority are cysts. Soft tissue masses include adenomatoid tumors, leiomyoma, and lipoma. After ultrasound, MRI is the preferred modality to evaluate an epididymal mass given superior soft tissue contrast and lack of ionizing radiation. Since often benign, follow up ultrasound is commonly used to ensure stability.- Epididymal rhabdomyosarcoma is uncommon in children and rare in adults, presenting as a painless, solid, vascular mass, with a high rate of metastases.- Tubular ectasia, secondary to ductus deferens obstruction, is often seen post vasectomy but can also be idiopathic.- Epididymal trauma is rare but can be seen associated with testicular trauma.

**TABLE OF CONTENTS/OUTLINE**

- Essential role of the epididymis in male reproduction with regards to anatomy, biology and function.- Congenital, infectious, inflammatory, cystic or solid masses, and traumatic abnormalities.- Multimodality imaging of epididymal pathology, predominantly ultrasound, with the aid of CT and MRI.- Differential diagnoses, complications and treatments.

## GUEE-75 TESTY SITUATIONS: A COMPREHENSIVE MULTIMODALITY IMAGING REVIEW OF THE ACUTE SCROTUM

**Awards**
**Certificate of Merit**

Mahan Mathur, MD (*Abstract Co-Author*) Nothing to Disclose
Balaji Rao, MBBS, FRCR (*Abstract Co-Author*) Nothing to Disclose
Yashant Aswani, MD (*Abstract Co-Author*) Nothing to Disclose
Joshua Roberts, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Acute scrotal pain is a common scenario in clinical practice. Etiologies include common entities, such as testicular torsion or epididymitis, to uncommon pathologies such as segmental testicular infarcts or Amyand hernia with appendicitis. Prompt recognition is essential in order to guide appropriate management and may require evaluation on multiple imaging modalities. This presentation will explore various causes of acute scrotal pathologies and at the conclusion of the module, the learner should be able to: • Elucidate role of imaging in a patient with acute scrotal pain • Recognize imaging findings and complications associated with common etiologies of acute scrotal pain • Describe imaging findings of uncommon causes of acute scrotal pain

### TABLE OF CONTENTS/OUTLINE

• Normal scrotal anatomy • Imaging of epididymitis, epididymo-orchitis, isolated orchitis and complications (abscess, infarct) • Radiology of scrotal trauma (including fracture, rupture, hematoma, hematocele) • Imaging of testicular torsion (complete, partial, torsion-detorsion, associated waveform analysis and complications) • Torsion of appendices • Review of uncommon etiologies of acute scrotal pain, including, but not limited to: • Fournier gangrene • Segmental testicular infarct • Thrombosed varicocele • Sigmoid diverticulitis contained within an inguinal hernia • Acute appendicitis in an inguinal hernia • Neoplasms presenting as acute scrotal pain • Pancreatic necrosis extending inferiorly into the scrotum

## GUEE-76 TO REDUCE PREOPERATIVE EVALUATION OF LIVING RENAL DONORS FROM 4 PHASE TO 1 PHASE-SCAN

Kousuke Aoyagi (*Abstract Co-Author*) Nothing to Disclose
Natsuki Mashikawa (*Abstract Co-Author*) Nothing to Disclose
Daisuke Kinoshita (*Abstract Co-Author*) Nothing to Disclose
Toshimitsu Shimizu (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. To learn about the need for preoperative imaging for renal transplantation.2. To learn about the problems with the conventional scan.3. To Learn about the imaging technique for performing 1-phase scan Dual energy.4. To learn the value of dual energy and triple split injection obtained images.

### TABLE OF CONTENTS/OUTLINE

1. The preoperative radiologic evaluation plays a crucial role in laparoscopic nephrectomy by providing assistance in surgical planning and aiding in the prevention of potential complications.2. Misregistration and exposure due to multiphase imaging are common issues encountered with conventional imaging methods. A new imaging technique using Triple Split and Dual energy allows visualization of stones, arteries, veins, and ureters in a single scan.3. Utilizing dual energy, the acquired images can retain sufficient CT values and can be evaluated for all abnormal formations.4. The new imaging method can reduce exposure by up to 75% without misregistration. Thus, donors benefit greatly.

## GUEE-77 THE GUIDELINE MATRIX: DECODING EURO-AMERICAN GUIDELINES FOR UPPER TRACT UROLOGICAL CARCINOMA (UTUC)

Claudia Mercader Barrull (*Abstract Co-Author*) Nothing to Disclose
Carmen Sebastia Cerqueda, MD (*Abstract Co-Author*) Nothing to Disclose
Lidia Fortuny, MD (*Abstract Co-Author*) Nothing to Disclose
Meritxell Costa-Grau (*Abstract Co-Author*) Nothing to Disclose
Daniel Corominas, MD (*Abstract Co-Author*) Nothing to Disclose
Carlos Nicolau, MD (*Abstract Co-Author*) Nothing to Disclose
Lledo Cabedo Esteve, MD (*Abstract Co-Author*) Nothing to Disclose
Rafael Jimenez Arjona, MD (*Abstract Co-Author*) Nothing to Disclose
Carlos Paredes, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1-To review radiological points that appear in the European Association of Urology (EAU) and the American Urological Association (AUA) for Upper Urinary Tract Carcinoma (UTUC) guidelines and to show their meaning for radiologists. 2- To describe radiological findings that are conclusive or inconclusive of UTUC by CT- and MR-urography and how to make the differential. 3- To detail the meaning of invasive/noninvasive, hydronephrosis/obstruction by image, to describe radiological patterns in high and low risk UTUC and to depict what a suspicious node is. 4- To review radiological follow-up in UTUC protocols. 5- To show tips on how to do an adequate UTUC presurgical radiological map.

### TABLE OF CONTENTS/OUTLINE

· CT and MR urography protocols for UTUC diagnosis: tips and tricks · Anatomy of upper urinary tract: urologist and radiologist agreement · Unequivocal and equivocal radiological findings of UTUC: management in guidelines · Differential diagnosis of UTUCs presented as renal masses, upper urinary tract papillary masses or sessile wall thickening: clues for the differential · Meaning of noninvasive aspect/local invasion by CT (EAU) · Low-risk, high-risk and favorable and unfavorable UTUC in AUA guidelines: role of imaging · Hydronephrosis and Obstruction - what do they mean? · Radiological signs in T3, T4, N1 and M1 UTUC TNM classification · How to diagnose N1 and M1 radiologically · Correlation between radiological and ureteroscopy findings to guide UTUC diagnosis and treatment. · Radiological tools to perform a high standard UTUC presurgical map in kidney-sparing management · Neoadjuvant and adjuvant treatment: radiological findings · Radiological follow-up after initial UTUC treatment: EAU and AUA comparison

## GUEE-78 INCIDENTAL EXTRAPROSTATIC FINDINGS IN MULTIPARAMETRIC MR IMAGING OF THE PROSTATE

Pardeep K. Mittal, MD (*Abstract Co-Author*) Nothing to Disclose
Manohar Roda, MD, MBBS (*Abstract Co-Author*) Nothing to Disclose
Thomas L. Estes JR, MD (*Abstract Co-Author*) Nothing to Disclose
Frank H. Miller, MD (*Abstract Co-Author*) Advisory Board, Bayer AG;Advisory Board, Guerbet SA
Nikolas Brozovich, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Discuss the significance of incidental findings in multiparametric magnetic resonance (mp-MR) of the prostate 2. Systematic search pattern to reduce the likelihood of missing key incidental extraprostatic findings 3. Review clinical cases with multi-system (Gastrointestinal, Genitourinary, and Musculoskeletal) incidental findings in mp-MR of the prostate

**TABLE OF CONTENTS/OUTLINE**

Mp-MR has significantly increased in popularity for the detection and surveillance of prostate cancer in recent years. This imaging method facilitates screening, surveillance, and post treatment follow-up with notable advantages over other modalities. Due to the increased use in MR imaging, an increased detection rate of incidentalomas has been reported.Our presentation will discuss the spectrum of extraprostatic findings noted on MR imaging of the prostate and provide a case-based review.

## GUEE-79 IMAGING CHARACTERISTICS OF RETROPERITONEAL TUMORS: DIAGNOSTIC CLUES, DIFFERENTIAL DIAGNOSIS AND HISTOPATHOLOGICAL CORRELATION

Pardeep K. Mittal, MD (*Abstract Co-Author*) Nothing to Disclose
Manohar Roda, MD, MBBS (*Abstract Co-Author*) Nothing to Disclose
Frank H. Miller, MD (*Abstract Co-Author*) Advisory Board, Bayer AG;Advisory Board, Guerbet SA
Camila L. Vendrami, MD, MD (*Abstract Co-Author*) Nothing to Disclose
Dallas Sturdevant, DO (*Abstract Co-Author*) Nothing to Disclose
Nikolas Brozovich, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Demonstrate diagnostic challenges including tumor localization, extent of invasion, and characterization of specific pathology.2. Illustrate tumor components, tumor vascularity, and patterns of spread to help narrow the differential diagnosis.

**TABLE OF CONTENTS/OUTLINE**

Imaging findings and characterization of retroperitoneal(RP) tumors with histopathology correlates will be discussed. Primary RP tumors originating in the RP but outside the major RP organs are uncommon. Accurate localization and extent of disease of retroperitoneal lesions can be difficult. Identifying the organ of origin, involvement of adjacent structures, vascular invasion, and fat content is valuable in evaluating RP tumors, particularly in staging. Specific diagnosis might be difficult to achieve due overlapping features but certain clues help narrow the differential diagnosis. Case discussion will include liposarcoma, leiomysarcoma, solitary fibrous tumor, extragonadal germ cell tumor, lymphoma, paraganglioma, and others.

## GUEE-8 SOLID RENAL MASSES: WHAT THE UROLOGISTS WANT TO KNOW FOR SURGICAL TREATMENT

Publio C. Viana, MD (*Abstract Co-Author*) Nothing to Disclose
William Nahas, MD (*Abstract Co-Author*) Nothing to Disclose
Mauricio Cordeiro, MD (*Abstract Co-Author*) Nothing to Disclose
Fernando M. Coelho, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Julia A. Miranda, MD (*Abstract Co-Author*) Nothing to Disclose
Leonardo Kenji N. Mitsutake, MD (*Abstract Co-Author*) Nothing to Disclose
Alexander Colodette, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Review imaging features for histological prediction.- Create a didactic approach to preoperative imaging staging, emphasizing tips and tricks for avoiding pathological upstaging and achieving positive surgical margins.- Discuss the relevance of vascular surgical planning in nephron-sparing surgeries.- Show didactic imaging findings on post-treatment for kidney cancer.

**TABLE OF CONTENTS/OUTLINE**

Introduction- Epidemiology of renal tumors.- Current management of kidney cancer based on AUA and EAU guidelines.- Main surgical techniques for managing renal masses.Role of imaging in the assessment of solid renal masses- Impact of histological prediction on surgical management.- How to perform local imaging staging.- Evaluation of vascular surgical planning in nephron-sparing approaches.- Expected and unexpected post-treatment imaging findings.- AI e radiomics to predict aggressiveness on cytoreduction nephrectomies.A didactic evaluation of renal masses with illustrated teaching cases from our department

## GUEE-81 A PICTORIAL REVIEW OF THE URETHRA: A RADIOLOGIST'S GUIDE TO KEY CLUES IN INTERPRETATION

**Awards**
**Certificate of Merit**

Ana Ines Rubio Aguilera, MD (*Abstract Co-Author*) Nothing to Disclose
Elena Romero (*Abstract Co-Author*) Nothing to Disclose
Lorena Melian Iribar, MD (*Abstract Co-Author*) Nothing to Disclose
Rosa M. Lorente-Ramos, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Candela Munoz Roldan (*Abstract Co-Author*) Nothing to Disclose
Javier Azpeitia Arman, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To illustrate imaging findings of male and female urethra including normal anatomy, variants, inflammatory/infectious diseases, benign and malignant tumors. To analyze the correlation between cystourethrogram, IVU, US, CT, and MRI imaging features with pathology in urethral lesions. To emphasize pitfalls, diagnostic difficulties, and differential diagnosis.

**TABLE OF CONTENTS/OUTLINE**

Retrograde urethrography and voiding cystourethrography are the modalities of choice for imaging the urethra. Several benign and malignant entities should be included in the differential diagnosis of urethral lesions. Through sample cases, a variety of imaging and pathology findings from lesions of the urethra with management discussion and clues to interpretation will be demonstrated in a quiz format. Imaging findings (cystourethrogram, IVU, US, CT, and MRI) and pathologic correlation will be presented. How pathologic correlation informs imaging interpretation will be highlighted. The list of cases presented includes congenital abnormalities, strictures, trauma, urethral or periurethral tumors, calculi, diverticula, postsurgical complications.

## GUEE-82 IMPROVING PROSTATE MRI COLLABORATIVELY: LESSONS LEARNED FROM THE ACR PROSTATE MR IMAGE QUALITY IMPROVEMENT COLLABORATIVE

David B. Larson, MD, MBA (*Abstract Co-Author*) Research Grant, Siemens AG ;Advisor, Bunkerhill Health;Shareholder, Bunkerhill Health
Mythreyi Bhargavan-Chatfield, PhD (*Abstract Co-Author*) Nothing to Disclose
Kay Zacharias-Andrews (*Abstract Co-Author*) Nothing to Disclose
Kandice Garcia, RN, MS (*Abstract Co-Author*) Nothing to Disclose
Andrei S. Purysko, MD (*Presenter*) Contract, Profound Medical Inc;Research support, Blue Earth Diagnostics Ltd;Consultant, KOELIS;

### TEACHING POINTS

1. Prostate MR image quality can affect prostate cancer detection on MRI.2. Adherence to PI-RADS technical standards is necessary for exam reproducibility and requires an effective protocol management process.3. Various methods for patient preparation can help reduce susceptibility artifacts on diffusion-weighted images and motion on T2-weighted images.4. Frontline staff training on image quality standards and troubleshooting of artifacts are essential to achieving high-quality images consistently.5. A reliable method for auditing the quality of prostate MR images allows the identification and remediation of issues contributing to poor image quality.

### TABLE OF CONTENTS/OUTLINE

1. Introduction2. The ACR Learning Network Prostate MR Image Quality Improvement Collaborative Aims and Framework3. Prostate Image Quality (PI-QUAL) System4. Key Drivers and Interventions4a. Protocol Management4b. Patient Preparation4c. Personnel Training4d. Process for Auditing the Images5. Beyond Image Quality Improvement6. Conclusions

## GUEE-83 ABDOMINAL INCIDENTALOMA: THE *ADRENAL*IN OF THE UNKNOWN

Ines Ocampo, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1- To identify adrenal incidentalomas requiring follow-up, further study, or biopsy/surgery based on recommendations from the American College of Radiology and the European Society of Endocrinology.2- To understand the acquisition protocol and recognize the importance of wash-out phase in CT scan and in phase/out phase (IP/OP) in MRI for the evaluation of the adrenal glands.3- To discuss the most prevalent adrenal pathologies, differentiating them into benign and indeterminate lesions based on imaging and clinical features.

### TABLE OF CONTENTS/OUTLINE

Given recent advancements in radiology, the detection of adrenal incidentalomas has become relatively frequent. Thus, radiologists need to stay updated with guidelines and recommendations in order to clarify the multiple possible diagnoses. Benign non-functioning lipid-rich adenomas represent the most prevalent lesions. Their imaging diagnosis relies on identifying the presence of microscopic fat within the adenoma. Therefore, the measurement of Hounsfield units and the wash-out protocol in CT scans, as well as the IP/OP images of a chemical-shift MRI, are used. Timely confirmation of benign nature avoids unnecessary imaging and radiation exposure. Likewise, it is important to suspect malignancy since it would require aggressive treatment. Each individual case presents a challenge, so current guidelines recommend standardized protocols and a multidisciplinary expert team for accurate decision-making.

## GUEE-84 KEEPING YOUR REAR IN THE CLEAR: IMAGING OF SPACEOAR HYDROGEL

Mahan Mathur, MD (*Abstract Co-Author*) Nothing to Disclose
Sandeep S. Arora, MBBS (*Abstract Co-Author*) Research support, Profound Medical Inc
Gary M. Israel, MD (*Abstract Co-Author*) Nothing to Disclose
Pavlo Mishyn, DO (*Abstract Co-Author*) Nothing to Disclose
Shadi Ebrahimian, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Epidemiology of prostate cancer and treatment options? Prostate cancer is the most common malignancy diagnosed in men in the United States. Besides surgery, radiation therapy is the standard therapy for prostate cancer. However, it may cause damage to the surrounding organs including rectum. 2. What is SpaceOAR? SpaceOAR hydrogel, is an FDA approved spacer, which is injected between the prostate and rectum and increases the distance between these structures, reducing rectal radiation exposure and associated complications.3. Indications of SpaceOAR placement? Patients with prostate cancer undergoing radiation therapy and those with significant proximity of rectum and prostate. 4. Techniques for SpaceOAR placement? SpaceOAR is placed in outpatient setting after administration of local anesthesia and under the guide of ultrasound and using a trans perineal approach.5. How is SpaceOAR characterized in CT and MRI? SpaceOAR has a hypodense opacity on CT, low signal on T1 and high signal on T2-weighted images.6. Optimally placed SpaceOARA? uniform and symmetric distribution of SpaceOAR between prostate and rectum is characterized as optimally placed.7. Suboptimal placement of the SpaceOAR and associated complications? Hydrogel migration, inadequate rectal sparing, rectal wall infiltration, etc.

### TABLE OF CONTENTS/OUTLINE

1. Overview to prostate cancer 2. Brief introduction to SpaceOAR and its history 3. Candidates for SpaceOAR placement 4. Techniques of placement 5. Appearance of SpaceOAR on CT and MRI 6. Optimal SpaceOAR placement 7. SpaceOAR related complications

## GUEE-85 VENOUS TUMORAL THROMBOSIS, LOOKING BEYOND CLEAR CELL RENAL CARCINOMA

Sebastian Pelaez SR, MD (*Abstract Co-Author*) Nothing to Disclose
Tatiana Arroyave, MEd (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Neoplastic intraluminal venous invasion is a form of advanced disease involvement. It is important to differentiate it from malignancy associated soft thrombus. Tumoral thrombus present contiguity with the primary tumor, enhance with the contrast medium, generate expansion of the blood vessel, are avid for fluorodeoxyglucose and restricted to diffusion.2.The renal tumor that most commonly presents with vein thrombus is clear cell renal carcinoma (90%), the most common subtype is clear cell. Transitional cell and papillary carcinoma rarely invades vascular structures. There are also some case reports of neuroectodermal tumors, squamous cell tumors and primary sarcomas of the kidney with renal venous involvement. The main benign renal tumor with vascular invasion into the renal vein is angiomyolipoma. However, it should be considered beyond renal cell carcinoma.3.The vascular invasion of tumors has implications on the prognosis and treatment of patients. In the TNM classification, renal tumors progress on stage if there is presence of intraluminal vascular invasion. The Mayo Clinic classification for the extent of tumor thrombus allows determination of the type of thrombectomy as well as the surgical implications in the patient with renal cell carcinoma.

**TABLE OF CONTENTS/OUTLINE**

Teaching points.Introduction.Diagnostic intraluminal vascular invasion.Primary renal tumors with thrombosis.Benign renal tumors with thrombosis.Renal metastases with thrombosis.Summary

## GUEE-86 EXPLORING PATHOLOGIES: CHALLENGING BLADDER CASES BEYOND UROTHELIAL NEOPLASMS

Thais Mussi, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Ronaldo H. Baroni, PhD (*Abstract Co-Author*) Nothing to Disclose
Fernando M. Coelho, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Gabriel Figueiredo, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Review the imaging feature of bladder urothelial carcinoma. - Describe the main oncological and non-oncological differential diagnosis of urothelial carcinoma. - Demonstrate didactic cases involving the bladder. - Suggest tips and tricks to narrow the differential diagnosis of bladder mass.

**TABLE OF CONTENTS/OUTLINE**

INTRODUCTION: Review typical findings of urothelial carcinoma; Describe the broad spectrum of diseases that may involve the bladder;DIDACTIC CASES: Demonstrate a case-based didactic review of bladder pathologies and some tips and tricks to narrow the diagnosis: Inflammatory; Infectious; Non-urothelial tumors; Endometriosis; Foreign bodies;

## GUEE-87 GOOD OLD CONVENTIONAL URETHROGRAPHY: CURRENT ROLE IN CLINICAL PRACTICE

Bharat Aggarwal, MD (*Abstract Co-Author*) Nothing to Disclose
Amit K. Sahu, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Akshey Sehgal, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Uroradiology includes essential procedures like Retrograde Urethrography (RGU) and Micturating Cystourethrogram (MCU), serves as a cornerstone in diagnosing and treating urological conditions even in the current era of advanced imaging. RGU allows for a detailed examination of the urethra, aiding in the identification of strictures, injuries, or abnormalities, and guiding customized treatment plans. MCU offers real-time visualization of the bladder and urethra, enabling detection of reflux, urinary dysfunction, or structural anomalies.

**TABLE OF CONTENTS/OUTLINE**

• Anatomy:- varies between the male and female urethra. The male urethra has anterior and posterior portions. The female urethra begins at the internal urethral meatus at the bladder neck and opens in the vestibule of the vagina.• Technique: Care should be taken in insertion of catheter with all aseptic measures. Appropriate positioning and radiograph exposures to be performed. • Clinical significance: Play pivotal role in identifying and evaluating conditions such as trauma, urethral strictures, urethral diverticula, infections, reflux nephropathy and posterior urethral valve abnormalities.• Complications: Infection; adverse reactions from contrast medium; catheter trauma leading to symptoms like dysuria, frequency, hematuria, and urinary retention, as well as potential complications such as perforation by the catheter. Additionally, there's risk of inadvertent catheterization of the vagina or ectopic ureteral orifice. Understanding and managing these complications are crucial for ensuring patient safety and optimizing procedural outcomes in urological practice.

## GUEE-88 COMPREHENSIVE IMAGING REVIEW OF TESTICULAR PATHOLOGIES ON ULTRASOUND AND MAGNETIC RESONANCE IMAGING: A PICTORIAL REVIEW

Giancarlo Schiappacasse, MD (*Abstract Co-Author*) Nothing to Disclose
Nicolas G. Molina Vasquez, MD (*Abstract Co-Author*) Nothing to Disclose
John Mac Kinnon, MD (*Abstract Co-Author*) Nothing to Disclose
Andres Labra, MD (*Abstract Co-Author*) Nothing to Disclose
Ricardo Aris (*Abstract Co-Author*) Nothing to Disclose
Fernando Vivanco, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Accurate diagnosis and management of testicular pathologies heavily relies on clinical presentation and ultrasound (US), forming the cornerstone of initial assessment. Magnetic resonance imaging (MRI) complements US, aiding in differentiating and characterizing suspicious testicular and paratesticular lesions for precise diagnosis and treatment. Ultrasound remains primary for evaluation in emergency departments, including inflammatory conditions like epididymitis-orchitis, as well as traumatic testicular injuries, enabling prompt identification and management of complications such as hematomas or torsions.

**TABLE OF CONTENTS/OUTLINE**

Cases selected from our institutional experience aim to showcase key findings of various testicular pathologies.Testicular Neoplasms: Most common are germ cell-derived, hypoechoic lesions on ultrasound. MRI is useful to characterize indeterminate lessons and to determine the extension of the tumor.Paratesticular Lesions: Adenomatoid tumors, common benign lesions, diagnosed primarily via ultrasound. MRI aids in characterizing indeterminate lesions or suspected malignancies like paratesticular rhabdomyosarcoma.Cystic Lesions: Typically simple lesions diagnosed by ultrasound, appearing as homogeneous hypoechoic lesions with defined edges. MRI may be used if an underlying lesion is suspected.Inflammatory: Epididymitis-orchitis, common in emergency services, is often diagnosed via ultrasound. MRI benefits in assessing chronic infections or suspected complications.Traumatic: Initial evaluation with US aims to rule out hematomas, twists, ruptures, or infarctions.

## GUEE-89 ADRENAL INFECTIONS UPDATE: HOW RADIOLOGISTS CAN ENHANCE PATIENT CARE

Patrick Navin, MBBCh, FFR(RCSI) (*Abstract Co-Author*) Nothing to Disclose
Antonio C. Westphalen, MD, PhD (*Abstract Co-Author*) Shareholder, ScanMed, LLC;Research funded, BotImage, Inc
Vanessa Murad, MD (*Abstract Co-Author*) Nothing to Disclose
Jorge A. Abreu Gomez, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Adrenal infections are considered clinically important but often go unrecognized. Radiologists play a key role in detection of involvement early in the course of disease to improve patient outcomes- Although adrenal infectious involvement is uncommon, it should be considered in the differential diagnosis of patients with widespread inflammation, taking into account the host's hormonal/immune status and the geographic region where certain

infective agents are more prevalent- The vascular-rich configuration of the adrenal gland, coupled with increased cortisol levels from zona fasciculata, creates an ideal microenvironment for the reservoir and replication of microorganisms- Adrenal thickening with associated stranding constitutes the radiological hallmark of adrenalitis, typically bilateral in histoplasmosis and tuberculosis and unilateral/variable in COVID-19, bacterial, HIV, and cytomegalovirus infections- Destruction of the adrenal parenchyma results in loss of endocrine adrenal function, contributing to a high mortality rate. Early radiological identification and awareness by the clinical team are pivotal for prompt patient management and preservation/recovery of endocrine function

**TABLE OF CONTENTS/OUTLINE**

1. Background2. Imaging techniques in the assessment of adrenal infections3. Bacterial adrenalitis and hemorrhage3.1 Adrenal Abscess3.2 Tuberculosis and Adrenal BCG granulomatosis 4. Viral adrenalitis5. Adrenal involvement in patients with SARS COVID-19 infection6. Fungal infections7. Parasitic infections8. Conclusion

## GUEE-9 LOOK AT THE KIDNEY! WHAT TO LOOK FOR IN THE FACE OF MULTISYSTEM DISEASE

Publio C. Viana, MD (*Abstract Co-Author*) Nothing to Disclose
Fernando M. Coelho, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Julia A. Miranda, MD (*Abstract Co-Author*) Nothing to Disclose
Lais F. Pimentel, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Review the main multisystem disorders with renal involvement.- Describe the renal imaging findings in the face of multisystem disease.- Create a systematic assessment and discuss tips for targeted analysis.

**TABLE OF CONTENTS/OUTLINE**

Multisystem diseases often affect the kidneys, resulting in diverse patterns of renal involvement. Radiologists play a crucial role in identifying focal or diffuse lesions, and it is essential to detect renal lesions assertively.INTRODUCTIONSYSTEMATIC APPROACH FOR EVALUATING IMAGES CASE-BASED REVIEW- Hereditary syndromes. Tuberous sclerosis. Von Hippel-Lindau disease. Birt-Hogg-Dubé syndrome. Autosomal Dominant Polycystic Kidney Disease. Autosomal Recessive Polycystic Kidney Disease- Neoplastic. Renal lymphoma. Urothelial cell carcinoma. Renal cell carcinoma. Plasmacytoma. Metastasis. Plexiform neurofibromas- Deposit diseases. Amyloidosis. Paroxysmal nocturnal hemoglobinuria. Extramedullary hematopoiesis- Inflammatory / Infection. Renal tuberculosis. IgG4-related disease. Erdheim-Chester disease

## GUEE-90 SCROTUM CROSS-SECTIONAL IMAGING EVALUATION: FROM BENIGN TO MALIGNANT CONDITIONS

Thais Mussi, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Ronaldo H. Baroni, PhD (*Abstract Co-Author*) Nothing to Disclose
Fernando M. Coelho, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Mauricio Zapparoli, MD, MSc (*Abstract Co-Author*) Nothing to Disclose
Alice Schuch, MD (*Abstract Co-Author*) Nothing to Disclose
Rafael Camilo, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Review the anatomy of the scrotum and its radiological and surgical implications.
- Propose an approach for recognizing the most usual imaging patterns of benign and malignant scrotal tumors.
- Review patterns of benign testicular lesions on magnetic resonance imaging (MRI) exams.
- Assess imaging findings of malignant testicular germ cell tumors on MRI.
- Describe key MRI findings for local staging and surgical planning.

**TABLE OF CONTENTS/OUTLINE**

INTRODUCTION
- Describe the usual anatomic features of the scrotum in the most common imaging methods used at the investigation and correlate didactic illustrations with ultrasound (US) and MRI.
- Elucidate the surgical implications of radiological anatomy of the scrotum.INDICATIONS AND TECHNIQUE
- Indications of the main imaging methods, their appropriate technique, limitations, and pitfalls.
- MRI protocol.STEP-BY-STEP EVALUATION
- Systematic approach to classifying testicular lesions.
- Evaluation of their origin, imaging features, and correlation with clinical and laboratory informationBENIGN TESTICULAR LESIONS
- Typical and atypical cases of testicular and paratesticular lesions on US and MRI.
- What information should the surgeon know to plan the appropriate approach?
- Correlation with pathological and surgical findings.MALIGNANT TESTICULAR LESIONS
- Typical cases of testicular cancer and their radiological appearances.
- Review of its epidemiology and risk factors.
- Importance of allying tumor markers and other clinical information.
- Local staging/ treatment response/ recurrence detection.THERAPEUTIC TECHNIQUES
- Types of surgical approaches in testicular and paratesticular masses.
- Sparing surgery and alternative therapy in testicular cancer.

## GUEE-91 PRACTICAL CONSIDERATIONS IN THE CONTRAST ENHANCED ULTRASOUND (CEUS) EVALUATION OF RENAL MASSES

Melanie P. Caserta, MD (*Abstract Co-Author*) Nothing to Disclose
Mary J. Clingan, MD (*Abstract Co-Author*) Nothing to Disclose
Neema J. Patel, MD (*Abstract Co-Author*) Nothing to Disclose
Madhura A. Desai, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

• CEUS is a safe option in patients who may not be able to undergo contrast CT or MR and offers particular benefit to patients with ESRD. • CEUS has high sensitivity and specificity when discriminating between solid and cystic lesions. • The high temporal and spatial resolution of CEUS enables accurate characterization and surveillance of complex cystic renal lesions. • As on CT and MR, overlapping patterns of enhancement can make it difficult to discriminate benign from malignant solid lesions or between RCC subtypes by perfusion characteristics alone.

**TABLE OF CONTENTS/OUTLINE**

1. US Contrast Agents a. Technical Factors b. Considerations/Comparison to CT and MR 2. Advantages of CEUS a. High Spatial Resolution i. Characterization of cyst complexity ii. Active surveillance b. High Contrast Resolution i. Sensitive to minimal flow ii. High NPV for excluding flow c. High Temporal Resolution i. Mitigate motion artifact ii. Dynamic contrast evaluation iii. Stored cine images 3. Limitations of CEUS (some generalized from US) a. Limited Visualization i. Large body habitus or deep-seated lesions ii. Lesions obscured by overlying bone or gas b. Limited FOV i. Limit exam to single or few targets ii. Multiple interrogations for larger lesion c. Technical Requirements specific to CEUS i. Patient IV access ii. Extra personnel iii. CEUS software 4. Characterization of Cystic Renal Masses a. Cystic or Solid b. Simple or Complex 5. Characterization of Solid Renal Masses a. Evaluation of Enhancement i. Corticomedullary enhancement relative to renal cortex ii. Washout iii. Heterogeneity b. Features of Common Benign Solid Lesions c. Features of Common RCC Subtypes

## GUEE-92 ROLE OF CROSS-SECTIONAL IMAGING ON MALE GENITOURINARY INFLAMMATORY AND INFECTIOUS DISORDERS: WHAT RESIDENTS NEED TO KNOW

Thais Mussi, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Ronaldo H. Baroni, PhD (*Abstract Co-Author*) Nothing to Disclose
Fernando M. Coelho, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Laura Damaso, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Review the main inflammatory and infectious conditions in the genitourinary (GU) system.Describe the cross-sectional imaging protocols for GU inflammatory and infectious disorders.Recognize the key imaging features for the detection and differentiation of these entities.

**TABLE OF CONTENTS/OUTLINE**

INTRODUCTION
- Inflammatory and infectious diseases overview.
- Describe the imaging evaluation role based on current guidelines.IMAGING EVALUATION
- CT technique
- MRI technique IMAGING EVALUATION PER ORGANAdrenal glands
- Adrenalitis
- Infectious (paracoccidioidomycosis)Kidney and ureters
- IgG4-related disease

## GUEE-93 BEYOND VI-RADS: CURRENT ROLE OF BLADDER MRI, SPECIAL INDICATIONS AND ASSESSMENT OF OTHER PATHOLOGIES

Teresa A. Garcia, MD (*Abstract Co-Author*) Nothing to Disclose
Julio R. Coronil, MD (*Abstract Co-Author*) Nothing to Disclose
Mauricio R. Oropeza Gutierrez II (*Abstract Co-Author*) Nothing to Disclose
Mailen Sarobe, MD (*Abstract Co-Author*) Nothing to Disclose
Agostina Sarobe, MD, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

-To describe multiparametric MRI protocol and the implementation of VI-RADS score in bladder cancer with pathology correlation. -To review special indications of bladder MRI such as bladder tumors located at the ureteral orifice, bladder diverticulum tumors and post neoadjuvant and TURB evaluation.-To display sample cases of different pathologies that could represent potential pitfalls in the use of bladder MRI.

**TABLE OF CONTENTS/OUTLINE**

-Image acquisition protocol and technique.-Recognize the normal MRI anatomy of the bladder.-Description of imaging characteristics of VI-RADS categories 1 to 5 with sample cases.-Review of the special indications of bladder MRI and sample cases. -Potential pitfalls in the use of MRI and VI-RADS

## GUEE-94 REVOLUTIONIZING COMFORT: THE PESSARY SOLUTION FOR OPTIMAL SUPPORT AND RELIEF!

Gaurav Khatri, MD (*Abstract Co-Author*) Nothing to Disclose
Cinthia Cruz Romero, MD (*Abstract Co-Author*) Nothing to Disclose
Renata R. Almeida, MD (*Abstract Co-Author*) Nothing to Disclose
Karthika Devi D S, MBBS (*Abstract Co-Author*) Nothing to Disclose
Manjiri K. Dighe, MD (*Abstract Co-Author*) Research Grant, Koninklijke Philips NV;Research Grant, General Electric Company
Minal C. Jagtiani, FRCR,MBBS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

This exhibit aims to discuss the anatomy of the (pre or post) menopausal pelvis, indications for insertion of vaginal pessaries, types of pessaries, and identify the common (and uncommon) post insertion complications and their appearances.

**TABLE OF CONTENTS/OUTLINE**

1. Post menopausal pelvic anatomy: describe the normal appearance of the postmenopausal uterus and ovaries 2. Discuss etiology of laxity of the pelvic floor, risk factors for pelvic prolapse, levels of pelvic organ prolapse 3. Describe the types of pessaries available and their appearances on various modalities: donut, ring, lever, Gellhorn, cube 4. Identify the indications for vaginal pessaries in the post-menopausal age group and explain the intended mechanism of action 5. Discuss the potential complications with specific consideration to appearances post pessary insertion: pain, bleeding, infection, altered lymphatics with increased chance of pelvic congestion syndrome

## GUEE-95 ASCENDING EXCELLENCE: GUIDING RENAL TUMOR TREATMENT STEP BY STEP WITH RENAL SCORE

Mauro Herrero (*Abstract Co-Author*) Nothing to Disclose

### TEACHING POINTS

Oncocytomas are the largest cause of nephrectomy in benign masses, due to inability of imaging and biopsy to reliably distinguish between benign oncocytomas and malignant chromophobe RCC. Emergence of ‘in-between’ entities considered together as ‘Oncocytic renal neoplasm of low malignant potential’ have further complicated diagnostic and management pathways.

### TABLE OF CONTENTS/OUTLINE

There have been numerous nomenclature changes. What is the latest classification of oncocytic neoplasm? What are the emerging entities (eosinophilic vacuolated tumor, low grade oncocytic tumor)? Which entities are benign, which are indolent and which are malignant? (Pathology images will be provided) - Are there other entities which mimic oncocytic neoplasms? - Why is imaging or biopsy in isolation not helpful? (what is the discordance rate between biopsy and surgery?). Where do these fall in the CCLS (clear cell likelihood score) or CT-renal score? - We present a hybrid (imaging + biopsy approach) in risk stratifying these masses - Chromophobe RCC - can we further risk stratify grade based on imaging? - How does hybrid neoplasms complicate the landscape? What are the oncocytic tumors with hereditary connotations (SDH-deficient, low grade FH-deficient, eosinophilic solid and cystic RCC -TSC associated, HOCT - Birt Hogg Dube associated)? Can genetic alterations (FLCN) provide insight? - What are the challenges in active surveillance of oncocytomas? Can benign oncocytomas metastasize? Do enlarging oncocytomas affect renal function? Does bilaterality and multifocality further complicate management? - Does Sestamibi have a role in management pathway? What is the ideal management strategy? Role of ablation and embolization?

GUEE-1

## MASS LESIONS OF TRANSPLANTED KIDNEYS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Kumaresan Sandrasegaran, MD (*Abstract Co-Author*) Nothing to Disclose
Mark D. Sugi, MD (*Abstract Co-Author*) Consultant, Nextrast, Inc;Author with royalties, RELX
Alecio F. Lombardi, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• 1. Masses of transplanted kidneys include benign and malignant tumors, infections and inflammatory pseudotumors • 2. Some lesions seen in transplant kidneys, such as mycobacterial abscess, are not usually seen in native kidneys • 3. Benign lesions, such as infiltrative fungal infection, may mimic malignant tumors on imaging

### TABLE OF CONTENTS/OUTLINE

1. 1. Optimal imaging of transplant (Tx) kidney tumors 2. Malignant tumors of transplant kidneys a. Differences in frequency of renal cell cancers in native and transplant kidneys b. Treatment of Renal Cell Cancer (RCC) in transplant kidneys 3. Hematologic tumors: PTLD, extra-osseous myeloma 4. Sarcomas and mesenchymal tumors 5. Infection of transplant kidneys: bacterial, mycobacterial and fungal 6. Unusual lesions of transplant kidneys: perinephric myxoid pseudotumor, amyloidoma 7. Value of image guided biopsy

## PENILE DOPPLER WITH DRUG-DIRECTED DIAGNOSIS OF ERECTILE DYSFUNCTION, WHAT THE RADIOLOGIST SHOULD KNOW

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Mildreth Juliana Acuna Rojas, MEd (*Abstract Co-Author*) Nothing to Disclose
Manuel Alejandro Garrido, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Introduction to the generalities of color Doppler in the diagnosis of erectile dysfunction, precise definition of erectile dysfunction, the correct indications to apply the study and when to apply them. Carry out an anatomical review of the penis, and physiological mechanism of the erection, that subsequently allows a diagnosis that adequately guides the doctor for a correct treatment. Know the radiological technique of the Doppler of the penis, a close look at each of the steps to elucidate and correctly present its findings. Learn criteria to think about the erectile dysfunction, taking into consideration patient signs and symptoms, clinical background, and ultrasonographic classification. Present two clinical cases of patients with erectile dysfunction, with their intrinsic repercussions in quality of life, each with independent risk factors and variable causes

### TABLE OF CONTENTS/OUTLINE

Introduction, Epidemiology, Etiology, Anatomic review, Physiology, Pathophysiology, Diagnosis, Radiological technique, Clinical cases, Conclusions, References.

GUEE-12

## ADRENAL LESIONS - NOT ALWAYS AN ADRENAL ADENOMA

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Anju Sahdev, FRCR (*Abstract Co-Author*) Nothing to Disclose
Katherine Ordidge, FRCR,MBBS (*Abstract Co-Author*) Nothing to Disclose
Michael Thomas, MBBS (*Abstract Co-Author*) Nothing to Disclose
James Fish, MBBS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Adrenal incidentalomas are commonly found in routine practice on up to 5% of all abdominal CT imaging.Clear guidelines exist as to the management of adrenal incidentalomas; including their initial characterisation on imaging (CT, MRI and PET-CT).Confident imaging characterisation of adrenal lesions helps ensure that patients follow the correct clinical management pathways and avoid expensive and unnecessary follow-up, including adrenal biopsy.

### TABLE OF CONTENTS/OUTLINE

Case based educational exhibit with examples of both benign and malignant adrenal conditions and their associations with referenced teaching points to include: Benign Adrenal lesions:Evaluation of classical imaging characteristics of adrenal adenomas on CT and MRI imaging including lipid-rich and lipid-poor subtypes with cross-correlation to functional status. Wide range of benign adrenal pathology distinct from adrenal adenomas including paragangliomas, adrenal rests, myelolipomas, angiomyolipomas, congenital adrenal hyperplasia (CAH), adrenal cysts and ganglioneuromas. Malignant Adrenal lesions: Delineate imaging characteristics which raise the suspicion of adrenal malignancy; both primary and secondary malignancy and in turn avoid unnecessary investigations or upstaging of patients. Array of malignant adrenal pathology including phaeochromocytomas, adrenocortical carcinomas, metastases to the adrenal gland, malignant neuroendocrine tumors and composite tumors.Indeterminate Adrenal lesions: What to do when lesions remain indeterminate including correlation with biochemical status, clinical assessment and further imaging modalities, e.g. nuclear medicine investigations

## WHO IS THAT INCIDENTALOMA? A PICTORIAL REVIEW OF AN ADRENAL MASS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Alejandro Sanchez, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• Review the anatomy, embryology, and function of the adrenal gland.• Describe de role of different imaging modalities techniques (CT, MRI, PET-CT) in the diagnosis of adrenal lesions. • Discuss clinical-radiological-histopathological key findings to help differentiate adrenal gland lesions (benign vs malignant). • Analyze what treatment and follow-up is necessary for each adrenal mass.• Treatment and follow-up of adrenal lesions.• How to do a good report of an adrenal mass.

### TABLE OF CONTENTS/OUTLINE

Description of general characteristics of adrenal gland and adrenal mass. Adrenal gland anatomy and physiology. Review multimodality adrenal protocols ( MRI, CT, PET-CT) Review of MRI and CT cases, common findings, imaging tips and pitfalls.Typical and atypical adrenal lesions. Adenoma, pheochromocytoma, lymphoma, myelolipoma, metastasis, carcinoma, neuroblastoma, nodular hyperplasia and neuroblastoma.- Histopathological findingsSummary Pearls and take home points.

## THE ROLE OF IMAGING IN EVALUATING PROSTATE CANCER AND ITS NATURAL HISTORY OVER TIME

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Leonardo K. Bittencourt, MD, PhD (*Abstract Co-Author*) Research Consultant, Canon Medical Systems Corporation
Eduardo Thadeu De Oliveira Correia, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Michaela Cooley, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Prostate cancer is the second leading cause of cancer death in men in the US. Despite this, there is debate about the utility of prostate cancer screening markers and the optimal treatment course. This educational exhibit takes the reader through diagnosing prostate cancer, evaluating risk for metastasis, surveillance imaging, and treatment options. All discussion points relate back to the imaging markers that are essential to look out for or are important in prognosis.

### TABLE OF CONTENTS/OUTLINE

1. Epidemiology of prostate cancer. a. Demographics; b. Incidence, prevalence; c. Role of screening. 2. Natural history of prostate cancer. a. How prostate cancer grows and metastasizes; b. Development of treatment resistance (e.g., androgen insensitivity); c. Gleason score; d. Percentages of patients with disease progression and death after diagnosis. 3. Evaluating risk though medical imaging. a. Imaging modalities used for initial diagnosis (e.g., MRI, US); b. Advantages and disadvantages of each imaging modality; c. Typical and atypical features of prostate cancer; d. Imaging characteristics used to differentiate local cancer from extracapsular extension.4. Surveillance imaging, metastasis, and whole-body imaging. a. Surveillance imaging modalities and timeline after initial treatment; b. Imaging markers indicating metastasis and what characteristics to look for; c. Indications for whole body imaging.5. Treatment options and selection. a. Local disease traditional treatment options; b. Discussion on new treatment options for local disease; c. Metastatic disease traditional and recent treatment options; d. How imaging plays a role in treatment selection.

### TEACHING POINTS

- Spermatogenesis is the process in which spermatogonia give rise to spermatocytes, while spermiogenesis is the stage in which spermatids mature into spermatozoa, forming part of the overall process of spermatogenesis.
- In patients with fertility disorders, while a semen analysis is crucial, it is essential to complement this with the evaluation of testicular volume and the use of ultrasound to detect abnormalities. This comprehensive approach is vital for accurately assessing male infertility, identifying potential underlying causes, and guiding appropriate treatment to improve male fertility rates.
- When predisposing risk factors are present, there is a clear association between testicular cancer and microlithiasis, emphasizing the need for a thorough evaluation.
- Sequelae of surgical manipulation, orchidopexy, or biopsies can be detected as alterations in the echogenicity of the parenchyma.
- Recent studies have revealed that a correction factor of 0.71 is likely the most accurate for estimating calculated testicular volume.
- A variation greater than 25% between the volumes of the two testes is considered significant.
- Ultrasound abnormalities, such as ectasia of the rete testis, dilation of epididymal ductules, and intratesticular cysts, are correlated with seminal parameters. These findings clearly indicate an obstructive etiology of infertility.

### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Embryology 3. Functional Anatomy 4. Workup of Male Infertility 5. Ultrasound Findings
- Echogenicity
- Volume
- Epididymis
- Vascularity
- Spermatic Cord
- Inguinal Canal 6. Take-Home Messages 7. Conclusions 8. Bibliography

## DIAGNOSTIC IMAGING TECHNIQUES IN RENAL TRANSPLANTATION

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Steven S. Raman, MD (*Abstract Co-Author*) Consultant, Johnson & Johnson;Consultant, Bayer AG;Consultant, Merck & Co, Inc;Consultant, Amgen Inc;Consultant, Profound Medical Inc
Alex Chung, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Imaging evaluation of the living kidney donor involves detailed evaluation of vascular anatomic information for surgical planning via CT Angiogram (CTA) or MR angiogram (MRA).Evaluation of renal allograft in the early posttransplant period involves evaluating for allograft size, collecting system dilation, periallograft fluid collection, signs of rejection and vascular flow via ultrasound, CT, MRI and nuclear medicine scintigraphy.Core needle biopsy of the transplanted kidney help determine the etiology of graft dysfunction when clinical evaluation and noninvasive diagnostic tests are nonspecific and commonly is performed to distinguish ATN from acute rejection and nephritis.Investigational MRI techniques that can eventually applied in post-transplant renal imaging include blood oxygenation level-dependent (BOLD) imaging, diffusion weighted imaging (DWI), diffusion tensor imaging (DTI), ferumoxytol enhanced MRA, Inflow Inversion Recovery, Arterial spin labeling, Phase contrast MRI, T1 relaxometry, MR Elastography and Magnetization Transfer Imaging.

### TABLE OF CONTENTS/OUTLINE

1. Imaging evaluation of living kidney donor.1a. CTA evaluation.1b. MRA evaluation.2. Imaging evaluation in early post-transplant period.2a. US evaluation2b. CT evaluation.2c. MRI evaluation2d. Scintigraphy evaluation.3. Core needle biopsy of the transplanted kidney: Indication, technique and complications.4. Investigational MRI techniques.

## ROLE OF IMAGING IN MANAGING SURGICAL BED COMPLICATIONS AFTER PROSTATECTOMY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Cum Laude**

Bohyun Kim, MD (*Abstract Co-Author*) Nothing to Disclose
Adam T. Froemming, MD (*Abstract Co-Author*) Nothing to Disclose
Ashish R. Khandelwal, MD (*Abstract Co-Author*) Nothing to Disclose
Garima Suman, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Imaging is increasingly being utilized to evaluate post-prostatectomy complications and guide treatment decisions. These include early complications, such as infection, hematoma, urine leak; and late complications, such as anastomotic strictures, urinary fistula, lymphocele. 2. MRI has become the gold standard for detection and characterization of urosymphyseal fistula due to high failure rate and complications associated with cystoscopy. 3. Incorporating Dynamic Voiding MRI enhances insights into urethral adhesions, mobility, strictures and improves detection of urinary fistula. 4. MRI enables precise characterization of the fistula defect relative to the urinary sphincter complex and rectum, that are critical considerations for surgical planning.

### TABLE OF CONTENTS/OUTLINE

1. Case-based review of surgical bed complications and spectrum of imaging findings, including : a) Urethral stricture; b) Urosymphyseal fistula; c) Rectourethral fistula; d) urine leak ; e)Soft tissue and osseous infections such as myositis and osteomyelitis 2. MRI protocol including Dynamic Voiding sequences for urethral strictures and fistula post-prostatectomy. 3. Role of CT angiography for presurgical vascular assessment and CT-guided bone biopsy for antimicrobial management prior to urethral reconstructive surgery. 4. How do MRI findings correlate with cystoscopy and influence surgical decision-making in urethral strictures and fistula (conservative management vs urethral reconstruction vs pelvic exenteration). 5. Limitations and pitfalls in MR interpretation, such as urethral recess mimicking fistula, infected urinoma mimicking recurrent cancer, and reactive osteitis resembling osteomyelitis.

### TEACHING POINTS

Outline the most common bladder pathologies in both the adult and pediatric population. Delineate bladder pathologies into four broad categories: congenital, acute non-neoplastic acquired, chronic non-neoplastic acquired, and neoplastic. List the common pathologies within each category, provide imaging correlates for each pathology, recognize the salient imaging features including more complex topics including the urachal abnormalities and malignancy.

### TABLE OF CONTENTS/OUTLINE

The bladder is often underemphasized in radiology training and can be a confusing organ . In this exhibit, we aim to demystify the myriad of bladder pathologies. We provide a flowchart separating bladder pathologies into four broad categories: congenital, acute, chronic, and neoplastic and highlight the salient imaging features to improve diagnostic acumen of trainees and the general radiologists and facilitate optimal treatment to improve the outcome of patients. Congenital pathologies described will include posterior urethral valves, prune belly syndrome, cloaca, exstrophy of the bladder, urachal abnormalities, reflux, and ureterocele. Acute pathologies will detail rupture (intraperitoneal, extraperitoneal), cystitis, and bladder stones. Chronic pathologies will involve bladder outlet obstruction, bladder diverticulum, and fistulization from chronic inflammatory conditions. Neoplastic pathologies will describe urothelial cell carcinoma, transitional cell carcinoma adenocarcinoma, squamous cell carcinoma, and metastases.

### TEACHING POINTS

Renal cell carcinoma is the most common kidney cancer, with various subtypes presenting distinct imaging characteristics. Clear cell RCC appears as a hypervascular mass with ‘halo’ on contrast-enchanced CT/MRI. Papillary RCC exhibits heterogeneous enhancement with cystic components. Chromophobe RCC presents as a hypovascular mass with peripheral enhancement. Collecting duct carcinoma is agressive, showing infiltrative growth and low attenuation. Multilocular cystic neoplasm of a low malignant potential is a benign tumor with multilocular cysts and thin septa. Sarcomatoid RCC is agressive, often with hemorrhage or necrosis. Unclassified RCC requires detailed histopathological evaluation. Other renal tumors include angiomyolipoma with macroscopic fat, oncocytoma with central scarring, and rare primary renal lymphoma. Renal metastases show variable characteristis. Transitional cell carcinoma appears as a filling defect. Retroperitoneal tumors include liposarcoma, pleomorphic sarcoma and leiomyosarcoma. Renal pseudotumors, like xantogranulomatous pyelonephritis, mimic tumors on imaging, requiring differentiation.

### TABLE OF CONTENTS/OUTLINE

Renal cell carcinoma Subtypes
- Clear cell RCC
- Papillary RCC
- Chromophobe RCC
- Collecting duct (Bellini)
- Multilocular cystic neoplasm of low malignant potential
- Sarcomatoid RCC
- Unclassified RCC Others renal tumors
- Angiomyolipoma
- Oncocytoma
- Renal lymphoma
- Renal metastasis Direct extension of neighboring tumors
- Transitional cell carcinoma / Urothelial cancer
- Retroperitoneal tumors Pseudotumors
- Xanthogranulomatous pyelonephritis

### TEACHING POINTS

• Understand key concepts about small renal masses and their potential treatment options; • Learn about the main indications of partial nephrectomy and thermal ablation in that context; • Understand the tumor characteristics that influence their management and treatment; • Recognize expected imaging features related to each kind of treatment; • Identify unexpected imaging findings and the main complications of these procedures, highlighting pearls and pitfalls for this assessment.

### TABLE OF CONTENTS/OUTLINE

• Introduction - General concepts about small renal masses and their different approaches o Current context and definitions o Treatment options o Partial nephrectomy o Thermal ablation o Active surveillance o Indications and contraindications o Advantages and disadvantages • Imaging features o Partial nephrectomy o Pre-procedural planning o Post-procedural imaging features o Thermal ablation o Pre-procedural planning o Post-procedural imaging features • Case- based review, with pearls and pitfalls o Complications related to partial nephrectomy o Complications related to thermal ablation • Future perspectives • Conclusions and key takeaways

## DON'T PANIC, IT'S JUST A PEEK: A COMPREHENSIVE LOOK AT MALE URETHRAL IMAGING

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

LOUISE FATIMA GOMES DE ALMEIDA (*Abstract Co-Author*) Nothing to Disclose
Clara Fiorot, MD (*Abstract Co-Author*) Nothing to Disclose
Paula Castro, MD (*Abstract Co-Author*) Nothing to Disclose
Luiza Ambrozino, MD (*Abstract Co-Author*) Nothing to Disclose
Eleonora Silva (*Abstract Co-Author*) Nothing to Disclose
Andre Ferreira, MD (*Abstract Co-Author*) Nothing to Disclose
Daniella Braz Parente (*Abstract Co-Author*) Nothing to Disclose
Luana Alves, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Compare Conventional Voiding Cystourethrography (VCUG) Retrograde Urethrography (RUG) vs. Magnetic Resonance Urethrography (MRU) to evaluate the male urethra.- Review the step-by-step procedures for each imaging method.- Analyze the advantages and limitations of VCUG/RUG and MRU.- Recognize key findings in urethral images for each technique.

### TABLE OF CONTENTS/OUTLINE

1. Introduction: Understanding the Urethra- Briefly explore anatomy, urination function, and common issues (strictures, injuries, infections).2. Imaging TechniquesA) Fluoroscopic Techniques: 1. VCUG:- Protocol: Step-by-step explanation of the VCUG procedure.- Patient Preparation: Instructions for patients before undergoing VCUG.2. RUG:- Protocol- Patient PreparationB) MRU- Protocol- Patient PreparationC) Comparison among Urethral Imaging: strengths and weaknesses of each techniqueD) Overcoming Difficulties Addressing challenges associated with each imaging method and solutions for optimal results.3. Choosing Wisely
- Visualization strengths (VCUG/RUG vs. MRU)
- Radiation exposure (VCUG/RUG vs. MRU)
- Cost
- Patient comfort4. Interpreting the Images
- Key Findings Pitfalls Recognize crucial details and avoid misinterpretations.
- Surgical Considerations Ensure imaging reports provide what surgeons need.5. Common Urethral Surgeries brief descriptions of procedures like urethroplasty for strictures.6. Interactive Case Studies solidify image interpretation skills.7. Conclusions summary of key points and the importance of accurate urethral imaging for diagnosis and treatment planning.

## DEVELOPMENT OF A DEEP PELVIC ENDOMETRIOSIS REPORTING AND DATA SYSTEM (ENDO-RADS) USING MRI

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Vlad V. Simianu, MD (*Abstract Co-Author*) Nothing to Disclose
Megan Loring (*Abstract Co-Author*) Nothing to Disclose
Achille Mileto, MD (*Abstract Co-Author*) Consultant, Bayer AG
Bahar Mansoori, MD (*Abstract Co-Author*) Nothing to Disclose
Karisma Gupta, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

We developed and herein present a Reporting and Data System for deep pelvic endometriosis (Endo-RADS). Endo-RADS is a scoring system determined by appearance and MRI signal characteristics of endometriotic lesions (lesion type) and location in the deep pelvis. The greater the Endo-RADS cumulative score, the higher the stage of deep pelvic endometriosis. While Endo-RADS is based on MRI findings, it also takes into account prior demonstration of deep pelvic endometriosis by laparoscopy or ultrasound. Endo-RADS can provide simplified and standardized terminology to solve complex narrative endometriosis reports.Learning Objectives:- To discuss shortcomings of previously proposed classifications for deep pelvic endometriosis.- To illustrate currently unmet needs and limitations of reporting systems for deep pelvic endometriosis.- To introduce Endo-RADS (Endometriosis Reporting and Data System).- To showcase how Endo-RADS scores are assigned based on MRI signal characteristics and location of the lesions.

### TABLE OF CONTENTS/OUTLINE

- To review epidemiology, clinical significance, and morbidity of deep pelvic endometriosis.- To highlight commonly encountered imaging findings of deep pelvic endometriosis at MRI.- To introduce the Endo-RADS scoring system.- To discuss anticipated imitations of Endo-RADS.- To illustrate future directions for Endo-RADS.

Carolina Soto-Davila, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Review the acute clinical presentation of various adnexal disorders and subsequent abdominal complications.2. Describe the multi-modality imaging findings of adnexal emergencies such as ovarian torsion, massive ovarian edema (MOE), isolated fallopian tube torsion, rupture of cystic teratoma, and rupture of endometrioma.3. Review clinicopathologic follow-up to establish a final diagnosis.

### TABLE OF CONTENTS/OUTLINE

1. To outline common and uncommon acute pathologies of the adnexa.2. To depict typical and atypical imaging appearances on ultrasound (US), computed tomography (CT), and magnetic resonance (MRI) exams.3. To discuss the most relevant differential diagnosis.Due to ambiguous and overlapping physical and laboratory findings, early and accurate diagnosis of acute adnexal pathology will help initiate appropriate management and fertility preservation. This educational exhibit will aid the radiologist in accurately and timely diagnose adnexal findings.

## PI-QUAL SCORE: A CASE-BASED USER GUIDE FOR OBJECTIVE ASSESSMENT OF PROSTATE MRI IMAGE QUALITY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Khyrul A. Khan (*Abstract Co-Author*) Nothing to Disclose
Leonardo K. Bittencourt, MD, PhD (*Abstract Co-Author*) Research Consultant, Canon Medical Systems Corporation
Eduardo Thadeu De Oliveira Correia, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Raphael Lanz (*Abstract Co-Author*) Nothing to Disclose
Andres Hernandez (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The Prostate Imaging Quality (PI-QUAL) scoring system has been increasingly adopted for the objective assessment and reporting of prostate MRI image quality. PI-QUAL consists of scores ranging from 1 to 5 based on technical parameters and the visual assessment of prostate MRI, with higher scores denoting superior imaging quality and enhanced diagnostic certainty. However, many radiologists are still unfamiliar with the PI-QUAL scoring system, which hinders its integration into prostate MRI reports, especially at non-academic centers. This exhibit provides a case-based user guide to facilitate the understanding of key rules of the PI-QUAL scoring system, to promote its widespread adoption into practice.

### TABLE OF CONTENTS/OUTLINE

1. Why should you include the PI-QUAL scoring system in your report? 2. Main components of the PI-QUAL scoring system: a. Technical parameters b. Visual assessment c. How is image quality scored? 3. A Case-Based User Guide: a. PI-QUAL Score 1 b. PI-QUAL Score 2 c. PI-QUAL Score 3 d. PI-QUAL Score 4 e. PI-QUAL Score 5 4. Test your knowledge! a. Case 1 b. Case 2

## APPLICATIONS OF DECT IN RENAL IMAGING

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Pablo G. Verdu, MD (*Abstract Co-Author*) Nothing to Disclose
Ana Puig (*Abstract Co-Author*) Nothing to Disclose
Polina Rudenko, MD (*Abstract Co-Author*) Nothing to Disclose
Celia Monton Gomez, MD (*Abstract Co-Author*) Nothing to Disclose
Monica Santos Blasco, MD (*Abstract Co-Author*) Nothing to Disclose
Claudia Fontenla Martinez (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Describe the basic physical principles of DECT.- Explain the post-processed DECT maps.- Exhibit the main applications of DECT in renal imaging.

### TABLE OF CONTENTS/OUTLINE

Imaging is key in the diagnosis of urological pathology, from incidental neoplasms to acute renal colic or hematuria. The introduction of dual-energy computed tomography (DECT) has significantly expanded diagnostic possibilities in radiology, impacting the field of urology as well.While conventional CT provides limited information by overlaying all data into a single CT sequence, DETC enables the analysis of the continuous energy spectrum of X-rays. This facilitates better tissue characterization through the analysis of the post-processing maps.Imaging Findings 1. Focal Lesions: Differentiate between cystic and solid lesions and guide the histological subtype and aggressiveness.2. Renal Vascularization: Better vascular evaluation prior to treatment procedures and distinguish tumor thrombus from soft thrombus.3. Follow-up of Treated Lesions: Distinguish between post-treatment intralesional changes and residual tumor after percutaneous treatments.4. Inflammatory Diseases: Detection of inflamed kidney foci in acute pyelonephritis.5. Lithiasis: Characterization lithiasis composition. 6. Staging: Low energy monoenergetic maps facilitate the detection of metastases, whether hyper- or hypovascular, due to increased contrast between structures.Conclusion:DECT offers multiple advantages in renal imaging, from lesion characterization to vascular evaluation and treatment monitoring. Knowing their applications is crucial for its effective application in daily practice.

Yashant Aswani, MD (*Abstract Co-Author*) Nothing to Disclose
Malak Itani, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Cystic lesions in the male and female pelvis have a wide differential. This exhibit will present cystic lesions of the lower genitourinary (GU) tract along with their mimics and highlight important pearls and pitfalls. The focus of this exhibit will be on the bladder, urethra, and deep pelvis excluding adnexal lesions given existing imaging guidelines. The goal of this exhibit is to: (1) Provide a detailed review of cystic lesions of the bladder and urethra; (2) Showcase variable etiologies of periurethral cystic lesions in the female pelvis, including uterine, cervical, vaginal, and vulvar lesions, with an algorithmic approach to differential considerations; (3) Present variable cystic lesions in the male pelvis with focus on genitourinary lesions

### TABLE OF CONTENTS/OUTLINE

A. Cystic lesions of the bladder and urethra: Diverticula Urachal abnormalities Infectious lesions Mimics and less common lesions (simple cyst, Brunn’s cyst, cloacal cyst, everted ureterocele, cystitis cystica, obturator hernia, implantable devices and injectables) B. Cystic lesions in the female pelvis: Uterine and cervical origin lesions: endosalpingiosis, cystic fibroids, adenomyomas, Nabothian cysts, tunnel cluster, cervicitis, adenoma malignum, endocervicosis. Vaginal lesions: Gartner’s duct cyst, vaginal cuff cyst, inclusion cysts. Vulvar and perineal lesions: Bartholin gland cyst or abscess, Skene duct cyst, canal of Nuck cyst. C. Cystic lesions in the male pelvis Utricle cyst Mullerian duct cyst Seminal vesicle cyst Ejaculatory duct cyst Cowper duct syringocele Mimics and other lesions (cystic BPH nodules, prostate retention cysts, hindgut cyst, angiomyxoma)

### TEACHING POINTS

Various pathologies can affect thoracic organs and the genitourinary system. Syndromes like Birt-Hogg-Dubé and tuberous sclerosis, with characteristic pulmonary changes, can predispose to renal lesions, including carcinomas.Granulomatous diseases such as tuberculosis have primary pulmonary forms, but can also involve genitourinary organs, including the kidneys, adrenals, seminal vesicles and testes.Similarly, various pulmonary neoplasms can metastasize to the genitourinary system, with adrenal involvement, for example. Lungs are also a common site for renal metastases, among others.Thus, the general radiologist who interprets chest and abdomen exams may encounter conditions that affect both systems, and knowing how to recognize them is crucial for reaching the correct diagnosis and recommending additional tests if necessary.The aim of this pictorial essay is to review the main pathologies with thoracic and genitourinary involvement, familiarizing the general radiologist who might encounter them in their daily work.

### TABLE OF CONTENTS/OUTLINE

A literature review was conducted under the guidance of radiologists specialized in thoracic and genitourinary imaging.Pathologies involving both the pulmonary and genitourinary systems were included, covering conditions affecting the lungs, kidneys, adrenals, bladder, prostate, testicles and vascular structures.

## MRI FOR PENILE TRAUMA AND TUMORS: WHAT THE RADIOLOGIST SHOULD KNOW

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Diana Murcia, MD (*Abstract Co-Author*) Nothing to Disclose
Noor Fatima Majeed, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

MRI is increasingly being used for evaluation of penile conditions, including post-traumatic and neoplastic etiologies. Previously used as a problem-solving tool in patients who had undergone ultrasound for penile trauma or neoplasm, it is now increasingly being used as a primary modality for evaluation of these conditions and is a useful adjunct to physical examination. With its excellent contrast resolution, MRI can be used evaluate the integrity of the tunica albuginea, urethra, and vasculature and thereby differentiate a contusion from a fracture, helping direct management (surgical versus non-surgical). It can also be used for accurate tumor staging - including assessment of local extent, nodal and distant metastatic disease - and for surveillance following resection.

### TABLE OF CONTENTS/OUTLINE

Review of penile anatomyPenile MRI protocol, including protocol challengesCase-based review of penile trauma on MRIPenile cancer types and staging of penile squamous cell carcinomaCase-based review of penile cancer stages on MRIPostoperative appearance following penectomy (partial/total), including tumor recurrence

MARIA BELEN DASS CORREA (*Abstract Co-Author*) Nothing to Disclose
Maria N. Napoli, MD (*Abstract Co-Author*) Nothing to Disclose
Leonela Panaccio (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Leiomyomas are the most common gynecological neoplasm.- Uterine leiomyomas and leiomyosarcomas are the two extremes within smooth muscle tumors, with diverse histological variants in the middle, including cellular histology, bizarre or atypical nuclei, mitotically active fibroids, and uterine smooth muscle tumor (STUM) lesions.- These variants present a distinctive histological profile and the characteristics may generate uncertainty in diagnostic interpretation.- There are no clear significant findings that can reliably distinguish fibroid variants, however there are some characteristics suggestive of non-typical or ordinary leiomyomas.- It´s essential for the radiologist to be aware of both the typical and atypical findings to best guide for diagnosis and management decisions- The definitive diagnosis of a leiomyoma variant is through post-surgical pathological examination.

### TABLE OF CONTENTS/OUTLINE

- Comprehensive description in imaging findings of leiomyoma variants and their pathologic features.- Comparative analysis of the features of uterine leiomyomas in ultrasound and magnetic resonance imaging that may be suggestive of one of the variants.- Demonstrate the significance of imaging findings in facilitating early detection, informing treatment strategies, and guiding patient monitoring for individuals affected by uterine leiomyomas.- Exemplify with cases.

## COMPREHENSIVE IMAGING AND DIAGNOSTIC APPROACH TO UPPER TRACT UROTHELIAL CANCERS: INSTITUTIONAL INSIGHTS AND CLINICAL IMPLICATIONS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Refky Nicola, MSc, DO (*Abstract Co-Author*) Royalties, RELX
Sravani Gampala, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Understand the distribution of upper tract urothelial cancers (UTUC) and their most common locations and presentations.2. Explore various clinical scenarios to raise the possibility of UTUC by interpreting radiologists.3. Discuss the best imaging modalities and optimal protocols for the diagnoses of UTUC based on our institutional experience.4. Recognize papillary, flat and infiltrative types and sub-types of the UTUC with relevant imaging from our institution. Differentiate tumors from pseudo tumors based on imaging to appropriately guide clinical management.5. Discuss the sequential involvement of UTUC and bladder cancer; educate trainees to carefully evaluate the urinary tract and bladder if they find any one of the cancers.

### TABLE OF CONTENTS/OUTLINE

1. Discuss the epidemiology, risk factors, and clinical presentation of the UTUC.2. Explore the distribution and association with concomitant or recurrent bladder cancer and contralateral urinary tract cancer.3. Discuss the optimal imaging protocols will be outlined in general and used at our institution for better evaluation of tumors from pseudo tumors.4. Present a case-based review of different types of UTUCs, including papillary, flat, and infiltrative types. Present a unique case of histologically different but synchronous UTUC involving the renal pelvis and ureter.5. Discuss various differential diagnoses, which mimic UTUC including blood clots, hypertrophied papilla, renal papillary necrosis (ball on tee sign), inflammation, retroperitoneal fibrosis, renal cell carcinomas, and renal lymphomas. Review of different imaging findings will be presentedusing a multimodality case-based approach.

### TEACHING POINTS

- Briefly review the prostate cancer focal treatment options.- Understand the current indications of high-intensity focused ultrasound (HIFU) and irreversible electroporation (IRE) and its technique procedures.- Review the prostate multiparametric MR imaging technique and zonal anatomy of the prostate.- Discuss the expected and unexpected post-ablation MR imaging findings.- Recognize the importance of DCE and DWI MRI sequences to detect prostate cancer recurrence afterablation.- Comprehend the new proposal PI-FAB score system and its role in patient follow-up.

### TABLE OF CONTENTS/OUTLINE

INTRODUCTION
● Overview of prostate cancer and focal therapy options
● New guidelines for HIFU for prostate cancer
HIFU AND IRE FOR PROSTATE CANCER
● What: Current concepts
● When: Potential candidates
● Where: Procedure description
● How: Tissue effects and limitations
PROSTATE IMAGING EVALUATION
● MRI protocol
● Prostate zonal anatomy at MRI
● The new scoring system for focal ablation (PI-FAB)
○ General concepts and rationale for using PI-FAB score system
○ When and how apply PI-FAB score system, correlating didactic cases.
○ Clinical management based on PI-FAB score
CASE-BASED REVIEW
● Expect and unexpected post-ablation MRI findings
● Normal temporal changes
● Residual or recurrent prostate cancer
● Pitfalls

## CRACKING THE CYSTS: MASTERING THE V2019 BOSNIAK CLASSIFICATION WITH A QUIZ-BASED APPROACH

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Leonardo K. Bittencourt, MD, PhD (*Abstract Co-Author*) Research Consultant, Canon Medical Systems Corporation
Eduardo Thadeu De Oliveira Correia, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Khyrul A. Khan (*Abstract Co-Author*) Nothing to Disclose
Ifeanyi Ekpunobi, BS (*Abstract Co-Author*) Nothing to Disclose
Andres Hernandez (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The Bosniak Classification v2019 provides a framework for classifying cystic lesions based on their complexity and likelihood of malignancy, with Bosniak classifications ranging from I to IV. Examination questions regarding focal renal lesions is a recurrent theme in medical training, such as in the US Medical Licensing Examination (USMLE). However, students often lack sufficient exposure to the principles of renal cyst imaging throughout their training. This exhibit aims to enhance the training of medical students and radiology residents by offering a quiz-based approach to the Bosniak Classification system in the form of a question bank, a popular exam preparation tool used by medical trainees.

### TABLE OF CONTENTS/OUTLINE

1. Main components of the Bosniak Classification system a. Separate CT and MRI criteria in the Bosniak Classification v2019 b. Overview of Bosniak classes I through IV 2. Cracking the cysts questions: translating imaging features into simple language for trainees a. Bosniak classification of a small, well-defined cystic lesion with no septa or calcifications i. Q1: Bosniak class I criteria ii. Q2: Follow-up for Bosniak I b. Bosniak classification of a small, well-defined cystic lesion with thin, non-enhancing septa i. Q3: Bosniak class II criteria ii. Q4: Follow-up for Bosniak II c. Bosniak classification of a cystic lesion with a minimally thickened enhancing wall i. Q5: Bosniak class IIF criteria ii. Q6: Follow-up for Bosniak IIF d. Bosniak classification of a cystic lesion with enhancing thick septa i. Q7: Bosniak class III criteria ii. Q8: Follow-up for Bosniak III e. Bosniak classification of a cystic lesion with enhancing nodules i. Q9: Bosniak class IV criteria ii. Q10: Follow-up for Bosniak IV

## RADIOLOGIST ROLE IN MR GUIDED FOCAL LASER ABLATION FOR LOCALIZED PROSTATE CANCER: LESSONS LEARNED AND ADVANCEMENTS IN PATIENT CARE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Sangeet Ghai, MD (*Abstract Co-Author*) Research Grant, INSIGHTEC Ltd
Nathan Perlis (*Abstract Co-Author*) Nothing to Disclose
Vanessa Murad, MD (*Abstract Co-Author*) Nothing to Disclose
Adriano Basso Dias, MD, MSc (*Abstract Co-Author*) Nothing to Disclose
Jorge A. Abreu Gomez, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Radiologist leadership enhances Focal Laser Ablation (FLA) performance and promotes procedure standardization through a systematic approach focused on safety and technical consistency.- MRI guidance enables precise lesion localization enhancing delineation of lesion boundaries and facilitating the planning of ablation volumes. Real-time MRI thermal monitoring facilitates intra-procedural optimization of ablation temperatures and treatment margins.- FLA is acknowledged as a safe and efficient method for executing targeted therapy, controlling disease target while preserving healthy prostatic tissue and reducing the likelihood of adverse effects.- Patient related factors such as motion or anatomical distortion resulting from the insertion and repositioning of the treatment device may hinder the achievement of a successful ablation.

### TEACHING POINTS

1. To introduce current limitations in urologic applications of single-energy CT (SECT) 2. To describe basic principles and various imaging/analyzing techniques of dual-energy CT (DECT) 3. To illustrate clinical utilities of DECT over SECT in urologic applications by presenting various clinical images

### TABLE OF CONTENTS/OUTLINE

1. Current limitations in urologic applications of SECT a) Limited image quality assessment of urinary tumor/stone composition b) Greater radiation/contrast media (CM) dose 2. Basic principles imaging/analyzing techniques of DECT a) Virtual monochromatic (VMI)/material decomposition imaging (MDI) b) Spectral HU (keV-HU) curve/effective Z analysis c) Metallic artifact reduction software (MARS) d) Iterative (IR)/deep-learning reconstruction (DLR) 3. Clinical utilities of DECT over SECT in urologic applications a) Improved image contrast/reduced CM dose: low-keV VMI/IR/DLR b) Reduced beam-hardening/metallic artifact: high-keV VMI/MARS c) Differentiation of cystic solid masses (e.g., complicated cysts): iodine-enhanced MDI d) Assessment of tumor grade/viability/response to chemotherapy: iodine-enhanced MDI e) Virtual non-contrast CT/reduced radiation dose: iodine-suppressed MDI/IR/DLR f) Bone metastasis detection: hydroxyapatite/calcium-suppressed MDI g) Lipid-rich lesion (e.g., renal angiomyolipoma) detection: fat-enhanced MDI/spectral HU curve/effective Z analysis h) Urinary stone composition analysis: uric acid/calcium MDI effective Z analysis

## WHICH KIDNEY TO EXTRACT, SECTIONAL CT OF LIVING RENAL DONORS. WE TELL YOU

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Carlos M. Campana SR, MD (*Abstract Co-Author*) Nothing to Disclose
Mary E. Arevalo Molina, MD (*Abstract Co-Author*) Nothing to Disclose
Omar A. Gamboa Abundis, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Kidney failure is a major health problem that affects approximately 7.2% of the world's population. There are multiple kidney replacement therapies; however, the only definitive one is kidney transplant, which offers a better quality of life. It is important for the resident physician and radiologist to develop a radiological reporting system with the necessary pre-surgical information for the surgeon and to specify the exclusion criteria for a probable kidney donor. The left kidney is preferred for donation due to the greater length of the renal vein. Presence of more than two arteries within a kidney exclude the donor. Unilateral agenesis, horseshoe kidney, cortical atrophy, polycystic kidney disease, medullary sponge kidney, and necrosis exclude the donor. A gonadal vein greater than 5mm in diameter should be reported as it alters the surgical technique.

### TABLE OF CONTENTS/OUTLINE

1. Objectives and introduction to renal insufficiency. 2. Low-dose radiation protocol for tomographic acquisition of the potential donor. 3. Checklist of key points to consider in the radiological report of the living kidney donor. 4. Location and size of the kidneys. 5. Number of renal arteries and veins. 6. Type and diameter of accessory renal arteries. 7. Location and distance of the first segmental arterial bifurcation. 8. Type and diameter of renal veins. 9. Frequent and infrequent vascular anatomical variants. 10. Perinephric fat and urinary tract11. Exclusion criteria for living kidney donors. 11. Common pathology. 12. Development of a radiological reporting system with the necessary preoperative information. 13. Conclusion and teaching points

### TEACHING POINTS

-To review the techniques and protocols used for the study of bladder injury, emphasizing the correlation between different imaging modalities. - To explain the anatomical basis and mechanisms of injury that determine the different types of bladder rupture. - To illustrate the different existing classifications that can be used to describe bladder injury.

### TABLE OF CONTENTS/OUTLINE

Introduction: Bladder perforation, rupture or trauma is the laceration of the bladder wall, whether full-thickness or incomplete. These can be very subtle injuries, which can be easily overlooked in the setting of trauma patients. If this happens, complications such as urinary tract infections, incontinence or fistulas may occur. Therefore, it is important for radiologists to be aware of this entity and the methods available for its study. Imaging techniques: In this presentation we explain the different imaging modalities that can be used when bladder injury is suspected. Not only conventional cystography and CT-cystography, but also covering US, non-contrast CT and MRI. We will explain protocols, advantages and disadvantages of each technique and provide details that, in our experience, make the difference. Mechanism of injury: We review the anatomy and the possible mechanisms of injury (spontaneous and traumatic, whether closed, penetrating or iatrogenic). Classifications: We will cover both Sandler and AAST classifications. Sandler's is the most used one and divides ruptures into intramural hematoma or contusion, intraperitoneal rupture, extraperitoneal rupture and intra- and extraperitoneal rupture. For all of the above, we will use representative images from our series of more than 50 cases.

## DEMYSTIFYING MRI PENILE PROSTHESIS EVALUATION: INTRODUCTION FOR NOVICES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Noor Fatima Majeed, MD (*Abstract Co-Author*) Nothing to Disclose
Diana Murcia, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Penile prosthesis is the ultimate treatment for erectile dysfunction. Dedicated penile MR protocol is the imaging of choice for evaluation of penile prostheses as it allows a three-in-one assessment of position, functionality, and penile anatomy. The currently most common prostheses include the 3-piece inflatable penile prosthesis (IPP), followed by the 2-piece IPP, and the malleable or semi-rigid penile prosthesis (MPP). Complications of any type and any component include fracture, infection, malposition, hematoma, and encapsulation. Inflatable type specific complications include kinking or buckling resulting in floppy glans syndrome, aneurysmal dilatation, and leakage. Knowledge of penile MR anatomical structures is crucial for the appropriate diagnosis of these complications.

### TABLE OF CONTENTS/OUTLINE

Penile MR protocol specific pre and post inflation sequences for IPP. Penile MR anatomy review. Types of penile prostheses: 2-piece Inflatable (IPP), 3-piece IPP, Malleable or semi rigid (MPP). Evaluation of anatomic location and functionality. Common complications.

### TEACHING POINTS

Active surveillance for prostate cancer is a management strategy employed in cases of low-risk and favorable intermediate-risk cancer. Its goal is to avoid invasive treatment options while maintaining a curative perspective. Several studies have highlighted the promising role of MRI in these cases, directly influencing clinical decisions and aiding urologists in providing optimal patient care.In 2016, the European School of Oncology established an international task force of experts, resulting in the publication of the PRECISE version 1 guidelines. These guidelines aimed to standardize the description of serial MRIs in both research studies and clinical practice. In 2024, Precise version 2 was released, with significant improvements discussed by an international panel comprising experts from various countries.The purpose of this educational exhibit is to explore the key differences between the first and current versions of PRECISE, emphasizing areas of improvement. Additionally, we aim to illustrate the clinical application of the current PRECISE classification using real cases from our institution.Finally, we will engage in a discussion about the current version of PRECISE, particularly discussing the areas for potential improvement.

### TABLE OF CONTENTS/OUTLINE

Introduction; Objetives; Main updates in PRECISE version 2; Illustration base on clinical cases of the applicability of PRECISE V2; Discuss its limitations and areas of improvement; Conclusion.

Marina Arroyo Olmedo, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. To understand the usefulness of contrast-enhanced ultrasound for the characterisation of renal cystic lesions and other renal masses. 2. To review the main differences that should be made when using the Bosniak classification in CEUS compared to the existing one for CT and MRI and when not to use this classification. 3. To analyse the role of CEUS in the context of pre- and post-ablative treatments.

### TABLE OF CONTENTS/OUTLINE

1. Introduction. In the USA, the use of contrast-enhanced ultrasound is only approved by the FDA for liver indications. Therefore, for kidney and other organs it is used off-label. CEUS has significant differences from CT and MRI in terms of contrast and temporal resolution (among others), so the characterisation of cystic renal masses requires certain specifications. It also provides greater sensitivity in the characterisation of enhancement in papillary tumours. 2. General considerations on renal contrast-enhanced ultrasonography. 3. Renal cystic lesions: 3.1. Definition. 3.2. Evaluation by CEUS (compared to CT) based on the Bosniak classification (pictorial review): 3.2.1. Bosniak I. 3.2.2. Bosniak II and IIF. 3.2.3. Bosniak III. 3.2.4. Bosniak IV. 3.3. When not to use the Bosniak classification: 3.3.1. Inflammatory-infectious. 3.3.2. Masses with cystic-necrotic component. 3.3.3. Vascular. 4. Problem solving: cysts and other renal masses. Limitations of CEUS. 5. Analyze the different type of treatments: multidisciplinary committees. 6. Usefulness of CEUS in local treatments. 6.1. Planning of ablation treatments. 6.2. Detection of early complications post-ablation. 6.3. Surveillance after ablative treatment (proposal of treatment and follow-up algorithm). 7. Conclusions.

Ana Gomes, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Ultrasonography of the scrotum is a very important tool for evaluating the testicles as well as their adjacent structures, providing important anatomical details with the possibility of real-time assessment of vascularization through the Color Doppler feature in a non-invasive way.Testicular pouch changes encompass a spectrum from benign to serious conditions. In relation to benign changes, acute scrotum refers to sudden onset scrotal pain and swelling, often due to serious conditions like testicular torsion, epididymitis, or trauma. US is crucial for accurate diagnosis and timely intervention to prevent complications and preserve testicular function. In pediatrics, cryptorchidism refers to undescended testicles, where one or both testes fail to descend into the scrotum. US is valuable for diagnosing, visualizing the testicles position and assessing any associated abnormalities. Retractable testicles, on the other hand, can retract into the inguinal canal but are otherwise normal. The method helps differentiate between these two pathologies.Ultrasound of the testicular sac is vital for evaluating various chronic disorders such as hydrocele, scrotal lithiasis, and epididymal cysts. Overall, US provides crucial imaging information for precise diagnosis, treatment planning, and monitoring of these conditions, ensuring optimal patient care.

### TABLE OF CONTENTS/OUTLINE

This work aims to differentiate the main benign testicular lesions as well as the main ultrasound findings.

## BALLS TO THE WALLS: A JOURNEY THROUGH TESTICULAR MRI PROTOCOLS AND CLINICAL APPLICATIONS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Raphael Lanz (*Abstract Co-Author*) Nothing to Disclose
Leonardo K. Bittencourt, MD, PhD (*Abstract Co-Author*) Research Consultant, Canon Medical Systems Corporation
Khyrul A. Khan (*Abstract Co-Author*) Nothing to Disclose
Eduardo Thadeu De Oliveira Correia, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Ultrasound is the most common imaging modality for the evaluation of the testicles. However, testicular MRI plays a crucial role in the diagnosis and characterization of various testicular conditions, encompassing non-neoplastic, benign neoplastic, and neoplastic entities. Despite its significance, this imaging technique is relatively unfamiliar to a considerable portion of the radiology community. This exhibit offers a comprehensive overview, exploring testicular MRI protocols, their clinical applications, common cases encountered in practice, and a glimpse into the evolving future of this diagnostic tool.

### TABLE OF CONTENTS/OUTLINE

1. Navigating Testicular MRI Clinical Indications, a. Non-neoplastic conditions, b. Benign neoplastic conditions, c. Neoplastic conditions. 2. How to structure a testicular MRI protocol in your institution, a. Patient preparation and positioning, b. Technical protocols for non-contrast and contrast-enhanced examinations. 3. How to read a testicular MRI? 4. Learning with cases, a. Case 1: a normal-appearing testicular MRI, b. Case 2: a benign condition, c. Case 3: a neoplastic condition. 5. Future perspectives for testicular MRI, a. The emergence of quantitative imaging techniques for the testicles, b. Potential future clinical applications of testicular MRI.

### TEACHING POINTS

1. CT Urogram is considered the imaging modality of choice for diagnosis; staging and follow-up of upper tract urothelial cancers.2. Spontaneous sub-urothelial hemorrhage can appear as hyperdense urothelial thickening on the non-enhanced phase with no or minimal enhancement. Follow-up imaging showing complete resolution should be obtained to avoid missing an underlying tumor that may have caused the hemorrhage.3. Pitfalls related to CTU and MRU techniques can mimic urothelial malignancy, and Radiologists should be aware of these while interpreting these studies.4. Radiologists should be cognizant of multimodality imaging appearances, ureteroscopy, and histopathology findings to accurately diagnose upper tract urothelial cancers and differentiate them from their mimics, to guide appropriate treatment.

### TABLE OF CONTENTS/OUTLINE

1. Introduction to Urothelial Cancer with pertinent anatomy2. Imaging: Role of CT and MR urography in identifying upper urinary tract urothelial cancer3. Role of ureteroscopy and histopathology 4. Mimics and their imaging appearances

Masahiro Jinzaki, MD, PhD (*Presenter*) Support, Canon Medical Systems Corporation;Support, General Electric Company

### TEACHING POINTS

The WHO Classification of Tumors is published to standardize tumor names and diagnostic criteria to promote international comparative research on malignant tumors. Renal tumors are included in the volume titled "Urinary Male Genital Tumors," which was revised for the first time in six years as the 5th edition in 2022. From this edition, both pathologists and radiologists have joined as contributors, considering the extent to which diverse pathological classifications can be reflected in images. In the future, as the presence of genetic mutations becomes increasingly reflected in diagnostic names alongside histological features, radiologists will find it increasingly important to consider imaging findings from the perspective of imaging-genetic correlations, not just as a position of radiologic-pathologic correlation. In this paper, we will discuss the key points of this revision compared to the 4th edition, and we will also present how this classification can be reflected in imaging. (1) To introduce the WHO Classification of Renal Tumors 5th edition (WHO 2022)(2) To present imaging findings of major subtypes based on the WHO 2022(3) To present imaging features of relatively rare renal tumors following the WHO 2022 classification.

### TABLE OF CONTENTS/OUTLINE

(1) Introduction (the points of revision of WHO 2022) (2) Protocols and Useful findings of US, CT or MRI (3) Diagnosis of major subtypes of renal tumors (Expansile growth and Invasive growth)(including Bosniak classification update 2019 and Clear Cell Likelihood Score) (4) Diagnosis of other renal tumors (Mucinous tubular and spindle cell carcinoma, etc) (5) Diagnosis of molecularly defined renal carcinoma (FH deficient RCC, etc)

Andres Labra, MD (*Abstract Co-Author*) Nothing to Disclose
Nicolas G. Molina Vasquez, MD (*Abstract Co-Author*) Nothing to Disclose
Fernando Vivanco, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Magnetic Resonance Imaging (MRI) offers a detailed anatomical assessment of penile structures, including the corpus spongiosum, cavernosum, and tunica albuginea, with specific signal characteristics on various sequences. A standardized acquisition protocol is necessary to ensure optimal imaging quality for evaluating penile pathologies. MRI is useful in the context of neoplasms, Peyronie's disease, trauma, and vascular pathology.

### TABLE OF CONTENTS/OUTLINE

Anatomic review on MRI: Both corpus spongiosum (CS) and cavernosum (CC) show high signal on T2-weighted imaging (T2WI) and intermediate signal on T1-weighted imaging (T1WI). Urethral musculature appears hypointense compared to CS on T2WI. Tunica albuginea (TU) demonstrates low signal on both T1WI and T2WI. Contrast-enhanced MRI reveals gradual/centrifugal enhancement in CC and early enhancement in CS.The acquisition protocol requires patient supine with the penis flexed over the scrotum, small FOV (160 mm) and thin slices (2-3 mm). Sequences obtained are T2WI in three orthogonal planes, coronal/sagittal T1WI, axial small field of view diffusion-weighted imaging (DWI), dynamic contrast-enhanced sequences with fat saturation, and subtraction.Among the most frequent pathologies where MRI proves invaluable is in the characterization of primary and secondary neoplasms. Another spectrum of conditions in which MRI demonstrates utility includes Peyronie's disease, playing a crucial preoperative role. MRI shows remarkable sensitivity (99%) and specificity (87%) in trauma cases. Furthermore, in vascular pathology, notably cavernous body thrombosis, MRI offers crucial insights into thrombosis extension and associated findings.

### TEACHING POINTS

I. Emphasize the uncommon nature and the unique associated conditions of congenital anomalies in the urinary tract. This accentuates the critical need for a detailed and comprehensive imaging approach, aiming to ensure the early and accurate identification of these rare anomalies. Such a focused strategy is essential for optimizing patient outcomes and guiding effective management plans. II. Review advanced imaging techniques and their application in diagnosing congenital urinary tract anomalies, focusing on the benefits of 3D reconstruction and contrast-enhanced studies in understanding the anatomical complexities and functional implications of these conditions. III. Underline the indispensable role of the radiologist in multidisciplinary teams managing congenital urinary tract anomalies, from prenatal imaging to postoperative assessment, emphasizing how radiologic expertise contributes to tailored treatment plans and optimizes patient prognoses.

### TABLE OF CONTENTS/OUTLINE

1. Embriology of urinary tract formation. 2. The role of computed tomography (CT) in evaluating congenital anomalies affecting the urinary tract. 3. Different presentations and examples of congenital anomalies affecting the urinary tract. a) Pancake kidney (discoid kidney) b) Renal cell carcinoma in a horseshoe kidney c) Supernumerary kidney d) Crossed renal ectopia e) Zinner Syndrome

## ULTRASOUND OF TESTICULAR MASSES IN A "CEC"

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Alejandra Valenzuela (*Abstract Co-Author*) Nothing to Disclose
Carlos F. Guardado Martinez, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

remember the different types of testicular tumors and the demographic and ultrasonographic characteristics that help in their identification

### TABLE OF CONTENTS/OUTLINE

GERM CELL TUMORS:¬ Seminomas: This is the most common pure tumor and is associated with TCG¬NS in older patients, around 40 years of age. Non-seminomatous germ cell tumors (NSGCT): These are often heterogeneous in echotexture, and the presence of cystic spaces and calcifications is much more common in this group.Mixed germ cell tumor: This is much more common than pure forms. The average age of presentation is around 30 years, and its ultrasound appearance varies depending on the histological types that compose it.•Embryonal carcinoma: Ultrasound shows it as a heterogeneous lesion with poorly defined borders.•Yolk sac tumors or endodermal sinus tumors: These represent 80% of testicular tumors in children, with most cases appearing before 2 years of age. In adults, the pure form is rare and is present in approximately half of mixed tumor cases.• Teratoma: This is the second most common type in children and appears before 4 years of age. The pure form in adults is very rare and is found in half of mixed tumors. Ultrasound shows it as a well-defined complex mass that may have cysts, calcifications, and areas of fibrosis.STROMAL TUMORS OF THE SEX CORDS:These represent about 5% of testicular tumors, with a prevalence of 10¬-30% in the pediatric age group. 90% of them are benign, but there are no specific radiological criteria to differentiate them.

Richard Mast Vilaseca (*Abstract Co-Author*) Nothing to Disclose
Sandra Lopez Coello, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Renal tumors comprise a spectrum of hypovascular lesions, including papillary and chromophobe renal carcinoma, alongside rare entities with diverse imaging presentations.- Distinguishing subtypes remains challenging due to overlapping imaging features, especially in small lesions.- Certain features like small size, regular margins, and angular interface sign lean towards benignity in renal lesions.- Low fat content angiomyolipomas resemble RCC, while cystic masses with calcifications and fat should raise suspicion of atypical papillary carcinoma.

### TABLE OF CONTENTS/OUTLINE

1. Introduction- Overview of hypovascular renal tumors and their diagnostic challenges.2. Imaging modalities in renal mass assessment- CT and MRI protocols for evaluating renal masses.3. Benign lesions- Angiomyolipomas: classic and fat-poor variants.- Tubulocystic oncocytoma: Mimicking chromophobe or papillary RCC.- Inflammatory conditions and pseudotumors: tuberculosis mimicking solid renal masses.4. Malignant lesions- Papillary RCC: Imaging characteristics and atypical presentations.- Chromophobe RCC: homogeneous or heterogeneous appearance.- Rare malignant tumors: metanephric adenoma, mucinous tubular and spindle cell carcinoma, and tubulocystic RCC.- Hematopoietic and lymphoid tumors: renal involvement in lymphoma and leukemia.5. Diagnostic algorithm6. ConclusionsImportance of recognizing diverse renal tumor types for prognosis and management decisions.

Cole P. Thompson, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

A wide range of interventions are employed in the management of benign prostatic hyperplasia (BPH) and prostate cancer (PCa). In BPH, recent innovations in minimally invasive procedures have expanded the options for treatment of lower urinary tract symptoms beyond transurethral resection of the prostate. Common interventions for PCa include ablation, radiation therapy, and surgery. On imaging, differentiation between the normal post-interventional appearance of the prostate and various complications has important implications for clinical management. These complications include those related to vascular injury; injury to the surrounding structures, including the urethra, bladder, and rectum; anastomotic leak; urethral stricture and bladder outlet obstruction; infection, including musculoskeletal involvement; and radiation injury to the pelvic organs. Radiologists should be familiar with the appearance of these complications on CT, MR, US, fluoroscopy and PET to ensure prompt identification and treatment. This educational exhibit will serve as a comprehensive multimodality review of the imaging manifestations of surgical complications after prostatic interventions.

### TABLE OF CONTENTS/OUTLINE

- Review of the different types of interventions available for management of BPH and PCa.
- Normal post-interventional appearance of the prostate.
- Multimodality imaging findings of complications, including those related to BPH interventions; prostate biopsy; placement of fiducial markers and SpaceOAR hydrogel for radiotherapy planning; and ablation, surgery, and radiation therapy for prostate cancer.
- Common pitfalls in post-procedural imaging interpretation.
- Summary.

Chikayuki Hattori (*Abstract Co-Author*) Nothing to Disclose
Koichiro Muraki, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Iodine-125 (I-125) seeds, measuring 970 μm in diameter and 4.5 mm in length, are commonly used in low dose rate brachytherapy (LDR-BT) for prostate cancer. Due to their small size, these seeds can occasionally migrate through the venous system and lodge in peripheral blood vessels of various organs. Consequently, incidental findings of migrated seeds on plain radiographs or CT scans are not uncommon in patients with a history of LDR-BT.The development of hydrogel spacers, inserted between the prostate and rectum, has contributed to a decrease in the risk of grade 3 or higher rectal toxicity.The purpose of this presentation is to outline the imaging considerations for I-125 permanent seed placement for prostate cancer, focusing on two important aspects: (1) seed placement and migration; and (2) imaging changes and complications associated with hydrogel spacers. By understanding these imaging features, radiologists can better interpret post-treatment findings and guide patient management.1. Discuss the importance of Modified Peripheral Loading in Low Dose Rate Brachytherapy (LDR-BT) for prostate cancer.2. Highlight key points in imaging diagnostics for seed migration.3. Explore the effectiveness and precautions of using a Hydrogel Spacer in brachytherapy.4. By the end of this course, participants will: Understand the role of postoperative Xp/CT/MRI in LDR-BT. Grasp key concepts related to seed migration, spacers, and complications.

### TABLE OF CONTENTS/OUTLINE

1. Concept and technique of Modified Peripheral Loading in LDR-BT. 2. Key points in postoperative imaging evaluation. 3. Imaging diagnostics for postoperative complications. 4. Summary.

Chooi Yan Anna Lois Lai, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

A. Review aspects of focal therapy (FT) in treatment of localised prostate cancer B. Discuss pretreatment considerations on multiparametric MRI (mpMRI) C. Review expected post FT changes in the prostate D. Review in- and out-field tumor recurrence using case review E. Discuss pearls and pitfalls in mpMRI detection of post FT tumor recurrence F. Review aspects in surveillance of the post FT prostate

### TABLE OF CONTENTS/OUTLINE

Focal therapy (FT) is an emerging middle ground between active surveillance and radical whole gland therapy for treatment of localized prostate cancer in the era of precision medicine. Pretreatment considerations on mpMRI for appropriate patient selection include accurate risk stratification through tumor detection and staging as well as determination of tumor location and volume through judicious use of DCE. Low volume clinically significant cancer and MRI-occult cancers present challenges in pretreatment mpMRI.Post FT surveillance with mpMRI is critical for assessing oncologic efficacy. Post FT mpMRI is challenging as treatment changes distort the prostate gland and alter the signal intensity of treated and untreated parenchyma. DCE is the dominant sequence for assessing recurrent cancer post FT. With histology proven case reviews, we showcase the use of PI-FAB score for in-field and PI-RADS v2.1 for out-field recurrences in medium and long term surveillance. We discuss the pearls and pitfalls of mpMRI in post FT surveillance including tumor mimics and the use of ADC in guiding post treatment biopsy decisions. Limitations of mpMRI staging post FT recurrence are discussed including management of post FT tumor recurrence.

Robert C. Sibley III, MD (*Abstract Co-Author*) Nothing to Disclose
Michael D. Bass, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Prostate cancer (PCa) care is rapidly evolving with multi-modality imaging, particularly multiparametric MRI, new ultrasound technologies, and molecular imaging now playing a key role in diagnosis, staging and treatment.2. Multiple reporting systems have been proposed to help standardize multi-modality image assessment and to facilitate communication with patients and referring physicians.3. We provide an illustrated, case-based review of the several proposed criteria used for assessment of MR image quality, detection and risk stratification of primary PCa, staging metastatic disease, and recurrence after conventional or focal therapy.

### TABLE OF CONTENTS/OUTLINE

1.Quality and Structured ReportingA. Pillars of Quality in Prostate Imaging: Image, Interpretation and BiopsyB. Advantages and Disadvantages2.Rationale, basic principles and illustrated review of standardized frameworks for reporting prostate imaging findings beyond PI-RADS A. MR image quality (PI-QUAL v1 and v2)B. Active surveillance (PRECISE)C. Post-treatment follow-up (PI-RR and PI-FAB)D. Micro-ultrasound (PRI-MUS)E. Molecular imaging (PSMA-RADS, PRIMARY)3.Implementation of multiple standardized frameworks in clinical practice - Practical RecommendationsA. Detection of primary PCaB. Characterization and risk assessment in primary PCaC. Detection of metastatic PCaD. Evaluation disease recurrence after conventional or focal therapy4.Challenges and OpportunitiesA. Use of Templates (picklists, references)B. Role of physician lead(s) (updates, radiologist training/feedback, communication with referring physicians) C. Integration of data from different systems and imaging-pathology data reconciliation

## PSMA RADS VERSION 2.0: AN INSTITUTIONAL CASE BASED REVIEW OF THE UTILITY OF UPDATED PSMA RADS IN CLINICAL PROBLEM SOLVING

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Refky Nicola, MSc, DO (*Abstract Co-Author*) Royalties, RELX
Sravani Gampala, MD (*Abstract Co-Author*) Nothing to Disclose
Arwa Elsamny, MBBCh (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Knowledge of the different radiotracers used for PSMA PET and the definition of physiological versus pathological uptake. 2. Review the PSMA RADS categories with emphasis on changes made to categories in PSMA-RADS 2.0. 3. Recognize the importance of the use of the updated PSMA RADS 2.0 for standardized reporting. 4. Understand how the application of PSMA RADS has helped direct management in clinically challenging situations.5. Acknowledge the limitations of the PSMA RADS classification and areas for reform.

### TABLE OF CONTENTS/OUTLINE

1. Introductory about the history of the PSMA RADS classification.2. Different radiotracers /Ligands for PSMA PET (Ga 68 and F18) at the molecular level.3. Definition of physiologic Vs pathologic uptake of the radiotracers. Definition of increased uptake. 4. Navigating the New Frontier: Key Updates in PSMA-RADS version 2.0.5. Examples of PSMA RADS1, 2, 3A, 3B, 3C, 3D, 4, and 5 lesions with emphasis on management recommendations and changes to categories in PSMA RADS 2.0. 6. Example of a timeline for a patient followed by PSMA PET and an example of post-treatment changes. 7. Limitations of the current PSMA RADS 2.0. and suggestions for reform.

Amr S. Abdelaziz, MD (*Abstract Co-Author*) Nothing to Disclose
Ayesha Nasrullah, MD,FRCR (*Abstract Co-Author*) Nothing to Disclose
Nanda Deepa Thimmappa, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Understand the unique roles of different imaging sequences used in MR Urography (MRU), including T2-weighted, T1-weighted, diffusion-weighted imaging (DWI), and dynamic contrast-enhanced (DCE) imaging for the diagnosis of various urological pathologies. 2. Explore how both contrast-enhanced and non-contrast MRU can effectively diagnose a wide range of urological conditions including pediatric anomalies, obstructive pathologies, and tumors within the urinary tract. Learn how the Vesical Imaging Reporting and Data System (VI-RADS) can be utilized by adding dedicated bladder sequences.3. Enhance diagnostic skills through review of illustrative cases that showcase the practical application of MRU in clinical practice. 4. Learn to identify and manage common pitfalls in MRU, including imaging and technique-related artifacts. Learn optimizing MRU protocols and adjusting imaging parameters to reduce artifacts and enhance image quality. Gain knowledge on managing patients with contraindications to MRI contrast agents or renal impairment.

### TABLE OF CONTENTS/OUTLINE

1. Technical Overview - Patient preparation and positioning for MRU. - Optimization of imaging sequences: T2-weighted, T1-weighted, DWI, and DCE. 2. Case Gallery - Pediatric Urology: Examples of congenital anomalies and their management, obstructive pathologies, urinary Tract Tumors: Identification and differentiation of benign versus malignant lesions. - Additional cases covering a range of common and rare conditions diagnosed via MRU. 3. Best Practices and Troubleshooting - Common imaging challenges and solutions. - Strategies for improving image quality. - Safety considerations with contrast-enhanced MRU.

## CARCINOMA OF THE VULVA: WHAT RADIOLOGISTS NEED TO KNOW

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Sanaz Behnia, MD (*Abstract Co-Author*) Nothing to Disclose
Bahar Mansoori, MD (*Abstract Co-Author*) Nothing to Disclose
Elham Taheri, MD (*Abstract Co-Author*) Nothing to Disclose
Priya O. Pathak, MBBS, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Highlight the clinical features, prognostic factors and routes of spread of vulvar malignancies. 2. Review the multimodality imaging features of vulvar malignancies (multi-parametric MRI, F18-FDG PET-CT and PET-MRI) in conjunction with International Federation of Gynecology and Obstetrics (FIGO) guidelines. 3. Review the role of imaging in treatment planning: assessment for resectability, radiotherapy, chemotherapy. 4. Review the role of imaging in post treatment evaluation: treatment response evaluation, post-treatment complications and detection of recurrent disease.

### TABLE OF CONTENTS/OUTLINE

1. Introduction (a) Epidemiology and risk factors. (b) Normal perineal and vulvar anatomy. (c) Review pathological subtypes.2. 2021 Revised FIGO staging system: Stage I: Tumor confined to the vulva. Stage II: Tumor of any size with extension to lower 1/3rd of urethra, vagina and anus with negative nodes. Stage III: Tumor of any size with extension to upper part of perineal structures or with nonfixed, nonulcerated nodes. Stage IV: Tumor of any size fixed to the bone or with fixed/ulcerated nodes, or distant metastasis.3. Sentinel lymph node mapping (a) Tracer: 99mTc-Filtered sulfur colloid or Tilamanocept. (b) Planar imaging and SPECT-CT is performed of the pelvis to localize the sentinel node.4. Role of MRI (technique and review of cases).5. Role of FDG-PET (technique and review of cases).6. Role of PET-MRI (technique and review of cases).

Martin M. Pesce, MD (*Abstract Co-Author*) Nothing to Disclose
Victorio Del Casale, MD (*Abstract Co-Author*) Nothing to Disclose
Rodrigo S. Loto, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- It’s always important to review the embryology, anatomy, pathophysiology, and radiological signs of the urinary tract. - Review of urinary tract imaging protocols. This presentation highlights the pivotal role of MDCTU (Multidetector computed tomography urography) in the imaging of the patient with hematuria. - Recognize the important role of radiologists in the multidisciplinary setting to communicate and collaborate findings in emergent cases.

### TABLE OF CONTENTS/OUTLINE

Hematuria has a wide range of causes:Causes of Hematuria:1. Kidney Stones: The presence of stones in the kidneys or urinary tract can lead to hematuria. We will emphasize some features (number, location, size, density, complications, post-op) to be able to carry out a detailed report.2. Urinary Tract Infections (UTIs): Many microorganisms can affect the urinary tract, and some of them can cause hematuria. An update: The urinary tract can be affected by numerous acute and chronic inflammatory processes that may be infectious or autoimmune.3. Trauma: Injuries to the urinary tract due to accidents, trauma, or medical procedures can cause hematuria. Grading injuries.4. Vascular: We will describe our most relevant cases that result in vascular-related hematuria.5. Neoplasm: Imaging features of urinary tract neoplasms. Tumor mimics.5. Miscellaneous: all those causes that we do not consider to be included in the previous ones.6. Take home points.In those most interesting and rare cases, we will review their pathophysiology and update the topic.

Alex Espinal Colominas, MD (*Abstract Co-Author*) Nothing to Disclose
Pablo Gilabert (*Abstract Co-Author*) Nothing to Disclose
Sandra Lopez Coello, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Various medical, minimally invasive, surgical, and radiation treatments may lead to iatrogenic complications affecting the urinary tract.- Multidetector CT is the preferred imaging modality for evaluating urinary tract injuries, offering detailed visualization of cortical, vascular, and collecting system injuries.- Imaging findings associated with specific procedures like extracorporeal shock wave lithotripsy (ESWL), nephron-sparing surgery, and percutaneous renal interventions are discussed, highlighting potential complications and their management.- Post-surgical CT scans revealing fluid accumulation and hydronephrosis should raise suspicion of ureteral injury, warranting additional delayed imaging.- Urinary catheter migration and misplacement cause significant morbidity, necessitating prompt detection.

### TABLE OF CONTENTS/OUTLINE

- Imaging Technique:- Role of Multidetector CT in evaluating urinary tract injuries- Optimal CT imaging protocols for suspected urinary tract injuries- Iatrogenic injuries:- Renal complications:- Minimally invasive procedures: ESWL, surgery-related complications- Renal infection and vascular Injuries- Ureteral injuries:- Causes, presentation, and imaging FindingsUreterovaginal fistulas- Bladder Injuries:- Causes and postoperative evaluation with CT cystography- Catheters malposition/migration- Conclusions:- Importance of radiologists' awareness of Iatrogenic Urinary Tract Injuries- Role of imaging in prompt diagnosis and treatment planning- Overview of interventional radiologic procedures and their potential complications.

## LOCALLY ADVANCED RENAL CELL CARCINOMA: DEVIL IS IN THE DETAILS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Angelica Patino, MD (*Abstract Co-Author*) Nothing to Disclose
Long Nguyen, MD (*Abstract Co-Author*) Nothing to Disclose
Eric Li, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

-Limitations exist in cross-sectional imaging characterization of renal cell carcinoma (RCC), particularly for locally advanced cancer (Stage 3), and more specifically, T3a tumors. Availability of treatment options is predicated on accurate staging.-Surgical interventions involving nephron-sparing techniques are typically not advisable for Stage =T3a renal cancers. Therefore, suggesting locally advanced cancer stage by imaging features before surgery is paramount, particularly for central renal masses.-Review of salient imaging features crucial for staging during evaluation of renal masses suspicious for RCC (e.g. renal sinus fat invasion, perirenal fascia thickening, venous invasion, etc.).-Review of management guidelines (National Comprehensive Cancer Network [NCCN], American Urologic Association [AUA]) and surgical interventions (e.g. nephron-sparing surgery, radical nephrectomy).-Operative feasibility can be assessed using imaging-based supplementary scoring systems (e.g. RENAL Nephrometry Score).

### TABLE OF CONTENTS/OUTLINE

1. Generala. Epidemiology of kidney cancer2. The Kidneya. Organb. Vascular and lymphatics3. Pathologya. The incidental renal mass and differential diagnosesb. Renal cell carcinoma and subtypes4. Imaginga. Imaging modalities (ultrasound, CT, MRI) and advantages/limitationsb. TNM classificationc. Stages 1-4 RCC with emphasis on Stage 3 and associated pearls/pitfalls5. Implicationsa. Management and guidelines (NCCN, AUA)b. Supplemental scoring systems: RENAL Nephrometry Score, Preoperative Aspects and Dimensions Used for an Anatomical Classification, Centrality index, and renal tumor contact surface area

## THE EVALUATION METHOD OF CONVENTIONAL < AND > FUNCTIONAL MR IMAGING FOR CHRONIC KIDNEY DISEASE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Keita Nagawa (*Abstract Co-Author*) Nothing to Disclose
Kaiji Inoue, MD (*Abstract Co-Author*) Nothing to Disclose
Tsutomu Inoue (*Abstract Co-Author*) Nothing to Disclose
Yuki Hara (*Abstract Co-Author*) Nothing to Disclose
EITO KOZAWA, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The major teaching points have been modified as follows:1. Traditional morphological assessment criteria and renal functional MR imaging techniques are promising methods for utilizing the kidney as a biomarker.2. In the evaluation of chronic kidney disease, there are limitations to both conventional MR imaging methods < and > functional MR imaging methods, highlighting the need for a more comprehensive diagnostic approach < and > further advancements.

### TABLE OF CONTENTS/OUTLINE

This exhibit aims to:1. Highlight the role of conventional MRI in assessing the kidney's structure (medulla-cortex ratio, cortical size) for grading chronic kidney disease (CKD).2. Introduce the basic principles of functional kidney MRI techniques, including blood oxygen level-dependent (BOLD) diffusion-weighted MR imaging (DWI), diffusion-tensor imaging (DTI), < and > Intravoxel incoherent motion (IVIM), for CKD.3. Discuss the benefits < and > the added value of functional MR imaging in managing chronic kidney disease.Content Organization:1. Depiction of normal and diseased kidneys in conventional MRI.The effectiveness < and > limitations of conventional MRI in diagnosing CKD.Presentation of CKD through functional MR imaging modalities (BOLD, DWI, DTI, IVIM).2. Evaluation of the utility < and > constraints of functional MR imaging in CKD.3. Future directions for enhancing the diagnostic capabilities of functional kidney MR imaging such as twelve-layer concentric objects method, texture analysis, deep learning < and > auto segmentation.

## ARE YOU SURE YOUR PROSTATE MPMRI REPORT IS COMPLETE?. LOOK FOR EXTRAPROSTATIC FINDINGS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Diana Romero Mayorga I, MD (*Abstract Co-Author*) Nothing to Disclose
Rodrigo Borrero, MD (*Abstract Co-Author*) Nothing to Disclose
Diego A. Aguirre, MD (*Abstract Co-Author*) Nothing to Disclose
Jorge A. Abreu Gomez, MD (*Abstract Co-Author*) Nothing to Disclose
John L. Torres Castiblanco SR, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The use of Prostate mpMRI has extended beyond detection of clinically significant prostate cancer, and is currently used for staging and treatment planning, active surveillance and post-treatment evaluation.Obtained MR images have a field of view centered on the prostate; however, adjacent extraprostatic and pelvic structures are included.The role of the radiologist must go beyond the search for extraprostatic extension and we must include in our report other relevant findings in neighboring organs included in the images.In order to achieve this objective, it is necessary that the radiologist systematically evaluates other extraprostatic structures, which we suggest: 1. Abdominal wall, 2. Bowel. 3. Musculoskeletal and 4. Genitourinary. The objectives of the following presentation are as follows:• Describe the frequency of the different extraprostatic findings on prostate mpMRI.• To provide an anatomic landmark to look for extraprostatic findings on prostate mpMRI.• To demonstrate the most frequent extraprostatic findings, per suggested anatomic segmentation, its relevance and clinical impact• To propose a structured report and follow up recommendations to improve communication and management of incidental findings to referring clinicians

### TABLE OF CONTENTS/OUTLINE

• Introduction: current recommended protocol for multiparametric Prostate mpMRI• Extraprostatic anatomical sites included in multiparametric Prostate mpMRI• Where to look for extraprostatic findings; bowel, genitourinary, abdominal wall, musculoskeletal.• A pictoral review of incidental findings on prostate mpMRI

## EXPLORING PERIRENAL PATHOLOGY: A CASE-BASED REVIEW INTO MULTIMODAL DIAGNOSIS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Inmaculada Ansio Vazquez (*Abstract Co-Author*) Nothing to Disclose
Mariano Jose Parada-Blazquez, MD (*Abstract Co-Author*) Nothing to Disclose
Ana Rus, MD (*Abstract Co-Author*) Nothing to Disclose
Mario Sanchez, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The objective of this poster is to provide a review of pathological conditions involving the perinephric space and to describe their key imaging characteristics, with a case-based approach using cross-sectional imaging.

### TABLE OF CONTENTS/OUTLINE

The perirenal space is the middle retroperitoneal space, sits between the anterior and posterior renal fascia and contains the kidney and adrenal glands. A variety of differential diagnoses can cause pathology within this space, often without specific clinical signs or symptoms. Sometimes it is not possible to differentiate the subcapsular or perinephric origin of a lesion, and these processes may be overlapping, so the differential diagnosis includes subcapsular disease. An understanding of commonly encountered conditions affecting the perirenal space, along with its main characteristics, can help narrow the potential diagnosis, however in some cases the diagnosis can only be done by histopathologic analysis.Pathology may be classified by their location and distribution as solitary or multifocal masses or rindlike soft-tissue lesions, as well as based on their etiology as neoplastic (sarcoma, renal or adrenal mases, lymphoma, metastasis) or non-neoplastic lesions (fluido colections, retroperitoneal fibrosis, systemic disease, extramedullary hematopoiesis).

## INDETERMINATE RENAL LESIONS: THE ROLE OF CONTRAST ENHANCED ULTRASOUND IN ASSESSMENT AND FOLLOW UP

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Henry H. Tam, FRCR (*Abstract Co-Author*) Nothing to Disclose
Christopher J. Harvey, MBBS (*Abstract Co-Author*) Nothing to Disclose
Andrea L. da Silva, MBBCh (*Presenter*) Nothing to Disclose

### TEACHING POINTS

renal lesions (both cystic and solid) are often encountered incidentally in radiology practice (especially at ultrasound). They can create more expense to the department with regards to further evaluation and/or follow up by use of CT/MRI. Contrast enhanced ultrasound provides a real-time assessment of renal lesions and their complexity. It can be used to classify cystic lesions, according to the Bosniak classification, and for follow up on non-surgical cystic renal lesions. Furthermore, it can assist in evaluation of indeterminate lesions - streaming patients into a management pathway sooner than should they be followed up with interval CT/MRI, as greater detail can be assessed. Aims: 1. Understand the classification of renal cysts with regards to the Bosniak classification of 2005 and proposed updates of version of 2019 with follow up recommendations. 2. Gain an understanding of solid renal lesions and imaging characteristics. 3. Review the currently used imaging modalities and protocols in the assessment of renal lesions and their costs, compared to contrast enhanced ultrasound: risk and benefits. 4. Review ultrasound contrast agents compared to CT/MR contrast agents. 5. The role of contrast enhanced ultrasound in assessment and follow up of renal lesions and case examples.

### TABLE OF CONTENTS/OUTLINE

Renal cysts - Bosniak classification system - review v2005 and updates proposed by v2019 Overview of solid renal lesions Current imaging techniques used in assessment of renal cystic lesions protocols and cost to department Introduction to contrast enhanced ultrasound: History Benefits and risks Costs Considerations when planning contrast enhanced ultrasound list Case examples of contrast enhanced ultrasound

Eduardo Thadeu De Oliveira Correia, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Prostate MRI adhering to PI-RADS v2.1 guidelines has been increasingly adopted for the detection and characterization of prostate cancer. Nonetheless, suboptimal reproducibility and the relatively high number of false-positive MRIs are still challenges, limiting the impact of MRI in prostate cancer diagnostic workflows worldwide. One of the key factors associated with these limitations is PI-RADS 3 (“equivocal”) lesions. This exhibit explores the nature of PI-RADS 3 lesions, their clinical implications, and strategies for their management.

### TABLE OF CONTENTS/OUTLINE

1. What’s a PI-RADS 3 lesion? a. PI-RADS 3 lesions in the peripheral zone b. PI-RADS 3 lesions in the transition zone 2. Do you know how to identify a PI-RADS 3 lesion? Learn with cases! a. Case 1: PI-RADS 3 lesion in the peripheral zone and a negative prostate biopsy b. Case 2: PI-RADS 3 lesion in the peripheral zone and a positive prostate biopsy c. Case 3: PI-RADS 3 lesion in the transition zone and a negative prostate biopsy d. Case 4: PI-RADS 3 lesion in the transition zone and a positive prostate biopsy 3. Understanding the challenges and implications of PI-RADS 3 a. Factors contributing to higher prevalence of PI-RADS 3 Scores b. Implications of a higher prevalence of PI-RADS 3 Scores c. Strategies to mitigate the prevalence of PI-RADS 3 Scores in your practice 4. Dealing with PI-RADS 3 a. The role of MRI in Diagnostic Pathways of Prostate Cancer b. Dealing with PI-RADS 3 in MRI-Based Diagnostic Pathways c. Dealing with PI-RADS 3 in Risk-Based Diagnostic Pathways 5. What does the future hold for PI-RADS 3? a. MRI innovations b. Ancillary biomarkers c. Upgrading rules and Diagnostic Pathways

## IMAGING OF THREE-PIECE INFLATABLE PENILE PROSTHESIS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Magna Cum Laude**

Yashant Aswani, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Erectile dysfunction (ED) is the inability to achieve or maintain erection sufficient for satisfactory sexual performance. It has a prevalence of 26/100 men in the age group of 40-70 years. ED unresponsive to pharmacotherapy or presence of penile fibrosis, are some of the many indications for penile prosthesis. Three-piece inflatable penile prosthesis (IPP) comprises paired cylinders, reservoir and pump. At the conclusion of this exhibit, the readers will be able to:1) Enumerate indications of penile prosthesis2) Describe imaging in three-piece inflatable penile prosthesis (IPP)3) Discuss complications of three-piece IPP

### TABLE OF CONTENTS/OUTLINE

1) Erectile dysfunction and 2018 American Urological association guidelines for management 2) Indications and contraindications for penile prosthesis 3) Types of penile prostheses 4) Role of Imaging 5) MRI protocol 6) Normal imaging appearance of 3-piece inflatable penile prosthesis 7) Complications of cylinder (mal positioning and mechanical failure) 8) Complications of rear tip extender (migration, extrusion) 9) Complications of reservoir (migration, leakage, collapse of low-profile reservoir, bowel obstruction, vascular compression) 10) Complications of pump (migration, stiction syndrome) 11) Complications of tubing (fracture, leakage, tail pipe penis) 12) Common complications (infection, hematoma, capsule formation) 13) Proposed template for reporting

## THE EPIDIDYMIS - WHO SAYS SIZE MATTERS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Sharon Gordon, MD (*Abstract Co-Author*) Nothing to Disclose
Rona J. Orentlicher, MD (*Abstract Co-Author*) Nothing to Disclose
Barak Friedman, MD (*Abstract Co-Author*) Nothing to Disclose
Monika Misra, MD (*Abstract Co-Author*) Nothing to Disclose
Kamran Ali, MD (*Abstract Co-Author*) Nothing to Disclose
Melody W. Lin, MD, MS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- The epididymis plays an essential role in sperm production and transport.- Ultrasound is the primary modality to evaluate the epididymis, with problem solving using CT and MRI.- Infection is the most common pathology in the epididymis, often presenting with concurrent orchitis, funiculitis, and cellulitis. Imaging is helpful to assess for secondary abscess or testicular torsion.- Appendix epididymis, the most common congenital variant, can present with sudden pain from torsion.- Cystic and solid epididymal masses are often benign. The majority are cysts. Soft tissue masses include adenomatoid tumors, leiomyoma, and lipoma. After ultrasound, MRI is the preferred modality to evaluate an epididymal mass given superior soft tissue contrast and lack of ionizing radiation. Since often benign, follow up ultrasound is commonly used to ensure stability.- Epididymal rhabdomyosarcoma is uncommon in children and rare in adults, presenting as a painless, solid, vascular mass, with a high rate of metastases.- Tubular ectasia, secondary to ductus deferens obstruction, is often seen post vasectomy but can also be idiopathic.- Epididymal trauma is rare but can be seen associated with testicular trauma.

### TABLE OF CONTENTS/OUTLINE

- Essential role of the epididymis in male reproduction with regards to anatomy, biology and function.- Congenital, infectious, inflammatory, cystic or solid masses, and traumatic abnormalities.- Multimodality imaging of epididymal pathology, predominantly ultrasound, with the aid of CT and MRI.- Differential diagnoses, complications and treatments.

## TESTY SITUATIONS: A COMPREHENSIVE MULTIMODALITY IMAGING REVIEW OF THE ACUTE SCROTUM

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Mahan Mathur, MD (*Abstract Co-Author*) Nothing to Disclose
Balaji Rao, MBBS, FRCR (*Abstract Co-Author*) Nothing to Disclose
Yashant Aswani, MD (*Abstract Co-Author*) Nothing to Disclose
Joshua Roberts, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Acute scrotal pain is a common scenario in clinical practice. Etiologies include common entities, such as testicular torsion or epididymitis, to uncommon pathologies such as segmental testicular infarcts or Amyand hernia with appendicitis. Prompt recognition is essential in order to guide appropriate management and may require evaluation on multiple imaging modalities. This presentation will explore various causes of acute scrotal pathologies and at the conclusion of the module, the learner should be able to: • Elucidate role of imaging in a patient with acute scrotal pain • Recognize imaging findings and complications associated with common etiologies of acute scrotal pain • Describe imaging findings of uncommon causes of acute scrotal pain

### TABLE OF CONTENTS/OUTLINE

• Normal scrotal anatomy • Imaging of epididymitis, epididymo-orchitis, isolated orchitis and complications (abscess, infarct) • Radiology of scrotal trauma (including fracture, rupture, hematoma, hematocele) • Imaging of testicular torsion (complete, partial, torsion-detorsion, associated waveform analysis and complications) • Torsion of appendices • Review of uncommon etiologies of acute scrotal pain, including, but not limited to: • Fournier gangrene • Segmental testicular infarct • Thrombosed varicocele • Sigmoid diverticulitis contained within an inguinal hernia • Acute appendicitis in an inguinal hernia • Neoplasms presenting as acute scrotal pain • Pancreatic necrosis extending inferiorly into the scrotum

Natsuki Mashikawa (*Abstract Co-Author*) Nothing to Disclose
Daisuke Kinoshita (*Abstract Co-Author*) Nothing to Disclose
Toshimitsu Shimizu (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. To learn about the need for preoperative imaging for renal transplantation.2. To learn about the problems with the conventional scan.3. To Learn about the imaging technique for performing 1-phase scan Dual energy.4. To learn the value of dual energy and triple split injection obtained images.

### TABLE OF CONTENTS/OUTLINE

1. The preoperative radiologic evaluation plays a crucial role in laparoscopic nephrectomy by providing assistance in surgical planning and aiding in the prevention of potential complications.2. Misregistration and exposure due to multiphase imaging are common issues encountered with conventional imaging methods. A new imaging technique using Triple Split and Dual energy allows visualization of stones, arteries, veins, and ureters in a single scan.3. Utilizing dual energy, the acquired images can retain sufficient CT values and can be evaluated for all abnormal formations.4. The new imaging method can reduce exposure by up to 75% without misregistration. Thus, donors benefit greatly.

Thomas L. Estes JR, MD (*Abstract Co-Author*) Nothing to Disclose
Frank H. Miller, MD (*Abstract Co-Author*) Advisory Board, Bayer AG;Advisory Board, Guerbet SA
Nikolas Brozovich, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Discuss the significance of incidental findings in multiparametric magnetic resonance (mp-MR) of the prostate 2. Systematic search pattern to reduce the likelihood of missing key incidental extraprostatic findings 3. Review clinical cases with multi-system (Gastrointestinal, Genitourinary, and Musculoskeletal) incidental findings in mp-MR of the prostate

### TABLE OF CONTENTS/OUTLINE

Mp-MR has significantly increased in popularity for the detection and surveillance of prostate cancer in recent years. This imaging method facilitates screening, surveillance, and post treatment follow-up with notable advantages over other modalities. Due to the increased use in MR imaging, an increased detection rate of incidentalomas has been reported.Our presentation will discuss the spectrum of extraprostatic findings noted on MR imaging of the prostate and provide a case-based review.

Camila L. Vendrami, MD, MD (*Abstract Co-Author*) Nothing to Disclose
Dallas Sturdevant, DO (*Abstract Co-Author*) Nothing to Disclose
Nikolas Brozovich, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Demonstrate diagnostic challenges including tumor localization, extent of invasion, and characterization of specific pathology.2. Illustrate tumor components, tumor vascularity, and patterns of spread to help narrow the differential diagnosis.

### TABLE OF CONTENTS/OUTLINE

Imaging findings and characterization of retroperitoneal(RP) tumors with histopathology correlates will be discussed. Primary RP tumors originating in the RP but outside the major RP organs are uncommon. Accurate localization and extent of disease of retroperitoneal lesions can be difficult. Identifying the organ of origin, involvement of adjacent structures, vascular invasion, and fat content is valuable in evaluating RP tumors, particularly in staging. Specific diagnosis might be difficult to achieve due overlapping features but certain clues help narrow the differential diagnosis. Case discussion will include liposarcoma, leiomysarcoma, solitary fibrous tumor, extragonadal germ cell tumor, lymphoma, paraganglioma, and others.

### TEACHING POINTS

To illustrate imaging findings of male and female urethra including normal anatomy, variants, inflammatory/infectious diseases, benign and malignant tumors. To analyze the correlation between cystourethrogram, IVU, US, CT, and MRI imaging features with pathology in urethral lesions. To emphasize pitfalls, diagnostic difficulties, and differential diagnosis.

### TABLE OF CONTENTS/OUTLINE

Retrograde urethrography and voiding cystourethrography are the modalities of choice for imaging the urethra. Several benign and malignant entities should be included in the differential diagnosis of urethral lesions. Through sample cases, a variety of imaging and pathology findings from lesions of the urethra with management discussion and clues to interpretation will be demonstrated in a quiz format. Imaging findings (cystourethrogram, IVU, US, CT, and MRI) and pathologic correlation will be presented. How pathologic correlation informs imaging interpretation will be highlighted. The list of cases presented includes congenital abnormalities, strictures, trauma, urethral or periurethral tumors, calculi, diverticula, postsurgical complications.

## ABDOMINAL INCIDENTALOMA: THE *ADRENAL*IN OF THE UNKNOWN

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Ines Ocampo, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1- To identify adrenal incidentalomas requiring follow-up, further study, or biopsy/surgery based on recommendations from the American College of Radiology and the European Society of Endocrinology.2- To understand the acquisition protocol and recognize the importance of wash-out phase in CT scan and in phase/out phase (IP/OP) in MRI for the evaluation of the adrenal glands.3- To discuss the most prevalent adrenal pathologies, differentiating them into benign and indeterminate lesions based on imaging and clinical features.

### TABLE OF CONTENTS/OUTLINE

Given recent advancements in radiology, the detection of adrenal incidentalomas has become relatively frequent. Thus, radiologists need to stay updated with guidelines and recommendations in order to clarify the multiple possible diagnoses. Benign non-functioning lipid-rich adenomas represent the most prevalent lesions. Their imaging diagnosis relies on identifying the presence of microscopic fat within the adenoma. Therefore, the measurement of Hounsfield units and the wash-out protocol in CT scans, as well as the IP/OP images of a chemical-shift MRI, are used. Timely confirmation of benign nature avoids unnecessary imaging and radiation exposure. Likewise, it is important to suspect malignancy since it would require aggressive treatment. Each individual case presents a challenge, so current guidelines recommend standardized protocols and a multidisciplinary expert team for accurate decision-making.

## KEEPING YOUR REAR IN THE CLEAR: IMAGING OF SPACEOAR HYDROGEL

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Mahan Mathur, MD (*Abstract Co-Author*) Nothing to Disclose
Sandeep S. Arora, MBBS (*Abstract Co-Author*) Research support, Profound Medical Inc
Gary M. Israel, MD (*Abstract Co-Author*) Nothing to Disclose
Pavlo Mishyn, DO (*Abstract Co-Author*) Nothing to Disclose
Shadi Ebrahimian, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Epidemiology of prostate cancer and treatment options? Prostate cancer is the most common malignancy diagnosed in men in the United States. Besides surgery, radiation therapy is the standard therapy for prostate cancer. However, it may cause damage to the surrounding organs including rectum. 2. What is SpaceOAR? SpaceOAR hydrogel, is an FDA approved spacer, which is injected between the prostate and rectum and increases the distance between these structures, reducing rectal radiation exposure and associated complications.3. Indications of SpaceOAR placement? Patients with prostate cancer undergoing radiation therapy and those with significant proximity of rectum and prostate. 4. Techniques for SpaceOAR placement? SpaceOAR is placed in outpatient setting after administration of local anesthesia and under the guide of ultrasound and using a trans perineal approach.5. How is SpaceOAR characterized in CT and MRI? SpaceOAR has a hypodense opacity on CT, low signal on T1 and high signal on T2-weighted images.6. Optimally placed SpaceOARA? uniform and symmetric distribution of SpaceOAR between prostate and rectum is characterized as optimally placed.7. Suboptimal placement of the SpaceOAR and associated complications? Hydrogel migration, inadequate rectal sparing, rectal wall infiltration, etc.

### TABLE OF CONTENTS/OUTLINE

1. Overview to prostate cancer 2. Brief introduction to SpaceOAR and its history 3. Candidates for SpaceOAR placement 4. Techniques of placement 5. Appearance of SpaceOAR on CT and MRI 6. Optimal SpaceOAR placement 7. SpaceOAR related complications

## VENOUS TUMORAL THROMBOSIS, LOOKING BEYOND CLEAR CELL RENAL CARCINOMA

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Sebastian Pelaez SR, MD (*Abstract Co-Author*) Nothing to Disclose
Tatiana Arroyave, MEd (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Neoplastic intraluminal venous invasion is a form of advanced disease involvement. It is important to differentiate it from malignancy associated soft thrombus. Tumoral thrombus present contiguity with the primary tumor, enhance with the contrast medium, generate expansion of the blood vessel, are avid for fluorodeoxyglucose and restricted to diffusion.2.The renal tumor that most commonly presents with vein thrombus is clear cell renal carcinoma (90%), the most common subtype is clear cell. Transitional cell and papillary carcinoma rarely invades vascular structures. There are also some case reports of neuroectodermal tumors, squamous cell tumors and primary sarcomas of the kidney with renal venous involvement. The main benign renal tumor with vascular invasion into the renal vein is angiomyolipoma. However, it should be considered beyond renal cell carcinoma.3.The vascular invasion of tumors has implications on the prognosis and treatment of patients. In the TNM classification, renal tumors progress on stage if there is presence of intraluminal vascular invasion. The Mayo Clinic classification for the extent of tumor thrombus allows determination of the type of thrombectomy as well as the surgical implications in the patient with renal cell carcinoma.

### TABLE OF CONTENTS/OUTLINE

Teaching points.Introduction.Diagnostic intraluminal vascular invasion.Primary renal tumors with thrombosis.Benign renal tumors with thrombosis.Renal metastases with thrombosis.Summary

## GOOD OLD CONVENTIONAL URETHROGRAPHY: CURRENT ROLE IN CLINICAL PRACTICE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Bharat Aggarwal, MD (*Abstract Co-Author*) Nothing to Disclose
Amit K. Sahu, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Akshey Sehgal, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Uroradiology includes essential procedures like Retrograde Urethrography (RGU) and Micturating Cystourethrogram (MCU), serves as a cornerstone in diagnosing and treating urological conditions even in the current era of advanced imaging. RGU allows for a detailed examination of the urethra, aiding in the identification of strictures, injuries, or abnormalities, and guiding customized treatment plans. MCU offers real-time visualization of the bladder and urethra, enabling detection of reflux, urinary dysfunction, or structural anomalies.

### TABLE OF CONTENTS/OUTLINE

• Anatomy:- varies between the male and female urethra. The male urethra has anterior and posterior portions. The female urethra begins at the internal urethral meatus at the bladder neck and opens in the vestibule of the vagina.• Technique: Care should be taken in insertion of catheter with all aseptic measures. Appropriate positioning and radiograph exposures to be performed. • Clinical significance: Play pivotal role in identifying and evaluating conditions such as trauma, urethral strictures, urethral diverticula, infections, reflux nephropathy and posterior urethral valve abnormalities.• Complications: Infection; adverse reactions from contrast medium; catheter trauma leading to symptoms like dysuria, frequency, hematuria, and urinary retention, as well as potential complications such as perforation by the catheter. Additionally, there's risk of inadvertent catheterization of the vagina or ectopic ureteral orifice. Understanding and managing these complications are crucial for ensuring patient safety and optimizing procedural outcomes in urological practice.

Fernando Vivanco, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Accurate diagnosis and management of testicular pathologies heavily relies on clinical presentation and ultrasound (US), forming the cornerstone of initial assessment. Magnetic resonance imaging (MRI) complements US, aiding in differentiating and characterizing suspicious testicular and paratesticular lesions for precise diagnosis and treatment. Ultrasound remains primary for evaluation in emergency departments, including inflammatory conditions like epididymitis-orchitis, as well as traumatic testicular injuries, enabling prompt identification and management of complications such as hematomas or torsions.

### TABLE OF CONTENTS/OUTLINE

Cases selected from our institutional experience aim to showcase key findings of various testicular pathologies.Testicular Neoplasms: Most common are germ cell-derived, hypoechoic lesions on ultrasound. MRI is useful to characterize indeterminate lessons and to determine the extension of the tumor.Paratesticular Lesions: Adenomatoid tumors, common benign lesions, diagnosed primarily via ultrasound. MRI aids in characterizing indeterminate lesions or suspected malignancies like paratesticular rhabdomyosarcoma.Cystic Lesions: Typically simple lesions diagnosed by ultrasound, appearing as homogeneous hypoechoic lesions with defined edges. MRI may be used if an underlying lesion is suspected.Inflammatory: Epididymitis-orchitis, common in emergency services, is often diagnosed via ultrasound. MRI benefits in assessing chronic infections or suspected complications.Traumatic: Initial evaluation with US aims to rule out hematomas, twists, ruptures, or infarctions.

## ADRENAL INFECTIONS UPDATE: HOW RADIOLOGISTS CAN ENHANCE PATIENT CARE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Patrick Navin, MBBCh, FFR(RCSI) (*Abstract Co-Author*) Nothing to Disclose
Antonio C. Westphalen, MD, PhD (*Abstract Co-Author*) Shareholder, ScanMed, LLC;Research funded, BotImage, Inc
Vanessa Murad, MD (*Abstract Co-Author*) Nothing to Disclose
Jorge A. Abreu Gomez, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Adrenal infections are considered clinically important but often go unrecognized. Radiologists play a key role in detection of involvement early in the course of disease to improve patient outcomes- Although adrenal infectious involvement is uncommon, it should be considered in the differential diagnosis of patients with widespread inflammation, taking into account the host's hormonal/immune status and the geographic region where certain infective agents are more prevalent- The vascular-rich configuration of the adrenal gland, coupled with increased cortisol levels from zona fasciculata, creates an ideal microenvironment for the reservoir and replication of microorganisms- Adrenal thickening with associated stranding constitutes the radiological hallmark of adrenalitis, typically bilateral in histoplasmosis and tuberculosis and unilateral/variable in COVID-19, bacterial, HIV, and cytomegalovirus infections- Destruction of the adrenal parenchyma results in loss of endocrine adrenal function, contributing to a high mortality rate. Early radiological identification and awareness by the clinical team are pivotal for prompt patient management and preservation/recovery of endocrine function

## SCROTUM CROSS-SECTIONAL IMAGING EVALUATION: FROM BENIGN TO MALIGNANT CONDITIONS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Thais Mussi, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Ronaldo H. Baroni, PhD (*Abstract Co-Author*) Nothing to Disclose
Fernando M. Coelho, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Mauricio Zapparoli, MD, MSc (*Abstract Co-Author*) Nothing to Disclose
Alice Schuch, MD (*Abstract Co-Author*) Nothing to Disclose
Rafael Camilo, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Review the anatomy of the scrotum and its radiological and surgical implications.
- Propose an approach for recognizing the most usual imaging patterns of benign and malignant scrotal tumors.
- Review patterns of benign testicular lesions on magnetic resonance imaging (MRI) exams.
- Assess imaging findings of malignant testicular germ cell tumors on MRI.
- Describe key MRI findings for local staging and surgical planning.

### TABLE OF CONTENTS/OUTLINE

INTRODUCTION
- Describe the usual anatomic features of the scrotum in the most common imaging methods used at the investigation and correlate didactic illustrations with ultrasound (US) and MRI.
- Elucidate the surgical implications of radiological anatomy of the scrotum.INDICATIONS AND TECHNIQUE
- Indications of the main imaging methods, their appropriate technique, limitations, and pitfalls.
- MRI protocol.STEP-BY-STEP EVALUATION
- Systematic approach to classifying testicular lesions.
- Evaluation of their origin, imaging features, and correlation with clinical and laboratory informationBENIGN TESTICULAR LESIONS
- Typical and atypical cases of testicular and paratesticular lesions on US and MRI.
- What information should the surgeon know to plan the appropriate approach?
- Correlation with pathological and surgical findings.MALIGNANT TESTICULAR LESIONS
- Typical cases of testicular cancer and their radiological appearances.
- Review of its epidemiology and risk factors.
- Importance of allying tumor markers and other clinical information.
- Local staging/ treatment response/ recurrence detection.THERAPEUTIC TECHNIQUES
- Types of surgical approaches in testicular and paratesticular masses.
- Sparing surgery and alternative therapy in testicular cancer.

## PRACTICAL CONSIDERATIONS IN THE CONTRAST ENHANCED ULTRASOUND (CEUS) EVALUATION OF RENAL MASSES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Melanie P. Caserta, MD (*Abstract Co-Author*) Nothing to Disclose
Mary J. Clingan, MD (*Abstract Co-Author*) Nothing to Disclose
Neema J. Patel, MD (*Abstract Co-Author*) Nothing to Disclose
Madhura A. Desai, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• CEUS is a safe option in patients who may not be able to undergo contrast CT or MR and offers particular benefit to patients with ESRD. • CEUS has high sensitivity and specificity when discriminating between solid and cystic lesions. • The high temporal and spatial resolution of CEUS enables accurate characterization and surveillance of complex cystic renal lesions. • As on CT and MR, overlapping patterns of enhancement can make it difficult to discriminate benign from malignant solid lesions or between RCC subtypes by perfusion characteristics alone.

### TABLE OF CONTENTS/OUTLINE

1. US Contrast Agents a. Technical Factors b. Considerations/Comparison to CT and MR 2. Advantages of CEUS a. High Spatial Resolution i. Characterization of cyst complexity ii. Active surveillance b. High Contrast Resolution i. Sensitive to minimal flow ii. High NPV for excluding flow c. High Temporal Resolution i. Mitigate motion artifact ii. Dynamic contrast evaluation iii. Stored cine images 3. Limitations of CEUS (some generalized from US) a. Limited Visualization i. Large body habitus or deep-seated lesions ii. Lesions obscured by overlying bone or gas b. Limited FOV i. Limit exam to single or few targets ii. Multiple interrogations for larger lesion c. Technical Requirements specific to CEUS i. Patient IV access ii. Extra personnel iii. CEUS software 4. Characterization of Cystic Renal Masses a. Cystic or Solid b. Simple or Complex 5. Characterization of Solid Renal Masses a. Evaluation of Enhancement i. Corticomedullary enhancement relative to renal cortex ii. Washout iii. Heterogeneity b. Features of Common Benign Solid Lesions c. Features of Common RCC Subtypes

### TEACHING POINTS

This exhibit aims to discuss the anatomy of the (pre or post) menopausal pelvis, indications for insertion of vaginal pessaries, types of pessaries, and identify the common (and uncommon) post insertion complications and their appearances.

### TABLE OF CONTENTS/OUTLINE

1. Post menopausal pelvic anatomy: describe the normal appearance of the postmenopausal uterus and ovaries 2. Discuss etiology of laxity of the pelvic floor, risk factors for pelvic prolapse, levels of pelvic organ prolapse 3. Describe the types of pessaries available and their appearances on various modalities: donut, ring, lever, Gellhorn, cube 4. Identify the indications for vaginal pessaries in the post-menopausal age group and explain the intended mechanism of action 5. Discuss the potential complications with specific consideration to appearances post pessary insertion: pain, bleeding, infection, altered lymphatics with increased chance of pelvic congestion syndrome

### TEACHING POINTS

Oncocytomas are the largest cause of nephrectomy in benign masses, due to inability of imaging and biopsy to reliably distinguish between benign oncocytomas and malignant chromophobe RCC. Emergence of 'in-between' entities considered together as 'Oncocytic renal neoplasm of low malignant potential' have further complicated diagnostic and management pathways.

### TABLE OF CONTENTS/OUTLINE

There have been numerous nomenclature changes. What is the latest classification of oncocytic neoplasm? What are the emerging entities (eosinophilic vacuolated tumor, low grade oncocytic tumor)? Which entities are benign, which are indolent and which are malignant? (Pathology images will be provided) - Are there other entities which mimic oncocytic neoplasms? - Why is imaging or biopsy in isolation not helpful? (what is the discordance rate between biopsy and surgery?). Where do these fall in the CCLS (clear cell likelihood score) or CT-renal score? - We present a hybrid (imaging + biopsy approach) in risk stratifying these masses - Chromophobe RCC - can we further risk stratify grade based on imaging? - How does hybrid neoplasms complicate the landscape? What are the oncocytic tumors with hereditary connotations (SDH-deficient, low grade FH-deficient, eosinophilic solid and cystic RCC -TSC associated, HOCT - Birt Hogg Dube associated)? Can genetic alterations (FLCN) provide insight? - What are the challenges in active surveillance of oncocytomas? Can benign oncocytomas metastasize? Do enlarging oncocytomas affect renal function? Does bilaterality and multifocality further complicate management? - Does Sestamibi have a role in management pathway? What is the ideal management strategy? Role of ablation and embolization?

### TEACHING POINTS

To discuss the diagnosis and radiological insights about sinus diseases, highlighting: - Definition and overview of sinusopathies, the importance of understanding sinus anatomy and function, and common causes and risk factors. - Sinus pathologies in a guide model, dividing into diffuse or unilateral involvement and also in acute or chronic pathology. - Potential complications of sinusopathies (e.g., orbital cellulitis, meningitis). Factors influencing prognosis and long-term outcomes and the importance of follow-up care and monitoring. - Research and Future Directions: Ongoing research in the field of sinusopathies with emerging treatments and technologies.

### TABLE OF CONTENTS/OUTLINE

- Introduction
- Anatomy of the paranasal cavities
- Guideline of sinusopathies diagnosis
- Acute diffuse involvement
- Inflammatory/Infectious involvement
- Traumatic/Surgical
- Potential complications
- Chronic diffuse involvement
- Nasosinusal polyposis

- Allergic fungal sinusitis
- Granulomatosis diseases
- Cocaine abuse
- Potential complications
- Predominantly unilateral acute involvement
- Odontogenic sinusitis
- Invasive fungical sinusitis
- Facial fractures
- Potential complications
- Predominantly unilateral chronic involvement
- Papilloma
- Fungal sinusitis
- Mucocele
- Neoplastic lesions
- Potential complications
- Future perspectives
- Take home messages

### HNEE-11 EXPLORING UNCOMMON PATHOLOGIES IN THE SELLAR/SUPRASELLAR REGION: IMAGING INSIGHTS

Rohan Samant, MBA (*Abstract Co-Author*) Nothing to Disclose
Rajan P. Patel, MD (*Abstract Co-Author*) Nothing to Disclose
Deepali Bhalla (*Abstract Co-Author*) Nothing to Disclose
Manav Bhalla, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The sellar and suprasellar regions present a complex landscape of pathologies, often challenging clinicians with their diverse presentations and management nuances. Recognizing the diverse spectrum of atypical pathologies in the sellar/suprasellar region is crucial for accurate diagnosis and appropriate management. This abstract offers a comprehensive overview of uncommon sellar and suprasellar pathologies, atypical presentation of common entities, shedding light on their clinical features, diagnostic considerations, pathologic correlates, and potential therapeutic implications. From rare tumors to unusual inflammatory conditions, this exploration aims to equip diagnostic Radiologists with practical insights to enhance diagnostic accuracy and optimize patient care.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction to uncommon Sellar/Suprasellar Pathologies. 2. Atypical imaging presentation of relatively common entities. 3. Radiological Evaluation of Sellar/Suprasellar Lesions 4. Types of Atypical Pathologies - A. Rare Neoplasms B. Metastatic lesions C. Hypophysitis, Langerhans cell Histiocytosis, Rosai-Dorfman disease and Erdheim-Chester disease D. Secondary pituitary hyperplasia E. Craniopharyngiomas F. Atypical appearance of Rathke's cleft cyst 4. Differential Diagnosis and Diagnostic Challenges 5. Imaging Features and Characterization

### HNEE-12 PERINEURAL SPREAD IN HEAD AND NECK MALIGNANCIES

Amit Janu, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Pranjal Rai, MBBS (*Abstract Co-Author*) Nothing to Disclose
Nivedita Chakrabarty (*Abstract Co-Author*) Nothing to Disclose

Suman Kumar Ankathi, MBBS (*Abstract Co-Author*) Nothing to Disclose
Vasundhara Smriti, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Understand the perineural spread. 2. Discuss the imaging protocol for perineural spread 3. Know the primary and secondary imaging features in perineural spread. 4. Detect the commonly involved nerves in perineural spread and know their anatomy. 5. Discuss the anatomical landmarks and pathway for perineural spread. 6. Describe the mimics of perineural spread

#### TABLE OF CONTENTS/OUTLINE

1. Anatomy of cranial nerves 2. Imaging features of perineural spread. 3. Know the possible routes of perineural spread in a given clinical condition. 4. Case-based discussion on the approach for various nerves involved. 5. Discuss the impact on management due to perineural spread

### HNEE-13 PLEOMORPHIC ADENOMA OR NOT? MASTERING THE DIAGNOSTIC RIDDLE OF SALIVARY GLAND TUMORS WITH MOUTH-WATERING CASES

**Awards**
**Certificate of Merit**

Yeliz Pekcevik, MD (*Abstract Co-Author*) Nothing to Disclose
Begum Ergin, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. To discuss the typical and atypical characteristics of benign salivary gland tumors in patients, with a specific emphasis on pleomorphic adenoma.2. To identify common and uncommon features of malignant salivary gland tumors in adults.3. To familiarize the radiologists with the typical and atypical presentations of salivary gland tumors and pitfalls by using a case-based approach.4. Review examples of congenital and acquired mimics of salivary gland tumors.

#### TABLE OF CONTENTS/OUTLINE

A. Background • MRI imaging of salivary glands (DWI, advanced MRI sequences) B. Mouth-Watering Cases • Common and Uncommon Features of Benign Salivary Gland Tumor 1. Typical and Atypical Pleomorphic Adenoma 2. Warthin Tumor 3. Oncocytoma 4. Schwannoma 5. Myofibroblastic Tumor 6. Lipoma 7. Infantile Hemangioma • Common and Uncommon Features of Malign Salivary Gland Tumors 1. Carcinoma Ex Pleomorphic Adenoma 2. Mucoepidermoid Carcinoma 3. Adenoid Cystic Carcinoma 4. Secretory Carcinoma 5. Lymphoma 6. Malign Melanoma • Non-neoplastic Salivary Gland Pathologies Mimicking

Salivary Gland Tumors 1. IG-G4 Related Disease 2. Intraparotid Lymph Nodes 3. Sjögren's Syndrome 4. Sialosis 5. Vascular Malformations 6. Branchial Cleft Cysts C. Take Home Points D. References

#### TEACHING POINTS

Acute otomastoiditis occurs when otitis media spreads beyond the mastoid air cells. A variety of infectious complications associated with the temporal bone are described, which may occur in cases of otomastoiditis. These include outer cortex erosion, resulting in the formation of a neck abscess (known as Bezold abscess), coalescent mastoiditis, petrous apicitis (Gradenigo's Syndrome), meningitis, venous sinus thrombosis, facial neuritis, bone cortex erosion potentially causing sigmoid sinus thrombosis or resulting in periauricular cellulitis with or without an abscess and intracranial extension, and suppurative labyrinthitis. This study aims to provide a briefly description of each case, from the most frequent to the rarest, correlate them with different imaging methods and didatic drawings.

#### TABLE OF CONTENTS/OUTLINE

- Introduction- Objective- Review of the complications related to otomastoiditis - Cases of the otomastoiditis complications in different imaging methods including a didatic drawings- References

### HNEE-15 MUSCLE MASTERCLASS: HEAD AND NECK ANATOMY IN ACTION

Shehbaz M. Ansari, MD, MBBS (*Abstract Co-Author*) Nothing to Disclose
Surjith Vattoth, MD, FRCR (*Abstract Co-Author*) Nothing to Disclose
Santhosh Gaddikeri, MD (*Abstract Co-Author*) Nothing to Disclose
Miral D. Jhaveri, MD, MBA (*Abstract Co-Author*) Royalties, RELX
Brian Mu, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Review muscular anatomy of the head and neck with a focus on routinely visualized but relatively overlooked deep muscles.2. Highlight important anatomic relationships between head and neck muscles as well as to adjacent structures.3. Describe relevant imaging findings involving these anatomical concepts and their associated underlying pathologies.

#### TABLE OF CONTENTS/OUTLINE

The head and neck comprise a rich and complex array of muscular anatomy that can be visualized in detail on routine imaging. Comprehensive knowledge of these muscles and sophisticated understanding of their relationships with each other and adjacent structures is requisite for the identification and interpretation of a diverse range of pathological findings. Additionally, head and neck muscles serve as important landmarks for demarcation of the deep spaces of the face and neck, cervical lymph node stations, and for surgical approaches. In this exhibit, we review the muscular anatomy of the head and neck in detail, including the prevertebral and paraspinal, scalene, suboccipital, floor of mouth, pharyngeal, laryngeal, and masticator muscles. The goal is to develop a three-dimensional understanding of intricate anatomy, such as the "stacked flower-pot" arrangement of the hypopharyngeal wall muscles. Special focus is given to areas of clinical significance, such as the role of the posterior belly of digastric as a surgical landmark for the glossopharyngeal and hypoglossal nerves in neck dissection. Sample cases are provided to demonstrate various pathologies and clinical applications of this anatomy.

### HNEE-16 BEYOND THE SURFACE: EXPLORING THE NASOPHARYNX FROM EMBRYOLOGY TO CANCER

Regina L. Elia Gomes, PhD, MD (*Abstract Co-Author*) Nothing to Disclose
Marcio Ricardo T. Garcia, MD (*Abstract Co-Author*) Nothing to Disclose
Carolina R. Soares, MD (*Abstract Co-Author*) Nothing to Disclose
Soraia A. Souza, MD, MS (*Abstract Co-Author*) Nothing to Disclose

Raphael M. Reali, MD (*Abstract Co-Author*) Nothing to Disclose
Daniel V. Sumi, MD (*Abstract Co-Author*) Nothing to Disclose
Eloisa M. Gebrim, MD (*Abstract Co-Author*) Nothing to Disclose
Carlos Alberto F. Coelho Neto, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

In this educational exhibit, our aim is to provide a comprehensive review of the nasopharyngeal anatomy and, through didactical cases, highlight the radiological features of common pathologies. We will discuss the role of imaging modalities in the diagnosis and management of nasopharyngeal disorders, with the key radiological findings in each pathology.

#### TABLE OF CONTENTS/OUTLINE

- Introduction - Nasopharyngeal embryology and anatomy- Radiological imaging modalities for nasopharyngeal evaluation- Congenital lesions, Inflammatory, and Infectious Conditions, including: branchial cleft cyst, craniopharyngeal canal, fossa navicularis, pharyngeal bursa, Tornwaldt cyst, retention cysts, glial heterotopia, infraselar craniopharyngioma, teratoma epignathus, adenoiditis, tuberculosis.- Vascular Conditions, including nasopharyngeal slow flow venous malformations- Benign and malignant neoplastic acquired lesions of the nasopharynx, including squamous cell carcinoma, rhabdomyosarcoma, inverted papilloma, juvenile nasopharyngeal angiofibroma and lymphomas.- TNM staging main featuresPost-treatment changes, including post-surgical and post-radiotherapy findings.- Conclusion

### HNEE-17 TOOTH BE TOLD: EXPLORING MANDIBULAR NEUROPATHY

**Awards**

**TEACHING POINTS**

This comprehensive review elucidates the anatomy and pathologies of the mandibular division of the trigeminal nerve (V3) through detailed MR neurography cases and schematic illustrations. The focus will be on the V3 nerve, particularly the lingual and inferior alveolar nerves, to explore both traumatic and non-traumatic lesions, and the Sunderland classification of nerve injuries.We aimed to demonstrate the correlation between MR neurography lesions and surgical findings and assess the utility of MR neurography in the evaluation of postsurgical recovery.

**TABLE OF CONTENTS/OUTLINE**

NORMAL ANATOMY OF THE MANDIBULAR NERVE (V3)• Didactic original drawings illustrating the V3 nerve and its branches.Detailed anatomy of the lingual and inferior alveolar nerves via MR neurography.MR NEUROGRAPHY SEQUENCES3D Double-Echo Steady-State with Water Excitation Sequence and contrast enhanced (3D) turbo spin echo with variable flip-angle (SPACE) short-tau inversion recovery (STIR) sequences MR NEUROGRAPHY AND NERVE INJURY CLASSIFICATION• Introduction to MR neurography as a diagnostic tool for nerve pathologies.• Review of the Sunderland classification for grading nerve injuries. CASES: CORRELATION OF MR NEUROGRAPHY WITH SUNDERLAND CLASSIFICATION• Detailed MR neurography cases correlated with nerve injury grades.Implications of Sunderland Classification on Treatment and Prognosis.• Comparison of MR neurography findings with intraoperative observations. POST-SURGICAL EVALUATION• Case studies highlighting postoperative recovery and follow-up MRI

## HNEE-18 HIDDEN ENEMY: DIFFERENT PRESENTATIONS AND CONSEQUENCES OF PARANASAL SINUS MUCOCELE

Adriano Magna, MD (*Abstract Co-Author*) Nothing to Disclose

Ula Passos, MD (*Abstract Co-Author*) Nothing to Disclose
Lucas P. Caldas, MD (*Abstract Co-Author*) Nothing to Disclose
Gabriel Goncalves, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Paranasal sinus mucoceles are benign inflammatory lesions developing after obstruction of the sinus ostium. They are characterized by the accumulation of mucus secreted by mucosal cells, leading to the expansion of the affected sinus cavities. Radiological findings are varied, and knowledge of these is crucial for accurate diagnosis.The frontal and ethmoidal sinus are most commonly affected.Symptoms are nonspecific and may vary from rhinological to neurologic or ophthalmologic, depending on the location.Appears on Computed Tomography Scan (CT Scan) as a homogenous well circumscribed expansible lesion with soft tissue density, without contrast enhancement, associated with sinus expansion, sclerosis and bone erosion, in addition to extension to the intra orbital region.Magnetic Resonance Imaging (MRI) provides a more detailed evaluation of the lesion composition and extent, offering crucial information for surgical planning. The usual signal characteristics are a low intense T1 and a high intense T2 but any combination of signal intensity may be seen depending on the presence of blood products or the degree of hydration of the contents.

**TABLE OF CONTENTS/OUTLINE**

This study reports a series of cases with CT and MRI images of different presentations and consequences of paranasal sinus mucoceles, related to inflammatory processes, anatomical variations and traumatic sequelae, highlighting the imaging characteristics for diagnosis and surgical planning.

## HNEE-19 REVISITING THE ETHMOID ROOF AND ANTERIOR ETHMOIDAL ARTERIES- DANGER AREAS IN FUNCTIONAL ENDOSCOPIC SINUS SURGERY (ESS)

Alan I. Araujo, MD (*Abstract Co-Author*) Nothing to Disclose
Luis G. Duarte, MD (*Abstract Co-Author*) Nothing to Disclose
Tamara Hernandes Ricci, MD (*Abstract Co-Author*) Nothing to Disclose
Marcio Ricardo T. Garcia, MD (*Abstract Co-Author*) Nothing to Disclose
Soraia A. Souza, MD, MS (*Abstract Co-Author*) Nothing to Disclose
Diogo C. Medeiros, MD (*Abstract Co-Author*) Nothing to Disclose
Raphael M. Reali, MD (*Abstract Co-Author*) Nothing to Disclose
Nathalia C. Santos, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Review the anatomy of the ethmoid roof, emphasizing significant anatomical features and critical variants that should be meticulously described in reports.- Present clinical cases from head and neck radiology indicating surgical treatment through endoscopic surgery (ESS). - Describe the areas of danger for potential post/intra-operative complications due to the unique anatomy.- Propose a step-by-step process for reviewing the anatomy of the ethmoid roof and anterior ethmoidal arteries (AEA) to guide surgical planning and minimize potential complications related to ESS.

**TABLE OF CONTENTS/OUTLINE**

1. The Endoscopic Sinus Surgery (ESS):- Illustrated imaging cases demonstrating some ESS indications- Key procedural points and radiologists' responsibilities in reporting 2. The Role of Imaging Anatomy:- Coronal diagram illustrating the components of the ethmoid roof- Coronal CT images depicting the anatomy of the AEA and their associated major anatomical structures 3. Key Points - a step-by-step guide for reporting:- Keros classification and the significance of olfactory fossa depth- The importance of the relationship between the lateral lamella and the cribriform plate- Identification of anatomical landmarks- The correlation between supraorbital pneumatization and the course of the AEA canal 4. Illustrated clinical cases of ethmoid roof and anterior ethmoidal artery anatomy:- Coronal CT images demonstrating anatomical landmarks, supraorbital pneumatization, and olfactory fossa depth

5. Critical areas of the anterior ethmoidal artery and the lateral lamella:- Coronal CT images illustrating critical areas during ESS- AEA injury during the procedure- Key take-home messages

### HNEE-2 LACRIMAL GLAND MASSES: A PRIMER FOR RADIOLOGISTS

Vasundhara Smriti, MD (*Abstract Co-Author*) Nothing to Disclose
Pranjal Rai, MBBS (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

• To understand the normal anatomy of the lacrimal glands. • To focus on the imaging features, pathogenesis and treatment options for different lacrimal gland masses and their benign mimickers. • To identify helpful; imaging clues to differentiate various pathologies from each other.

#### TABLE OF CONTENTS/OUTLINE

1. Normal lacrimal gland anatomy. 2. Localizing a true lacrimal lesion versus a lesion causing secondary involvement of the lacrimal gland. 3. Various lacrimal gland masses, their classification according to etiology, their pathogenesis, imaging characteristics, and brief discussion of their management strategies. 4. Benign mimickers of lacrimal lesions, and use of imaging features to differentiate them. 5. A flowchart to help narrow down a radiological differential diagnosis for a lacrimal gland lesion. 6. Surgical techniques for lacrimal gland lesions.

### HNEE-20 RADIOLOGICAL INSIGHTS AND CLINICAL MANAGEMENT STRATEGIES: AN EDUCATIONAL EXHIBIT ON MéNIèRE'S DISEASE

Patricia Cuadras Collsamata (*Abstract Co-Author*) Nothing to Disclose
Paloma Puyalto, PhD, MD (*Abstract Co-Author*) Nothing to Disclose

Hernan Rivera (*Abstract Co-Author*) Nothing to Disclose
Carlos Ordonez (*Abstract Co-Author*) Nothing to Disclose
Giovanni Mattiello, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Ménič re's Disease (MD) is believed to be a result of abnormalities in the fluid balance within the inner ear, particularly those involving the endolymphatic system; is characterized by episodic vertigo, sensorineural hearing loss, tinnitus, and aural fullness and presents a significant challenge for otolaryngology specialists.MRI, particularly gadolinium contrast-enhanced delayed sequences 3D- FLAIR and 3D -IR , plays a critical role in confirming the diagnosis and assessing the severity of MD. This exhibit provides a comprehensive exploration of the fundamental role of MRI in understanding this entity and guiding its clinical management.Educational Objectives:To understand the role of radiological imaging in diagnosing and monitoring MD and to describe the main sequences used for the radiologic diagnosis and grading of endolymphatic hydrops, with special emphasis on the 3D-FLAIR and 3D-IR sequences, their pitfalls, and differential diagnosis.To present evidence-based clinical management strategies for MD, including pharmacological, rehabilitative, and surgical interventions.

#### TABLE OF CONTENTS/OUTLINE

Definition, demography, physiopathology and grading systems of MD.Radiological insights: MRI sequence protocol, postprocess, grading and volumetric assessment of the inner ear in patients with MD. Pitfalls and differential diagnosis.Clinical management strategies based on multidisciplinary approach to diagnosis analysis.

### HNEE-21 A MOUTHFUL: WHAT THE RADIOLOGIST NEEDS TO KNOW REGARDING ORTHOPANTOMOGRAPHY

Richard L. Barger JR, MD (*Abstract Co-Author*) Nothing to Disclose
Vijaya K. Kosaraju, MD (*Abstract Co-Author*) Nothing to Disclose
Navid Faraji, MD (*Abstract Co-Author*) Nothing to Disclose
Nathan Katragadda (*Abstract Co-Author*) Nothing to Disclose
Gregory R. Liller, DO (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

A growing body of evidence demonstrates strong associations between dental pathologies and systemic pathologies. As a result, there is an increased need for radiologists to understand and interpret dental imaging modalities to assess dental pathologies which could serve as risk factors for systemic pathologies. The Orthopantomogram (OPG), also known as Panorex, is a single-image radiograph used to visualize various gross anatomy and pathology of various oral and maxillofacial structures. It is often used as a screening and diagnostic tool in assessing dental and maxillofacial pathology, such as before cardiac valve surgery. The purpose of this exhibit is to:1. Discuss the acquisition process of OPGs.2. Review basic dental and facial anatomy visualized on an OPG.3. Discuss the different dental and facial pathologies and surgical changes seen on OPG.

#### TABLE OF CONTENTS/OUTLINE

1.Introduction discussing the history, epidemiology of dental and maxillofacial disease and ordering indications. 2. Assessing the technique of OPGs through discussion of equipment, acquisition, optimal imaging appearance and artifacts. 3. Discussion of basic oral and maxillofacial anatomy and physiology on OPGs including: tooth numbering and anatomy, dental embryology, stages of tooth eruption, and associated structures. 4. Evaluating various radiologic pathologies involving teeth (caries, impactions, and anomalies), periodontal disease, masses and mass-like lesions, anatomical variants, trauma, miscellaneous disorders, and dental and maxillofacial surgery, including mandibular arthroplasty and LeFort osteotomy.

### HNEE-22 BEYOND THE BLINK: NAVIGATING SUPERFICIAL PERIORBITAL LESIONS WITH HIGH-FREQUENCY ULTRASOUND AND MRI

**Awards**
**Certificate of Merit**

Heron Werner JR, MD (*Abstract Co-Author*) Nothing to Disclose
Clarissa C. Moraes Do Carmo, MD (*Abstract Co-Author*) Nothing to Disclose
Flavia M. Costa, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Claudia B. Camara, MD (*Abstract Co-Author*) Nothing to Disclose

MICHELLE GOMES (*Abstract Co-Author*) Nothing to Disclose
Carolina A. Almeida, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The superficial periorbital lesions serve various functions, including protection. An understanding of the anatomy of superficial periorbital lesions is crucial for interpreting the imaging features of lesions that affect them. High-frequency ultrasound presents itself as an advantageous option for imaging periorbital lesions due to its cost-effectiveness and widespread availability. Utilizing a 3T MRI with surface coil can aid in identifying superficial and millimetric lesions affecting the periorbital region. Demonstrate the utilization of high-frequency probes and surface coil MRI and elucidate the examination technique to radiology residents. Compose a pictorial essay detailing the principal periorbital lesions and their differential diagnoses, encompassing skin cancer, cosmetic fillers, inflammatory lesions, and lacrimal gland lesions.

**TABLE OF CONTENTS/OUTLINE**

Anatomy of superficial periorbital lesionsCases of tumorous, inflammatory, and filler-related lesions.

## HNEE-23 DON'T FLUCTUATE: MR IMAGING CASE-BASED DIDACTICS OF ENDOLYMPHATIC HYDROPS IN MéNIèRE'S DISEASE

Suresh K. Mukherji, MD, MBA (*Abstract Co-Author*) Nothing to Disclose
Maira Sarpi, MD (*Abstract Co-Author*) Nothing to Disclose
Luis G. Duarte, MD (*Abstract Co-Author*) Nothing to Disclose
Murilo B. Cintra (*Abstract Co-Author*) Nothing to Disclose

Soraia A. Souza, MD, MS (*Abstract Co-Author*) Nothing to Disclose
Camila S. Barbosa, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

• Understand the anatomy and physiology involved in endolymphatic hydrops • Review the MR protocol and specific sequences • Review methods for identifying and classifying the disease based on imaging findings • Illustrate concepts through a case-based review of the main grades in their classic presentations

**TABLE OF CONTENTS/OUTLINE**

• Ménière's Disease Imaging: Magnetic Resonance (MR) Sequences, Indications, Advanced Sequences • Relevant Anatomy of Ménière's Disease • Case-Based Didactics: Sample Cases to Illustrate Classification and Solidify Concepts • What's on the Horizon: Areas for Improvement • Approach to Differential Diagnosis

## HNEE-24 PRE- AND POST-OPERATIVE IMAGING OF CRANIOSYNOSTOSIS - WHAT RADIOLOGIST NEED TO KNOW?

**Awards**
**Cum Laude**

Elka Miller, MD, FRCPC (*Abstract Co-Author*) Nothing to Disclose
Shivaprakash B. Hiremath, DMRD, FRCR (*Abstract Co-Author*) Nothing to Disclose
Neetika Gupta, MBBS, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. To explain the embryology and anatomy of the developing calvarium.2. To describe the imaging modalities and protocol in children with suspected craniosynostosis. 3. To highlight various types of craniosynostosis and associated anomalies along with syndromic association. 4. To elucidate the pre- and post-operative imaging in craniosynostosis emphasizing on the surgical techniques, complications and follow up.

**TABLE OF CONTENTS/OUTLINE**

1. Illustrate the embryology and imaging anatomy of the developing calvarium and normal variants. 2. Comprehensive discussion of the various types of craniosynostosis and syndromic association in children.3. Identify and familiarize with the imaging features that need to be focused in the pre surgical evaluation and assessed in post-operative period along with mention about the evolution of surgical findings.4. Systematic imaging-based approach could help in highlighting the necessary findings to guide appropriate management and genetic evaluation, aid in surgical decision making and avoid complications.

## HNEE-25 ANOSMIA: BEYOND COVID

Eloisa M. Gebrim, MD (*Abstract Co-Author*) Nothing to Disclose
Julia M. Brunelli, MD (*Abstract Co-Author*) Nothing to Disclose

Ula Passos, MD (*Abstract Co-Author*) Nothing to Disclose
Isabela D. Alves, MD (*Abstract Co-Author*) Nothing to Disclose
Ramon Borge Rizzi, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

This study intends to show the various etiologies that can cause anosmia. This theme has been widely publicized after the spread of the Sars-Cov 2, as it has been one of the most prevalent symptoms.The purpose of this exhibition is to:Review the path of smell formation.Show other etiologies to anosmia besides COVIDEvidence of different groups involved, such as congenital, infectious, inflammatory, trauma, and use of drugs. Illustrate such cases with radiological examples.

**TABLE OF CONTENTS/OUTLINE**

Smell pathway : • Overview of the normal anatomy, showing how the smell is formed going from the external nose to the cortex.Before we start... let's look at how it appears at COVID! • Given the importance of the pandemic that started in 2020, we dedicated this slide to evidence of how COVID can cause anosmia, while also exposing other etiologies.Inflammatory and infectious•Nasal polyposis, rhinosinusitis, and fungal infections are shown as examples of causes of anosmia.Septal disorders• Nasal fractures, cocaine abuse, and granulomatosis with polyangiitis enter as etiologies of anosmia

which affect the nasal septum.Others cases• We conclude the exhibit by showing other various etiologies: atrophic nasal turbinates, respiratory adenomatoid hamartoma, and Kallmann syndrome.

## HNEE-26 SHINE A LIGHT ON DIPLOPIA: UNLOCKING DIFFERENTIAL DIAGNOSES IN OUR MIND'S EYES

Jose Roberto F. Fonseca, MD (*Abstract Co-Author*) Nothing to Disclose

Mariana Carmo, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To review unusual diseases that cause diplopia and are infrequent to diagnosis. To present diagnostic challenging cases of diplopia and their radiologic presentation. To be aware of life-threatening acute causes of diplopia which Imaging features can help with the diagnoses. To highlight the purpose of learning and evaluating rare diseases, adding experience to a better medical practice.

### TABLE OF CONTENTS/OUTLINE

Diplopia is a wide diagnosis made by ophthalmologists and neurologists. Numerous diseases occur with diplopia, leading to a late diagnosis when present in an infrequent disease. Diplopia itself can present as a challenge for radiologists, particularly when aiming for a differential diagnosis. This work can have a significant impact on patients with life-threatening diseases early diagnosed. Overview of the main diseases including diplopia. Key radiological findings in cross-section orbital images that aid in distinguishing rare pathologies. Didactic exposition of illustrative rare cases in which diplopia was included such as thyroid-associated orbitopathy, IgG4-related orbital disease, Tolosa-Hunt syndrome, a solitary fibrous tumor of the orbit, orbital lymphoma, sphenoid wing meningioma, conjugate gaze palsy and mechanisms, other causes of idiopathic orbital inflammation, orbital metastasis, chorioretinitis, and nuclei ischemic stroke of the oculomotor (III) and abducens (VI).

Helen Ribeiro De Oliveira, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

List and compartmentalize the different causes of granulomatous diseasesRecognize typical radiological aspects of their head and neck involvementImprove the approach of differential diagnosis by correlating multimodality imaging and clinical findings

### TABLE OF CONTENTS/OUTLINE

Introduction Definition of granuloma and its histological aspects Subdivision of various pathologies that can present granulomatous inflammation based on etiologyAutoimmune disorders: Granulomatosis with polyangiitis, Churg-Strauss syndrome, Behēet disease, systemic lupus erythematosus, rheumatoid arthritis, relapsing polychondritisHereditary condition: chronic granulomatous diseaseInfectious diseases:Fungal: blastomycosis, histoplasmosis, paracoccidioidomycosis, cryptococcosisBacterial: tuberculosis, cat-scratch disease, syphilis, leprosy, actinomycosis, rhinoscleroma, tularemiaParasitic: leishmaniasis, myiasis, toxoplasmosisIdiopathic disorders: Sarcoidosis, Kikuchi-Fujimoto disease, Kimura disease, Rosai-Dorfman disease, Langerhans cell histiocytosisSecondary granuloma: chemical exposure to vaccine, cocaine, talc, beryllium, silicosisPractical diagnostic approach for suspected granulomatous disorder

## HNEE-28 THE SKELETON MADE OF CARTILAGES: A PICTORIAL REVIEW OF LARYNGEAL CARTILAGINOUS SKELETON PATHOLOGIES FOR RADIOLOGY RESIDENTS

Janani Baradwaj, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Anu Kamalasanan, FRCR, MBBS (*Abstract Co-Author*) Nothing to Disclose
Thiru A. Sudarshan, DMRD, FRCR (*Abstract Co-Author*) Nothing to Disclose
Janani Asogan Vaishnavi, MD, FRCR (*Presenter*) Nothing to Disclose

### TEACHING POINTS

--Trauma of the anterior neck may result in various injuries of the laryngeal soft tissues, cartilages and surrounding structures. MDCT is used as a first line examination in the acute trauma setting.--An understanding of the anatomy of head and neck cartilaginous structures is critical to correctly identifying the spectrum of cartilaginous lesions occurring in the head and neck.--The important imaging clues in diagnosis of the head and neck cartilaginous tumours include characteristic location, internal calcified chondroid matrix, and typical T2 hyper intense signal due to high water content in hyaline cartilage.--Knowledge of the age-related changes in the signal characteristics of the laryngeal cartilages may help to improve detection of tumour invasion.--Cartilage invasion by laryngeal cancer has a poor prognosis . Exclusion of cartilage invasion is important as its presence often precludes laryngeal conservation surgery.--Ultrasound and MRI can be used to differentiate unossified thyroid cartilage and reactive oedema from infiltration.

### TABLE OF CONTENTS/OUTLINE

1. Radiological anatomy of laryngeal cartilaginous skeleton including embryology.2. Pitfalls related to ossification patterns of laryngeal cartilages.3. Role of various imaging modalities in the evaluation of laryngeal cartilages including protocol and instructions during scanning such as quiet respiration, avoiding swallowing/coughing etc.4. Provide a pictorial review of various pathologies including traumatic, inflammatory, congenital, benign and malignant lesions.5. Briefly describe how to identify cartilage invasion in malignancy and how it affects the management.

## HNEE-29 DON'T GET LOST IN THE LABYRINTH! MÉNIÈRE'S DISEASE AND OTHER LABYRINTHOPATHIES

## HNEE-32 NEOPLASTIC LESIONS OF THE SKULL BASE: A COMPARTMENTAL APPROACH

Taisa Santos, MD (*Abstract Co-Author*) Nothing to Disclose
Max Yunior Orsi Salazar, MD (*Abstract Co-Author*) Nothing to Disclose
Henrique B. Zuppani, MD (*Abstract Co-Author*) Nothing to Disclose
Thiago Luiz P. Scoppetta, MD (*Abstract Co-Author*) Nothing to Disclose
Giovanna S. Calfi, MD (*Abstract Co-Author*) Nothing to Disclose
Fernanda B. Assuncao, MD (*Abstract Co-Author*) Nothing to Disclose
Victor Tramonte Pereira (*Abstract Co-Author*) Nothing to Disclose
Manoel Barbosa, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

; Review the skull base anatomy and to stablish its compartments ; Recognize the imaging patterns of neoplastic lesions of the skull base and its compartment distribution to narrow the differential diagnosis ; Propose a flowchart of the location and imaging characteristics of the lesions to narrow the differential diagnosis

**TABLE OF CONTENTS/OUTLINE**

; Introduction: ; Review of the anatomy of the skull base and its compartments ; Anterior compartment: ; Esthesioneuroblastoma ; Sinonasal carcinoma ; Diagnostic flowchart proposal ; Middle compartment: ; Central compartment: ; Invasive macroadenoma ; Craniopharyngioma ; Nasopharyngeal carcinoma ; Paramedian/Paracentral: ; Juvenile nasopharyngeal angiofibroma ; Lateral: ; Langerhans cell histiocytosis ; Diagnostic flowchat proposal; Posterior compartment: ; Chordoma ; Chodrosarcoma ; Jugulotympanic paraganglioma ; Endolymphatic sac tumor ; Diagnostic flowchart proposal ; Multicompartmental lesions: ; Schwannoma ; Meningioma ; Solitary fibrous tumor ; Plasmacytoma ; Metastasis ; Mimics: ; Petrous apicitis ; Otogenic osteomyelitis ; Fibrous dysplasia ; Cholesterol granuloma ; Fungal invasive sinusitis ; Frontal mucocele ; Ecchodosis physaliphora ; Cephalocele ; Arrested pneumatization ; Conclusion ; General diagnostic flowchart

## HNEE-33 DECODING NASOPHARYNGEAL TUMOURS - WHAT THE TUMOUR BOARD WANTS TO KNOW

Janani Asogan Vaishnavi, MD, FRCR (*Abstract Co-Author*) Nothing to Disclose
Anu Kamalasanan, FRCR, MBBS (*Abstract Co-Author*) Nothing to Disclose
Thiru A. Sudarshan, DMRD, FRCR (*Abstract Co-Author*) Nothing to Disclose
Richard D. White, MBChB, FRCR (*Abstract Co-Author*) Nothing to Disclose
Janani Baradwaj, MBBS, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Most nasopharyngeal carcinomas originate in the posterolateral recess of the pharyngeal wall (82%) or midline (10%), with a small percentage (6%) presenting as normal at endoscopy MRI is the modality of choice for delineating the extent of NPC Key sequences : T1WI to identify skull base involvement and fat planes. CE-T1WI in detecting tumour extent, perineural spread, and intracranial extension. Diffusion-weighted imaging and MRI spectroscopy help to differentiate NPC from lymphoma CT is used to assess bony destruction and also for the purpose of RT planning . CT in combination with PET, is crucial for detecting distant metastasis and monitoring patients post-therapy for NPC recurrence. The presence of positive neck nodes is associated with higher incidence of disease recurrence. Nodes are measured in GREATEST DIMENSION in the neck in TNM staging and not in short axis diameter. Retropharyngeal nodes must be looked for in all cases. However these may be skipped and Level II nodes first involved in some cases.

**TABLE OF CONTENTS/OUTLINE**

Describe relevant imaging findings of nasopharyngeal tumours that would impact treatment decisions. Staging of the nasopharyngeal tumours and illustrate the route of spread of malignancy. Understand the general treatment considerations of Nasopharyngeal Tumours

## HNEE-34 POPPING OUT THE FACTS: A CLOSER LOOK AT THE CAUSES OF PROPTOSIS

Mariana Carmo, MD (*Abstract Co-Author*) Nothing to Disclose
Helio Yamashita, MD (*Abstract Co-Author*) Nothing to Disclose
Angela M. Wolosker (*Abstract Co-Author*) Nothing to Disclose
Jose R. Fonseca, MD,PhD (*Abstract Co-Author*) Nothing to Disclose
MARCELO DOS SANTOS BANDEIRA FILHO (*Abstract Co-Author*) Nothing to Disclose
Roberto Bastos, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

§ To outline and describe the diverse etiologies of ocular proptosis, emphasizing the importance of recognizing underlying conditions. § To illustrate the key imaging findings associated with each cause of proptosis, utilizing CT and MRI scans for effective diagnosis. § To underscore the crucial role of multidisciplinary collaboration in the diagnosis and management of patients with ocular proptosis, facilitating a timely and accurate treatment plan.

**TABLE OF CONTENTS/OUTLINE**

§ Introduction to Ocular Proptosis and its Clinical Significance. § Detailed Analysis of Causes: v Metabolic Causes: Focus on Thyroid Orbitopathy. v Neoplastic Conditions: Sphenoid wing meningioma, Lymphoma, Bone Metastasis. v Trauma-Induced Proptosis: Case Studies on Fractures. v Infectious Etiologies: Highlighting Subperiosteal Abscess. v Inflammatory Conditions: Idiopathic Inflammatory Orbitopathy. v Vascular Contributions: Carotid-Cavernous Fistula, Venous Malformations, and Lymphangioma.

## HNEE-35 PEARLS AND PITFALLS OF SKULL BASE CSF LEAK IMAGING

**Awards**
**Certificate of Merit**

Kyle Hunter, MD (*Abstract Co-Author*) Nothing to Disclose
Michael Markovic, MD (*Abstract Co-Author*) Nothing to Disclose
Vikas Jain, MD (*Abstract Co-Author*) Nothing to Disclose
Evgeniia Grik, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1) Introduce imaging options for the evaluation of skull base CSF fistula. 2) Provide an overview of the diagnostic algorithm and importance of beta2-transferrin testing. 3) Review thin-section high-resolution CT of the skull base as the first-line imaging test. 4) Discuss pros and cons of other imaging tests such as CT- and MR-cisternography. 5) Emphasize proper technique and highlight pitfalls while performing and reporting CT cisternography.

### TABLE OF CONTENTS/OUTLINE

1) CSF leak is a serious condition and can lead to significant morbidity and mortality. We introduce classification of CSF fistulae and provide an overview of the relevant anatomy. 2) We outline the algorithm of diagnosis with thin-section high-resolution CT of the skull base as first-line imaging following positive beta2-transferrin testing. 3) CT- and MR-cisternography are performed in certain clinical scenarios. MR is excellent in diagnosing meningoencephaloceles and differentiation from mucosal thickening. 4) We outline the proper imaging technique for CT-cisternograms and potential preventable interpretive mistakes. 5) We address our teaching points with illustrative cases of CSF leaks of various presentations and etiologies: Idiopathic intracranial hypertension as a major cause of spontaneous CSF leaks. CSF leaks post-endoscopic surgery and risk factors. Multimodality approach to evaluation of CSF leaks and the role of CT-cisternogram. Avoiding false-negative studies by adhering to appropriate imaging technique. Pearls and pitfalls of CT-cisternogram reporting. Role of brain MR and correlation of MR findings with pathology. CSF leaks in the setting of acute trauma. Imaging of recurrent CSF leaks and postsurgical changes.

## HNEE-36 SECRETS OF SKULL-BASE: OPENING THE PANDORA'S BOX

Shehbaz M. Ansari, MD, MBBS (*Abstract Co-Author*) Nothing to Disclose
Zubin Driver, MBBS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Better understanding of anatomy is a prerequisite for skull-base pathologies. 2. Localising pathology to the anterior, middle or posterior cranial fossa and ascertain its origin to the skull-base itself, intracranial or extracranial compartment is key to narrow down the differentials of a skull-base lesion aided by their imaging characteristics on cross-sectional imaging. 3. Role of radiology is not limited to diagnosis but also to describe the extent and relation to important neurovascular structures.

### TABLE OF CONTENTS/OUTLINE

Skull base has been a nightmare for radiologists, given its intricate anatomy and varied pathology. We intend to demystify the skull-base radiology by having a centre of origin-based approach. In this exhibit we will begin with the basics of skull-base anatomy as a building block using illustrations and cross-sectional imaging. This will be followed by application of centre of origin-based approach in diagnosing skull-base pathologies using case examples for each sub-category. In this approach, lesions will be categorised into anterior, middle and posterior cranial fossa with each category subdivided into extra-cranial, skull-base and intra-cranial as the centre of origin. For example, in the anterior cranial fossa category, fronto-ethmoidal meningoencephalocele, fibrous dysplasia and esthesioneuroblastoma represent lesions of intracranial, skull-base and extra-cranial origin. Similarly, lesions of middle and posterior cranial fossa will be discussed.

## HNEE-37 BOOST YOUR GPA KNOWLEDGE! UNMASKING THE HEAD AND NECK INVOLVEMENT IN GRANULOMATOSIS WITH POLYANGIITIS

Regina L. Elia Gomes, PhD, MD (*Abstract Co-Author*) Nothing to Disclose
Eloisa M. Gebrim, MD (*Abstract Co-Author*) Nothing to Disclose
Ula Passos, MD (*Abstract Co-Author*) Nothing to Disclose
Mario Padula, MD (*Abstract Co-Author*) Nothing to Disclose
Rodrigo W. Murakoshi, MD (*Abstract Co-Author*) Nothing to Disclose
Lucas Roberto Lelis B. Oliveira, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Recognize granulomatosis with polyangiitis (GPA) pathogenesis and clinical relevance.- Understand important imaging findings in head and neck involvement in GPA.- Recognize several differential diagnosis and their imaging findings.

### TABLE OF CONTENTS/OUTLINE

1. INTRODUCTION:• Overview of granulomatosis with polyangiitis (GPA), including a brief overview of the pathophysiology, diagnosis and clinical significance, with emphasis on head and neck related symptoms.2. IMAGING IN GPA:• Case-based review of GPA imaging findings, especially in CT and MRI imaging, demonstrating:o Sinonasal involvement in initial, progressing, and advanced diseaseo Temporal bone involvemento Orbital Involvemento Upper airway involvement• Discussion of the diagnostic criteria for GPA, including laboratory tests, imaging studies, and histopathological findings, to aid in accurate and timely diagnosis.3. IMAGING OF DIFFERENTIAL DIAGNOSIS:• Case-based review of other diseases with similar findings, including sinonasal involvement in sarcoidosis, cocaine-induced lesions, Hansen's disease, invasive fungal rhinosinusitis, and more, with emphasis on red-flags that may suggest GPA or alternative diagnosis.4. CONCLUSION:• Take-home messages, focusing on key imaging findings in head and neck imaging involvement.

## HNEE-38 HEAR ME OUT: EMERGENCY IMAGING PATTERNS IN NECROTIZING OTITIS EXTERNA - EARLY DETECTION

Mario Porfirio Neto, MD (*Abstract Co-Author*) Nothing to Disclose

Lucas P. Caldas, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

This study aims to assess the most common findings of the necrotizing otitis externa in the emergency context, and also show the most common dissemination patterns. Review the temporal bone anatomy, focusing on the main anatomical references that are affected by the disease.The purpose of this exhibition is to: Provide basic pathological concepts to help professionals to improve their skills to identify the main imaging findings and complications that should be actively looked for when reading a temporal bone CT in the emergency in patients with suspected necrotizing external otitis, helping to prevent delayed treatment due to diagnostic failure; Review the anatomical relation between the temporal bone, external ear and skull base, and the how the cervical spaces can be affected due to this relation in the disease dissemination, resulting in possible complications; Review subtle findings that may suggest that the patient could benefit from a MRI complementation study.

**TABLE OF CONTENTS/OUTLINE**

Schematic illustrations related to the pathophysiology of the external necrotizing otitis, correlating the temporal bone CT with the infection dissemination pattern through the anatomic references and cervical spaces; Demonstration of multiple cases with subtle imaging findings to help increase the early diagnosis rate.

## HNEE-39 BEHIND BULGING EYES: THE RADIOLOGIST HITCHHIKER'S GUIDE TO THE GRAVES OPHTHALMOPATHY

Denise D. Zantut-Wittmann (*Abstract Co-Author*) Nothing to Disclose
Gustavo Yamada, MD (*Abstract Co-Author*) Nothing to Disclose
Fabiano Reis (*Abstract Co-Author*) Nothing to Disclose
Caio Silveira, MD (*Abstract Co-Author*) Nothing to Disclose

**TEACHING POINTS**

- Review the normal anatomy of the orbits and the sumarize the current pathophysiology of Graves' ophthalmopathy. - Review and illustrate the imaging findings for Graves orbitophaty in MR, focus on provide an objective approach and for studying the anomalies. - Correlate MRI and CT with clinical images, to demonstrate what happens in the eye.

**TABLE OF CONTENTS/OUTLINE**

- Overview of Graves' ophthalmopathy as a complex autoimmune disorder- Description of the underlying autoimmune mechanisms- Pathophysiology: - Autoantibodies binding to thyrotropin receptors and insulin-like growth factor 1 receptors - Inflammatory response involving immune cells and cytokines - Differentiation of fibroblasts into adipocytes and myofibroblasts - Role of fibrocytes in tissue remodeling - Symptoms: exophthalmos, eyelid retraction - Complications: diplopia, restrictive strabismus - Association with hyperthyroidism- Radiological Findings - Importance for diagnosis and monitoring - Increased thickness and volume of extraocular muscles (EOM) in CT and MRI - Imaging during active inflammatory phase - Assessment of disease activity and complications - Compression of the optic nerve with apical crowding - Measurement of muscle diameters and impact on exophthalmos classification - Exploration of different imaging sequences - Evaluation of involvement of the lacrimal gland by MRI

## HNEE-4 DIFFUSE THYROID DISEASE: CT AND MR IMAGING APPROACH

Naoko Saito, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Ryohei Kuwatsuru, MD (*Abstract Co-Author*) Nothing to Disclose
Osamu Sakai, MD, PhD (*Abstract Co-Author*) Consultant, Boston Imaging Core Lab LLC
Naoki Takemasa (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Diffuse thyroid enlargement is frequently encountered on CT and MRI with clinical symptoms or incidentally. A wide variety of diseases can affect the thyroid gland diffusely, ranging from thyroiditis to malignant tumors. Familiarity with the imaging and clinical characteristics of diffuse thyroid disease (DTD) is essential for prompt diagnosis and treatment. The teaching points are: 1. To review clinical and imaging findings of various DTD 2. To recognize important features that can help differentiate the various DTD 3. To learn the current knowledge about the therapy for DTD

**TABLE OF CONTENTS/OUTLINE**

1. Normal imaging findings of the thyroid gland 2. Review of various cases of diffuse thyroid enlargement: clinical and imaging findings and treatment a. Autoimmune thyroid diseases: Graves' disease, Hashimoto thyroiditis, postpartum thyroiditis, IgG4-related thyroiditis b. Nonautoimmune thyroid diseases: acute and subacute thyroiditis c. Depositions: amyloidosis d. Drug-induced thyroid disorders e. Acute transient thyroid swelling following FNA f. Benign tumors: adenomatous goiter, simple diffuse goiter g. Malignant tumors: anaplastic thyroid cancer, diffuse sclerosing papillary cancer, malignant lymphoma, metastatic tumor h. Fetal goiter i. Shock thyroid 3. Current topics of treatment for DTD (anaplastic thyroid cancer and advanced thyroid cancer) a. Molecular target drug b. Immune checkpoint inhibitor c. Genomic medicine 4. Suggested algorithms for the diagnosis of DTD

## HNEE-40 RIGHT UNDER YOUR NOSE - ULTRASOUND GUIDE TO POST-SURGICAL RHINOPLASTY EVALUATION

Eduardo Sampaio, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Rhinoplasty or "nose job" is an ancient plastic surgery dating back to the time before Christ, with the first reports by Indian and Egyptian people. Despite being an old and frequently performed procedure, it still is considered challenging due to unexpected results and complications that can be related to the partially known anatomy prior to the procedure. Ultrasound (US) is an objective, accessible and widely used method for pre- and post-operative monitoring of many structures. Therefore, high-frequency nasal US should be included in the preoperative planning and in the postoperative follow-up of rhinoplasties.1. Review the structural anatomy of the nasal region on ultrasound;2. Introduce the different types of most common surgical rhinoplasty;3.

Review the ultrasound aspect of the most used surgical rhinoplasty techniques;4. Evaluate the materials commonly used in the procedure and their ultrasound appearances;5. Demonstrate what to expect in the post-operative period.

**TABLE OF CONTENTS/OUTLINE**

IntroductionUltrasound (US) nasal anatomyClinical and surgical benefits of US for nose proceduresSurgical RhinoplastyDifferent types of most common techniques (rhinoplasty, septoplasty, rhinectomy, maxillary antrostomy and uncinectomy, nasal turbinate surgery, ethmoidectomy, nasal prosthesis, etc)Grafts and materialsMaterials commonly used in nose jobUS aspect of most used materialsPost-surgical changesUS aspect of most used surgical rhinoplasty techniquesComplicationsSequelsTake-home messages

## HNEE-41 ARYEPIGLOTTIC FOLDS, A SMALL SPOT WITH BIG POSSIBILITIES. A CLINICO-RADIOLOGICAL AND ANATOMOPATHOLOGICAL REVIEW

Jose Maria Maiques Llacer, MD (*Abstract Co-Author*) Nothing to Disclose
Brigitte Beltran Marmol (*Abstract Co-Author*) Nothing to Disclose
Jaume Capellades, MD (*Abstract Co-Author*) Nothing to Disclose
Paulina Miranda, MD (*Abstract Co-Author*) Nothing to Disclose
Jorge Ivan Martinez Cano, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

This educational poster presents a clinico-radiological and anatomopathological's review of pathology of the aryepiglottic folds (AEF) of the supraglottis, from the common to the rare and from the benign to the malignant based on cases observed in the head and neck tumor committee of our centre.

**TABLE OF CONTENTS/OUTLINE**

Laryngeal neoplasms account for about a quarter of all head and neck neoplasms. The supraglottis is the most common site for these neoplasms and can be subdivided into different anatomical spaces that have prognostic and management differences. The aryepiglottic fold is the border between the larynx and the hypopharynx and is an uncommon site for tumors. The vast majority of these have epidermal origin, but multiple lesions can arise from the structures that make up the EFA. The pathology harbored in this site usually presents with larval and non-specific clinical manifestations, making timely diagnosis difficult; this problem is compounded by unfamiliarity with the imaging of these lesions, making their diagnosis even more difficult. Sometimes benign pathology can be confused with neoplasia, which can be difficult to differentiate on imaging. However, clinics and some tools to determine the benign origin of these lesions (contrast enhancement behavior) can help to refine the diagnosis and avoid invasive procedures in patients. This review summarizes the clinical, radiological and anatomopathological differences between neoplasms and benign pathology that may occur in this space. In addition, we aim to provide useful imaging tools for the recognition of certain features of clinical and prognostic importance.

## HNEE-42 INTRATHYROIDAL PARATHYROID: YOU MUST REMEMBER THIS!

Carolina R. Soares, MD (*Abstract Co-Author*) Nothing to Disclose
Lucas Carrara Ribeiro (*Abstract Co-Author*) Nothing to Disclose
Fabio Montenegro (*Abstract Co-Author*) Nothing to Disclose
Eloisa M. Gebrim, MD (*Abstract Co-Author*) Nothing to Disclose
Hugo Tames, MD (*Abstract Co-Author*) Nothing to Disclose
Regina L. Elia Gomes, PhD, MD (*Abstract Co-Author*) Nothing to Disclose
Felipe Magnabosco (*Abstract Co-Author*) Nothing to Disclose
Lucas O. Madeira, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The concept of enlarged parathyroid represents the possibility of disease. Classically, the parathyroids are located in the thyroid contours, however they can be found in ectopic situations, including inside the thyroid gland, in regions clearly surrounded by the thyroid parenchyma. They can often be confused by thyroid nodules, sometimes with a high ACR TI-RADS classification. The purposes of this exhibit are: to make this diagnosis possible and incorporated into radiological practice, especially in the clinical context of hyperparathyroidism; to review the imaging method aspects of these glands; and to show the findings of the 10 original cases from our institutions, illustrated by different imaging methods. Results: scintigraphy: 100% with focal hyperuptake to the radiopharmaceutical;ultrasound: 100% with hypoechogenicity;CT scan (only 50%): hypoattenuating nodule;MRI (only 20%): hypersignal in T2.

**TABLE OF CONTENTS/OUTLINE**

Introduction: epidemiology, embryology and clinical aspects of the intrathyroidal parathyroid.Imaging methods of intrathyroidal parathyroids: Ultrasound, Scintigraphy, CT scan and MRI.Illustrative original cases with anatomopathological correlation: 80% adenoma, 10% hyperplasia, and 10% carcinoma.Possible atypical characteristics of these nodules.Recommendation for radiologists - in what context should we remember this diagnosis? Conclusion "take-home messages".

## HNEE-43 "THE RADIOLOGIST'S ROADMAP: MAPPING OUT JAW LESIONS AND MULTIMODALITY IMAGING FEATURES"

**Awards**
**Certificate of Merit**

Moataz Ahmed Sayed Mohammed Soliman, MD,MSc (*Abstract Co-Author*) Nothing to Disclose
Reham M. Ellessy, MBBCh (*Abstract Co-Author*) Nothing to Disclose
Mohamed Badawy, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Discuss the different lesions in the Jaw. Review imaging features and clinical associations of odontogenic and non-odontogenic lesions. Describe a practical approach to narrow the differential diagnosis and identify the various lesions.

**TABLE OF CONTENTS/OUTLINE**

IntroductionClassification of the jaw lesionsRadiological characteristics Radiopaque vs radiolucentDifferent attenuation patterns (e.g. sclerotic, vs ground glass. Solid vs cystic)Margins (well vs ill-defined)Associated lesions.Clinical implications, e.g. prevalence, clinical presentation, behavior, treatment options.Differential diagnosis and practical approach to identify lesions according to the location and radiological features.RadiopaqueOdontogenicSclerotic: (odontoma, cementoblastoma, cemento osseous dysplasia, condensing osteitis)Ground glass: (cemento ossifying fibroma)NonodontogenicSclerotic: (Osteoma, Exostoses)Ground glass: (Fibrous dysplasia, Renal osteodystrophy, Paget disease of the Jaw)RadiolucentWell-defined marginsOdontogenicCystic lesions without mineralization (dentigerous cyst, Keratocyst, radicular cyst, residual cyst)Solid lesions without mineralization (Ameloblastoma)NonodontogenicCystic lesions ( Lingual Salivary Gland Inclusion Defect, simple bone, nasopalatine cysts)Solid lesions ( central joint cell granuloma, arteriovenous malformation, Langerhan cell histiocytosis)Ill-defined marginsOdontogenic (odontogenic

carcinoma, carcinosarcoma, sarcoma)Nonodontogenic Non neoplastic:(Osteomyelitis, osteonecrosis)Neoplastic: (distant metastasis, squamous cell carcinoma of the oral cavity, osteosarcoma/chondrosarcoma/fibrosarcoma of the jaw)

## HNEE-44 COCAINE-INDUCED MIDLINE DESTRUCTIVE LESIONS: WHAT DO WE HAVE TO LOOK FOR IN THE ENT AREA?

Maria J. Galante I, MD (*Abstract Co-Author*) Nothing to Disclose
Marta Barrios Lopez, MD (*Abstract Co-Author*) Nothing to Disclose
Ana Berasategui Criado, MD (*Abstract Co-Author*) Nothing to Disclose
Sofia Bretos Azcona, MD (*Abstract Co-Author*) Nothing to Disclose

Cobo Diaz Ramon (*Abstract Co-Author*) Nothing to Disclose
Angela Guitian Pinilla, MD (*Abstract Co-Author*) Nothing to Disclose
Celia Cantolla, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- To review the anatomy of the nasal cavities and paranasal sinuses.- To describe the key radiological findings in Computed Tomography (CT) and Magnetic Resonance Imaging (MRI) of cocaine-induced midline destructive lesions (CIMDL).- - To review the differential diagnosis with other pathologies that cause destructive midline lesions.

### TABLE OF CONTENTS/OUTLINE

A) Anatomy of the sinunasal areaB) Main ENT lesions- Perforation of the nasal septum.- Destruction of nasal turbinates.- Lateral nasal wall involvement.- Palate perforation.- Sinus neo-osteogenesis.- Orbital damage (obstruction of the nasolacrimal duct, destruction of the orbital bones, inflammatory mass..)- Otitis signs.- Skull base involvement (erosions of the anterior cranial fossa, encephalocele, CSF fistulae..)- Skin lesions/soft tissue destruction of the nasal area, mainly of the columella, alar cartilages, nasal philtrum and upper lip.C) Differential diagnosis- Traumatic lesions. - Infections (bacterial, fungi)- Toxic effect.- Inflammatory diseases.- Neoplasm.

## HNEE-45 TEMPORAL BONE OSTEODYSTROPHIES: EXPLORING OTOSCLEROSIS AND BEYOND

Eloisa M. Gebrim, MD (*Abstract Co-Author*) Nothing to Disclose
Regina L. Elia Gomes, PhD, MD (*Abstract Co-Author*) Nothing to Disclose
Bruno C. Olivetti, MD (*Abstract Co-Author*) Nothing to Disclose
Carlos Toyama (*Abstract Co-Author*) Nothing to Disclose
Hugo Tames, MD (*Abstract Co-Author*) Nothing to Disclose
Isadora Campos De Matos (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- To highlight the main characteristics and imaging findings of osteodystrophies of the temporal bone.- To review and illustrate dysplasias of the temporal bone with cases from our institution.- To familiarize radiologists with imaging aspects that aid in the differential diagnosis of these pathologies.

### TABLE OF CONTENTS/OUTLINE

INTRODUCTION- Organogram osteodystrophies of temporal bone organized into groups according to the predominant pattern of bone involvement (lytic, scleroticand mixed)Temporal bone disease with predominance of lytic pattern- Otosclerosis- Osteogenesis imperfecta- Otosyphilis Temporal bone disease with predominance of mixed pattern- Paget's disease- Fibrous dysplasia Temporal bone disease with predominance of sclerotic pattern- Osteopetrosis- Camurati-engelmann- Scleosteosis- Van buchemTAKE HOME MESSAGESTemporal Bone Osteodystrophies, such as otosclerosis and other bone dysplasias exhibit varied clinical presentations and genetic origins. By classifying them based on predominant bone involvement patterns, clinicians and radiologists can better understand their complexities and facilitate accurate diagnosis. Imaging modalities play a crucial role in delineating disease characteristics and guiding treatment strategies. Recognizing key features of each condition is imperative for tailored patient management and improved outcomes. In essence, a comprehensive understanding of temporal bone diseases empowers healthcare professionals to provide optimal care and support for affected individuals.

## HNEE-46 BRANCHIAL CLEFT ANOMALIES: EMBRYOLOGICAL DEVELOPMENT AND MULTIMODALITY IMAGING FINDINGS. WHAT THE RADIOLOGIST NEEDS TO KNOW

Maria J. Sarda, MD (*Abstract Co-Author*) Nothing to Disclose
Eduardo D. Sarda, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Review key embryological aspects of branchial arch development.Know the anatomical anomalies caused by failures in the embryological development of the branchial arch -usually presented as cysts, sinuses and fistulas.Identify the key imaging findings to establish the diagnosis of anomalies of the branchial arches: morphological characteristics, location of the lesion.Review the complications associated with anomalies of the branchial arches as well as their imaging findings: infections, persistent fistula.

### TABLE OF CONTENTS/OUTLINE

Embryological branchial arch development. - Temporary cavity of "Sinus of His": normal fusion.Failure of complete wall fusion: -branchial cleft cyst: type 1, type 2, type 3, type 4-Branchial cleft sinus-Branchial cleft fistulaKey multimodality imaging findings: -Branchial cleft cyst-Branchial cleft sinus-Branchial cleft fistulaComplications of branchial arches anomalies - and imaging findings-Infections-Persistent fistula -Collections

## HNEE-47 MERKEL CELL CARCINOMA MANIFESTATION IN HEAD AND NECK

Carlota Andreu Arasa, MD, PhD (*Abstract Co-Author*) Nothing to Disclose

Osamu Sakai, MD, PhD (*Abstract Co-Author*) Consultant, Boston Imaging Core Lab LLC
Karen Buch, MD (*Abstract Co-Author*) Nothing to Disclose
Serena Pham, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Merkel cell carcinoma (MCC) is a rare, aggressive neuroendocrine cutaneous malignancy, with a predilection for early local, regional and distant metastasis with frequent recurrence, and is associated with poor prognosis.1-9 Since MCC rapidly progresses and metastasizes, early detection and achievement of R0 excision of the primary lesion, with a safety margin of >1 cm in stage 1 disease and >2 cm in higher stages, as well as sentinel lymph

node biopsy and excision, are key to improving prognosis.1,4 While the gold-standard method of diagnosing MCC is pathologic analysis, imaging is essential for staging, management, and follow-up guidance.5-9 To date, there is no consensus for specific imaging algorithm for assisting diagnosing and staging of MCC.5,9 The purpose of this exhibit is to: 1) Review the MCC epidemiology and risk factors 2) Discuss various MCC manifestations in head and neck 3) Discuss management of MCC in head and neck 4) Discuss the role of the most recent imaging approach for diagnosing and staging of MCC in head and neck (Reference is available upon request.)

**TABLE OF CONTENTS/OUTLINE**

1) MCC epidemiology and risk factors 2) MCC manifestations in head and neck 3) Management of MCC in head and neck 4) Imaging approach for diagnosing and staging of MCC in head and neck

## HNEE-48 PARAPHARYNGEAL SPACE: THE GREAT UNKNOWN

Silvia Cisneros Carpio, MD (*Abstract Co-Author*) Nothing to Disclose
Marta Legorburu Tona, MD (*Abstract Co-Author*) Nothing to Disclose
Javier Castillo de Juan (*Abstract Co-Author*) Nothing to Disclose
Udane Oiartzabal, MD (*Abstract Co-Author*) Nothing to Disclose

Leire Ormaetxe Albeniz, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To review the boundaries and anatomical relationships of the parapharyngeal space.To describe the diversity of focal lesions affecting this space and the radiological key findings that lead their differential diagnosis.

**TABLE OF CONTENTS/OUTLINE**

The parapharyngeal space is a deep cervical compartment with inverted pyramid morphology, bounded laterally by the masticator and parotid spaces, posteriorly by the retropharyngeal and prevertebral spaces, and medially by the pharyngeal mucosal space, and divided into a pre-styloid and a post-styloid compartment by the tensor-vascular-styloid fascia.Although predominantly composed of fatty tissue, it also includes multiple vascular and nervous structures, minor salivary glands, and, occasionally, the retromandibular portion of the deep parotid lobe. Additionally, due to its location, it maintains a close relationship with multiple neighboring anatomical structures.The differential diagnosis of lesions affecting this space includes both primary lesions originating within the space itself and secondary lesions extending into it from adjacent structures. These encompass a wide range of pathologies, both congenital and acquired, including neoplastic, inflammatory, and infectious etiologies.A review of the main differential diagnosis of the parapharyngeal space lesions has been conducted, based on both anatomic references and key radiological findings, using cases from our institution.

## HNEE-49 IMAGING-DETECTED EXTRANODAL EXTENSION IN HEAD AND NECK CANCER: CLINICAL IMPLICATIONS AND DIAGNOSTIC CRITERIA IN THE ERA OF HIGH-RESOLUTION IMAGING INCLUDING PHOTON-COUNTING DETECTOR CT

**TEACHING POINTS**

Extranodal extension (ENE) is a significant adverse prognostic factor in head and neck squamous cell carcinoma (HNSCC), and pathologic ENE (pENE)/clinically evident ENE (cENE) are classified as N3b in p16-negative HNSCC based on the AJCC staging system. While imaging-detected ENE (iENE) without clinically apparent cENE is not included in the current N category, there has been active discussion regarding the importance of pretreatment iENE evaluation for accurate prognostication and treatment strategy as well as the many aspects of iENE that remain unresolved such as diagnostic criteria including the associated terminology. At the same time, the advent of high-resolution imaging techniques such as photon-counting detector CT with 1024 matrix capability allows for more detailed visualization of fine structures compared to conventional imaging.The objectives of this presentation are: 1) to review the clinical implications of iENE in patients with head and neck cancer, and 2) to discuss the diagnostic criteria for iENE in the era of high-resolution imaging with radiolo-pathologic / clinico-radiologic correlation.

**TABLE OF CONTENTS/OUTLINE**

1. Clinical background of ENE in the patient with head and neck cancer.2. Diagnostic criteria and the recently proposed grading of iENE.3. High-resolution CT including photon-counting CT4. Case discussion and clinical implications of iENE- iENE Grade 1- iENE Grade 2- iENE Grade 35. Summary

## HNEE-5 ENDOLYMPHATIC HYDROPS IN MRI, A DEEPER LOOK AT THE INNER EAR

Yukiyoshi Kimura, MD (*Abstract Co-Author*) Nothing to Disclose
Yumi Kimura Sandoval, MD (*Abstract Co-Author*) Nothing to Disclose
Carlos Calderon Cardenas SR, MD, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Establish an anatomical correlation of the inner ear and its visualization with MR images.2. Show the type of sequences used as well as the contrast administration and image acquisition times in the evaluation of patients with suspected endolymphatic hydrops.3. Explain and illustrate the importance of a step-by-step evaluation in patients with endolymphatic hydrops.4. Illustrate characteristic imaging findings in posterior fossa pathology considered as a differential diagnosis.

**TABLE OF CONTENTS/OUTLINE**

• Introduction• Indications• Anatomy of the inner ear• Image acquisition protocol (use of contrast media and administration times, sequence and acquisition times)• Endolymphatic hydrops: what is it? why is it produced?• Step-by-step evaluation on MRI • Classification systems used• Differential

diagnoses• Take home points• References

## HNEE-50 QUANTITATIVE AND QUALITATIVE ASSESSMENT OF THE PHARYNGOESOPHAGEAL SEGMENT (PES) IN THE VIDEOFLUOROSCOPIC SWALLOW STUDY (VFSS): A PRACTICAL APPROACH

Javier Azpeitia-Hernandez, MD (*Abstract Co-Author*) Nothing to Disclose
Ana Ines Rubio Aguilera, MD (*Abstract Co-Author*) Nothing to Disclose
Rosa M. Lorente-Ramos, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Araceli Munoz Hernandez, MD, PHD (*Abstract Co-Author*) Nothing to Disclose
Itxaso Galan-Gonzalez (*Abstract Co-Author*) Nothing to Disclose
Javier Azpeitia Arman, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- To describe the normal anatomy of the pharyngoesophageal segment (PES).
- To analyze the normal physiology of the upper esophageal sphincter (UES)
- To propose a systematic approach for the study of pathology of the pharyngoesophageal segment.
- To illustrate common and uncommon imaging findings in videofluoroscopy swallow study (VFSS).
- To emphasize pitfalls and clues to differential diagnosis.
- To describe recommendations and rehabilitative strategies based on VFSS by evaluating the effectiveness of postures, maneuvers, bolus modifications, and sensory enhancements in improving swallowing safety and efficiency.

### TABLE OF CONTENTS/OUTLINE

The pharyngoesophageal segment (PES) is one of the only region of the swallowing mechanism that can be modified with therapy and surgery. The VFSS is the gold-standard tool for diagnosing PES dysfunction. A systematic approach to PES analysis ensures a comprehensive assessment of dysfunction. The systematic evaluation of the PES includes evaluation of pre-swallow PES fluoroscopic anatomy, laryngohyoid elevation, pharyngeal contractility, PES opening, evaluation of the posterior cricoid region, the posterior hypopharyngeal wall region and the esophageal function. We present different objective measures to study the PES pathology: the pharyngeal constriction ratio (PCR), UES opening diameter, Determination of the PES opening dimensions, UES closure, measurement of the cricopharyngeus bar to distinguish between obstructive and non-obstructive bars, and normalized residue ratio scale (NRRS).

## HNEE-51 PATHOLOGY OF THE OUTER, MIDDLE AND INNER EAR: TECHNIQUES, PROTOCOLS AND KEY FINDINGS

### TEACHING POINTS

; The temporal bone is an anatomical area of great complexity and harbors different pathologies.; The most suitable technique for examining the outer ear is Computed Tomography. However, CT is used to assess bone structures in the middle and inner ear, whether Magnetic Resonance Imaging is required for inflammatory or tumorous diseases.

### TABLE OF CONTENTS/OUTLINE

The temporal bone can present a variety of pathologies (infectious, traumatic, congenital, tumor) that can affect the outer, middle, or inner ear. This education exhibit aims to review the ear's anatomy showing the most appropriate techniques and protocols for basic findings that will allow the detection of different ear pathologies.; Most diseases of the outer ear are assessed by CT, sometimes with contrast (inflammatory and tumorous processes).; In the middle ear, CT without contrast allows the assessment of hearing loss, trauma, otitis, and cholesteatoma. CT with contrast medium is used for infectious processes with intracranial extension such as epidural abscesses or thromboses. MRI is used to assess tumor diseases and inflammatory diseases.; In the inner ear, MRI is the method of choice to identify cranial nerves and the labyrinth, using contrast agents for tumors and infectious diseases. CT can be used to assess congenital pathologies and other pathologies such as otosclerosis and dehiscence.

## HNEE-52 BEYOND THE ORDINARY: A DEEP DIVE INTO BRACHIAL PLEXITIS AND PLEXOPATHY

**Awards**
**Certificate of Merit**

Carlos H. Torres, MD, FRCPC (*Abstract Co-Author*) Nothing to Disclose
Vinil Shah, MD (*Abstract Co-Author*) Nothing to Disclose
Maria Lucia Brun, MD (*Abstract Co-Author*) Nothing to Disclose
Pierre Bourque (*Abstract Co-Author*) Nothing to Disclose
Azza Reda, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

○ To review the common and uncommon causes of brachial plexitis and discuss the key imaging features that may aid in the differential diagnosis.○ To correlate the imaging features with the clinical findings of Brachial Plexitis.○ To understand the clinico-radiological and electrodiagnostic approach in the multidisciplinary assessment of brachial plexitis.

### TABLE OF CONTENTS/OUTLINE

1. Introduction and Background2. Clinical approach and electrodiagnostic correlation3. MRI findings: A Case-Based Review- Viral plexitis- Immune-related plexitis- Post-radiation plexitis- Toxic plexitis (vaccines, drugs)- Heredofamilial Hypertrophic Neuropathies- Charcot-Marie-Tooth- CIDP- Idiopathic plexitis (Parsonage-Turner syndrome)- Miscellaneous cases 4. Conclusions and take-home pointsBrachial plexitis represents a clinical challenge as symptoms are vague and nonspecific. However, the combination of clinical history, EMG, NCS and MRI findings is helpful to reach the diagnosis.

## HNEE-53 DISEASES INVOLVING THE EXTRAOCULAR MUSCLES (EOM): IMAGING FINDINGS

**Awards**

**TEACHING POINTS**

The extraocular muscles (EOM) can be involved in a wide variety of diseases that can be local, regional or systemic. The conditions often have a similar clinical and radiological presentation, which can make differential diagnosis difficult.It is necessary to know the orbital anatomy, how to perform its radiological evaluation and the clinical and imaging manifestations of the diseases that may affect de EOM.The key points to evaluate for a systematic approach and differential diagnosis are:- Pattern of muscle involvement: how many muscles, which ones, and what part of them.- Involvement of one or both orbits and symmetry.- Involvement of other orbital or extraorbital structures.- Clinical presentation.The purpose of this work is to review the conditions that can affect the EOM, to describe and to illustrate their characteristic imaging findings, focusing on clues for differential diagnosis.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction1.1. Orbital anatomy, focusing on the EOM1.2. Imaging modalities used for the evaluation of the orbit and the EOM and its radiological features2. Systematic approach and clues for differential diagnosis3. Diseases involving the extraocular muscles:3.1. Thyroid ophthalmopathy (Graves' disease)3.2. Orbital myositis: idiopathic orbital inflammation (orbital pseudotumor) and secondary myositis (associated to systemic or autoimmune diseases)3.3. Neoplasms: lymphoproliferative disorders and metastasis3.4. Orbital trauma and iatrogenic complications3.5. Infectious diseases: orbital cellulitis and other entities3.6. Miscellaneous: Brown syndrome, vascular conditions and others4. Conclusions5. References

## HNEE-54 RADIOGRAPHIC GUIDE TO CYSTIC ODONTOGENIC LESIONS: A MULTIMODAL IMAGING APPROACH

Michael Vaccaro, DO (*Abstract Co-Author*) Nothing to Disclose
Hannah Iqbal (*Abstract Co-Author*) Nothing to Disclose
Josef Iqbal (*Abstract Co-Author*) Nothing to Disclose
Nandor K. Pinter, MD (*Abstract Co-Author*) Consultant, Koninklijke Philips NV

**TEACHING POINTS**

Introduction to Cystic Odontogenic Lesions: - Overview of cystic odontogenic lesions and their classification. Review differential diagnosis of cystic odontogenic lesions, including: radicular cyst, dentigerous cyst, odontogenic keratocyst, ameloblastoma, odontogenic myxoma, residual cyst, calcifying odontogenic cyst, etc.- Discuss the importance of the Radiologist in diagnosis and management of these lesions.Multimodal Imaging Approach:- Advantages in using a multimodal imaging approach, including radiography, computed tomography, magnetic resonance imaging.Radiographic Features:- Review the radiographic techniques used in imaging odontogenic lesions.- Typical radiographic appearance of discussed cystic odontogenic lesions.Computed Tomography Imaging - Discuss role of CT in evaluation and diagnosis of cystic odontogenic lesions.- Review the key CT findings for differentiating cystic odontogenic lesions.Magnetic Resonance Imaging - Utility of MRI in characterizing cystic lesions. Importance of evaluating adjacent soft tissues and internal cyst contents.- Discuss characteristic signal patterns for specific odontogenic lesions.

**TABLE OF CONTENTS/OUTLINE**

-Title Slide-Disclosures -Exhibit Learning Objectives-Introduction to Cystic Odontogenic Lesions, Importance of the Radiologist-Multimodality Approach in Diagnosing Cystic Odonotgenic Lesions (Radiography, CT, MRI)-Periapical Cyst (Radicular Cyst)-Dentigerous Cyst (Follicular Cyst)-Keratocystic Odontogenic Tumor (Odontogenic Keratocyst)-Ameloblastoma-Odontogenic Myxoma-Residual Cyst-Calcifying odontogenic cyst (Gorlin Cyst)-Summary-References

## HNEE-55 APPLICATION OF CT-LIKE MRI IN CRANIAL AND FACIAL BONE LESIONS

Masayuki Maeda, MD (*Abstract Co-Author*) Nothing to Disclose
Hajime Sakuma, MD, PhD (*Abstract Co-Author*) Research Grant, Eisai Co, Ltd;Research Grant, FUJIFILM Holdings Corporation;Research Grant, Guerbet SA;
Fumine Tanaka (*Abstract Co-Author*) Nothing to Disclose
Maki Umino, MD (*Abstract Co-Author*) Nothing to Disclose
Seiya Kishi (*Abstract Co-Author*) Nothing to Disclose
Ryota Kogue, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Recently, a new technique known as CT-like MRI has been developed that enhances MRI contrast similar to CT. We present our clinical experience using fast field-echo resembling a CT using restricted echo spacing (FRACTURE) MRI in comparison with CT in cranial and facial bone lesions. Our aim is1) to understand the principle of FRACTURE MRI.2) to demonstrate FRACTURE MRI cases of cranial and facial bone lesions compared with CT.3) to learn the diagnostic value and drawbacks of FRACTURE MRI in evaluating bone lesions.

**TABLE OF CONTENTS/OUTLINE**

1. Principle of FRACTURE MRI2. Delineation of osteolytic change indicates whether the lesion is malignant (permeative bone destruction) or benign (expansive bone destruction).3. Delineation of sclerotic change is useful for diagnosing fibrous dysplasia, osteochondroma, meningioma, etc.4. Benefit: FRACTURE MRI may omit CT examination in pediatric cases.5. Drawback: FRACTURE MRI may be difficult to assess the lesions near nasal/paranasal or mastoid air.6. Conclusion: FRACTURE MRI provides added value in the evaluation of cranial and facial bone lesions that is difficult with conventional MRI.

## HNEE-56 PATTERNS OF VISUAL FIELD DEFECT: THE KEY FOR SELECTING APPROPRIATE IMAGING MODALITY AND MAKING ACCURATE DIAGNOSIS

Yuhua Dou (*Abstract Co-Author*) Nothing to Disclose
Guanglei Tang, MBBS (*Abstract Co-Author*) Nothing to Disclose

Xueguo Liu, MD,PhD (*Abstract Co-Author*) Nothing to Disclose
Jian Guan, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. To review the anatomy, physiology and normal imaging appearance of the visual pathway. 2. To know about the relevant clinical examination for visual field analysis 3. To recognize different visual field defect patterns associated with specific segment of the visual pathway, which can be assisting in lesion localization on imaging. 4. To learn unilateral and bilateral visual field defect based on cases.

**TABLE OF CONTENTS/OUTLINE**

1. The anatomy of the visual pathway and its normal appearance on CT and MRI imaging. 2. Relevant clinical examinations of visual field: (1)Testing of visual fields (including methods to study and analyze the visual field, as well as terminology relating to visual field defects); (2)Testing of the pupillary light reflex. 3. Different patterns of visual field defect, imaging findings and diagnosis: (1)Visual field defect with unilateral eye involved(central visual field defect, peripheral visual field defect, altitudinal hemianopsia, nasal hemianopsia and total visual loss) and related diseases. (2)Visual field defect with bilateral eyes involved (junctional scotoma, altitudinal hemianopsia, heteronymous visual field defect, homonymous visual field defect and quadranopsia) and related diseases. 4. Application of visual field defect and lesion localization in complex cases

## HNEE-57 STAYING IN ORBIT: A REVIEW OF INTRAORBITAL PATHOLOGY

Han Zhong, MD (*Abstract Co-Author*) Nothing to Disclose
Christopher Ciasullo, DO (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Review orbital anatomy. 2. Review the cross-sectional imaging appearance as well as typical patient presentation/demographics and management of non-traumatic orbital pathologies including inflammatory, neoplastic, and vascular etiologies.Summary As orbital pathology is infrequently encountered by many residents, it can become a source of anxiety and confusion. The myriad of entities that can manifest in such a small region of the human body may be overwhelming - a dilemma that this educational exhibit seeks to address. It will start with fundamental orbital anatomy and progress to key characteristics of multiple pathologies, broken down into more easily digestible categories. In addition, understanding common presenting symptoms and demographics for each pathology can often help narrow the differential. The objective is to instill confidence in residents not only as they prepare for board exams, but also to help form differential diagnoses as they encounter orbital imaging throughout their call shifts and career.

**TABLE OF CONTENTS/OUTLINE**

1. Orbital anatomy. 2. Cross-sectional imaging appearance as well as typical patient presentation/demographics and management of non-traumatic orbital pathologies. a. Inflammatory - optic neuritis, orbital pseudotumor, scleritis, thyroid orbitopathy. b. Neoplastic - optic nerve glioma, optic nerve sheath meningioma, orbital lymphoma. c. Vascular - orbital cavernous venous malformation, orbital infantile hemangioma, orbital lymphangioma.

## HNEE-58 MAGNETIC RESONANCE NEUROGRAPHY IN HEAD AND NECK: HOW TO DO AND WHAT TO VALUE

Andre F. Formiga, MD (*Abstract Co-Author*) Nothing to Disclose

Elisabetta Ponte, MD (*Abstract Co-Author*) Nothing to Disclose
Esnelly F. Berrios Bonilla, MD (*Abstract Co-Author*) Nothing to Disclose
Javier Tejedor Toquero, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The aim of this report is to review the various ways in which non-odontogenic jaw lesions manifest in adult and pediatric population.To describe how non odontogenic jaw lesions adjacent structures, and the best way to recognize them with their imaging characteristics at plain radiograph, ultrasound, computed tomography and resonance magnetic studies.To illustrate the main imaging features and to highlight associated injuries with-own experienced images.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction 2. Lesions 3. ConclusionNon-odontogenic jaw lesions represent a wide spectrumof pathologies that include benign inflammatory/infectious lesions, as well as more aggressive malignant lesions such as tumors.The classification of non-odontogenic mandibular lesions must be taken into account according to their histolology since they may have a hematological origin (plasmocytoma), derived from fat (lipoma), neoplastic (osteosarcoma...) etc

## HNEE-6 DETECTION OF PARATHYROID ADENOMAS AIDED BY THEIR TIME ENHANCEMENT CURVE: GETTING THE MOST OUT OF 4DCT

Steven Raeymaeckers, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Based on multiple cases we illustrate the embryology of the parathyroid glands using relevant antomical reference markers 2. Three different types of enhancement curves for parathyroid adenomas exist 3. Arterial wash-in of contrast is an effect that can be very shortlived and thus missed 4. Multiphase 4DCT allows for the contruction of time-density curves which can be used to easily detect and characterize even very small parathyroid adenomas

### TABLE OF CONTENTS/OUTLINE

1. Multiphase 4DCT: - Scanning protocol and dose - The different types of enhancement curves of parathyroid adenomas 2. Processing multiphase 4DCT images - Non rigid registration - 4D visualisation 3. Setting up a reading protocol - Embryology of the parathyroid glands using antomical references - What does the surgeon want to know?

## HNEE-60 PRACTICAL APPLICATION OF ULTRASOUND-GUIDED CERVICAL LYMPH NODE BIOPSY: TIPS AND PEARLS

Shi Tan (*Abstract Co-Author*) Nothing to Disclose
Yan Sun, MD (*Abstract Co-Author*) Nothing to Disclose
Li Gang Cui, PhD, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Cervical lymphadenoma can be resulted from a variety of causes. It is necessary to identify the cause. Now ultrasound-guided core needle biopsy (a kind of interventional ultrasound) is generally accepted as the optimal diagnose way to make correct histopathological diagnosis in non-surgical condition. We will introduce the definition, tools, and basic methods of interventional ultrasound, and discuss the tips and pearls of ultrasound-guided cervical lymph node biopsy combing cases.After reviewing this slide presentation, participants will be able to learn: biopsy device and needle of interventional ultrasound; methods of ultrasound guidance procedure: needle-guide and free-hand biopsy; puncture approach: in-plane and out-plane biopsy; tips and pearls of ultrasound-guided cervical lymph node biopsy

### TABLE OF CONTENTS/OUTLINE

1 Introduction2 Learning objections3 Introduction of interventional ultrasound 3.1 Definition of interventional ultrasound 3.2 History of interventional ultrasound 3.3 Biopsy device and needle of interventional ultrasound 3.4 Methods of ultrasound guidance procedure 3.4.1 Biopsy device guided 3.4.2 Free-hand 3.4.2.1 Applicable conditions and disadvantages of in-plane 3.4.2.2 Applicable conditions and disadvantages of out-plane 4. Tips of cervical lymph node biopsy (demonstrated by cases) 4.1 Adjust the range according to the situation 4.2 Return to manual biopsy when the distance is limited 4.3 Hydrodissection 4.4 Use hydrodissection needle as a lever 4.5 Fine needle biopsy for lymph node metastasis 4.6 Use the flexibility of cervical fascia spaces 4.7 Use the contrast-enhanced ultrasound 5 Suggested Readings

## HNEE-61 PARRY-ROMBERG SYNDROME: HOW CAN DERMATOLOGICAL ULTRASOUND HELP? A CASE SERIES

Priscilla Foster, MD (*Abstract Co-Author*) Nothing to Disclose
Juliana Lie Taya (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Explain the importance of radiological imaging to early diagnosis and monitoring of disease progression in five patients with Parry-Romberg Syndrome; Demonstrate the efficacy of dermatological Ultrasound to detect dermatological atrophy in these patients; Compare the dermatological findings versus the radiological findings to monitor the disease progression; Describe different degrees of dermal atrophy and radiological results in between the patients of this case series.

### TABLE OF CONTENTS/OUTLINE

1. Brief overview of Parry-Romberg Syndrome (clḵnical manifestations and epidemiology); 2. Why imaging is important in patients with Parry-Romberg Syndrome; 3. Explain the usage of multimodality imaging (dermatological ultrasound, TC and MRI) in patients with Parry-Romberg Syndrome; 4. How we performed the evaluation of patients in this case series; 5. Provide image-rich exemples and descriptions of five patients with Parry-Romberg Syndrome who underwent radiological imaging; 6. Discuss the dermatological finding and radiological findings; 7. Point out the importante of dermatological US in patients with Parry-Romberg Syndrome; 8. Conclusion and Take Home Message

## HNEE-62 ISOLATED PATHOLOGY OF THE SPHENOID SINUS: THINK TWICE

Siddhartha Gaddamanugu, MBBS (*Abstract Co-Author*) Nothing to Disclose
Andrew Ammons (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. The sphenoid sinus is unique due to lack of localizing signs on physical exam and relative paucity of isolated disease compared to the other paranasal sinuses. 2. The sphenoid sinuses lies at an “anatomical crossroads”, with numerous important adjacent intracranial structures which can contribute to, or be affected by, disease. This makes the sinus a hotbed for unique and interesting pathologies which may be encountered by radiologists on imaging. In particular, CT imaging of isolated sphenoid sinus pathology can be misinterpreted as “sinusitis” due to its lower contrast resolution of identifying abnormalities in adjacent compartments. 3. While infectious and inflammatory conditions are the most common causes of sphenoid sinus pathology, other important etiologies that trainees should consider when forming their differential include vascular, neoplastic, developmental, and traumatic. Origin from nasopharynx, cavernous sinuses, pituitary, and middle skull base should be considered. A variety of such unique cases to the sphenoid sinus will be presented.

### TABLE OF CONTENTS/OUTLINE
