I. Review sphenoid sinus anatomy. II. Important anatomic variants. III. Sphenoid pathologies which arise in the setting of variant anatomy including lateral cephaloceles, optic nerve canal dehiscence, etc. IV. Infectious and inflammatory pathologies including sinusitis (acute bacterial, invasive granulomatous fungal, etc.), mucocele, etc. V. Vascular pathologies. VI. Neoplastic processes (benign, e.g. pituitary adenoma, etc., and malignant, e.g. metastases, myeloma, lymphoma, nasopharyngeal carcinoma). VII. Miscellaneous Pathologies VIII. Conclusion.

## HNEE-63 THE POSTRADIATION NECK: A PRACTICAL GUIDE FOR RADIOLOGISTS

Matheus Carlota, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Head and neck neoplasms account for 4% of tumors, with 60% of cases diagnosed in advanced stages. Radiotherapy is frequently required as treatment. All tissues in the radiation field show actinic changes. Spectrum of soft tissue and cartilage changes following radiation therapy for head and neck tumors can range from acute ( tissue edema and inflammation) to chronic fibrosis, scarring, and atrophy. Image review requires systematic evaluation in order to avoid mistakes between expected changes and tumor persistence/recurrence. Focal thickening of mucosa or solid neck mass suggest residual or recurrent tumor/nodes. Persistent or enlarged mass on baseline posttreatment scan indicates treatment failure.

### TABLE OF CONTENTS/OUTLINE

The actinic changes in follow up imaging of head and neck cancer will be summarized: Acute phase after radiotherapy:1. Changes in the skin and subcutaneous tissue: Skin thickening and densification of subcutaneous tissues. 2. Mucosal changes: Edema of the laryngeal mucosa, notably supraglottis 3. Glandular alteration: Hyperenhancement and hypertrophy of the submandibular glands Chronic phase after radiotherapy:1. Glandular alteration: Atrophy of the submandibular, parotid and thyroid glands, Glandular liposubstitution; 2. Mucosal changes: Reduction of laryngeal thickening; 3. Change in the cricoid cartilage; 4. AtherosclerosisComplication after radiotherapy: 1. Jaw osteoradionecrosis; 2. Encephalic osteoradionecrosis

## HNEE-64 HOW CAN MULTIMODALITY IMAGING AND HISTOPATHOLOGIC CORRELATION DECODE PARATHYROID DISEASE?

Arianne Idaly Ramos Galvan, MD (*Abstract Co-Author*) Nothing to Disclose
Mariana De Los Ssantos Carmona, MD (*Abstract Co-Author*) Nothing to Disclose
Juan P. Chavez Torres, MD (*Abstract Co-Author*) Nothing to Disclose
Veronica Espinoza Cruz (*Abstract Co-Author*) Nothing to Disclose
Axel A. Torres Monarrez, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• Provide an overview of different imaging modalities used in parathyroid disease.• Emphasize the indications, limitations, and benefits of different imaging modalities evaluating the parathyroid gland.• Become familiar with descriptive terms for normal parathyroid gland in radiology.• Review the most common pathologies and provide case studies to illustrate the practical application of theoretical concepts.• Analyze differential diagnoses, tips, and tricks.• Discuss updates in imaging evaluation for parathyroid gland pathology.

### TABLE OF CONTENTS/OUTLINE

- Overview of Different Imaging Modalities Used in Radiology
- Discuss the evolution of these modalities and their increasing importance in modern medicine.
- Emphasize the Indications, Limitations, and Benefits of Different Imaging Modalities Evaluating the Parathyroid Gland
- Comparison of imaging techniques for the parathyroid gland: ultrasound, 4DCT, and SPECT/CT.
- Descriptive Terms for Normal Parathyroid Gland in Different Imaging Modalities
- Common Pathologies in the Parathyroid Gland
- Discuss parathyroid adenoma, multiglandular parathyroid disease, parathyroid carcinoma, atypical parathyroid adenoma, and metastasis in parathyroid gland.
- Analyze the Differential Diagnoses, Tips, and Tricks in Different Imaging Modalities
- Discuss Updates in Imaging Evaluation for Parathyroid Gland Pathology
- Explore future trends or emerging technologies in this field.
- Conclusion

## HNEE-65 A JOURNEY THROUGH THE INNER EAR: EXPLORING ANATOMY AND PATHOLOGY

Lucia Martinez De Vega, MD (*Abstract Co-Author*) Nothing to Disclose
Juan Gredilla (*Abstract Co-Author*) Nothing to Disclose
Ana M. Vera-Carmona, MD (*Abstract Co-Author*) Nothing to Disclose
Juan S. Martinez San Millan, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Montserrat Medina Diaz, PhD (*Abstract Co-Author*) Nothing to Disclose
Beatriz Alba Perez, MD (*Abstract Co-Author*) Nothing to Disclose
Juan V. Quintana Perez, MD (*Abstract Co-Author*) Nothing to Disclose
Noelia Bravo Alcobendas, MD (*Abstract Co-Author*) Nothing to Disclose
Alba Fernandez-Rodriguez, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Recognize and understand the normal anatomy of the inner ear.- Review the technical aspects of MRI to study the anatomy of the inner ear and the essential sequences for each pathology.- Identify the key diagnostic features of main acquired inner ear pathologies by correlating different imaging techniques such as CT and MRI.

### TABLE OF CONTENTS/OUTLINE

1. Anatomy and physiology of the inner ear.2. Technical aspects: MRI protocol.3. Review of acquired pathology of the inner ear by a case-based approach learning.3.1 Inflammatory-infectious pathology: Labyrinthitis. 3.1.1 Diagnostic Keys and value of the FLAIR sequence.3.1.2 Differential Diagnosis with labyrinthitis ossificans and carcinomatous meningitis.3.2 Endolymphatic hydrops. 3.2.1 MRI protocol 3.2.2 Diagnostic criteria.3.2.3 Classification systems.3.3. Otospongiosis.3.3.1 MRI findings and correlation with other imaging techniques (CT).3.4 Vestibular Schwannoma. 3.4.1 Characteristic Findings. 3.4.2. Differential Diagnosis (cerebellopontine angle meningioma, epidermoid cyst).3.5. Peripheral facial paralysis.3.5.1 Bell palsy vs neoplastic palsy.3.6 Traumatic injury. 3.6.1 Labyrinthitis ossificans as a sequel to trauma.3.6.2 Intralabyrinthine haemorrhage.3.7 Miscellany: 3.7.1 Fibrous dysplasia.3.7.2. Osteogenesis imperfecta.3.7.3. Paget´s disease.4. Conclusion

## HNEE-66 IMMUNOTHERAPY FOR HEAD AND NECK ONCOLOGY: A PRIMER FOR RADIOLOGISTS. MECHANISMS, TREATMENT PARADIGMS, AND IMAGING EVALUATION

Khalaf, MD (*Abstract Co-Author*) Nothing to Disclose
Susana Calle, MD (*Abstract Co-Author*) Nothing to Disclose
Kim Learned, MD (*Abstract Co-Author*) Nothing to Disclose
Samir Dagher, MD (*Abstract Co-Author*) Nothing to Disclose
Richard Dagher, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1) To highlight the key mechanisms of small molecule and monoclonal antibodies, immune-checkpoint inhibitors (ICIs), CAR-T cells transfer therapy and T-VEC oncolytic virus. 2) To review the response evaluation guidelines for immunotherapy (iRECIST, imPERCIST). 3) To illustrate the immunotherapy tumor response patterns and their role in treatment paradigm and perioperative management. 4) To discuss clinical evaluation and recognize imaging findings for immunotherapy-related adverse events

**TABLE OF CONTENTS/OUTLINE**

1) Mechanism of action of targeted antibodies. a) Small molecules versus monoclonal antibodies: nomenclature and actions. b) Tyrosine Kinase Inhibitor, BRAF and MEK inhibitors in BRAF V600 mutation tumor. c) EGFR, CD20 monoclonal antibodies. 2) Mechanisms of action of ICIs. a) Cytotoxic T-lymphocyte antigen-4 (CTLA-4) Inhibitors. b) Programmed death-1 (PD-1) and programmed death ligand-1 (PD-L1) pathway inhibitors. 3) Mechanism of action of CAR-T cell and T-VEC. 4) Current applications of immunotherapy in curative, palliative, neoadjuvant and adjuvant treatment paradigms. 5) Response evaluation guidelines. a) RECIST 1.1 vs iRECIST. b) PERCIST 1.0 vs imPERCIST. 6) Atypical patterns of response to immunotherapy. a) Pseudoprogression. b) Hyperprogression. c) Dissociated response. d) Durable response. 7) Imaging of common immune-related adverse events. a) Skin rash, pneumonitis, sarcoidosis. b) Thyroiditis. c) Hypophysitis, encephalitis, CNS vasculitis. d) Immune effector cell-associated neurotoxicity syndrome (ICANS)

## HNEE-67 IMAGING OF THE CEREBELLOPONTINE ANGLE: PRACTICAL ANATOMY AND CASE-BASED DIAGNOSTIC APPROACHES FOR RADIOLOGISTS

Mehmet Simsar, MD (*Abstract Co-Author*) Nothing to Disclose
Yeliz Pekcevik, MD (*Abstract Co-Author*) Nothing to Disclose
Yesim Y. Yuruk, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

• Provides a comprehensive overview of the radiologic anatomy of the cerebellopontine angle (CPA) • Describes a practical approach for localizing the pathologies affecting the CPA • Reviews common and rare pathologies in the CPA using case-based examples, highlighting clinical and imaging features that can aid in the best diagnosis

**TABLE OF CONTENTS/OUTLINE**

1. The cerebellopontine angle anatomy and structures 2. Classification of the CPA tumors based on imaging features 3. Case-based review of the CPA tumors using signal intensities and contrast-enhancement features Outline • Knowledge of anatomy and structures is essential for describing a lesion in the CPA. • Understanding the contents and common/rare lesions of CPA is the first step in generating a differential diagnosis. • Obtaining relevant clinical history and recognizing specific imaging appearances can help provide the best diagnosis.

## HNEE-68 LEUKEMIA AND HEAD AND NECK: MORE THAN NODES

Diego Dias, MD (*Abstract Co-Author*) Nothing to Disclose
Ezir Lima Neto, MD (*Abstract Co-Author*) Nothing to Disclose
Rainer G. Haetinger, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Maria Sabrina Medeiros Olimpio, MD (*Abstract Co-Author*) Nothing to Disclose

Carolinny Cruvinel Maia, MD (*Abstract Co-Author*) Nothing to Disclose
Marnya Wellysa Leite Tavares, MD (*Abstract Co-Author*) Nothing to Disclose
Odilo M. Queiroz, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The purpose of this exhibit is: ; To review the epidemiology, clinical scenarios and imaging features of head and neck leukemia manifestations; ; To demonstrate the spectrum of pathologies associated with leukemia affecting head and neck strutures; ; To emphasize key imaging features to narrow the differential diagnosis.

**TABLE OF CONTENTS/OUTLINE**

; Introduction - Epidemiology - Clinical scenarios ; Typical imaging features of head and neck leukemia manifestations ; Series of cases of leukemia manifestations on head and neck; ; Differential diagnosis; ; Take-home messages.

## HNEE-69 IMAGING REVIEW OF OPTIC PERINEURITIS AND OPTIC NEURITIS WITH DIFFERENTIAL DIAGNOSIS CONSIDERATIONS

Gavin Wu, BA (*Abstract Co-Author*) Nothing to Disclose
Mohammad T. Shujaat, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Optic neuritis and perineuritis can present as common clinical manifestations of CNS inflammation related to a wide variety of autoimmune, infectious or demyelinating etiologies. However, while these pathologies may present with similar clinical and imaging findings, their disease course and treatment can differ. It is important for radiologists to distinguish between these pathologies and other non-inflammatory mimics to facilitate proper diagnosis and guide appropriate treatment. Our exhibit will demonstrate diagnostic clues, which will include imaging patterns and enhancement distribution and systemic involvement, to help in differentiating etiologies and formulate a clinically relevant differential diagnosis. As such, our teaching points will be to: 1. Review the relevant anatomy of the orbit, optic nerve and optic nerve sheath. 2. Examine inflammatory manifestations of the optic nerve complex and present the main imaging features of these pathologies. 3. Recognize and distinguish the spectrum of other optic nerve complex inflammatory etiologies with similar presentations.4. Highlight the importance of distinguishing these pathologies to facilitate proper diagnosis and guide appropriate treatment plans.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction 2. Inflammatory Manifestations In the Orbit 3. Importance of Differential Considerations 4. Optic Nerve-Sheath Complex Pathologies and Mimics 5. Summary and Conclusions

## HNEE-7 NORMAL INNER EAR ANATOMY AND COCHLEAR MORPHOMETRY FOR CONGENITAL INNER EAR MALFORMATION DIAGNOSIS AND COCHLEAR IMPLANT CANDIDACY

Savith Kumar, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Aysha Tamanna, MBBS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

A thorough understanding of inner ear anatomy is important for diagnosing congenital inner ear malformations, interpreting imaging of this area, and providing essential preoperative information about the inner ear and the vestibulocochlear nerve. Pre-operative cochlear morphometry is pivotal for patient selection to rule out conditions that would make surgery impossible or that could compromise the procedure and to decide on the devices and access.

**TABLE OF CONTENTS/OUTLINE**

Pictorial representation of cochlea with its external and internal architecture, vestibule, semicircular canals, and internal auditory canal with their internal architecture and contents.Protocol and methods for morphometric analysis of cochlea including cochlear base diameter, cochlear duct length, diameter of each cochlear turns, cochlear height, cochlear aperture, cochlear rotation, internal auditory canal diameter, distance from vertical facial nerve to posterior annulus and to mastoid cortex and caliber of facial and cochlear nerves using computed tomography and magnetic resonance imaging along with the normal range of parameters and implication of each parameter prior to surgery.Approach to diagnosis of inner ear malformations including complete labyrinthine aplasia, cochlear aplasia, cochlear hypoplasia and types, common cavity, incomplete partition and types, enlarged vestibular aqueduct, cochlear aperture abnormalities, vestibular and semicircular canal malformations, inner ear anomalies and vestibulocochlear nerve anomalies with radiological and hand drawn illustrations.

## HNEE-8 CHRONIC RHINOSINUSITIS: CURRENT CONCEPT

Osamu Sakai, MD, PhD (*Abstract Co-Author*) Consultant, Boston Imaging Core Lab LLC
Inseon Ryoo, MD (*Abstract Co-Author*) Nothing to Disclose
Naoki Takemasa (*Abstract Co-Author*) Nothing to Disclose
Ryohei Kuwatsuru, MD (*Abstract Co-Author*) Nothing to Disclose
Naoko Saito, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Chronic rhinosinusitis (CRS) has been classified into CRS without nasal polyps (CRSsNP) and CRS with nasal polyps (CRSwNP). The previous classification system was based on the phenotype, whereas the current system is based on anatomical distribution and endotype dominance. The current system can predict the severity of disease and lead to the optimal personalized treatment. Since the current concept has become the foundation for daily practice, radiologists need to be familiar with this classification system. The teaching points are: 1. To describe the current changes in the classification of CRS 2. To become familiar with the inflammatory mechanisms of CRS 3. To review imaging features of various CRS based on current classification

**TABLE OF CONTENTS/OUTLINE**

1. Definition of CRS 2. Various classification systems of CRS a. Previous classification b. Based on EPOS2020 (European Position Paper on Rhinosinusitis and Nasal Polyps) c. Based on ICAR-RS-2021 (International Consensus Statement on Allergy and Rhinology: Rhinosinusitis) 3. Inflammatory mechanisms of CRS a. Type 2 response b. non-Type 2 response 4. Review of imaging and clinical features of CRS based on current classification a. Primary CRS: AFRS (allergic fungal rhinosinusitis), eCRS (eosinophilic CRS), CRSwNP, CCAD (central compartment allergic disease), non-eCRS, isolated sinusitis b. Secondary CRS: odontogenic, fungal ball, GPA (granulomatosis with polyangiitis), eGPA (eosinophilic GPA), primary ciliary dyskinesia

## HNEE-9 FOLLOW YOUR NOSE - ULTRASOUND ROLE IN THE AESTHETIC RHINOMODELATION

Matheus Taborda, MD (*Abstract Co-Author*) Nothing to Disclose
Joao P. Ferreira, MD (*Abstract Co-Author*) Nothing to Disclose
Luciana A. Takahashi, MD (*Abstract Co-Author*) Nothing to Disclose
Eduardo Sampaio, MD (*Abstract Co-Author*) Nothing to Disclose
Luis R. Ferreira (*Abstract Co-Author*) Nothing to Disclose
Nathalia Bonmann, MD (*Abstract Co-Author*) Nothing to Disclose
Gabriel Da Silva Eli, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The amount of aesthetic rhinomodelation procedures has significantly increased in the past decades. This procedures are not risk-free, with associated complications such as accidental injection of fillers into the arterial branches that supply the nose. Consequently, high-frequence nasal ultrasonography (US) has emerged to help in the pre-procedural setting to assess the nasal anatomy and its variants in detail. Additionally, the US is capable of providing a detailed mapping of previously injected fillers, each one with specific imaging features.1. Review the structural anatomy of the nasal region on ultrasound;2. Detail the different types of materials used in non-surgical rhinoplasty;3. Evaluate the role of ultrasonography in the safety of rhinomodelation procedures 4. Review the ultrasound appearance of the most commonly used fillers.5. Elaboration of a facial map encompassing the different procedures and fillers used.

**TABLE OF CONTENTS/OUTLINE**

1. Introductiona. US nasal anatomyb.Clinical application of US to aesthetic procedures of the nosec. Main arteries that supply the nosed. Arterial variants that should be reported to increase procedure safety2. Fillersa. Differences between the main types of fillersb. Ultrasound appearance of fillers;c. Different roles and objectives of fillers in each nasal region.3. Extensive pre - and post procedure US imaging, including possible complications4. Elaboration of the nasal ultrasound report - What the dermatologists need to know.5. Take-home messages

### TEACHING POINTS

To discuss the diagnosis and radiological insights about sinus diseases, highlighting: - Definition and overview of sinusopathies, the importance of understanding sinus anatomy and function, and common causes and risk factors. - Sinus pathologies in a guide model, dividing into diffuse or unilateral involvement and also in acute or chronic pathology. - Potential complications of sinusopathies (e.g., orbital cellulitis, meningitis). Factors influencing prognosis and long-term outcomes and the importance of follow-up care and monitoring. - Research and Future Directions: Ongoing research in the field of sinusopathies with emerging treatments and technologies.

### TABLE OF CONTENTS/OUTLINE

- Introduction
- Anatomy of the paranasal cavities
- Guideline of sinusopathies diagnosis
- Acute diffuse involvement
- Inflammatory/Infectious involvement
- Traumatic/Surgical
- Potential complications
- Chronic diffuse involvement
- Nasosinusal polyposis
- Allergic fungal sinusitis
- Granulomatosis diseases
- Cocaine abuse
- Potential complications
- Predominantly unilateral acute involvement
- Odontogenic sinusitis
- Invasive fungical sinusitis
- Facial fractures
- Potential complications
- Predominantly unilateral chronic involvement
- Papilloma
- Fungal sinusitis
- Mucocele
- Neoplastic lesions
- Potential complications
- Future perspectives
- Take home messages

## EXPLORING UNCOMMON PATHOLOGIES IN THE SELLAR/SUPRASELLAR REGION: IMAGING INSIGHTS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Rohan Samant, MBA (*Abstract Co-Author*) Nothing to Disclose
Rajan P. Patel, MD (*Abstract Co-Author*) Nothing to Disclose
Deepali Bhalla (*Abstract Co-Author*) Nothing to Disclose
Manav Bhalla, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The sellar and suprasellar regions present a complex landscape of pathologies, often challenging clinicians with their diverse presentations and management nuances. Recognizing the diverse spectrum of atypical pathologies in the sellar/suprasellar region is crucial for accurate diagnosis and appropriate management. This abstract offers a comprehensive overview of uncommon sellar and suprasellar pathologies, atypical presentation of common entities, shedding light on their clinical features, diagnostic considerations, pathologic correlates, and potential therapeutic implications. From rare tumors to unusual inflammatory conditions, this exploration aims to equip diagnostic Radiologists with practical insights to enhance diagnostic accuracy and optimize patient care.

### TABLE OF CONTENTS/OUTLINE

1. Introduction to uncommon Sellar/Suprasellar Pathologies. 2. Atypical imaging presentation of relatively common entities. 3. Radiological Evaluation of Sellar/Suprasellar Lesions 4. Types of Atypical Pathologies - A. Rare Neoplasms B. Metastatic lesions C. Hypophysitis, Langerhans cell Histiocytosis, Rosai-Dorfman disease and Erdheim-Chester disease D. Secondary pituitary hyperplasia E. Craniopharyngiomas F. Atypical appearance of Rathke's cleft cyst 4. Differential Diagnosis and Diagnostic Challenges 5. Imaging Features and Characterization

## PLEOMORPHIC ADENOMA OR NOT? MASTERING THE DIAGNOSTIC RIDDLE OF SALIVARY GLAND TUMORS WITH MOUTH-WATERING CASES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Yeliz Pekcevik, MD (*Abstract Co-Author*) Nothing to Disclose
Begum Ergin, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. To discuss the typical and atypical characteristics of benign salivary gland tumors in patients, with a specific emphasis on pleomorphic adenoma.2. To identify common and uncommon features of malignant salivary gland tumors in adults.3. To familiarize the radiologists with the typical and atypical presentations of salivary gland tumors and pitfalls by using a case-based approach.4. Review examples of congenital and acquired mimics of salivary gland tumors.

### TABLE OF CONTENTS/OUTLINE

A. Background • MRI imaging of salivary glands (DWI, advanced MRI sequences) B. Mouth-Watering Cases • Common and Uncommon Features of Benign Salivary Gland Tumor 1. Typical and Atypical Pleomorphic Adenoma 2. Warthin Tumor 3. Oncocytoma 4. Schwannoma 5. Myofibroblastic Tumor 6. Lipoma 7. Infantile Hemangioma • Common and Uncommon Features of Malign Salivary Gland Tumors 1. Carcinoma Ex Pleomorphic Adenoma 2. Mucoepidermoid Carcinoma 3. Adenoid Cystic Carcinoma 4. Secretory Carcinoma 5. Lymphoma 6. Malign Melanoma • Non-neoplastic Salivary Gland Pathologies Mimicking Salivary Gland Tumors 1. IG-G4 Related Disease 2. Intraparotid Lymph Nodes 3. Sjögren’s Syndrome 4. Sialosis 5. Vascular Malformations 6. Branchial Cleft Cysts C. Take Home Points D. References

Marnya Wellysa Leite Tavares, MD (*Abstract Co-Author*) Nothing to Disclose
Ezir Lima Neto, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Acute otomastoiditis occurs when otitis media spreads beyond the mastoid air cells. A variety of infectious complications associated with the temporal bone are described, which may occur in cases of otomastoiditis. These include outer cortex erosion, resulting in the formation of a neck abscess (known as Bezold abscess), coalescent mastoiditis, petrous apicitis (Gradenigo's Syndrome), meningitis, venous sinus thrombosis, facial neuritis, bone cortex erosion potentially causing sigmoid sinus thrombosis or resulting in periauricular cellulitis with or without an abscess and intracranial extension, and suppurative labyrinthitis. This study aims to provide a briefly description of each case, from the most frequent to the rarest, correlate them with different imaging methods and didatic drawings.

### TABLE OF CONTENTS/OUTLINE

- Introduction- Objective- Review of the complications related to otomastoiditis - Cases of the otomastoiditis complications in different imaging methods including a didatic drawings- References

## MUSCLE MASTERCLASS: HEAD AND NECK ANATOMY IN ACTION

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Shehbaz M. Ansari, MD, MBBS (*Abstract Co-Author*) Nothing to Disclose
Surjith Vattoth, MD, FRCR (*Abstract Co-Author*) Nothing to Disclose
Santhosh Gaddikeri, MD (*Abstract Co-Author*) Nothing to Disclose
Miral D. Jhaveri, MD, MBA (*Abstract Co-Author*) Royalties, RELX
Brian Mu, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Review muscular anatomy of the head and neck with a focus on routinely visualized but relatively overlooked deep muscles.2. Highlight important anatomic relationships between head and neck muscles as well as to adjacent structures.3. Describe relevant imaging findings involving these anatomical concepts and their associated underlying pathologies.

### TABLE OF CONTENTS/OUTLINE

The head and neck comprise a rich and complex array of muscular anatomy that can be visualized in detail on routine imaging. Comprehensive knowledge of these muscles and sophisticated understanding of their relationships with each other and adjacent structures is requisite for the identification and interpretation of a diverse range of pathological findings. Additionally, head and neck muscles serve as important landmarks for demarcation of the deep spaces of the face and neck, cervical lymph node stations, and for surgical approaches. In this exhibit, we review the muscular anatomy of the head and neck in detail, including the prevertebral and paraspinal, scalene, suboccipital, floor of mouth, pharyngeal, laryngeal, and masticator muscles. The goal is to develop a three-dimensional understanding of intricate anatomy, such as the “stacked flower-pot” arrangement of the hypopharyngeal wall muscles. Special focus is given to areas of clinical significance, such as the role of the posterior belly of digastric as a surgical landmark for the glossopharyngeal and hypoglossal nerves in neck dissection. Sample cases are provided to demonstrate various pathologies and clinical applications of this anatomy.

Carlos Alberto F. Coelho Neto, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

In this educational exhibit, our aim is to provide a comprehensive review of the nasopharyngeal anatomy and, through didactical cases, highlight the radiological features of common pathologies. We will discuss the role of imaging modalities in the diagnosis and management of nasopharyngeal disorders, with the key radiological findings in each pathology.

### TABLE OF CONTENTS/OUTLINE

- Introduction - Nasopharyngeal embryology and anatomy- Radiological imaging modalities for nasopharyngeal evaluation- Congenital lesions, Inflammatory, and Infectious Conditions, including: branchial cleft cyst, craniopharyngeal canal, fossa navicularis, pharyngeal bursa, Tornwaldt cyst, retention cysts, glial heterotopia, infraselar craniopharyngioma, teratoma epignathus, adenoiditis, tuberculosis.- Vascular Conditions, including nasopharyngeal slow flow venous malformations- Benign and malignant neoplastic acquired lesions of the nasopharynx, including squamous cell carcinoma, rhabdomyosarcoma, inverted papilloma, juvenile nasopharyngeal angiofibroma and lymphomas.- TNM staging main featuresPost-treatment changes, including post-surgical and post-radiotherapy findings.- Conclusion

### TEACHING POINTS

This comprehensive review elucidates the anatomy and pathologies of the mandibular division of the trigeminal nerve (V3) through detailed MR neurography cases and schematic illustrations. The focus will be on the V3 nerve, particularly the lingual and inferior alveolar nerves, to explore both traumatic and non-traumatic lesions, and the Sunderland classification of nerve injuries.We aimed to demonstrate the correlation between MR neurography lesions and surgical findings and assess the utility of MR neurography in the evaluation of postsurgical recovery.

### TABLE OF CONTENTS/OUTLINE

NORMAL ANATOMY OF THE MANDIBULAR NERVE (V3)• Didactic original drawings illustrating the V3 nerve and its branches.Detailed anatomy of the lingual and inferior alveolar nerves via MR neurography.MR NEUROGRAPHY SEQUENCES3D Double-Echo Steady-State with Water Excitation Sequence and contrast enhanced (3D) turbo spin echo with variable flip-angle (SPACE) short-tau inversion recovery (STIR) sequences MR NEUROGRAPHY AND NERVE INJURY CLASSIFICATION• Introduction to MR neurography as a diagnostic tool for nerve pathologies.• Review of the Sunderland classification for grading nerve injuries. CASES: CORRELATION OF MR NEUROGRAPHY WITH SUNDERLAND CLASSIFICATION• Detailed MR neurography cases correlated with nerve injury grades.Implications of Sunderland Classification on Treatment and Prognosis.• Comparison of MR neurography findings with intraoperative observations. POST-SURGICAL EVALUATION• Case studies highlighting postoperative recovery and follow-up MRI

### TEACHING POINTS

Paranasal sinus mucoceles are benign inflammatory lesions developing after obstruction of the sinus ostium. They are characterized by the accumulation of mucus secreted by mucosal cells, leading to the expansion of the affected sinus cavities. Radiological findings are varied, and knowledge of these is crucial for accurate diagnosis.The frontal and ethmoidal sinus are most commonly affected.Symptoms are nonspecific and may vary from rhinological to neurologic or ophthalmologic, depending on the location.Appears on Computed Tomography Scan (CT Scan) as a homogenous well circumscribed expansible lesion with soft tissue density, without contrast enhancement, associated with sinus expansion, sclerosis and bone erosion, in addition to extension to the intra orbital region.Magnetic Resonance Imaging (MRI) provides a more detailed evaluation of the lesion composition and extent, offering crucial information for surgical planning. The usual signal characteristics are a low intense T1 and a high intense T2 but any combination of signal intensity may be seen depending on the presence of blood products or the degree of hydration of the contents.

### TABLE OF CONTENTS/OUTLINE

This study reports a series of cases with CT and MRI images of different presentations and consequences of paranasal sinus mucoceles, related to inflammatory processes, anatomical variations and traumatic sequelae, highlighting the imaging characteristics for diagnosis and surgical planning.

Diogo C. Medeiros, MD (*Abstract Co-Author*) Nothing to Disclose
Raphael M. Reali, MD (*Abstract Co-Author*) Nothing to Disclose
Nathalia C. Santos, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Review the anatomy of the ethmoid roof, emphasizing significant anatomical features and critical variants that should be meticulously described in reports.- Present clinical cases from head and neck radiology indicating surgical treatment through endoscopic surgery (ESS). - Describe the areas of danger for potential post/intra-operative complications due to the unique anatomy.- Propose a step-by-step process for reviewing the anatomy of the ethmoid roof and anterior ethmoidal arteries (AEA) to guide surgical planning and minimize potential complications related to ESS.

### TABLE OF CONTENTS/OUTLINE

1. The Endoscopic Sinus Surgery (ESS):- Illustrated imaging cases demonstrating some ESS indications- Key procedural points and radiologists' responsibilities in reporting 2. The Role of Imaging Anatomy:- Coronal diagram illustrating the components of the ethmoid roof- Coronal CT images depicting the anatomy of the AEA and their associated major anatomical structures 3. Key Points - a step-by-step guide for reporting:- Keros classification and the significance of olfactory fossa depth- The importance of the relationship between the lateral lamella and the cribriform plate- Identification of anatomical landmarks- The correlation between supraorbital pneumatization and the course of the AEA canal 4. Illustrated clinical cases of ethmoid roof and anterior ethmoidal artery anatomy:- Coronal CT images demonstrating anatomical landmarks, supraorbital pneumatization, and olfactory fossa depth 5. Critical areas of the anterior ethmoidal artery and the lateral lamella:- Coronal CT images illustrating critical areas during ESS- AEA injury during the procedure- Key take-home messages

## LACRIMAL GLAND MASSES: A PRIMER FOR RADIOLOGISTS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Vasundhara Smriti, MD (*Abstract Co-Author*) Nothing to Disclose
Pranjal Rai, MBBS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• To understand the normal anatomy of the lacrimal glands. • To focus on the imaging features, pathogenesis and treatment options for different lacrimal gland masses and their benign mimickers. • To identify helpful; imaging clues to differentiate various pathologies from each other.

### TABLE OF CONTENTS/OUTLINE

1. Normal lacrimal gland anatomy. 2. Localizing a true lacrimal lesion versus a lesion causing secondary involvement of the lacrimal gland. 3. Various lacrimal gland masses, their classification according to etiology, their pathogenesis, imaging characteristics, and brief discussion of their management strategies. 4. Benign mimickers of lacrimal lesions, and use of imaging features to differentiate them. 5. A flowchart to help narrow down a radiological differential diagnosis for a lacrimal gland lesion. 6. Surgical techniques for lacrimal gland lesions.

Carlos Ordonez (*Abstract Co-Author*) Nothing to Disclose
Giovanni Mattiello, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Ménič re's Disease (MD) is believed to be a result of abnormalities in the fluid balance within the inner ear, particularly those involving the endolymphatic system; is characterized by episodic vertigo, sensorineural hearing loss, tinnitus, and aural fullness and presents a significant challenge for otolaryngology specialists.MRI, particularly gadolinium contrast-enhanced delayed sequences 3D- FLAIR and 3D -IR , plays a critical role in confirming the diagnosis and assessing the severity of MD. This exhibit provides a comprehensive exploration of the fundamental role of MRI in understanding this entity and guiding its clinical management.Educational Objectives:To understand the role of radiological imaging in diagnosing and monitoring MD and to describe the main sequences used for the radiologic diagnosis and grading of endolymphatic hydrops, with special emphasis on the 3D-FLAIR and 3D-IR sequences, their pitfalls, and differential diagnosis.To present evidence-based clinical management strategies for MD, including pharmacological, rehabilitative, and surgical interventions.

### TABLE OF CONTENTS/OUTLINE

Definition, demography, physiopathology and grading systems of MD.Radiological insights: MRI sequence protocol, postprocess, grading and volumetric assessment of the inner ear in patients with MD. Pitfalls and differential diagnosis.Clinical management strategies based on multidisciplinary approach to diagnosis analysis.

Navid Faraji, MD (*Abstract Co-Author*) Nothing to Disclose
Nathan Katragadda (*Abstract Co-Author*) Nothing to Disclose
Gregory R. Liller, DO (*Presenter*) Nothing to Disclose

### TEACHING POINTS

A growing body of evidence demonstrates strong associations between dental pathologies and systemic pathologies. As a result, there is an increased need for radiologists to understand and interpret dental imaging modalities to assess dental pathologies which could serve as risk factors for systemic pathologies. The Orthopantomogram (OPG), also known as Panorex, is a single-image radiograph used to visualize various gross anatomy and pathology of various oral and maxillofacial structures. It is often used as a screening and diagnostic tool in assessing dental and maxillofacial pathology, such as before cardiac valve surgery. The purpose of this exhibit is to:1. Discuss the acquisition process of OPGs.2. Review basic dental and facial anatomy visualized on an OPG.3. Discuss the different dental and facial pathologies and surgical changes seen on OPG.

### TABLE OF CONTENTS/OUTLINE

1.Introduction discussing the history, epidemiology of dental and maxillofacial disease and ordering indications. 2. Assessing the technique of OPGs through discussion of equipment, acquisition, optimal imaging appearance and artifacts. 3. Discussion of basic oral and maxillofacial anatomy and physiology on OPGs including: tooth numbering and anatomy, dental embryology, stages of tooth eruption, and associated structures. 4. Evaluating various radiologic pathologies involving teeth (caries, impactions, and anomalies), periodontal disease, masses and mass-like lesions, anatomical variants, trauma, miscellaneous disorders, and dental and maxillofacial surgery, including mandibular arthroplasty and LeFort osteotomy.

Claudia B. Camara, MD (*Abstract Co-Author*) Nothing to Disclose
MICHELLE GOMES (*Abstract Co-Author*) Nothing to Disclose
Carolina A. Almeida, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The superficial periorbital lesions serve various functions, including protection. An understanding of the anatomy of superficial periorbital lesions is crucial for interpreting the imaging features of lesions that affect them. High-frequency ultrasound presents itself as an advantageous option for imaging periorbital lesions due to its cost-effectiveness and widespread availability. Utilizing a 3T MRI with surface coil can aid in identifying superficial and millimetric lesions affecting the periorbital region. Demonstrate the utilization of high-frequency probes and surface coil MRI and elucidate the examination technique to radiology residents. Compose a pictorial essay detailing the principal periorbital lesions and their differential diagnoses, encompassing skin cancer, cosmetic fillers, inflammatory lesions, and lacrimal gland lesions.

### TABLE OF CONTENTS/OUTLINE

Anatomy of superficial periorbital lesionsCases of tumorous, inflammatory, and filler-related lesions.

## PRE- AND POST-OPERATIVE IMAGING OF CRANIOSYNOSTOSIS - WHAT RADIOLOGIST NEED TO KNOW?

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Cum Laude**

Elka Miller, MD, FRCPC (*Abstract Co-Author*) Nothing to Disclose
Shivaprakash B. Hiremath, DMRD, FRCR (*Abstract Co-Author*) Nothing to Disclose
Neetika Gupta, MBBS, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. To explain the embryology and anatomy of the developing calvarium.2. To describe the imaging modalities and protocol in children with suspected craniosynostosis. 3. To highlight various types of craniosynostosis and associated anomalies along with syndromic association. 4. To elucidate the pre- and post-operative imaging in craniosynostosis emphasizing on the surgical techniques, complications and follow up.

### TABLE OF CONTENTS/OUTLINE

1. Illustrate the embryology and imaging anatomy of the developing calvarium and normal variants. 2. Comprehensive discussion of the various types of craniosynostosis and syndromic association in children.3. Identify and familiarize with the imaging features that need to be focused in the pre surgical evaluation and assessed in post-operative period along with mention about the evolution of surgical findings.4. Systematic imaging-based approach could help in highlighting the necessary findings to guide appropriate management and genetic evaluation, aid in surgical decision making and avoid complications.

### TEACHING POINTS

This study intends to show the various etiologies that can cause anosmia. This theme has been widely publicized after the spread of the Sars-Cov 2, as it has been one of the most prevalent symptoms.The purpose of this exhibition is to:Review the path of smell formation.Show other etiologies to anosmia besides COVIDEvidence of different groups involved, such as congenital, infectious, inflammatory, trauma, and use of drugs. Illustrate such cases with radiological examples.

### TABLE OF CONTENTS/OUTLINE

Smell pathway : • Overview of the normal anatomy, showing how the smell is formed going from the external nose to the cortex.Before we start... let’s look at how it appears at COVID! • Given the importance of the pandemic that started in 2020, we dedicated this slide to evidence of how COVID can cause anosmia, while also exposing other etiologies.Inflammatory and infectious•Nasal polyposis, rhinosinusitis, and fungal infections are shown as examples of causes of anosmia.Septal disorders• Nasal fractures, cocaine abuse, and granulomatosis with polyangiitis enter as etiologies of anosmia which affect the nasal septum.Others cases• We conclude the exhibit by showing other various etiologies: atrophic nasal turbinates, respiratory adenomatoid hamartoma, and Kallmann syndrome.

### TEACHING POINTS

To review unusual diseases that cause diplopia and are infrequent to diagnosis. To present diagnostic challenging cases of diplopia and their radiologic presentation. To be aware of life-threatening acute causes of diplopia which Imaging features can help with the diagnoses. To highlight the purpose of learning and evaluating rare diseases, adding experience to a better medical practice.

### TABLE OF CONTENTS/OUTLINE

Diplopia is a wide diagnosis made by ophthalmologists and neurologists. Numerous diseases occur with diplopia, leading to a late diagnosis when present in an infrequent disease. Diplopia itself can present as a challenge for radiologists, particularly when aiming for a differential diagnosis. This work can have a significant impact on patients with life-threatening diseases early diagnosed. Overview of the main diseases including diplopia. Key radiological findings in cross-section orbital images that aid in distinguishing rare pathologies. Didactic exposition of illustrative rare cases in which diplopia was included such as thyroid-associated orbitopathy, IgG4-related orbital disease, Tolosa-Hunt syndrome, a solitary fibrous tumor of the orbit, orbital lymphoma, sphenoid wing meningioma, conjugate gaze palsy and mechanisms, other causes of idiopathic orbital inflammation, orbital metastasis, chorioretinitis, and nuclei ischemic stroke of the oculomotor (III) and abducens (VI).

Janani Asogan Vaishnavi, MD, FRCR (*Presenter*) Nothing to Disclose

### TEACHING POINTS

--Trauma of the anterior neck may result in various injuries of the laryngeal soft tissues, cartilages and surrounding structures. MDCT is used as a first line examination in the acute trauma setting.--An understanding of the anatomy of head and neck cartilaginous structures is critical to correctly identifying the spectrum of cartilaginous lesions occurring in the head and neck.--The important imaging clues in diagnosis of the head and neck cartilaginous tumours include characteristic location, internal calcified chondroid matrix, and typical T2 hyper intense signal due to high water content in hyaline cartilage.--Knowledge of the age-related changes in the signal characteristics of the laryngeal cartilages may help to improve detection of tumour invasion.--Cartilage invasion by laryngeal cancer has a poor prognosis . Exclusion of cartilage invasion is important as its presence often precludes laryngeal conservation surgery.--Ultrasound and MRI can be used to differentiate unossified thyroid cartilage and reactive oedema from infiltration.

### TABLE OF CONTENTS/OUTLINE

1. Radiological anatomy of laryngeal cartilaginous skeleton including embryology.2. Pitfalls related to ossification patterns of laryngeal cartilages.3. Role of various imaging modalities in the evaluation of laryngeal cartilages including protocol and instructions during scanning such as quiet respiration, avoiding swallowing/coughing etc.4. Provide a pictorial review of various pathologies including traumatic, inflammatory, congenital, benign and malignant lesions.5. Briefly describe how to identify cartilage invasion in malignancy and how it affects the management.

Richard D. White, MBChB, FRCR (*Abstract Co-Author*) Nothing to Disclose
Janani Baradwaj, MBBS, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Most nasopharyngeal carcinomas originate in the posterolateral recess of the pharyngeal wall (82%) or midline (10%), with a small percentage (6%) presenting as normal at endoscopy MRI is the modality of choice for delineating the extent of NPC Key sequences : T1WI to identify skull base involvement and fat planes. CE-T1WI in detecting tumour extent, perineural spread, and intracranial extension. Diffusion-weighted imaging and MRI spectroscopy help to differentiate NPC from lymphoma CT is used to assess bony destruction and also for the purpose of RT planning . CT in combination with PET, is crucial for detecting distant metastasis and monitoring patients post-therapy for NPC recurrence. The presence of positive neck nodes is associated with higher incidence of disease recurrence. Nodes are measured in GREATEST DIMENSION in the neck in TNM staging and not in short axis diameter. Retropharyngeal nodes must be looked for in all cases. However these may be skipped and Level II nodes first involved in some cases.

### TABLE OF CONTENTS/OUTLINE

Describe relevant imaging findings of nasopharyngeal tumours that would impact treatment decisions. Staging of the nasopharyngeal tumours and illustrate the route of spread of malignancy. Understand the general treatment considerations of Nasopharyngeal Tumours

## PEARLS AND PITFALLS OF SKULL BASE CSF LEAK IMAGING

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Kyle Hunter, MD (*Abstract Co-Author*) Nothing to Disclose
Michael Markovic, MD (*Abstract Co-Author*) Nothing to Disclose
Vikas Jain, MD (*Abstract Co-Author*) Nothing to Disclose
Evgeniia Grik, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1) Introduce imaging options for the evaluation of skull base CSF fistula. 2) Provide an overview of the diagnostic algorithm and importance of beta2-transferrin testing. 3) Review thin-section high-resolution CT of the skull base as the first-line imaging test. 4) Discuss pros and cons of other imaging tests such as CT- and MR-cisternography. 5) Emphasize proper technique and highlight pitfalls while performing and reporting CT cisternography.

### TABLE OF CONTENTS/OUTLINE

1) CSF leak is a serious condition and can lead to significant morbidity and mortality. We introduce classification of CSF fistulae and provide an overview of the relevant anatomy. 2) We outline the algorithm of diagnosis with thin-section high-resolution CT of the skull base as first-line imaging following positive beta2-transferrin testing. 3) CT- and MR-cisternography are performed in certain clinical scenarios. MR is excellent in diagnosing meningoencephaloceles and differentiation from mucosal thickening. 4) We outline the proper imaging technique for CT-cisternograms and potential preventable interpretive mistakes. 5) We address our teaching points with illustrative cases of CSF leaks of various presentations and etiologies: Idiopathic intracranial hypertension as a major cause of spontaneous CSF leaks. CSF leaks post-endoscopic surgery and risk factors. Multimodality approach to evaluation of CSF leaks and the role of CT-cisternogram. Avoiding false-negative studies by adhering to appropriate imaging technique. Pearls and pitfalls of CT-cisternogram reporting. Role of brain MR and correlation of MR findings with pathology. CSF leaks in the setting of acute trauma. Imaging of recurrent CSF leaks and postsurgical changes.

## SECRETS OF SKULL-BASE: OPENING THE PANDORA'S BOX

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Shehbaz M. Ansari, MD, MBBS (*Abstract Co-Author*) Nothing to Disclose
Zubin Driver, MBBS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Better understanding of anatomy is a prerequisite for skull-base pathologies. 2. Localising pathology to the anterior, middle or posterior cranial fossa and ascertain its origin to the skull-base itself, intracranial or extracranial compartment is key to narrow down the differentials of a skull-base lesion aided by their imaging characteristics on cross-sectional imaging. 3. Role of radiology is not limited to diagnosis but also to describe the extent and relation to important neurovascular structures.

### TABLE OF CONTENTS/OUTLINE

Skull base has been a nightmare for radiologists, given its intricate anatomy and varied pathology. We intend to demystify the skull-base radiology by having a centre of origin-based approach. In this exhibit we will begin with the basics of skull-base anatomy as a building block using illustrations and cross-sectional imaging. This will be followed by application of centre of origin-based approach in diagnosing skull-base pathologies using case examples for each sub-category. In this approach, lesions will be categorised into anterior, middle and posterior cranial fossa with each category subdivided into extra-cranial, skull-base and intra-cranial as the centre of origin. For example, in the anterior cranial fossa category, fronto-ethmoidal meningoencephalocele, fibrous dysplasia and esthesioneuroblastoma represent lesions of intracranial, skull-base and extra-cranial origin. Similarly, lesions of middle and posterior cranial fossa will be discussed.

Mario Padula, MD (*Abstract Co-Author*) Nothing to Disclose
Rodrigo W. Murakoshi, MD (*Abstract Co-Author*) Nothing to Disclose
Lucas Roberto Lelis B. Oliveira, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Recognize granulomatosis with polyangiitis (GPA) pathogenesis and clinical relevance.- Understand important imaging findings in head and neck involvement in GPA.- Recognize several differential diagnosis and their imaging findings.

### TABLE OF CONTENTS/OUTLINE

1. INTRODUCTION:• Overview of granulomatosis with polyangiitis (GPA), including a brief overview of the pathophysiology, diagnosis and clinical significance, with emphasis on head and neck related symptoms.2. IMAGING IN GPA:• Case-based review of GPA imaging findings, especially in CT and MRI imaging, demonstrating:o Sinonasal involvement in initial, progressing, and advanced diseaseo Temporal bone involvemento Orbital Involvemento Upper airway involvement• Discussion of the diagnostic criteria for GPA, including laboratory tests, imaging studies, and histopathological findings, to aid in accurate and timely diagnosis.3. IMAGING OF DIFFERENTIAL DIAGNOSIS:• Case-based review of other diseases with similar findings, including sinonasal involvement in sarcoidosis, cocaine-induced lesions, Hansen's disease, invasive fungal rhinosinusitis, and more, with emphasis on red-flags that may suggest GPA or alternative diagnosis.4. CONCLUSION:• Take-home messages, focusing on key imaging findings in head and neck imaging involvement.

### TEACHING POINTS

This study aims to assess the most common findings of the necrotizing otitis externa in the emergency context, and also show the most common dissemination patterns. Review the temporal bone anatomy, focusing on the main anatomical references that are affected by the disease.The purpose of this exhibition is to: Provide basic pathological concepts to help professionals to improve their skills to identify the main imaging findings and complications that should be actively looked for when reading a temporal bone CT in the emergency in patients with suspected necrotizing external otitis, helping to prevent delayed treatment due to diagnostic failure; Review the anatomical relation between the temporal bone, external ear and skull base, and the how the cervical spaces can be affected due to this relation in the disease dissemination, resulting in possible complications; Review subtle findings that may suggest that the patient could benefit from a MRI complementation study.

### TABLE OF CONTENTS/OUTLINE

Schematic illustrations related to the pathophysiology of the external necrotizing otitis, correlating the temporal bone CT with the infection dissemination pattern through the anatomic references and cervical spaces; Demonstration of multiple cases with subtle imaging findings to help increase the early diagnosis rate.

## DIFFUSE THYROID DISEASE: CT AND MR IMAGING APPROACH

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Naoko Saito, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Ryohei Kuwatsuru, MD (*Abstract Co-Author*) Nothing to Disclose
Osamu Sakai, MD, PhD (*Abstract Co-Author*) Consultant, Boston Imaging Core Lab LLC
Naoki Takemasa (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Diffuse thyroid enlargement is frequently encountered on CT and MRI with clinical symptoms or incidentally. A wide variety of diseases can affect the thyroid gland diffusely, ranging from thyroiditis to malignant tumors. Familiarity with the imaging and clinical characteristics of diffuse thyroid disease (DTD) is essential for prompt diagnosis and treatment. The teaching points are: 1. To review clinical and imaging findings of various DTD 2. To recognize important features that can help differentiate the various DTD 3. To learn the current knowledge about the therapy for DTD

### TABLE OF CONTENTS/OUTLINE

1. Normal imaging findings of the thyroid gland 2. Review of various cases of diffuse thyroid enlargement: clinical and imaging findings and treatment a. Autoimmune thyroid diseases: Graves' disease, Hashimoto thyroiditis, postpartum thyroiditis, IgG4-related thyroiditis b. Nonautoimmune thyroid diseases: acute and subacute thyroiditis c. Depositions: amyloidosis d. Drug-induced thyroid disorders e. Acute transient thyroid swelling following FNA f. Benign tumors: adenomatous goiter, simple diffuse goiter g. Malignant tumors: anaplastic thyroid cancer, diffuse sclerosing papillary cancer, malignant lymphoma, metastatic tumor h. Fetal goiter i. Shock thyroid 3. Current topics of treatment for DTD (anaplastic thyroid cancer and advanced thyroid cancer) a. Molecular target drug b. Immune checkpoint inhibitor c. Genomic medicine 4. Suggested algorithms for the diagnosis of DTD

### TEACHING POINTS

Rhinoplasty or “nose job” is an ancient plastic surgery dating back to the time before Christ, with the first reports by Indian and Egyptian people. Despite being an old and frequently performed procedure, it still is considered challenging due to unexpected results and complications that can be related to the partially known anatomy prior to the procedure. Ultrasound (US) is an objective, accessible and widely used method for pre- and post-operative monitoring of many structures. Therefore, high-frequency nasal US should be included in the preoperative planning and in the postoperative follow-up of rhinoplasties.1. Review the structural anatomy of the nasal region on ultrasound;2. Introduce the different types of most common surgical rhinoplasty;3. Review the ultrasound aspect of the most used surgical rhinoplasty techniques;4. Evaluate the materials commonly used in the procedure and their ultrasound appearances;5. Demonstrate what to expect in the post-operative period.

### TABLE OF CONTENTS/OUTLINE

IntroductionUltrasound (US) nasal anatomyClinical and surgical benefits of US for nose proceduresSurgical RhinoplastyDifferent types of most common techniques (rhinoplasty, septoplasty, rhinectomy, maxillary antrostomy and uncinectomy, nasal turbinate surgery, ethmoidectomy, nasal prosthesis, etc)Grafts and materialsMaterials commonly used in nose jobUS aspect of most used materialsPost-surgical changesUS aspect of most used surgical rhinoplasty techniquesComplicationsSequelsTake-home messages

## ARYEPIGLOTTIC FOLDS, A SMALL SPOT WITH BIG POSSIBILITIES. A CLINICO-RADIOLOGICAL AND ANATOMOPATHOLOGICAL REVIEW

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Jose Maria Maiques Llacer, MD (*Abstract Co-Author*) Nothing to Disclose
Brigitte Beltran Marmol (*Abstract Co-Author*) Nothing to Disclose
Jaume Capellades, MD (*Abstract Co-Author*) Nothing to Disclose
Paulina Miranda, MD (*Abstract Co-Author*) Nothing to Disclose
Jorge Ivan Martinez Cano, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

This educational poster presents a clinico-radiological and anatomopathological's review of pathology of the aryepiglottic folds (AEF) of the supraglottis, from the common to the rare and from the benign to the malignant based on cases observed in the head and neck tumor committee of our centre.

### TABLE OF CONTENTS/OUTLINE

Laryngeal neoplasms account for about a quarter of all head and neck neoplasms. The supraglottis is the most common site for these neoplasms and can be subdivided into different anatomical spaces that have prognostic and management differences. The aryepiglottic fold is the border between the larynx and the hypopharynx and is an uncommon site for tumors. The vast majority of these have epidermal origin, but multiple lesions can arise from the structures that make up the EFA. The pathology harbored in this site usually presents with larval and non-specific clinical manifestations, making timely diagnosis difficult; this problem is compounded by unfamiliarity with the imaging of these lesions, making their diagnosis even more difficult. Sometimes benign pathology can be confused with neoplasia, which can be difficult to differentiate on imaging. However, clinics and some tools to determine the benign origin of these lesions (contrast enhancement behavior) can help to refine the diagnosis and avoid invasive procedures in patients. This review summarizes the clinical, radiological and anatomopathological differences between neoplasms and benign pathology that may occur in this space. In addition, we aim to provide useful imaging tools for the recognition of certain features of clinical and prognostic importance.

Regina L. Elia Gomes, PhD, MD (*Abstract Co-Author*) Nothing to Disclose
Felipe Magnabosco (*Abstract Co-Author*) Nothing to Disclose
Lucas O. Madeira, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The concept of enlarged parathyroid represents the possibility of disease. Classically, the parathyroids are located in the thyroid contours, however they can be found in ectopic situations, including inside the thyroid gland, in regions clearly surrounded by the thyroid parenchyma. They can often be confused by thyroid nodules, sometimes with a high ACR TI-RADS classification. The purposes of this exhibit are: to make this diagnosis possible and incorporated into radiological practice, especially in the clinical context of hyperparathyroidism; to review the imaging method aspects of these glands; and to show the findings of the 10 original cases from our institutions, illustrated by different imaging methods. Results: scintigraphy: 100% with focal hyperuptake to the radiopharmaceutical;ultrasound: 100% with hypoechogenicity;CT scan (only 50%): hypoattenuating nodule;MRI (only 20%): hypersignal in T2.

### TABLE OF CONTENTS/OUTLINE

Introduction: epidemiology, embryology and clinical aspects of the intrathyroidal parathyroid.Imaging methods of intrathyroidal parathyroids: Ultrasound, Scintigraphy, CT scan and MRI.Illustrative original cases with anatomopathological correlation: 80% adenoma, 10% hyperplasia, and 10% carcinoma.Possible atypical characteristics of these nodules.Recommendation for radiologists - in what context should we remember this diagnosis? Conclusion "take-home messages".

Hugo Tames, MD (*Abstract Co-Author*) Nothing to Disclose
Isadora Campos De Matos (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- To highlight the main characteristics and imaging findings of osteodystrophies of the temporal bone.- To review and illustrate dysplasias of the temporal bone with cases from our institution.- To familiarize radiologists with imaging aspects that aid in the differential diagnosis of these pathologies.

### TABLE OF CONTENTS/OUTLINE

INTRODUCTION- Organogram osteodystrophies of temporal bone organized into groups according to the predominant pattern of bone involvement (lytic, scleroticand mixed)Temporal bone disease with predominance of lytic pattern- Otosclerosis- Osteogenesis imperfecta- Otosyphilis Temporal bone disease with predominance of mixed pattern- Paget's disease- Fibrous dysplasia Temporal bone disease with predominance of sclerotic pattern- Osteopetrosis- Camurati-engelmann- Scleosteosis- Van buchemTAKE HOME MESSAGESTemporal Bone Osteodystrophies, such as otosclerosis and other bone dysplasias exhibit varied clinical presentations and genetic origins. By classifying them based on predominant bone involvement patterns, clinicians and radiologists can better understand their complexities and facilitate accurate diagnosis. Imaging modalities play a crucial role in delineating disease characteristics and guiding treatment strategies. Recognizing key features of each condition is imperative for tailored patient management and improved outcomes. In essence, a comprehensive understanding of temporal bone diseases empowers healthcare professionals to provide optimal care and support for affected individuals.

Serena Pham, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Merkel cell carcinoma (MCC) is a rare, aggressive neuroendocrine cutaneous malignancy, with a predilection for early local, regional and distant metastasis with frequent recurrence, and is associated with poor prognosis.1-9 Since MCC rapidly progresses and metastasizes, early detection and achievement of R0 excision of the primary lesion, with a safety margin of >1 cm in stage 1 disease and >2 cm in higher stages, as well as sentinel lymph node biopsy and excision, are key to improving prognosis.1,4 While the gold-standard method of diagnosing MCC is pathologic analysis, imaging is essential for staging, management, and follow-up guidance.5-9 To date, there is no consensus for specific imaging algorithm for assisting diagnosing and staging of MCC.5,9 The purpose of this exhibit is to: 1) Review the MCC epidemiology and risk factors 2) Discuss various MCC manifestations in head and neck 3) Discuss management of MCC in head and neck 4) Discuss the role of the most recent imaging approach for diagnosing and staging of MCC in head and neck (Reference is available upon request.)

### TABLE OF CONTENTS/OUTLINE

1) MCC epidemiology and risk factors 2) MCC manifestations in head and neck 3) Management of MCC in head and neck 4) Imaging approach for diagnosing and staging of MCC in head and neck

### TEACHING POINTS

To review the boundaries and anatomical relationships of the parapharyngeal space.To describe the diversity of focal lesions affecting this space and the radiological key findings that lead their differential diagnosis.

### TABLE OF CONTENTS/OUTLINE

The parapharyngeal space is a deep cervical compartment with inverted pyramid morphology, bounded laterally by the masticator and parotid spaces, posteriorly by the retropharyngeal and prevertebral spaces, and medially by the pharyngeal mucosal space, and divided into a pre-styloid and a post-styloid compartment by the tensor-vascular-styloid fascia.Although predominantly composed of fatty tissue, it also includes multiple vascular and nervous structures, minor salivary glands, and, occasionally, the retromandibular portion of the deep parotid lobe. Additionally, due to its location, it maintains a close relationship with multiple neighboring anatomical structures.The differential diagnosis of lesions affecting this space includes both primary lesions originating within the space itself and secondary lesions extending into it from adjacent structures. These encompass a wide range of pathologies, both congenital and acquired, including neoplastic, inflammatory, and infectious etiologies.A review of the main differential diagnosis of the parapharyngeal space lesions has been conducted, based on both anatomic references and key radiological findings, using cases from our institution.

### TEACHING POINTS

Extranodal extension (ENE) is a significant adverse prognostic factor in head and neck squamous cell carcinoma (HNSCC), and pathologic ENE (pENE)/clinically evident ENE (cENE) are classified as N3b in p16-negative HNSCC based on the AJCC staging system. While imaging-detected ENE (iENE) without clinically apparent cENE is not included in the current N category, there has been active discussion regarding the importance of pretreatment iENE evaluation for accurate prognostication and treatment strategy as well as the many aspects of iENE that remain unresolved such as diagnostic criteria including the associated terminology. At the same time, the advent of high-resolution imaging techniques such as photon-counting detector CT with 1024 matrix capability allows for more detailed visualization of fine structures compared to conventional imaging.The objectives of this presentation are: 1) to review the clinical implications of iENE in patients with head and neck cancer, and 2) to discuss the diagnostic criteria for iENE in the era of high-resolution imaging with radiolo-pathologic / clinico-radiologic correlation.

### TABLE OF CONTENTS/OUTLINE

1. Clinical background of ENE in the patient with head and neck cancer.2. Diagnostic criteria and the recently proposed grading of iENE.3. High-resolution CT including photon-counting CT4. Case discussion and clinical implications of iENE- iENE Grade 1- iENE Grade 2- iENE Grade 35. Summary

## ENDOLYMPHATIC HYDROPS IN MRI, A DEEPER LOOK AT THE INNER EAR

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Yukiyoshi Kimura, MD (*Abstract Co-Author*) Nothing to Disclose
Yumi Kimura Sandoval, MD (*Abstract Co-Author*) Nothing to Disclose
Carlos Calderon Cardenas SR, MD, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Establish an anatomical correlation of the inner ear and its visualization with MR images.2. Show the type of sequences used as well as the contrast administration and image acquisition times in the evaluation of patients with suspected endolymphatic hydrops.3. Explain and illustrate the importance of a step-by-step evaluation in patients with endolymphatic hydrops.4. Illustrate characteristic imaging findings in posterior fossa pathology considered as a differential diagnosis.

### TABLE OF CONTENTS/OUTLINE

• Introduction• Indications• Anatomy of the inner ear• Image acquisition protocol (use of contrast media and administration times, sequence and acquisition times)• Endolymphatic hydrops: what is it? why is it produced?• Step-by-step evaluation on MRI • Classification systems used• Differential diagnoses• Take home points• References

Araceli Munoz Hernandez, MD, PHD (*Abstract Co-Author*) Nothing to Disclose
Itxaso Galan-Gonzalez (*Abstract Co-Author*) Nothing to Disclose
Javier Azpeitia Arman, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- To describe the normal anatomy of the pharyngoesophageal segment (PES).
- To analyze the normal physiology of the upper esophageal sphincter (UES)
- To propose a systematic approach for the study of pathology of the pharyngoesophageal segment.
- To illustrate common and uncommon imaging findings in videofluoroscopy swallow study (VFSS).
- To emphasize pitfalls and clues to differential diagnosis.
- To describe recommendations and rehabilitative strategies based on VFSS by evaluating the effectiveness of postures, maneuvers, bolus modifications, and sensory enhancements in improving swallowing safety and efficiency.

### TABLE OF CONTENTS/OUTLINE

The pharyngoesophageal segment (PES) is one of the only region of the swallowing mechanism that can be modified with therapy and surgery. The VFSS is the gold-standard tool for diagnosing PES dysfunction. A systematic approach to PES analysis ensures a comprehensive assessment of dysfunction. The systematic evaluation of the PES includes evaluation of pre-swallow PES fluoroscopic anatomy, laryngohyoid elevation, pharyngeal contractility, PES opening, evaluation of the posterior cricoid region, the posterior hypopharyngeal wall region and the esophageal function. We present different objective measures to study the PES pathology: the pharyngeal constriction ratio (PCR), UES opening diameter, Determination of the PES opening dimensions, UES closure, measurement of the cricopharyngeus bar to distinguish between obstructive and non-obstructive bars, and normalized residue ratio scale (NRRS).

### TEACHING POINTS

; The temporal bone is an anatomical area of great complexity and harbors different pathologies.; The most suitable technique for examining the outer ear is Computed Tomography. However, CT is used to assess bone structures in the middle and inner ear, whether Magnetic Resonance Imaging is required for inflammatory or tumorous diseases.

### TABLE OF CONTENTS/OUTLINE

The temporal bone can present a variety of pathologies (infectious, traumatic, congenital, tumor) that can affect the outer, middle, or inner ear. This education exhibit aims to review the ear’s anatomy showing the most appropriate techniques and protocols for basic findings that will allow the detection of different ear pathologies.; Most diseases of the outer ear are assessed by CT, sometimes with contrast (inflammatory and tumorous processes).; In the middle ear, CT without contrast allows the assessment of hearing loss, trauma, otitis, and cholesteatoma. CT with contrast medium is used for infectious processes with intracranial extension such as epidural abscesses or thromboses. MRI is used to assess tumor diseases and inflammatory diseases.; In the inner ear, MRI is the method of choice to identify cranial nerves and the labyrinth, using contrast agents for tumors and infectious diseases. CT can be used to assess congenital pathologies and other pathologies such as otosclerosis and dehiscence.

### TEACHING POINTS

The extraocular muscles (EOM) can be involved in a wide variety of diseases that can be local, regional or systemic. The conditions often have a similar clinical and radiological presentation, which can make differential diagnosis difficult.It is necessary to know the orbital anatomy, how to perform its radiological evaluation and the clinical and imaging manifestations of the diseases that may affect de EOM.The key points to evaluate for a systematic approach and differential diagnosis are:- Pattern of muscle involvement: how many muscles, which ones, and what part of them.- Involvement of one or both orbits and symmetry.- Involvement of other orbital or extraorbital structures.- Clinical presentation.The purpose of this work is to review the conditions that can affect the EOM, to describe and to illustrate their characteristic imaging findings, focusing on clues for differential diagnosis.

### TABLE OF CONTENTS/OUTLINE

1. Introduction1.1. Orbital anatomy, focusing on the EOM1.2. Imaging modalities used for the evaluation of the orbit and the EOM and its radiological features2. Systematic approach and clues for differential diagnosis3. Diseases involving the extraocular muscles:3.1. Thyroid ophthalmopathy (Graves' disease)3.2. Orbital myositis: idiopathic orbital inflammation (orbital pseudotumor) and secondary myositis (associated to systemic or autoimmune diseases)3.3. Neoplasms: lymphoproliferative disorders and metastasis3.4. Orbital trauma and iatrogenic complications3.5. Infectious diseases: orbital cellulitis and other entities3.6. Miscellaneous: Brown syndrome, vascular conditions and others4. Conclusions5. References

## APPLICATION OF CT-LIKE MRI IN CRANIAL AND FACIAL BONE LESIONS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Masayuki Maeda, MD (*Abstract Co-Author*) Nothing to Disclose
Hajime Sakuma, MD, PhD (*Abstract Co-Author*) Research Grant, Eisai Co, Ltd;Research Grant, FUJIFILM Holdings Corporation;Research Grant, Guerbet SA;
Fumine Tanaka (*Abstract Co-Author*) Nothing to Disclose
Maki Umino, MD (*Abstract Co-Author*) Nothing to Disclose
Seiya Kishi (*Abstract Co-Author*) Nothing to Disclose
Ryota Kogue, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Recently, a new technique known as CT-like MRI has been developed that enhances MRI contrast similar to CT. We present our clinical experience using fast field-echo resembling a CT using restricted echo spacing (FRACTURE) MRI in comparison with CT in cranial and facial bone lesions. Our aim is1) to understand the principle of FRACTURE MRI.2) to demonstrate FRACTURE MRI cases of cranial and facial bone lesions compared with CT.3) to learn the diagnostic value and drawbacks of FRACTURE MRI in evaluating bone lesions.

### TABLE OF CONTENTS/OUTLINE

1. Principle of FRACTURE MRI2. Delineation of osteolytic change indicates whether the lesion is malignant (permeative bone destruction) or benign (expansive bone destruction).3. Delineation of sclerotic change is useful for diagnosing fibrous dysplasia, osteochondroma, meningioma, etc.4. Benefit: FRACTURE MRI may omit CT examination in pediatric cases.5. Drawback: FRACTURE MRI may be difficult to assess the lesions near nasal/paranasal or mastoid air.6. Conclusion: FRACTURE MRI provides added value in the evaluation of cranial and facial bone lesions that is difficult with conventional MRI.

## PATTERNS OF VISUAL FIELD DEFECT: THE KEY FOR SELECTING APPROPRIATE IMAGING MODALITY AND MAKING ACCURATE DIAGNOSIS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Yuhua Dou (*Abstract Co-Author*) Nothing to Disclose
Guanglei Tang, MBBS (*Abstract Co-Author*) Nothing to Disclose
Xueguo Liu, MD,PhD (*Abstract Co-Author*) Nothing to Disclose
Jian Guan, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. To review the anatomy, physiology and normal imaging appearance of the visual pathway. 2. To know about the relevant clinical examination for visual field analysis 3. To recognize different visual field defect patterns associated with specific segment of the visual pathway, which can be assisting in lesion localization on imaging. 4. To learn unilateral and bilateral visual field defect based on cases.

### TABLE OF CONTENTS/OUTLINE

1. The anatomy of the visual pathway and its normal appearance on CT and MRI imaging. 2. Relevant clinical examinations of visual field: (1)Testing of visual fields (including methods to study and analyze the visual field, as well as terminology relating to visual field defects); (2)Testing of the pupillary light reflex. 3. Different patterns of visual field defect, imaging findings and diagnosis: (1)Visual field defect with unilateral eye involved(central visual field defect, peripheral visual field defect, altitudinal hemianopsia, nasal hemianopsia and total visual loss) and related diseases. (2)Visual field defect with bilateral eyes involved (junctional scotoma, altitudinal hemianopsia, heteronymous visual field defect, homonymous visual field defect and quadranopsia) and related diseases. 4. Application of visual field defect and lesion localization in complex cases

## STAYING IN ORBIT: A REVIEW OF INTRAORBITAL PATHOLOGY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Han Zhong, MD (*Abstract Co-Author*) Nothing to Disclose
Christopher Ciasullo, DO (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Review orbital anatomy. 2. Review the cross-sectional imaging appearance as well as typical patient presentation/demographics and management of non-traumatic orbital pathologies including inflammatory, neoplastic, and vascular etiologies.Summary As orbital pathology is infrequently encountered by many residents, it can become a source of anxiety and confusion. The myriad of entities that can manifest in such a small region of the human body may be overwhelming - a dilemma that this educational exhibit seeks to address. It will start with fundamental orbital anatomy and progress to key characteristics of multiple pathologies, broken down into more easily digestible categories. In addition, understanding common presenting symptoms and demographics for each pathology can often help narrow the differential. The objective is to instill confidence in residents not only as they prepare for board exams, but also to help form differential diagnoses as they encounter orbital imaging throughout their call shifts and career.

### TABLE OF CONTENTS/OUTLINE

1. Orbital anatomy. 2. Cross-sectional imaging appearance as well as typical patient presentation/demographics and management of non-traumatic orbital pathologies. a. Inflammatory - optic neuritis, orbital pseudotumor, scleritis, thyroid orbitopathy. b. Neoplastic - optic nerve glioma, optic nerve sheath meningioma, orbital lymphoma. c. Vascular - orbital cavernous venous malformation, orbital infantile hemangioma, orbital lymphangioma.

## DETECTION OF PARATHYROID ADENOMAS AIDED BY THEIR TIME ENHANCEMENT CURVE: GETTING THE MOST OUT OF 4DCT

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Steven Raeymaeckers, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Based on multiple cases we illustrate the embryology of the parathyroid glands using relevant antomical reference markers 2. Three different types of enhancement curves for parathyroid adenomas exist 3. Arterial wash-in of contrast is an effect that can be very shortlived and thus missed 4. Multiphase 4DCT allows for the contruction of time-density curves which can be used to easily detect and characterize even very small parathyroid adenomas

### TABLE OF CONTENTS/OUTLINE

1. Multiphase 4DCT: - Scanning protocol and dose - The different types of enhancement curves of parathyroid adenomas 2. Processing multiphase 4DCT images - Non rigid registration - 4D visualisation 3. Setting up a reading protocol - Embryology of the parathyroid glands using antomical references - What does the surgeon want to know?

## ISOLATED PATHOLOGY OF THE SPHENOID SINUS: THINK TWICE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Siddhartha Gaddamanugu, MBBS (*Abstract Co-Author*) Nothing to Disclose
Andrew Ammons (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. The sphenoid sinus is unique due to lack of localizing signs on physical exam and relative paucity of isolated disease compared to the other paranasal sinuses. 2. The sphenoid sinuses lies at an “anatomical crossroads”, with numerous important adjacent intracranial structures which can contribute to, or be affected by, disease. This makes the sinus a hotbed for unique and interesting pathologies which may be encountered by radiologists on imaging. In particular, CT imaging of isolated sphenoid sinus pathology can be misinterpreted as “sinusitis” due to its lower contrast resolution of identifying abnormalities in adjacent compartments. 3. While infectious and inflammatory conditions are the most common causes of sphenoid sinus pathology, other important etiologies that trainees should consider when forming their differential include vascular, neoplastic, developmental, and traumatic. Origin from nasopharynx, cavernous sinuses, pituitary, and middle skull base should be considered. A variety of such unique cases to the sphenoid sinus will be presented.

### TABLE OF CONTENTS/OUTLINE

I. Review sphenoid sinus anatomy. II. Important anatomic variants. III. Sphenoid pathologies which arise in the setting of variant anatomy including lateral cephaloceles, optic nerve canal dehiscence, etc. IV. Infectious and inflammatory pathologies including sinusitis (acute bacterial, invasive granulomatous fungal, etc.), mucocele, etc. V. Vascular pathologies. VI. Neoplastic processes (benign, e.g. pituitary adenoma, etc., and malignant, e.g. metastases, myeloma, lymphoma, nasopharyngeal carcinoma). VII. Miscellaneous Pathologies VIII. Conclusion.

## THE POSTRADIATION NECK: A PRACTICAL GUIDE FOR RADIOLOGISTS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Matheus Carlota, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Head and neck neoplasms account for 4% of tumors, with 60% of cases diagnosed in advanced stages. Radiotherapy is frequently required as treatment. All tissues in the radiation field show actinic changes. Spectrum of soft tissue and cartilage changes following radiation therapy for head and neck tumors can range from acute ( tissue edema and inflammation) to chronic fibrosis, scarring, and atrophy. Image review requires systematic evaluation in order to avoid mistakes between expected changes and tumor persistence/recurrence. Focal thickening of mucosa or solid neck mass suggest residual or recurrent tumor/nodes. Persistent or enlarged mass on baseline posttreatment scan indicates treatment failure.

### TABLE OF CONTENTS/OUTLINE

The actinic changes in follow up imaging of head and neck cancer will be summarized: Acute phase after radiotherapy:1. Changes in the skin and subcutaneous tissue: Skin thickening and densification of subcutaneous tissues. 2. Mucosal changes: Edema of the laryngeal mucosa, notably supraglottis 3. Glandular alteration: Hyperenhancement and hypertrophy of the submandibular glands Chronic phase after radiotherapy:1. Glandular alteration: Atrophy of the submandibular, parotid and thyroid glands, Glandular liposubstitution; 2. Mucosal changes: Reduction of laryngeal thickening; 3. Change in the cricoid cartilage; 4. AtherosclerosisComplication after radiotherapy: 1. Jaw osteoradionecrosis; 2. Encephalic osteoradionecrosis

### TEACHING POINTS

• Provide an overview of different imaging modalities used in parathyroid disease.• Emphasize the indications, limitations, and benefits of different imaging modalities evaluating the parathyroid gland.• Become familiar with descriptive terms for normal parathyroid gland in radiology.• Review the most common pathologies and provide case studies to illustrate the practical application of theoretical concepts.• Analyze differential diagnoses, tips, and tricks.• Discuss updates in imaging evaluation for parathyroid gland pathology.

### TABLE OF CONTENTS/OUTLINE

- Overview of Different Imaging Modalities Used in Radiology
- Discuss the evolution of these modalities and their increasing importance in modern medicine.
- Emphasize the Indications, Limitations, and Benefits of Different Imaging Modalities Evaluating the Parathyroid Gland
- Comparison of imaging techniques for the parathyroid gland: ultrasound, 4DCT, and SPECT/CT.
- Descriptive Terms for Normal Parathyroid Gland in Different Imaging Modalities
- Common Pathologies in the Parathyroid Gland
- Discuss parathyroid adenoma, multiglandular parathyroid disease, parathyroid carcinoma, atypical parathyroid adenoma, and metastasis in parathyroid gland.
- Analyze the Differential Diagnoses, Tips, and Tricks in Different Imaging Modalities
- Discuss Updates in Imaging Evaluation for Parathyroid Gland Pathology
- Explore future trends or emerging technologies in this field.
- Conclusion

## A JOURNEY THROUGH THE INNER EAR: EXPLORING ANATOMY AND PATHOLOGY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Lucia Martinez De Vega, MD (*Abstract Co-Author*) Nothing to Disclose
Juan Gredilla (*Abstract Co-Author*) Nothing to Disclose
Ana M. Vera-Carmona, MD (*Abstract Co-Author*) Nothing to Disclose
Juan S. Martinez San Millan, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Montserrat Medina Diaz, PhD (*Abstract Co-Author*) Nothing to Disclose
Beatriz Alba Perez, MD (*Abstract Co-Author*) Nothing to Disclose
Juan V. Quintana Perez, MD (*Abstract Co-Author*) Nothing to Disclose
Noelia Bravo Alcobendas, MD (*Abstract Co-Author*) Nothing to Disclose
Alba Fernandez-Rodriguez, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Recognize and understand the normal anatomy of the inner ear.- Review the technical aspects of MRI to study the anatomy of the inner ear and the essential sequences for each pathology.- Identify the key diagnostic features of main acquired inner ear pathologies by correlating different imaging techniques such as CT and MRI.

### TABLE OF CONTENTS/OUTLINE

1. Anatomy and physiology of the inner ear.2. Technical aspects: MRI protocol.3. Review of acquired pathology of the inner ear by a case-based approach learning.3.1 Inflammatory-infectious pathology: Labyrinthitis. 3.1.1 Diagnostic Keys and value of the FLAIR sequence.3.1.2 Differential Diagnosis with labyrinthitis ossificans and carcinomatous meningitis.3.2 Endolymphatic hydrops. 3.2.1 MRI protocol 3.2.2 Diagnostic criteria.3.2.3 Classification systems.3.3. Otospongiosis.3.3.1 MRI findings and correlation with other imaging techniques (CT).3.4 Vestibular Schwannoma. 3.4.1 Characteristic Findings. 3.4.2. Differential Diagnosis (cerebellopontine angle meningioma, epidermoid cyst).3.5. Peripheral facial paralysis.3.5.1 Bell palsy vs neoplastic palsy.3.6 Traumatic injury. 3.6.1 Labyrinthitis ossificans as a sequel to trauma.3.6.2 Intralabyrinthine haemorrhage.3.7 Miscellany: 3.7.1 Fibrous dysplasia.3.7.2. Osteogenesis imperfecta.3.7.3. Paget´s disease.4. Conclusion

## IMMUNOTHERAPY FOR HEAD AND NECK ONCOLOGY: A PRIMER FOR RADIOLOGISTS. MECHANISMS, TREATMENT PARADIGMS, AND IMAGING EVALUATION

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Alexander M. Khalaf, MD (*Abstract Co-Author*) Nothing to Disclose
Susana Calle, MD (*Abstract Co-Author*) Nothing to Disclose
Kim Learned, MD (*Abstract Co-Author*) Nothing to Disclose
Samir Dagher, MD (*Abstract Co-Author*) Nothing to Disclose
Richard Dagher, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1) To highlight the key mechanisms of small molecule and monoclonal antibodies, immune-checkpoint inhibitors (ICIs), CAR-T cells transfer therapy and T-VEC oncolytic virus. 2) To review the response evaluation guidelines for immunotherapy (iRECIST, imPERCIST). 3) To illustrate the immunotherapy tumor response patterns and their role in treatment paradigm and perioperative management. 4) To discuss clinical evaluation and recognize imaging findings for immunotherapy-related adverse events

### TABLE OF CONTENTS/OUTLINE

1) Mechanism of action of targeted antibodies. a) Small molecules versus monoclonal antibodies: nomenclature and actions. b) Tyrosine Kinase Inhibitor, BRAF and MEK inhibitors in BRAF V600 mutation tumor. c) EGFR, CD20 monoclonal antibodies. 2) Mechanisms of action of ICIs. a) Cytotoxic T-lymphocyte antigen-4 (CTLA-4) Inhibitors. b) Programmed death-1 (PD-1) and programmed death ligand-1 (PD-L1) pathway inhibitors. 3) Mechanism of action of CAR-T cell and T-VEC. 4) Current applications of immunotherapy in curative, palliative, neoadjuvant and adjuvant treatment paradigms. 5) Response evaluation guidelines. a) RECIST 1.1 vs iRECIST. b) PERCIST 1.0 vs imPERCIST. 6) Atypical patterns of response to immunotherapy. a) Pseudoprogression. b) Hyperprogression. c) Dissociated response. d) Durable response. 7) Imaging of common immune-related adverse events. a) Skin rash, pneumonitis, sarcoidosis. b) Thyroiditis. c) Hypophysitis, encephalitis, CNS vasculitis. d) Immune effector cell-associated neurotoxicity syndrome (ICANS)

## IMAGING OF THE CEREBELLOPONTINE ANGLE: PRACTICAL ANATOMY AND CASE-BASED DIAGNOSTIC APPROACHES FOR RADIOLOGISTS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Mehmet Simsar, MD (*Abstract Co-Author*) Nothing to Disclose
Yeliz Pekcevik, MD (*Abstract Co-Author*) Nothing to Disclose
Yesim Y. Yuruk, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• Provides a comprehensive overview of the radiologic anatomy of the cerebellopontine angle (CPA) • Describes a practical approach for localizing the pathologies affecting the CPA • Reviews common and rare pathologies in the CPA using case-based examples, highlighting clinical and imaging features that can aid in the best diagnosis

### TABLE OF CONTENTS/OUTLINE

1. The cerebellopontine angle anatomy and structures 2. Classification of the CPA tumors based on imaging features 3. Case-based review of the CPA tumors using signal intensities and contrast-enhancement features Outline • Knowledge of anatomy and structures is essential for describing a lesion in the CPA. • Understanding the contents and common/rare lesions of CPA is the first step in generating a differential diagnosis. • Obtaining relevant clinical history and recognizing specific imaging appearances can help provide the best diagnosis.

## IMAGING REVIEW OF OPTIC PERINEURITIS AND OPTIC NEURITIS WITH DIFFERENTIAL DIAGNOSIS CONSIDERATIONS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Gavin Wu, BA (*Abstract Co-Author*) Nothing to Disclose
Mohammad T. Shujaat, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Optic neuritis and perineuritis can present as common clinical manifestations of CNS inflammation related to a wide variety of autoimmune, infectious or demyelinating etiologies. However, while these pathologies may present with similar clinical and imaging findings, their disease course and treatment can differ. It is important for radiologists to distinguish between these pathologies and other non-inflammatory mimics to facilitate proper diagnosis and guide appropriate treatment. Our exhibit will demonstrate diagnostic clues, which will include imaging patterns and enhancement distribution and systemic involvement, to help in differentiating etiologies and formulate a clinically relevant differential diagnosis. As such, our teaching points will be to: 1. Review the relevant anatomy of the orbit, optic nerve and optic nerve sheath. 2. Examine inflammatory manifestations of the optic nerve complex and present the main imaging features of these pathologies. 3. Recognize and distinguish the spectrum of other optic nerve complex inflammatory etiologies with similar presentations.4. Highlight the importance of distinguishing these pathologies to facilitate proper diagnosis and guide appropriate treatment plans.

### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Inflammatory Manifestations In the Orbit 3. Importance of Differential Considerations 4. Optic Nerve-Sheath Complex Pathologies and Mimics 5. Summary and Conclusions

## NORMAL INNER EAR ANATOMY AND COCHLEAR MORPHOMETRY FOR CONGENITAL INNER EAR MALFORMATION DIAGNOSIS AND COCHLEAR IMPLANT CANDIDACY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Savith Kumar, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Aysha Tamanna, MBBS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

A thorough understanding of inner ear anatomy is important for diagnosing congenital inner ear malformations, interpreting imaging of this area, and providing essential preoperative information about the inner ear and the vestibulocochlear nerve. Pre-operative cochlear morphometry is pivotal for patient selection to rule out conditions that would make surgery impossible or that could compromise the procedure and to decide on the devices and access.

### TABLE OF CONTENTS/OUTLINE

Pictorial representation of cochlea with its external and internal architecture, vestibule, semicircular canals, and internal auditory canal with their internal architecture and contents.Protocol and methods for morphometric analysis of cochlea including cochlear base diameter, cochlear duct length, diameter of each cochlear turns, cochlear height, cochlear aperture, cochlear rotation, internal auditory canal diameter, distance from vertical facial nerve to posterior annulus and to mastoid cortex and caliber of facial and cochlear nerves using computed tomography and magnetic resonance imaging along with the normal range of parameters and implication of each parameter prior to surgery.Approach to diagnosis of inner ear malformations including complete labyrinthine aplasia, cochlear aplasia, cochlear hypoplasia and types, common cavity, incomplete partition and types, enlarged vestibular aqueduct, cochlear aperture abnormalities, vestibular and semicircular canal malformations, inner ear anomalies and vestibulocochlear nerve anomalies with radiological and hand drawn illustrations.

## CHRONIC RHINOSINUSITIS: CURRENT CONCEPT

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Osamu Sakai, MD, PhD (*Abstract Co-Author*) Consultant, Boston Imaging Core Lab LLC
Inseon Ryoo, MD (*Abstract Co-Author*) Nothing to Disclose
Naoki Takemasa (*Abstract Co-Author*) Nothing to Disclose
Ryohei Kuwatsuru, MD (*Abstract Co-Author*) Nothing to Disclose
Naoko Saito, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Chronic rhinosinusitis (CRS) has been classified into CRS without nasal polyps (CRSsNP) and CRS with nasal polyps (CRSwNP). The previous classification system was based on the phenotype, whereas the current system is based on anatomical distribution and endotype dominance. The current system can predict the severity of disease and lead to the optimal personalized treatment. Since the current concept has become the foundation for daily practice, radiologists need to be familiar with this classification system. The teaching points are: 1. To describe the current changes in the classification of CRS 2. To become familiar with the inflammatory mechanisms of CRS 3. To review imaging features of various CRS based on current classification

### TABLE OF CONTENTS/OUTLINE

1. Definition of CRS 2. Various classification systems of CRS a. Previous classification b. Based on EPOS2020 (European Position Paper on Rhinosinusitis and Nasal Polyps) c. Based on ICAR-RS-2021 (International Consensus Statement on Allergy and Rhinology: Rhinosinusitis) 3. Inflammatory mechanisms of CRS a. Type 2 response b. non-Type 2 response 4. Review of imaging and clinical features of CRS based on current classification a. Primary CRS: AFRS (allergic fungal rhinosinusitis), eCRS (eosinophilic CRS), CRSwNP, CCAD (central compartment allergic disease), non-eCRS, isolated sinusitis b. Secondary CRS: odontogenic, fungal ball, GPA (granulomatosis with polyangiitis), eGPA (eosinophilic GPA), primary ciliary dyskinesia

## FOLLOW YOUR NOSE - ULTRASOUND ROLE IN THE AESTHETIC RHINOMODELATION

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Matheus Taborda, MD (*Abstract Co-Author*) Nothing to Disclose
Joao P. Ferreira, MD (*Abstract Co-Author*) Nothing to Disclose
Luciana A. Takahashi, MD (*Abstract Co-Author*) Nothing to Disclose
Eduardo Sampaio, MD (*Abstract Co-Author*) Nothing to Disclose
Luis R. Ferreira (*Abstract Co-Author*) Nothing to Disclose
Nathalia Bonmann, MD (*Abstract Co-Author*) Nothing to Disclose
Gabriel Da Silva Eli, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The amount of aesthetic rhinomodelation procedures has significantly increased in the past decades. This procedures are not risk-free, with associated complications such as accidental injection of fillers into the arterial branches that supply the nose. Consequently, high-frequence nasal ultrasonography (US) has emerged to help in the pre-procedural setting to assess the nasal anatomy and its variants in detail. Additionally, the US is capable of providing a detailed mapping of previously injected fillers, each one with specific imaging features.1. Review the structural anatomy of the nasal region on ultrasound;2. Detail the different types of materials used in non-surgical rhinoplasty;3. Evaluate the role of ultrasonography in the safety of rhinomodelation procedures 4. Review the ultrasound appearance of the most commonly used fillers.5. Elaboration of a facial map encompassing the different procedures and fillers used.

### TABLE OF CONTENTS/OUTLINE

1. Introductiona. US nasal anatomyb.Clinical application of US to aesthetic procedures of the nosec. Main arteries that supply the nosed. Arterial variants that should be reported to increase procedure safety2. Fillersa. Differences between the main types of fillersb. Ultrasound appearance of fillers;c. Different roles and objectives of fillers in each nasal region.3. Extensive pre - and post procedure US imaging, including possible complications4. Elaboration of the nasal ultrasound report - What the dermatologists need to know.5. Take-home messages

## INEE-1 WHAT IS A DIFFUSION MODEL? CONTRIBUTION TO MEDICINE USING CUTTING-EDGE TECHNOLOGY

Atsushi Teramoto, PhD (*Abstract Co-Author*) Nothing to Disclose
Noritaka Yoshioka (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Generative AI models, which have fueled the recent AI boom, are coming into their own in various fields. The medical field is no exception. Generative AI models are improving the accuracy and reliability of conventional AI models, enabling pathologists to make more accurate diagnoses and reduce their workload. This exhibition aims to teach the idea of the diffusion model, which is attracting more attention than any other generative AI model, and to show how it will contribute to the future development of medicine.

### TABLE OF CONTENTS/OUTLINE

Table of Contents1. Why diffusion models are attracting attention based on the challenges of conventional generative models2. Basic ideas of diffusion models3. What is possible with the diffusion model and examples of medical applicationsOutline1.Why the diffusion model? 2.Basis of the diffusion model- Forward method- Reverse method 3.What the diffusion model can do- Scope of application of diffusion model- Medical Applications

## INEE-10 REFOCUSING ON THE STEREOSCOPIC DISPLAY USING PHOTO-REALISTIC 3D-CT IMAGES AND CT COLONOGRAPHY

Hiroki Kawashima, PhD (*Abstract Co-Author*) Kyoto kagaku, Research collaboration
Katsuhiro Ichikawa, PhD (*Abstract Co-Author*) Nothing to Disclose
Shiori Yamashita, BS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Existing types of stereoscopic display for medical imaging. - Understand the limitations of stereo viewing with the conventional volume rendering (VR) images. - Explore the principles of photorealistic VR and its applications to three dimensional (3D) CT images and CT colonography. - Effectiveness of stereoscopic displays with polarized glasses using photorealistic VR (PRVR) images. - Experience of stereo viewing with PRVR images using the demonstration system of this exhibit.

### TABLE OF CONTENTS/OUTLINE

Introduction - Background of stereo display in medical imaging. - Motivation for refocusing on the stereo display using PRVR images. Methods - A new algorithm for realizing very fast rendering photorealistic 3D image and its specialization for stereo viewing with precise shading and shadowing using multiple light sources. - Measurements of the rendering speed. - Visual comparison between stereo viewings using conventional VR (CVR) and PRVR for depth perception and overall visiblility (observers: three radiological technologists with experiences of clinical 3D-CT image producing). Results - Rendering speed: approximately 25 ms per stereo frame. - Visual comparison: all observes rated the maximum score (PRVR >> CVR) - Demonstration of PRVR stereo images (Please manipulate the demonstration system.) Discussion - The PRVR's photo-reality, with its faithful shading and shadowing, was more emphasized on the stereo display. - Operational facility due to the photo-reality and fast rendering. - Future directions and potential applications. Conclusion - Photorealistic VR images ensured the usefulness of stereoscopic displays. - Potential clinical significance and implications for patient care.

## INEE-11 A RADIOLOGISTS PERSPECTIVE OF GROUNDBREAKING ADVANCEMENTS IN LARGE LANGUAGE MODELS: PAST, PRESENT AND FUTURE

Amit Gupta, MD (*Abstract Co-Author*) Nothing to Disclose
Joshua Hunter, BS (*Abstract Co-Author*) Nothing to Disclose
Syed Muhammad Awais Bukhari, MD (*Abstract Co-Author*) Nothing to Disclose
Orlando M. Martinez (*Abstract Co-Author*) Nothing to Disclose
Charit R. Tippareddy, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• Discuss the basics of LLMs and their utility within radiology • Explore the major breakthroughs and updates over this past year • Showcase the current LLMs available on the market o Compare and contrast the most popular options o Discuss strengths and weakness of each o Highlighting specific use cases of interest to radiologists

**TABLE OF CONTENTS/OUTLINE**

1. What is a Large Language Model (LLM) and why should we care? a. Brief history of LLMs b. Recent news headlines/articles c. Recently published radiology journal articles highlighting LLMs 2. Major breakthroughs in LLMs a. Emphasis on ChatGPT's breakthroughs and how other companies are following suit b. Multimodality LLMs c. Improvements in accuracy/precision 3. Examples of the top used LLMs that are currently available a. General chat engines vs trainable models b. Compare and contrast differences between LLMs c. Highlight strengths and weaknesses d. Explain best LLM for specific use cases (writing papers, research, education, etc?) 4. Biggest barriers for introduction of LLMs into radiology a. Discuss cases of how people/institutions have circumvented these barriers b. Explore potential pathways forward 5. Near Horizon and future of LLMs a. Rise of open source LLMs more compatible for medical use (HIPAA compliant) b. Enterprise based LLMs (company-specific) c. Improved accuracy and speed with new technological advancements (Self fact-checking) d. Artificial general intelligence

## INEE-12 STREAMLINING SUCCESS: ENHANCING RADIOLOGY READING ROOM EFFICIENCY WITH AUTOMATED PYTHON PIPELINES

Amit Gupta, MD (*Abstract Co-Author*) Nothing to Disclose
Syed Muhammad Awais Bukhari, MD (*Abstract Co-Author*) Nothing to Disclose
Richard L. Barger JR, MD (*Abstract Co-Author*) Nothing to Disclose
Charit R. Tippareddy, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Discuss the integration of basic python coding to enhance radiology workflow in the reading room
- Compare and contrast the utility of python coding to large language models (LLMs)
- Showcase existing tools and future ideas
- Demonstrate how large language models can help radiologists with no programming background create useful tools

**TABLE OF CONTENTS/OUTLINE**

1. What is Python? a. Historical perspective b. Usage in fields including medicine. c. Appeal of Python in clinical settings due to simplicity and community support. 2. Compare and contrast Python vs LLMs 3. Capabilities of Python and useful downloadable packages a. PyAutoGUI, tkinter, EasyOCR, PyperClip for custom UI based programs b. NumPy, SciPy, and Pandas for data manipulation c. PyDicom for DICOM files handling. 4. Examples of programs using these packages a. AI generated output to final report (decode AI output into report verbiage) b. Copy forward tool (automate transfer of historical findings into new reports to save time) c. Updating comparisons on reporting software (import dates for past images that have been reviewed) d. Input series/image numbers with keybind (insert image series number and slice number into report for referencing) e. Manipulating PACS (look at a series number and slice number on a report, and directly open up to that image) 5. Implementation in clinical practice: a. Challenges/Barriers: i. Steep learning curve for non-programmers ii. System compatibility issues iii. Cultural shift required in adopting new technologies b. Solutions i. Education ii. Phased implementation iii. Involving IT support 6. Future of python coding 7. Tutorial for Non-programmers a. Installation guide b. Downloading packages c. Programming with LLMs

## INEE-13 STREAMLINING MEDICAL IMAGE ANNOTATION: MITK'S AI POWERED WORKFLOW FOR EFFICIENT SEGMENTATION TASKS

**Awards**
**Certificate of Merit**

Klaus Maier-Hein (*Abstract Co-Author*) Nothing to Disclose
Marco Nolden (*Abstract Co-Author*) Nothing to Disclose
Ralf Floca (*Abstract Co-Author*) Nothing to Disclose
Stefan Dinkelacker (*Abstract Co-Author*) Nothing to Disclose
Ashis Ravindran, MS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The Medical Imaging Interaction Toolkit (MITK) is a well-established open-source software for interactive medical image processing applications. Amongst others MITK showcases a feature rich toolkit for medical image segmentation, integrating state-of-the-art AI tools to enhance the accuracy and efficiency of segmentation tasks. Utilizing these tools, the MITK Workbench facilitates users to generate instance or semantic image segmentations to produce high quality annotations for supervised learning tasks or medical image analysis. MITK offers, besides classical tools, a user-friendly interface to popular interactive AI models like the Segment Anything Model MedSAM for interactive image segmentation, making it accessible adding 3D support. MITK also offers easy access to the ML-based automatic segmentation algorithms Totalsegmentator nnUNet. In addition, MITK also covers the gamut of MONAI world via its support of MONAI Label app. The available tools are also enhanced by interpolation options and support for 3D+t images. Additionally, MITK introduces the Segmentation Task Lists, an optimized workflow for batches of segmentation tasks based on user-defined task lists. This feature significantly streamlines annotation and review processes, allowing for efficient management of multiple segmentation tasks. Overall, by leveraging AI, MITK offers a comprehensive solution for medical image segmentation, enhancing the accuracy efficiency of medical imaging analysis.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction 2. General segmentation tools 3. AI Segmentation tools 4. MONAI Label 5. Utilities 6. Segmentation Tasks Lists 7. Integration in annotation workflows 8. Conclusion and Future directions

## INEE-14 NOT MAGIC, MATHEMATICS! A RADIOLOGIST'S VISUAL GUIDE TO PERFORMANCE METRICS IN AI RESEARCH

Leticia M. Pessanha Alves, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

As Artificial Intelligence integration deepens within the radiology field, it becomes essential for radiologists to become familiar with the performance metrics of Machine Learning Models. This familiarity is not just crucial for the application but also for the critical evaluation of AI tools in clinical settings. However, the complexity of the mathematical concepts involved can present a significant barrier. This education exhibit aims to simplify these concepts through visual aids and correlate them with specific radiological tasks, making the information more accessible and comprehensible.

**TABLE OF CONTENTS/OUTLINE**

1. Types of Machine Learning applications in radiology and their corresponding performance metrics; 2. Accuracy; 3. Confusion Matrix; 4. Specificity; 5. Recall; 6. Precision; 7. F1-score; 8. ROC curve / AUC; 9. Dice Score; 10. Mean Absolute Error

## INEE-15 EMERGING HORIZONS: FDA-APPROVED AI TECHNOLOGIES IN ABDOMINAL IMAGING - PIONEERING PRECISION, REDEFINING PRACTICE

Panagiotis Korfiatis, PhD (*Abstract Co-Author*) Nothing to Disclose
Andrew Missert, PhD (*Abstract Co-Author*) Nothing to Disclose
Ryan Dillard (*Abstract Co-Author*) Nothing to Disclose
Ashish R. Khandelwal, MD (*Abstract Co-Author*) Nothing to Disclose
Timothy L. Kline, PhD (*Abstract Co-Author*) Nothing to Disclose
Pranav Ajmera, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

•Introduce the evolution of artificial intelligence (AI) in radiology, specifically focusing on its application to abdominal imaging. • Examine the FDA approval process for AI-driven medical devices and tools, highlighting the rigorous measures in place to ensure safety and efficacy. • Overview of existing FDA-approved AI technologies in abdominal imaging, detailing their applications across the liver, biliary system, intestine, prostate, kidney, bladder, and vascular imaging. • Impact of AI technologies on diagnostic accuracy, workflow optimization, patient care, and explore future directions for AI in abdominal radiology.

### TABLE OF CONTENTS/OUTLINE

Introduction • Overview of the transformative alliance between radiology and AI in modern medicine.FDA Approval Process• Explanation of the revamped FDA approval pathway for AI-driven software as medical devices in radiology.• Discuss the challenges and adaptations required for evaluating AI algorithms under the FDA's regulatory framework.Organ-Specific AI Applications • Utilize an organ-specific approach to examine FDA-approved AI technologies. • Overview of AI solutions, including their functionalities, applications, and impact on clinical practice. • Analysis of AI-driven advancements in image quality, noise reduction, longitudinal comparison, and anatomical descriptors across multi-organ systems.Limitations • Elaborate on data privacy, algorithmic bias, need for ongoing validation and monitoring.Conclusion • Reflect on the paradigm shift in healthcare due to AI and the importance of transparent collaboration between developers, regulatory bodies, and the medical community for ascertaining ethical, patient-safe usage.

## INEE-16 UNLOCKING HIDDEN INSIGHTS: LEVERAGING AI FOR OPPORTUNISTIC SCREENING IN RADIOLOGY

Judy W. Gichoya, MBChB, MS (*Abstract Co-Author*) Consultant, Softbrew Digital LTD
Seyed Mohammadreza Chavoshi, MD (*Abstract Co-Author*) Nothing to Disclose
Bardia Khosravi, MD, MPH (*Abstract Co-Author*) Nothing to Disclose
Frank Li (*Abstract Co-Author*) Nothing to Disclose
Hari Trivedi, MD (*Abstract Co-Author*) Founder, Lightbox AI ; Consultant, Sirona Medical, Inc ; Consultant, Flatiron Health ; Consultant, PMX Inc ; Research support, Kheiron Medical Technologies ; Research support, Clairity, Inc ; Research support, Nightingale Open Science ;
Theodorus Dapamede, MD, PhD (*Abstract Co-Author*) Intern, MARS BioImaging Ltd
Amirali Khosravi (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Understand the concept and potential benefits of opportunistic screening in radiology.2. Explore current applications of AI-driven opportunistic screening and their impact on patient care.3. Identify challenges and ethical concerns associated with the implementation of opportunistic screening.

### TABLE OF CONTENTS/OUTLINE

1. Introduction to Opportunistic Screening and AI in Radiology (a). Defining opportunistic screening and its role in early disease detection (b). Current trends and advancements in AI-assisted opportunistic screening research 2. Applications of AI-Driven Opportunistic Screening (a). General approaches to opportunistic screening using AI (b). Case studies: AI-based opportunistic screening using direct signal processing (c). Case studies: AI-based opportunistic screening using surrogate signal processing 3. Future Directions and Challenges (a). Expanding AI-based opportunistic screening to other diseases and imaging modalities (b). Collaborating with healthcare providers to optimize patient care and integrate AI-based screening into clinical workflows 4. Ethical Considerations (a). Informed consent and patient autonomy in the context of opportunistic screening (b). Potential misuse of AI-generated information by third parties (e.g., insurance companies) (c). Ensuring equitable access to AI-based screening technologies across diverse patient populations 5. Conclusion (a). Recap of the potential benefits and challenges of AI-driven opportunistic screening in radiology (b). Future directions for research and implementation to enhance patient care and outcomes

## INEE-17 LARGE LANGUAGE MODELS FOR RADIOLOGISTS: A STEP-BY-STEP PRIMER FOR EFFECTIVE USE

David A. Woodrum, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Pouria Rouzrokh, MD, MPH (*Abstract Co-Author*) Nothing to Disclose

Sanaz Vahdati, MD (*Abstract Co-Author*) Nothing to Disclose
Ali Ganjizadeh, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

I. The Power of Context: LLMs vs. String Search: Unlike string search, which is limited to exact word matches, LLMs excel at grasping context and summarization. This makes them indispensable for tasks that require a deeper understanding of a text, such as identifying tumor recurrences or excluding false positives in radiology reports - particularly in retrospective studies.II. The Art of Crafting Effective Prompts for LLMs: The quality of your prompts can make all the difference in the output of your LLM. You can significantly influence the model's response by asking the right questions and providing clear instructions. To take it to the next level, combine effective prompting with reinforcement learning and human feedback (RLHF) to achieve the desired outcomes.III. Simplifying PHI Protection with Low-Code/No-Code Solutions: By leveraging no-code tools like Ollama, Llamafile, or GPT4all, you can run open-source models like LLaMA3 or Mixtral on your workstation, ensuring HIPAA compliance without massive computation power.

### TABLE OF CONTENTS/OUTLINE

I. LLMs vs. String Searcho Limitations of String Search: Understanding the limitations of exact word matcheso The Advantages of LLMs: context understanding and summarizationo Real-World Applications: Identifying tumor recurrences, excluding false positives in radiology reportsII. Crafting Effective Prompts for LLMso How prompts influence LLM outputo Strategies for asking the right questions and providing clear instructionso Taking it to the Next Level: Combining effective prompting with RLHFIII. Simplifying PHI Protection with Low-Code/No-Code Solutionso Running Open-Source Models Locally

Syed Muhammad Awais Bukhari, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Understand the journey of AI from bench to bedside 2. Know about the importance of clinical implementation of AI tools utilizing a sample workflow 3. Understand how to overcome challenges associated with the clinical deployment of AI

### TABLE OF CONTENTS/OUTLINE

1. AI Use Cases in Radiology o Classification o Segmentation o Localization o Preprocessing o Detection o Prediction 2. Journey of an AI tool: From Bench to Bedside o Identification of a Clinical Problem o Dataset Selection o Dataset Preparation o Algorithm development and training o Clinical Implementation and Monitoring 3. FDA approval process o FDA oversight (ensure compliance, including premarket review, risk classification, and post-market surveillance.) o Software as a Medical Device (SaMD) o Risk Classification and Premarket approval (Most radiology tools fall under Class II or III, requiring premarket approval) o Federated learning (data privacy-preserving method for AI tool training) o Adaptive Learning (regulatory framework for adaptive AI models, ensuring they meet initial and ongoing standards) 4. Clinical Deployment of AI: Basic steps and Clinical applications o Knowing the availability of resources and strengths of the radiology system o Identifying and addressing the needs of your system o Creating unique workflows o Performance monitoring of AI o Involving clinical teams o Dealing with increasing complexities

## INEE-19 PIXEL-PERFECT PROTECTION: CYBERSECURITY TACTICS FOR RADIOLOGISTS

Tatiana C. Tucunduva, MD (*Abstract Co-Author*) Nothing to Disclose
Alexandre Domingos De Sousa (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Understanding Cyber Threats in Radiology highlights the range of cyber threats like ransomware and data breaches targeting radiology, aiming to increase awareness of system vulnerabilities.- Principles of Secure Data Management emphasize encrypting patient data and images, secure access, and regular backups to protect data's confidentiality, integrity, and availability.- Incident Response and Recovery Planning details steps for radiology departments to prepare for cyber incidents, including detection, containment, and recovery, emphasizing effective communication.

### TABLE OF CONTENTS/OUTLINE

- Introduction to Cybersecurity in Radiology offers an overview of cybersecurity's importance and challenges in radiology.- Common Cyber Threats and Vulnerabilities in Radiology explores cyber threats specific to radiology departments.- Fundamental Cybersecurity Practices for Radiologists introduces basic cybersecurity measures like strong passwords and secure internet practices.- Advanced Data Protection Techniques covers sophisticated strategies like encryption and anonymization of patient data.- Legal and Regulatory Considerations provides an overview of data protection laws in healthcare.- Developing a Cyber Resilient Culture in Radiology Departments discusses fostering cybersecurity awareness through training and simulations.

## INEE-2 USING ANATOMICAL SEGMENTATION ALGORITHMS FOR CONTEXT-SENSITIVE CT IMAGING RECONSTRUCTION

Nathalie Mertens (*Abstract Co-Author*) Nothing to Disclose
Peter De Jaeger, PhD (*Abstract Co-Author*) Nothing to Disclose
Kristof De Smet, MD, MSc (*Abstract Co-Author*) Nothing to Disclose
Thomas Ryckaert (*Abstract Co-Author*) Nothing to Disclose
Stijn Schatteman, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

CT imaging workflows frequently entail the review of multiple reconstructions of the same anatomical region, customized to distinct structures. This process involves manipulating various image windows and applying different kernel reconstructions, which can be time-intensive.Context-Sensitive reconstruction represents an innovative method designed to alleviate this burden. Employing anatomical segmentation algorithms, this technique accurately identifies and delineates diverse organs and tissues within a standard CT scan. Subsequently, it adjusts reconstruction settings specific to each anatomical structure, including tailored windowing, kernel selection. This methodology was initially proposed by S. Dorn et al. in 2018.By enabling a single comprehensive image that integrates all necessary reconstructions, this approach significantly reduces redundancy. Context-Sensitive reconstruction not only streamlines the interpretation process but also enhances efficiency and diagnostic precision in CT imaging.We outline a practical application of this method using the MONAI framework. Utilizing the publicly accessible "total segmenter" tool by J. Wasserthal et al., we generate segmentation maps that inform customized reconstruction settings for each anatomical structure, culminating in a unified image.

### TABLE OF CONTENTS/OUTLINE

1) An overview of common reconstruction parameters.2) Introduce the concept of context-Sensitive reconstruction to streamline CT imaging interpretation.3) Demonstrate the practical implementation process using freely available tools.4) Case studies to illustrate the potential benefits and limitations of this technique in clinical settings.

## INEE-20 AN OVERVIEW OF THE APPLICATIONS OF ARTIFICIAL INTELLIGENCE/MACHINE LEARNING IN MEDICAL IMAGING AND THE PROCESS OF DEVELOPING SUPERVISED LEARNING MODELS

William Fan (*Presenter*) Nothing to Disclose

### TEACHING POINTS

This education exhibit presentation covers some use-cases based on supervised machine learning models for medical imaging and provides a brief rationale for the impact of artificial intelligence in healthcare.It goes on to present a broad overview of the steps involved in the development of supervised machine learning projects, from problem selection all the way to model deployment and monitoring.An in-depth diagram describing the roles of different datasets used in the development process of a supervised model is also displayed.Finally, a mini-glossary with some of the key terms for projects of machine learning in healthcare is also presented.

**TABLE OF CONTENTS/OUTLINE**

1) Will artificial intelligence replace or augment doctors?2) Use-cases based on supervised machine learning in medical imaging3) Development steps of supervised machine learning (ML) models4) Overview of datasets involved in a supervised machine learning diagnostic algorithm5) Mini-glossary of technical terms for projects of machine learning in healthcare

## INEE-21 STANDARDIZING IMAGING FINDINGS REPRESENTATION: HARNESSING COMMON DATA ELEMENTS SEMANTICS AND FAST HEALTHCARE INTEROPERABILITY RESOURCES STRUCTURES

**Awards**
**Certificate of Merit**

Marc D. Kohli, MD (*Abstract Co-Author*) Founder, Alara Imaging;Stockholder, Alara Imaging
Teri M. Sippel Schmidt, MS (*Abstract Co-Author*) Nothing to Disclose
Kevin O'Donnell (*Abstract Co-Author*) Employee, Canon Medical Systems Corporation
Brian Bialecki (*Abstract Co-Author*) Nothing to Disclose
Tarik K. Alkasab, MD, PhD (*Abstract Co-Author*) Consultant, Nuance Communications, Inc;Medical Advisory Board, Nuance Communications, Inc
Ali S. Tejani, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Introduce joint Radiological Society of North America (RSNA)/American College of Radiology (ACR) Common Data Elements (CDEs) project 2. Outline the emerging framework using CDEs as the semantic labels on standard FHIR structures 3. Review relationship between CDE Sets/Elements and radiology finding attributes 4. Review examples of findings encoded as Health Level 7 Fast Healthcare Interoperability Resources (HL7 FHIR) Observations using CDE Set/Element identifiers as standardized semantic labels ?

**TABLE OF CONTENTS/OUTLINE**

1. Introduction a. Limitations of integrating information in radiology reports i. Heterogeneous reporting styles ii. Absence of a uniformly accepted standard for structured data iii. Difficult to extract meaningful insight at scale b. Introduce joint RSNA/ACR CDE project c. Introduce Health Level 7 Fast Healthcare Interoperability Resources (HL7 FHIR) d. Role of standard ontologies i. RadLex ii. SNOMED CT iii. LOINC 2. Propose CDEs as a Data Model and review terminology a. Hierarchy of Sets/Elements/Values b. Role of Set/Element IDs c. Structure of a Set Definition d. Representing CDE Sets/Elements with HL7 FHIR Observations 3. "Anatomy" of an observation encoded as a CDE 4. Specific use cases demonstrating model in practice a. Example coding structures for radiology findings i. Pulmonary nodule (RDES195) ii. CT Stroke (RDES22) iii. Acute diverticulitis (RDES138) b. Longitudinal tracking of findings over time c. AI result integration and monitoring

## INEE-22 POST DEPLOYMENT MONITORING AND POST-MARKET SURVEILLANCE IN RADIOLOGY AI: CURRENT PRACTICES, POSSIBILITIES, AND MANDATES

Abhishek Gupta (*Abstract Co-Author*) Employee, CARPL.ai
Vasantha Kumar Venugopal, MD (*Presenter*) Officer, CARPL.AI Inc

**TEACHING POINTS**

1. Continuous monitoring is crucial for ensuring that AI tools perform reliably and safely after deployment, aligning with both clinical needs and regulatory standards. 2. Critical metrics such as temporal stability and predictive divergence provide insights into an AI system's reliability and the necessity for periodic recalibration 3. Differentiating between what is currently required by law and what practices could be implemented to further enhance AI monitoring 4. Exploring how different levels of human involvement in monitoring (in-the-loop, out-of-the-loop, over-the-loop, on-the-loop) can impact the effectiveness and efficiency of AI systems 5. Identifying and addressing the practical challenges in implementing effective AI surveillance, including technological, operational, and regulatory hurdles

**TABLE OF CONTENTS/OUTLINE**

Current Monitoring Practices in Radiology AI: Detailed examination of human-in-the-loop and human-out-of-the-loop systems.Use of human-over-the-loop and human-on-the-loop as supervisory and alert-based monitoring methods.Potential Advancements in AI Surveillance: Innovations in AI monitoring techniques that could enhance efficacy and safety. Discussion of predictive analytics and automated systems for real-time anomaly detection.Regulatory Frameworks and Mandatory Practices: Overview of global regulatory mandates for AI monitoring in healthcare.Specific requirements for continuous monitoring and performance reporting.Challenges and Solutions in Implementing Effective Surveillance

## INEE-23 CLINICAL CONTEXT-BASED WORKFLOW AUTOMATION WITH LARGE LANGUAGE MODEL (CHAT-GPT 4): FROM ACQUISITION AND RECONSTRUCTION FACTORS TO IMAGE POSTPROCESSING AND AI MODEL AUTO-SELECTION

Subba R. Digumarthy, MD (*Abstract Co-Author*) Consultant, Merck & Co, Inc;Consultant, Pfizer Inc;Consultant, Bristol-Myers Squibb Company;Consultant, Novartis AG;Consultant, F. Hoffmann-La Roche Ltd;Consultant, Polaris;Consultant, Cascadian;Consultant, AbbVie Inc;Consultant, Gradalis, Inc;Consultant, Bayer AG;Consultant, Zai Lab Limited;Consultant, Biengen;Consultant, Riverain Technologies, LLC;Consultant, Resonance Health;Consultant, Annalise-AI Pty Ltd;Research Grant, Lunit Inc;Research Grant, General Electric Company;Research Grant, Qure.ai;Speaker, Siemens AG
Michael Suhling, PhD (*Abstract Co-Author*) Employee, Siemens AG
Chelsea Dunning, PHD (*Abstract Co-Author*) Nothing to Disclose
Alexander Katzmann (*Abstract Co-Author*) Consultant, Siemens AG
Oliver Taubmann (*Abstract Co-Author*) Nothing to Disclose
Javier Contreras Yametti, MD (*Abstract Co-Author*) Nothing to Disclose
Mannudeep K. Kalra, MD (*Abstract Co-Author*) Research Grant, Siemens AG;Research Grant, Riverain Technologies, LLC;Research Grant, Coreline Inc
Monica O. Bernardo, MD (*Abstract Co-Author*) Nothing to Disclose
Matthias F. Froelich, MD (*Abstract Co-Author*) Consultant, Smart Reporting GmbH;Consultant, Guerbet SA
George S.K. Fung, PhD (*Abstract Co-Author*) Employee, Siemens AG
Parisa Kaviani, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Key elements of CT workflow from protocol selection, acquisition and reconstruction factors, image post-processing, and AI model selection 2. Manual workflow and importance of clinical context (reason for CT/prior radiology reports) for optimizing radiation dose and image processing 3. Application of large language model (Chat-GPT 4) extraction of relevant clinical context to automate radiology workflow based on customizable rules and guidelines.

**TABLE OF CONTENTS/OUTLINE**

1. Visual summary of manual workflow and pain points in current radiology workflow for incorporating clinical indications for CT and prior CT reports. 2. Elements of radiology workflow automating LLM augmented with >300 clinical rules/guidelines 3. Case-based demonstration of how the proposed LLM uses clinical context for automating workflow by picking the right CT protocol, the acquisition and reconstruction factors, image post-processing, and AI model 4. Real-world examples of how LLM handles exception cases with prior contrast allergies, metal implants, large body habitus and motion artifacts 5. Uses, strengths and limitations of proposed LLM in radiology workflow

## INEE-24 LIVER SEGMENTATION: PRACTICAL APPLICATIONS OF MACHINE LEARNING IN PREOPERATIVE ASSESSMENT, PREDICTION AND EVALUATION OF TREATMENT RESPONSE

John D. Hazle, PhD (*Abstract Co-Author*) Nothing to Disclose
Ahmed Marey, MBBCh (*Abstract Co-Author*) Nothing to Disclose
Awj Twam (*Abstract Co-Author*) Nothing to Disclose
David Fuentes (*Abstract Co-Author*) Nothing to Disclose
Mohamed Eltaher, MD (*Abstract Co-Author*) Nothing to Disclose
Khaled M. Elsayes, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Describe the role of machine learning in tumor segmentation. - Discuss the pros and cons of various segmentation methods.- List the imaging requirements for a liver segmentation project.- Illustrate the current clinical applications of liver segmentation, particularly in preoperative assessment and evaluation of treatment response. - Discuss future directions for liver segmentation.

**TABLE OF CONTENTS/OUTLINE**

1. The role of machine learning in liver segmentation. 2. Current applications of liver volumetry: a. Assessment of treatment response in hepatic malignancies. b. Prediction of patients' overall survival and time-to-progression. c. Future liver volume prior to major hepatectomy. d. Virtual surgical planning. 3. Illustration of available segmentation methods. 4. Comparison: pros and cons of each segmentation method. 5. Step by step tutorial for liver segmentation. 6. Current challenges facing automated liver segmentaion. 7. Future directions: a. Vascular sub-segmentation. b. Radiogenomics. c. Fully automated segmental volumetry. d. Automated volumetric RECIST measurements.

## INEE-25 NEEDLEPATH: AN OPEN SOURCE TOOL FOR OUT-OF-PLANE CT GUIDED NEEDLE PROCEDURES

Phillip M. Cheng, MD, MS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

CT-guided needle placement is a common initial task required for a variety ofinterventional radiology procedures including biopsy, drainage, ablation, injection, fiducial placement, and catheter deployment. Most commonly, the body entry point and target can be imaged in the same axial plane ("in-plane" procedures). However, sometimes an in-plane needle trajectory is either impossible or unsafe.In this exhibit, we illustrate the challenging 3D geometry of out-of-plane CT guided needle placements. We have created an open source software program called NeedlePath, which we designed to allow easy measurement of in-plane and out-of-plane needle angles for these procedures. The program retrieves a series of DICOM images from the PACS, and allows the user to mark the start position and the target on the images. NeedlePath shows the in-plane and out-of-plane needle angles and the projected needle path.

**TABLE OF CONTENTS/OUTLINE**

1. In-plane versus out-of-plane CT procedures (biopsy, drain, fiducialplacement, ablation, injection). 3D geometry of out-of-plane procedures.2. Currently available solutions: patient repositioning, gantry tilt, optical or electromagnetic sensors, robotic systems, dead reckoning3. NeedlePath- open source software program we have created to easily calculate in- and out-of-plane angles, and 3D target distance. Details on mechanics of usage for planning out-of-plane CT procedures and calculating needle adjustments during procedures.

## INEE-26 UNDERSTANDING DICOM IMAGES AND PHI PROTECTION, OR "STAYING OUT OF JAIL", FOR CLINICAL AND RESEARCH PURPOSES

**Awards**
**Cum Laude**

Gabe Lafond (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

DICOM (Digital Imaging Communications in Medicine) images play a vital role in medical diagnostics research. DICOM files contain metadata, a blend of neutral scientific data sensitive protected health information (PHI). Scientific data is interesting to researchers, anonymous safe to share, but the presence of PHI necessitates de-identification/anonymization to uphold patient privacy in accordance with HIPAA. We delve into understanding the DICOM standard, scrutinizing metadata content with knowledge of its use abuse in the wild, the execution of thorough PHI cleansing while retaining useful scientific data. We share insights from our institution's experience data gathered while developing a computer program for anonymization of DICOM images for advanced imaging research purposes. Anonymizing DICOM files entails removal of PHI from metadata, sometimes with provisions for authorized personnel to recover patient identities when necessary. While traditional anonymization methods remove all private tags, leaving only a set of standard tags known to be safe, our recommended approach selectively removes private tags with information matching values from standard tags known to contain PHI. We have validated this method on diverse DICOM datasets, ensuring thorough PHI elimination while preserving scientific data compatibility with popular medical image processing programs.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction to DICOM images Metadata2. Examples of HIPAA violations through DICOM Metadata its Consequences3. Understanding PHI in DICOM Metadata4. Anonymization Methods Challenges5. Selective Anonymization Approach6. Validation of the Method7. Conclusion Future Directions

## INEE-27 FROM CONCEPT TO CLINIC: A STEP-BY-STEP GUIDE TO INTEGRATION OF MEDICAL AI TOOLS INTO RADIOLOGY PRACTICE

Antonio C. Westphalen, MD, PhD (*Abstract Co-Author*) Shareholder, ScanMed, LLC;Research funded, BotImage, Inc
Negar Firoozeh, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Implement a road map to introduce AI/clinical informatics tools in radiology Review challenges with the initiation of AI implementation in a healthcare system Present the value of a team approach to establish a workflow for the validation of AI diagnostic and triage algorithms and future program growth

**TABLE OF CONTENTS/OUTLINE**

Introducing AI tools into a radiology department involves several steps: 1-Needs assessment: Evaluating challenges faced by the evolving radiology department based on patient needs. 2-AI platform selection: Finding the best option based on department needs, priorities, and plans considering available platform features, AI tools menu, and pricing. 3-Stakeholder engagement: A collaborative approach among radiologists, informatics, quality and safety, clinicians, imaging operators, trainees, and research teams. 4-Integration: Defining a workflow for PACS/EHR integration. 5-Piloting: Testing AI tools to assess workflow, efficacy, and potential pitfalls. 6-Education: Training stakeholders for clinical adoption. 7-Communication: Establishing a communication and feedback loop for continued learning and improvement. 8-Data analytics and validation: Validation of AI algorithms with data analytics, with collection, processing, and analysis of large data volumes. 9-Evaluation and optimization: Continued review of AI performance to identify opportunities for improvement, fulfilling unmet needs, and track performance drift.

## INEE-28 PROPOSED MEDICAL SCHOOL CURRICULA FOR 3D PRINTING

**TEACHING POINTS**

1 Medical students should and want to learn 3D printing2 While there are abundant, disparate learning resources, this exhibit aims to fill the unmet need to integrate and standardize 3D printing and its appropriateness into US medical education3 The 3D printing community outside of medicine thrives on free, open exchange of ideas and tools4 The 3 proposed curricula will be open source using a website that welcomes evaluation of outside material

**TABLE OF CONTENTS/OUTLINE**

1 LCME accredits US medical education, mandating content on modern biomedical sciences and organ systems; 3D printing aligns with LCME standards by supporting anatomy and organ system learning2 In response to student desire for learning and the need to align US medical education, multidisciplinary (medical leadership, radiologists, engineers, technologists) experts from five medical schools developed three curricula with medical students3 All curricula have common introduction slides, notes, and videos4 Clinically validated, deidentified .DCM .STL .OBJ files plus 3D PDFs and .JPG photos are available5 Primers focus on commonly used printers: material extrusion and inverted vat polymerization6 Hands-on learning will include end-to-end manufacturing: segmentation, Computer Aided Design, 3D printing, and post-processing. Troubleshooting will be emphasized7 Guidance for medical school leadership includes laboratory start-up and development to include space, technical support, and estimated costs8 Project ideas and proficiency testing will be openly shared9 Medical students will be provided the opportunity to learn how 3D printing is integrated into various specialtiesAll medical student authors contributed equally to this abstract

## INEE-29 AI STARTER: A BEGINNER'S GUIDE TO IMAGE ANALYSIS PROJECTS

Diana V. Vera-Garcia, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. To understand machine learning project requirements and to review the types of resources required for different projects2. To review how to set up the software environment for machine learning projects by guiding learners through the process of software installation and introducing programming languages3. To discuss data preprocessing, the fundamentals of machine learning algorithm creation and validation

**TABLE OF CONTENTS/OUTLINE**

1. Introduction2. Defining the aim of your project3. What computer resources do you need?3.1 The kind of resources that your task requires- Small-scale projects using Machine Learning vs highly computational projects using Deep Learning- GPU, RAM, HARD DRIVE, cloud bases resources and tools4. What software do you need to install?4.1 Can I use the same software for different tasks? 5 How do you get started with coding?5.1 Selection of the best language for my task/project5.2 Which is the easiest way to learn coding? -Use development tools, start a coding project, or implement a use-case scenario problem 7. Preparing data for the project7.1 How much data do you need? 7.2 Data preprocessing, data collection, cleaning, splitting, transformation, and augmentation8. Creating your algorithm8.1 Training and fine-tuning the algorithm8.2 Creating the final model9. Validation and metrics for the algorithm9.1 Internal and external validation9.2 Determining the appropriate metrics for accuracy evaluation11. Code and data sharing11.1 Common platforms for sharing software code and data12. Implementation of already published algorithms12.1 Understanding the task and implementation details12.2 Compare your results with the original model

## INEE-3 THE PITFALLS OF UNDERSTANDING AI PRODUCTS - A RADIOLOGIST'S GUIDE

Bogdan Bercean (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Radiologists face an ever-increasing wide range of choices when comparing and selecting the right AI product. The lack of standardisation in technical specifications and the plethora of new AI-related technical terms could quickly become overwhelming and confusing. To this end, this exhibit uncovers some common pitfalls medical professionals are prone to make. After reviewing it, the radiologist will understand:1) When and how can AUROC be a misleading metric, and what to look for when understanding the quantitative performance of an AI product;2) How the overused "dataset size" selling point is not an absolute reference by itself;3) What types of research articles to look for and what distinctions are to be made;4) How to ask better questions when considering an AI product.

### TABLE OF CONTENTS/OUTLINE

1) Performance metrics and where does AUROC stand?a. continuous metrics;b. dichotomous metrics;2) Varying dataset sizes and types and their impact on different AI paradigms.3) Research types in radiological AI. Which ones are meant for radiologists?4) Top questions a radiologist should ask?

## INEE-30 A PRIMER ON THE FUNDAMENTALS OF GENERATIVE AI FOR MEDICAL IMAGING

Spyridon Bakas, PhD (*Abstract Co-Author*) Nothing to Disclose
Szymon Mazurek (*Abstract Co-Author*) Nothing to Disclose
Sarthak Pati, MSc (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Recent advances in generative artificial intelligence (GenAI) have influenced nearly every industry, including healthcare. Their impact can be especially seen in the domain of medical imaging, where they enabled groundbreaking progress in the fields of denoising, data augmentation, and unsupervised feature extraction. Additionally, GenAI can be used to address clinical issues with a dataset, such as class imbalance. Finally, it can potentially add privacy guarantees in a collaborative training framework, such as federated learning. The landscape of possible approaches is massive, with each solution being characterized by its unique properties and requirements. Furthermore, GenAI often exhibits complex principles of operation and high sensitivity to the chosen hyperparameters. All these properties are potential obstacles for the users, especially the ones not deeply familiar with GenAI. We want to address these entry barriers by providing an overview of the available solutions, as well as showing practical examples of using such methodologies with various open-source frameworks. Additionally, we plan on highlighting specific methodologies (autoencoders, generative adversarial methods, diffusion models) along with their principles of operation using an extensive and open-source mammography dataset.

### TABLE OF CONTENTS/OUTLINE

The exhibit will present various techniques for the application of GenAI in medical imaging using open-source frameworks. Users will see practical examples of applying those methods to high-resolution mammography data, highlighting different aspects of using such models and properly configuring their architectures hyperparameters.

## INEE-31 AVOIDING AUTOMATION BIAS: CASE SERIES OF FALSE POSITIVES SEEN IN INTRACRANIAL HEMORRHAGE DETECTION ALGORITHMS

Steven A. Rothenberg, MD (*Abstract Co-Author*) Founder, Empower Therapeutics Inc ;Member, Translation Holdings LLC;Consultant, Radiostics LLC
Houman Sotoudeh, MD (*Abstract Co-Author*) Nothing to Disclose
Srini Tridandapani, MD, PhD (*Abstract Co-Author*) Co-founder, Camerad Technologies, LLC;Spouse, Co-founder, Camerad Technologies, LLC;Officer, Camerad Technologies, LLC;Spouse, Officer, Camerad Technologies, LLC
Jordan D. Perchik, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Background Intracranial hemorrhage (ICH) detection algorithms are some of the most widely used artificial intelligence (AI) applications in clinical radiology practice. These algorithms can assist radiologist in the detection of subtle ICH, and some algorithms interface with the worklist to triage positive exams. No algorithm is perfect, and when false positives occur, this can lead to inappropriate treatment, prolonged hospitalization, and misuse of hospital resources. Radiologists using these algorithms must know when to override the AI result and avoid automation bias. Teaching points The goal of this presentation is to demonstrate the different types of false positives that can be observed with ICH detection algorithms. Understanding how an AI algorithm determines true positives is key to understanding false positives. Examples of the different types of imaging artifacts, pathologic processes, and anatomic variants will be presented alongside an AI heatmap highlighting the image region contributing to the false positive finding.

### TABLE OF CONTENTS/OUTLINE

Example 1Presentation of the different types of imaging artifacts that can result in ICH false positives, including motion artifact and beam hardening. Example 2 Different pathologic processes can trigger a false positive ICH flag. These cases include cortical laminar necrosis, meningiomas, and cavernomas. Example 3 Some anatomic variants, and even normal anatomy, can sometimes cause ICH false positives. These include colloid cysts, the dural venous sinuses, and the choroid plexus.

## INEE-32 DEFINING AI MODELS AND DATASETS TO PROMOTE DISCOVERY AND INTEROPERABILITY

**Awards**
**Certificate of Merit**

Hari Trivedi, MD (*Abstract Co-Author*) Founder, Lightbox AI ; Consultant, Sirona Medical, Inc ; Consultant, Flatiron Health ; Consultant, PMX Inc ; Research support, Kheiron Medical Technologies ; Research support, Clairity, Inc ; Research support, Nightingale Open Science ;
Charles E. Kahn JR, MD, MS (*Abstract Co-Author*) Nothing to Disclose
Safwan Halabi, MD (*Abstract Co-Author*) Advisor, Change Healthcare
Abhinav Suri, BA, MPH (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Describe ontologies and their role in radiology.2, Define the FAIR (Findability, Accessibility, Interoperability, and Reuse) principles.3. Identify gaps in current approaches to capture critical information about AI models and data.4. Understand how an ontology can make radiology AI models and datasets more discoverable and interoperable.

**TABLE OF CONTENTS/OUTLINE**

1. Ontologies a. Overview and definitions b. Why ontologies are useful c. Examples (RadLex, SNOMED CT, etc.)2. FAIR principles a. Overview and definitions b. Applications to radiology AI3. Current approaches a. Model cards b. Datasheets for datasets c. Shortcomings for radiology AI applications4. Radiology Model and Dataset Ontology (RMDO) a. Overview b. Example RMDO-based documents5. Discussion and Next Steps

## INEE-33 ADVANCING RADIOLOGY EDUCATION WITH AI: ENHANCING CURRICULUM PLANNING, IMPLEMENTATION, AND EVALUATION IN RADIOLOGY TRAINING

Bradley J. Erickson, MD, PhD (*Abstract Co-Author*) Board of Directors, VoiceIt Technologies, LLC;Stockholder, VoiceIt Technologies, LLC;Board of Directors, FLOWSIGMA Inc;Officer, FLOWSIGMA Inc;Stockholder, FLOWSIGMA Inc;Officer, Yunu Inc;Stockholder, Yunu Inc
Hillary W. Garner, MD (*Abstract Co-Author*) Nothing to Disclose
Bardia Khosravi, MD, MPH (*Abstract Co-Author*) Nothing to Disclose
Pouria Rouzrokh, MD, MPH (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Artificial intelligence (AI) applications in radiology practice have experienced exponential growth in recent years. Similarly, many radiology programs have incorporated AI education into their curricula. However, the potential impact of AI on radiology education itself remains underemphasized in current literature. While AI's contributions to medical education have been discussed for long, the recent emergence of advanced AI tools for imaging data and large language models holds the promise of significantly improving the quality of radiology education and automating its workflows. These AI tools may be as transformative as distance learning once was, reducing educational disparities and ultimately enhancing the quality of radiologist care and patient outcomes. This educational exhibit aims to provide a comprehensive review of possible strategies, opportunities, and limitations for applying AI to different aspects of radiology education.

**TABLE OF CONTENTS/OUTLINE**

A) Context: A-1) What are the current gaps in terms of using AI to advance radiology education?A-2) The SWOT Analysis of applying AI to radiology education.B) What are the strategies for applying AI to different stages of radiology curriculum planning (examples are provided in the PDF file)?B-1) Needs assessmentB-2) Aims and Objectives Planning B-3) Content collection B-4) Content organization B-5) Learning strategies B-6) Teaching methods B-7) Assessment methods B-8) Curriculum communication B-9) Educational environment B-10) Curriculum managementC) Where to start? C-1) A stepwise roadmap for the gradual introduction of AI to radiology education. C-2) Lesson learned from previous experiences in applying AI to medical education.

## INEE-34 FROM THE LABORATORY TO CLINICAL PRACTICE: CLINICAL TRIALS IN ASSESSING THE EFFICACY OF AI ALGORITHMS IN RADIOLOGY

**TEACHING POINTS**

Emerging literature underscores the transformative potential of Artificial Intelligence (AI) in healthcare. Ensuring robustness and evaluating the generalizability of AI methods necessitates ample and diverse multi-site patient datasets. Yet, access is often hindered by bureaucratic processes, data ownership issues, and legal considerations tied to patient privacy. To address these challenges, we present the Comprehensive Open Federated Ecosystem (COFE), a community-driven initiative featuring multiple open-source tools. COFE aims to democratize distributed healthcare AI by leveraging zero/low code principles, enabling models to learn across data silos via Federated Learning (FL), and assessing their performance on diverse, previously unseen datasets through Federated Evaluation (FE). The exhibit's objectives are to: 1) enhance the community's understanding of FL FE, 2) demonstrate how users can employ FL to train a model across multiple sites, 3) present results using COFE (the inaugural real-world federation evaluation challenge across

71 collaborating sites focusing on brain tumors multi-site breast cancer risk assessment), 4) discuss privacy data protection concerns and COFE's proposed solutions, and 5) illustrate how users can utilize FE to generate generalizable statistics for AI methods.

**TABLE OF CONTENTS/OUTLINE**

This exhibit will present a community-driven open-source ecosystem to train evaluate AI models across multiple clinical sites in a data-private paradigm. Specific principles to protect data privacy will be described, along with common pitfalls to avoid when performing FL-based studies.

## INEE-36 DE-IDENTIFICATION OF RADIOLOGY IMAGING STUDIES: A COMPREHENSIVE REVIEW OF CURRENT PRACTICES AND FUTURE NEEDS IN THE AGE OF AI

Bradley J. Erickson, MD, PhD (*Abstract Co-Author*) Board of Directors, VoiceIt Technologies, LLC;Stockholder, VoiceIt Technologies, LLC;Board of Directors, FLOWSIGMA Inc;Officer, FLOWSIGMA Inc;Stockholder, FLOWSIGMA Inc;Officer, Yunu Inc;Stockholder, Yunu Inc

Shahriar Faghani, MD (*Abstract Co-Author*) Nothing to Disclose
Pouria Rouzrokh, MD, MPH (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

De-identification (DiD) of radiology imaging studies is crucial for ensuring patient privacy during research endeavors, data transfers, and the development of artificial intelligence (AI) models. In this educational exhibit, we begin by reviewing what image DiD is, how it differs from image anonymization, and why it is an important step toward compliance with the Health Insurance Portability and Accountability Act (HIPAA) in radiology. We then review the most frequent formats for storing radiology imaging studies to set the scene for our main discussion. At the core of our content, we delve into four different levels of DiD: radiology reports, imaging file metadata, imaging markers, and morphological features. We will discuss what each of these steps involves and some of the most commonly used tools for implementing them. Most importantly, we will explore how AI algorithms can both threaten the reliability of such tools and be used to enhance each of these four levels. Finally, we wrap up by addressing several common questions and doubts about image DiD in radiology studies. We aim our presentation at general radiologists and strive to deliver our technical content in a language that is accessible to that audience.

**TABLE OF CONTENTS/OUTLINE**

A) Introduction A-1 ) What is image de-identification (DiD)? A-2) How is DiD different from anonymization? A-3) Why is DiD important? B) Frequent file formats for storing image data (DICOM, NIfTI, NRRD, etc.) C) DiD levels-1) Radiology report level: C-2) Imaging file metadata level C-3) Imaging marker level C-4) Morphological features D) How can AI threaten image DiD) E) How can AI improve image DiD) F) Commonly asked questions regarding image DiD.

## INEE-37 CLAIM 2024 AI REPORTING GUIDELINE -- WHAT'S NEW?

**TEACHING POINTS**

1. Understand differences between various large language models (LLMs) and their implications for radiology applications2. Design experiments to systematically select the most appropriate LLM for specific radiology tasks3. Identify and interpret key performance metrics for evaluating LLMs in radiology research

**TABLE OF CONTENTS/OUTLINE**

1. Introduction to Large Language Models in Radiology: (a) Overview of LLMs and their applications in radiology (b) Considerations for of LLM model selection and experimental design (c) Differences between Large Language Models (open vs proprietary; different number of parameters)2. Systematic approach for selecting an LLM use strategy: (a) Fully automatic labeling (b) Semi-automatic labeling3. Designing Experiments for Systematic LLM Model Selection: (a) Defining a radiology task and its complexity (b) Curating annotated datasets for LLM model evaluation (c) Considerations for selecting a range of LLM models with varying sizes and architectures (d) Implementing LLM prompting strategies, such as chain-of-thought (CoT) (e) Measuring

compute time and LLM resource requirements4. Key Performance Metrics for Evaluating LLMs in Radiology: (a) Relatively balanced set: Accuracy(b) Highly imbalance set: F1-score(c) Semi-automatic labeling: NPV5. Case Studies: End-to-end application of the Systematic Approach including task definition, LLM selection, data annotation, prompting, and evaluation: (a) Pneumothorax detection: Simple task complexity and the role of smaller models (b) Rib fracture identification: Moderate task complexity and the impact of model size (c) Cardiomegaly assessment: Complex tasks and the need for larger models6. Conclusion

## INEE-39 LOWERING BARRIERS FOR MEDICAL PRACTITIONERS TO UTILIZE AI: A GUIDE TO IMAGE CLASSIFICATION IN KAAPANA

Klaus Maier-Hein (*Abstract Co-Author*) Nothing to Disclose

### TEACHING POINTS

The integration of artificial intelligence (AI) in medical imaging has been hindered by complexities in AI tool utilization. Streamlining the application process can lower barriers and enable broader adoption by practitioners. This work introduces an automated workflow implemented in Kaapana, designed to facilitate 2D and 3D medical image classification without requiring extensive technical knowledge. This workflow supports various classification settings with a focus on enhancing user accessibility and efficiency in medical AI applications. The Classification Workflow automates several critical aspects of AI model training and application, including hyperparameter setting, preprocessing, and data augmentation. The default parameters are optimized based on principles derived from the successful nnUnet framework. A user-friendly interface allows real-time monitoring and easy adjustment of hyperparameters without coding, enabling experimentation and customization. Additionally, Kaapana’s Datasets View facilitates the tagging and annotation of image datasets, simplifying dataset creation. The Classification Workflow in Kaapana represents a significant step towards democratizing AI in medical imaging, offering a user-friendly tool that abstracts complex processes and allows medical practitioners to utilize the advantages of AI.

### TABLE OF CONTENTS/OUTLINE

- Introduction to Kaapana and AI in Medical Imaging- Overview of Automated Classification Workflow- Hyperparameter Automation, Preprocessing, and Data Augmentation- Showcasing Application Scenarios- User Interface for Hyperparameter Tuning- Real-Time Monitoring with Tensorboard- Dataset Creation via Datasets View

## INEE-4 EXTENDED REALITY RADIOLOGY EDUCATION AND IVR PRACTICE USING VIDEO PASS-THROUGH WEARABLE SPATIAL COMPUTING HEADSET

Takuya Sueyoshi (*Abstract Co-Author*) Holoeyes Inc. : Employment RIVERFIELD Inc. : Research grant Fujitsu Ltd. : Research grant Japan Society for the Promotion of Science (JSPS) : Grant-in-Aid for Scientific Research (KAKENHI)
Maki Sugimoto, MD, PhD (*Presenter*) Officer, Holoeyes Inc

### TEACHING POINTS

The utilization of wearable spatial computing headsets with video pass-through functionality in IVR practice and radiology education enhances diagnostic capabilities, treatment outcomes, and safety. Understanding technical advantages, such as imaging and sensor analysis, facilitates spatial assistance in medical image diagnosis, surgical planning, and therapeutic support. Practical examples demonstrate spatial computing's role in clinical procedures like TAVI, endovascular aneurysm repair, and percutaneous ultrasound-guided liver biopsy. Guidance is provided on overcoming challenges associated with integrating spatial computing into radiology education and clinical interventions.

### TABLE OF CONTENTS/OUTLINE

1. Introduction to Spatial Computing and Video Pass-Through in Radiology Education and IVR Practice.2. Mechanism and Technical Advantages of Device (Apple Vision Pro). Enhancing Spatial Diagnosis: Utilizing augmented reality overlays and real-time image integration.3. Facilitating Surgical Planning and Intervention in IVR.Therapeutic Support in IVR: Utilizing immersive simulations and interactive scenarios.4. Practical Applications in Clinical Procedures: Case-based exploration.5. Addressing Challenges and Pitfalls in Adopting Spatial Computing in Radiology.

## INEE-40 REAL-WORLD FEDERATED LEARNING IN RADIOLOGY: HURDLES TO OVERCOME AND BENEFITS TO GAIN

### TEACHING POINTS

Federated Learning (FL) enables collaborative model training while keeping data locally, holding immense potential to enhance radiological diagnosis and therapy for rare diseases with scarce data. Currently, the majority of FL studies in radiology are simulated due to various hurdles impeding the translation into practice. The few existing real-world FL initiatives rarely communicate measures taken to overcome hurdles, leaving behind a significant knowledge gap. We categorized insights from FL literature with our findings based on their phase of occurrence while establishing a FL initiative. We built our own FL infrastructure within the nation-wide German Radiological Cooperative Network (RACOON) and demonstrated its functionality by training a FL model on a lung pathology segmentation task across six university hospitals. We evaluated FL against less complex alternatives in three evaluation scenarios.From gathered insights, we propose a detailed guide outlining steps, hurdles, and solutions to establish successful FL initiatives conducting real-world experiments. Our experimental results demonstrate superior performance of FL in all evaluation scenarios, justifying itself despite the efforts of real-world FL.The proposed guide aims to aid future FL researchers in circumventing pitfalls, thereby speeding up the translation of FL into practice. Our investigations highlight FL's superiority over alternative approaches, and the importance of strategic organization, robust handling of distributed data and infrastructure in the real world.

### TABLE OF CONTENTS/OUTLINE

1. Introduction2. Implementing conducting real-world FL3. Guide to build real-world FL initiatives4. Discussion

### TEACHING POINTS

Integrating advanced computational tools into clinical environments is a significant challenge, often requiring specialized technical skills and the use of various separate applications in a diverse infrastructural landscape. Kaapana addresses these challenges by providing a comprehensive, open-source and customizable medical image analysis platform that seamlessly incorporates AI capabilities into existing clinical infrastructures. Kaapana enables radiologists and data scientists to train and execute state-of-the-art segmentation algorithms, such as nnU-Net and TotalSegmentator. It also allows users to create, curate, and visualize datasets; manage numerous workflows running in parallel; and train and evaluate new models as ready-to-use solutions. In addition to offering these advanced research tools, by employing the DICOM standard, Kaapana also allows for direct PACS interactions on the platform. The platform’s design enables extensive customizations for specific use cases, and facilitates the integration of new tools and workflows. With robust data protection capabilities, the capacity to manage vast datasets, and support for federated learning, Kaapana is an ideal choice for conducting large-scale, multi-center, interdisciplinary studies that can lead to significant advancements in medical research and patient care.

### TABLE OF CONTENTS/OUTLINE

## INEE-42 ELECTRONIC CLEANSING REIMAGINED: THE POWER OF DIFFUSION-BASED GENERATIVE AI IN CT COLONOGRAPHY

Hiroyuki Yoshida, PhD (*Abstract Co-Author*) Patent holder, Hologic, Inc;Patent holder, Median Technologies
Toru Hironaka (*Abstract Co-Author*) Nothing to Disclose
Janne J. Nappi, PhD (*Abstract Co-Author*) Patent holder, Median Technologies;Patent holder, Hologic, Inc;;
Masaki Okamoto (*Abstract Co-Author*) Stockholder, TOKYO analytica
Rie Tachibana, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The purpose of electronic cleansing (EC) is to subtract orally tagged fecal materials from CT colonography (CTC) images to improve the sensitivity of polyp detection in virtual endoscopic fly-through reading. Diffusion models are a powerful state-of-the-art generative AI technology that has recently achieved tremendous success in various computer vision tasks. This exhibit's teaching points are (1) to explain the role of EC in CTC, (2) to explain how generative AI can be used to perform EC, and (3) to demonstrate clinical outcomes of the state-of-the-art diffusion-based EC in CTC.

### TABLE OF CONTENTS/OUTLINE

1. Introduction: (1.1) the importance of colon cancer screening; (1.2) the role of EC in CTC; (1.3) A brief history of EC methodologies. 2. Generative AI for EC: how it differs from traditional EC. 3. Diffusion-based EC: how it works. 4. Case studies: using a phantom study and clinical CTC cases, demonstrate how the image quality of diffusion-based EC outperforms those of existing EC methods.

## INEE-43 INNOVATIVE APPROACHES TO RADIOLOGY REPORTING: UNRAVELING THE POTENTIAL OF NATURAL LANGUAGE PROCESSING AND AI TECHNOLOGIES

Faiq Tariq (*Abstract Co-Author*) Nothing to Disclose
Pamela H. Nguyen, DO (*Abstract Co-Author*) Nothing to Disclose
Azwade F. Rahman, MD,PhD (*Abstract Co-Author*) Nothing to Disclose
Michael X. Jin, MD, MBA (*Abstract Co-Author*) Nothing to Disclose

Austin Young (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Understand the role of natural language processing (NLP) in transforming radiology reporting2. Showcase ways that NLP software can be utilized to augment radiology practices3. Investigate the potential of voice-to-text software and generative AI to automate radiology reporting4. Explore the potential of automated impression generation in radiology reporting5. Highlight pilot studies conducted at our institution showcasing the potential of ChatGPT and natural language processing (NLP) technologies in radiology reporting

### TABLE OF CONTENTS/OUTLINE

1. Title SlideInnovative Approaches to Radiology Reporting: Unraveling the Potential of Natural Language Processing and AI Technologies2. Learning Objectives3. What is Natural Language Processing? Definition and overview of NLPExplanation of how NLP works 4. Examples of NLP Applications Overview of various applications of NLP in different domainsDiscussion on healthcare-related applicationsIntroduction to benefits/use cases of ChatGPT in healthcare settings5. NLP in RadiologyExploration of the potential of NLP in radiology reporting 6. Automated Report Generation Pilot StudyDescription of study design and methodologyResults and implications 7. Impression Generation Pilot StudyDescription of study design and methodologyResults and implications 8. Other Applications Explore other applications and studies published of NLP in radiology reporting 9. ConclusionSummary of key points

## INEE-5 CT IMAGING BIOMARKERS FOR PHENOTYPIC BIOLOGICAL AGING: OVERVIEW AND COMPARISON WITH OTHER RADIOLOGICAL AND NON-RADIOLOGICAL APPROACHES

Perry J. Pickhardt, MD (*Abstract Co-Author*) Advisor, Bracco Group;Advisor, Zebra Medical Vision Ltd;Advisor, Nano X Imaging;
John W. Garrett, PhD (*Abstract Co-Author*) Nothing to Disclose
Matthew H. Lee, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Chronological age (CA) and sex are drivers of important healthcare decisions (primary prevention, screening, intervention) but CA is an imperfect measure of "healthspan" and longevity. 2. Biological age (BA) attempts to capture the cumulative physiologic effect of genetic predisposition, lifestyle habits, genetic, and disease processes, and has been attempted for decades with limited success. 3. As opposed to existing "frailomics" used in existing BA models, CT-based tissue markers are accessible, reproducible, and reflect a "big picture" net effect of aging at the organ/tissue level. 4. Advances in technology, computing power, and emerging AI technologies make "explainable" and "black box" image-based BA models poised to revolutionize our understanding of aging and longevity. 5. CT-based, "phenotypic" cardiometabolic assessment shows potential for improved personalized prediction and augmentation of current models for predicting "healthspan" and longevity compared with typical demographics.

### TABLE OF CONTENTS/OUTLINE

1. Describe the difference between CA and BA as well as a brief overview of existing BA models. 2. Review common imaging and non-imaging-based models for determining BA. 3. Describe existing AI tools for deriving image-based tissue biomarkers. 4. Contrast "explainable" AI CT-based methodologies from more opaque "black box" deep learning approaches. 5. Discuss early experiences with image-based BA models using both explainable (e.g. fully-automated CT-based abdominal body composition markers) and "black box" AI tools (e.g. BA derived from CXRs). 6. Future directions - image-based AI tools allow for objective, large-scale, population-based investigation.

## INEE-6 A SOFT TISSUE SARCOMA RADIOMICS ATLAS: A VISUAL GUIDE

Matthew J. Nyflot, PhD (*Abstract Co-Author*) Nothing to Disclose
Atefe Pooyan, MD, MPH (*Abstract Co-Author*) Nothing to Disclose
Peter C. Thurlow, MD (*Abstract Co-Author*) Nothing to Disclose
Majid Chalian, MD (*Abstract Co-Author*) Grant, The Boeing Company
Arash Azhideh, MD, MPH (*Abstract Co-Author*) Nothing to Disclose
Paul E. Kinahan, PhD (*Abstract Co-Author*) Co-founder, PET/X LLC
Gita Y. Karande, MMEd, FRCR (*Abstract Co-Author*) Nothing to Disclose
Ehsan Alipour, MD, MPH (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Understand what radiomics features are and how they are utilized in radiology research. 2. An exploration of what radiomic features look like in the context of soft tissue sarcoma imaging. 3. Look into some clinical cases in which an understanding of radiomics features can help with better assessment of the disease. 4. Look into some of the studies that used radiomics to predict various outcome in soft tissue sarcoma and what the most significant features from those studies mean.

### TABLE OF CONTENTS/OUTLINE

1. Introduction: a. Define radiomics features. b. Show example of the utility of radiomics features in assessment of soft tissue sarcoma. i. Radiomics in prediction of post-surgical tissue margin status. ii. Radiomics in prediction of treatment responsec. Explain the radiomics analysis pipeline. d. Overview of radiomics features families. 2. Imaging atlas of each major radiomics feature family a. First Order Statistics b. Shape Based c. Gray Level Co-occurrence Matrixd. Gray Level Run Length Matrixe. Gray Level Size Zone Matrix f. Neighboring Gray Tone Difference Matrixg. Gray Level Dependence Matrix 3. Example Clinical Cases a. Example cases of soft tissue sarcoma with positive and negative post-surgical tissue margin status and their respective radiomics features b. Example cases of soft tissue sarcoma with good and bad treatment response and their respective radiomics features 4. Conclusion a. Summarize the role of radiomics in soft tissue sarcoma assessment. b. Highlight the various families of radiomics features and their meaning.

## INEE-7 PRACTICAL GUIDE FOR CREATING 3D PRINTED MODELS FROM MEDICAL IMAGING STUDIES USING FREE SOFTWARE

Juan Francisco Sallaberry Vega, MD (*Abstract Co-Author*) Nothing to Disclose

Patricia Fraga Rivas, MD (*Abstract Co-Author*) Investigator, General Electric Company
Jaime de Miguel Criado, MD (*Abstract Co-Author*) Nothing to Disclose
Sandra Robledo (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Introduction to 3D printing for medical imaging studies.Selection of suitable images. Description and illustration of data conversion and segmentation steps using open-source software.Overview of printing materials and techniques. Clinical and educational impact examples.

### TABLE OF CONTENTS/OUTLINE

3D printing has emerged as a revolutionary tool in radiology, significantly enhancing surgical planning and medical education.A practical and accessible guide is presented for creating 3D printed models from medical imaging studies using free software. The process begins with the selection of suitable images, emphasizing the need for high resolution and contrast in CT and MRI studies. Subsequently, the segmentation of anatomical structures using free specialized software and the conversion of data to formats suitable for 3D printing are explained.Additionally, we provide insights into different printing materials and techniques available, highlighting the importance of choosing appropriately according to the clinical or educational purpose. Finally, the utility of 3D printed models in various medical applications is examined through cases from our own service.

## INEE-8 APPLYING AI TO MEDICAL IMAGING: HOW TO BUILD A PROJECT FROM THE GROUND UP

Christian Henriksen (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Aimed at radiologists with an interest in how to leverage AI for research but a lack of experience in machine learning, this presentation will use detailed but accessible language to provide an overview of the necessary steps to take a project from idea to full-fledged functional AI model. Teaching points will include an overview of current types of AI model and their capabilities as they relate to medical imaging, a review of current interpretability methods for

imaging AI, an outline of the components of a project to develop an AI model, and a discussion of two real example projects that I myself have developed.

**TABLE OF CONTENTS/OUTLINE**

1. What is AI? a. Deep Learning b. AI in Medical Imaging i. Convolutional Neural Networks ii. Vision Transformers 2. What Can AI Do? a. Classification b. Regression c. Segmentation. 3. What Can't AI Do? 4. A Note on Interpretability a. Saliency Maps. 5. Anatomy of a Project a. The Idea b. The Dataset i. The Input Data ii. The Output Data Ground Truth c. The Hardware d. The Software e. The Training f. The Evaluation. 6. Example Projects a. Bone Mineral Density from Computed Tomography b. Diagnosis of Normal Pressure Hydrocephalus from Head CT

**TEACHING POINTS**

Derivative datasets, created by generative AI models, closely resemble real-world medical data while preserving patient privacy and enabling data diversity. This educational exhibit aims to:1. Understand the concept of derivative datasets and their role in medical imaging research2. Explore the potentials and promises of generative AI in creating diverse, privacy-preserving, and versatile datasets3. Discuss the challenges and ethical considerations associated with the use of derivative datasets

**TABLE OF CONTENTS/OUTLINE**

1. Introduction to derivative datasets and generative models in medical imaging: (a) Definition and concept of derivative datasets (b) Types of generative models (VAEs, GANs, DDPMs)(c) Role of derivative datasets in medical imaging research2. Potentials and promises of derivative datasets:(a) Increased dataset size and diversity:(b) Privacy-preserving nature(c) Versatility across tasks(d) Modeling complex biological phenomena3. Challenges and considerations (a) Patient privacy and data copying(b) Identification of source dataset and disclosure(c) Interpretability and explainability(d) Potential biases4. Future directions and conclusions:(a) Development of robust and standardized evaluation frameworks(b) Exploration of novel architectures and training strategies(c) Integration with other AI techniques (d) Addressing ethical and regulatory challenges (e) Importance of collaboration and responsible utilization

## WHAT IS A DIFFUSION MODEL? CONTRIBUTION TO MEDICINE USING CUTTING-EDGE TECHNOLOGY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Atsushi Teramoto, PhD (*Abstract Co-Author*) Nothing to Disclose
Noritaka Yoshioka (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Generative AI models, which have fueled the recent AI boom, are coming into their own in various fields. The medical field is no exception. Generative AI models are improving the accuracy and reliability of conventional AI models, enabling pathologists to make more accurate diagnoses and reduce their workload. This exhibition aims to teach the idea of the diffusion model, which is attracting more attention than any other generative AI model, and to show how it will contribute to the future development of medicine.

### TABLE OF CONTENTS/OUTLINE

Table of Contents1. Why diffusion models are attracting attention based on the challenges of conventional generative models2. Basic ideas of diffusion models3. What is possible with the diffusion model and examples of medical applicationsOutline1.Why the diffusion model? 2.Basis of the diffusion model- Forward method- Reverse method 3.What the diffusion model can do- Scope of application of diffusion model- Medical Applications

## REFOCUSING ON THE STEREOSCOPIC DISPLAY USING PHOTO-REALISTIC 3D-CT IMAGES AND CT COLONOGRAPHY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Hiroki Kawashima, PhD (*Abstract Co-Author*) Kyoto kagaku, Research collaboration
Katsuhiro Ichikawa, PhD (*Abstract Co-Author*) Nothing to Disclose
Shiori Yamashita, BS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Existing types of stereoscopic display for medical imaging. - Understand the limitations of stereo viewing with the conventional volume rendering (VR) images. - Explore the principles of photorealistic VR and its applications to three dimensional (3D) CT images and CT colonography. - Effectiveness of stereoscopic displays with polarized glasses using photorealistic VR (PRVR) images. - Experience of stereo viewing with PRVR images using the demonstration system of this exhibit.

### TABLE OF CONTENTS/OUTLINE

Introduction - Background of stereo display in medical imaging. - Motivation for refocusing on the stereo display using PRVR images. Methods - A new algorithm for realizing very fast rendering photorealistic 3D image and its specialization for stereo viewing with precise shading and shadowing using multiple light sources. - Measurements of the rendering speed. - Visual comparison between stereo viewings using conventional VR (CVR) and PRVR for depth perception and overall visiblility (observers: three radiological technologists with experiences of clinical 3D-CT image producing). Results - Rendering speed: approximately 25 ms per stereo frame. - Visual comparison: all observes rated the maximum score (PRVR >> CVR) - Demonstration of PRVR stereo images (Please manipulate the demonstration system.) Discussion - The PRVR's photo-reality, with its faithful shading and shadowing, was more emphasized on the stereo display. - Operational facility due to the photo-reality and fast rendering. - Future directions and potential applications. Conclusion - Photorealistic VR images ensured the usefulness of stereoscopic displays. - Potential clinical significance and implications for patient care.

## A RADIOLOGISTS PERSPECTIVE OF GROUNDBREAKING ADVANCEMENTS IN LARGE LANGUAGE MODELS: PAST, PRESENT AND FUTURE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Amit Gupta, MD (*Abstract Co-Author*) Nothing to Disclose
Joshua Hunter, BS (*Abstract Co-Author*) Nothing to Disclose
Syed Muhammad Awais Bukhari, MD (*Abstract Co-Author*) Nothing to Disclose
Orlando M. Martinez (*Abstract Co-Author*) Nothing to Disclose
Charit R. Tippareddy, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• Discuss the basics of LLMs and their utility within radiology • Explore the major breakthroughs and updates over this past year • Showcase the current LLMs available on the market o Compare and contrast the most popular options o Discuss strengths and weakness of each o Highlighting specific use cases of interest to radiologists

### TABLE OF CONTENTS/OUTLINE

1. What is a Large Language Model (LLM) and why should we care? a. Brief history of LLMs b. Recent news headlines/articles c. Recently published radiology journal articles highlighting LLMs 2. Major breakthroughs in LLMs a. Emphasis on ChatGPT's breakthroughs and how other companies are following suit b. Multimodality LLMs c. Improvements in accuracy/precision 3. Examples of the top used LLMs that are currently available a. General chat engines vs trainable models b. Compare and contrast differences between LLMs c. Highlight strengths and weaknesses d. Explain best LLM for specific use cases (writing papers, research, education, etc?) 4. Biggest barriers for introduction of LLMs into radiology a. Discuss cases of how people/institutions have circumvented these barriers b. Explore potential pathways forward 5. Near Horizon and future of LLMs a. Rise of open source LLMs more compatible for medical use (HIPAA compliant) b. Enterprise based LLMs (company-specific) c. Improved accuracy and speed with new technological advancements (Self fact-checking) d. Artificial general intelligence

## STREAMLINING SUCCESS: ENHANCING RADIOLOGY READING ROOM EFFICIENCY WITH AUTOMATED PYTHON PIPELINES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Amit Gupta, MD (*Abstract Co-Author*) Nothing to Disclose
Syed Muhammad Awais Bukhari, MD (*Abstract Co-Author*) Nothing to Disclose
Richard L. Barger JR, MD (*Abstract Co-Author*) Nothing to Disclose
Charit R. Tippareddy, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Discuss the integration of basic python coding to enhance radiology workflow in the reading room
- Compare and contrast the utility of python coding to large language models (LLMs)
- Showcase existing tools and future ideas
- Demonstrate how large language models can help radiologists with no programming background create useful tools

### TABLE OF CONTENTS/OUTLINE

1. What is Python? a. Historical perspective b. Usage in fields including medicine. c. Appeal of Python in clinical settings due to simplicity and community support. 2. Compare and contrast Python vs LLMs 3. Capabilities of Python and useful downloadable packages a. PyAutoGUI, tkinter, EasyOCR, PyperClip for custom UI based programs b. NumPy, SciPy, and Pandas for data manipulation c. PyDicom for DICOM files handling. 4. Examples of programs using these packages a. AI generated output to final report (decode AI output into report verbiage) b. Copy forward tool (automate transfer of historical findings into new reports to save time) c. Updating comparisons on reporting software (import dates for past images that have been reviewed) d. Input series/image numbers with keybind (insert image series number and slice number into report for referencing) e. Manipulating PACS (look at a series number and slice number on a report, and directly open up to that image) 5. Implementation in clinical practice: a. Challenges/Barriers: i. Steep learning curve for non-programmers ii. System compatibility issues iii. Cultural shift required in adopting new technologies b. Solutions i. Education ii. Phased implementation iii. Involving IT support 6. Future of python coding 7. Tutorial for Non-programmers a. Installation guide b. Downloading packages c. Programming with LLMs

## STREAMLINING MEDICAL IMAGE ANNOTATION: MITK'S AI POWERED WORKFLOW FOR EFFICIENT SEGMENTATION TASKS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Klaus Maier-Hein (*Abstract Co-Author*) Nothing to Disclose
Marco Nolden (*Abstract Co-Author*) Nothing to Disclose
Ralf Floca (*Abstract Co-Author*) Nothing to Disclose
Stefan Dinkelacker (*Abstract Co-Author*) Nothing to Disclose
Ashis Ravindran, MS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The Medical Imaging Interaction Toolkit (MITK) is a well-established open-source software for interactive medical image processing applications. Amongst others MITK showcases a feature rich toolkit for medical image segmentation, integrating state-of-the-art AI tools to enhance the accuracy and efficiency of segmentation tasks. Utilizing these tools, the MITK Workbench facilitates users to generate instance or semantic image segmentations to produce high quality annotations for supervised learning tasks or medical image analysis. MITK offers, besides classical tools, a user-friendly interface to popular interactive AI models like the Segment Anything Model MedSAM for interactive image segmentation, making it accessible adding 3D support. MITK also offers easy access to the ML-based automatic segmentation algorithms Totalsegmentator nnUNet. In addition, MITK also covers the gamut of MONAI world via its support of MONAI Label app. The available tools are also enhanced by interpolation options and support for 3D+t images. Additionally, MITK introduces the Segmentation Task Lists, an optimized workflow for batches of segmentation tasks based on user-defined task lists. This feature significantly streamlines annotation and review processes, allowing for efficient management of multiple segmentation tasks. Overall, by leveraging AI, MITK offers a comprehensive solution for medical image segmentation, enhancing the accuracy efficiency of medical imaging analysis.

### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. General segmentation tools 3. AI Segmentation tools 4. MONAI Label 5. Utilities 6. Segmentation Tasks Lists 7. Integration in annotation workflows 8. Conclusion and Future directions

## NOT MAGIC, MATHEMATICS! A RADIOLOGIST'S VISUAL GUIDE TO PERFORMANCE METRICS IN AI RESEARCH

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Leticia M. Pessanha Alves, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

As Artificial Intelligence integration deepens within the radiology field, it becomes essential for radiologists to become familiar with the performance metrics of Machine Learning Models. This familiarity is not just crucial for the application but also for the critical evaluation of AI tools in clinical settings. However, the complexity of the mathematical concepts involved can present a significant barrier. This education exhibit aims to simplify these concepts through visual aids and correlate them with specific radiological tasks, making the information more accessible and comprehensible.

### TABLE OF CONTENTS/OUTLINE

1. Types of Machine Learning applications in radiology and their corresponding performance metrics; 2. Accuracy; 3. Confusion Matrix; 4. Specificity; 5. Recall; 6. Precision; 7. F1-score; 8. ROC curve / AUC; 9. Dice Score; 10. Mean Absolute Error

## EMERGING HORIZONS: FDA-APPROVED AI TECHNOLOGIES IN ABDOMINAL IMAGING - PIONEERING PRECISION, REDEFINING PRACTICE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Panagiotis Korfiatis, PhD (*Abstract Co-Author*) Nothing to Disclose
Andrew Missert, PhD (*Abstract Co-Author*) Nothing to Disclose
Ryan Dillard (*Abstract Co-Author*) Nothing to Disclose
Ashish R. Khandelwal, MD (*Abstract Co-Author*) Nothing to Disclose
Timothy L. Kline, PhD (*Abstract Co-Author*) Nothing to Disclose
Pranav Ajmera, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

•Introduce the evolution of artificial intelligence (AI) in radiology, specifically focusing on its application to abdominal imaging. • Examine the FDA approval process for AI-driven medical devices and tools, highlighting the rigorous measures in place to ensure safety and efficacy. • Overview of existing FDA-approved AI technologies in abdominal imaging, detailing their applications across the liver, biliary system, intestine, prostate, kidney, bladder, and vascular imaging. • Impact of AI technologies on diagnostic accuracy, workflow optimization, patient care, and explore future directions for AI in abdominal radiology.

### TABLE OF CONTENTS/OUTLINE

Introduction • Overview of the transformative alliance between radiology and AI in modern medicine.FDA Approval Process• Explanation of the revamped FDA approval pathway for AI-driven software as medical devices in radiology.• Discuss the challenges and adaptations required for evaluating AI algorithms under the FDA's regulatory framework.Organ-Specific AI Applications • Utilize an organ-specific approach to examine FDA-approved AI technologies. • Overview of AI solutions, including their functionalities, applications, and impact on clinical practice. • Analysis of AI-driven advancements in image quality, noise reduction, longitudinal comparison, and anatomical descriptors across multi-organ systems.Limitations • Elaborate on data privacy, algorithmic bias, need for ongoing validation and monitoring.Conclusion • Reflect on the paradigm shift in healthcare due to AI and the importance of transparent collaboration between developers, regulatory bodies, and the medical community for ascertaining ethical, patient-safe usage.

Theodorus Dapamede, MD, PhD (*Abstract Co-Author*) Intern, MARS BioImaging Ltd
Amirali Khosravi (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Understand the concept and potential benefits of opportunistic screening in radiology.2. Explore current applications of AI-driven opportunistic screening and their impact on patient care.3. Identify challenges and ethical concerns associated with the implementation of opportunistic screening.

### TABLE OF CONTENTS/OUTLINE

1. Introduction to Opportunistic Screening and AI in Radiology (a). Defining opportunistic screening and its role in early disease detection (b). Current trends and advancements in AI-assisted opportunistic screening research 2. Applications of AI-Driven Opportunistic Screening (a). General approaches to opportunistic screening using AI (b). Case studies: AI-based opportunistic screening using direct signal processing (c). Case studies: AI-based opportunistic screening using surrogate signal processing 3. Future Directions and Challenges (a). Expanding AI-based opportunistic screening to other diseases and imaging modalities (b). Collaborating with healthcare providers to optimize patient care and integrate AI-based screening into clinical workflows 4. Ethical Considerations (a). Informed consent and patient autonomy in the context of opportunistic screening (b). Potential misuse of AI-generated information by third parties (e.g., insurance companies) (c). Ensuring equitable access to AI-based screening technologies across diverse patient populations 5. Conclusion (a). Recap of the potential benefits and challenges of AI-driven opportunistic screening in radiology (b). Future directions for research and implementation to enhance patient care and outcomes

Mana Moassefi, MD (*Abstract Co-Author*) Nothing to Disclose
Sanaz Vahdati, MD (*Abstract Co-Author*) Nothing to Disclose
Ali Ganjizadeh, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

I. The Power of Context: LLMs vs. String Search: Unlike string search, which is limited to exact word matches, LLMs excel at grasping context and summarization. This makes them indispensable for tasks that require a deeper understanding of a text, such as identifying tumor recurrences or excluding false positives in radiology reports - particularly in retrospective studies.II. The Art of Crafting Effective Prompts for LLMs: The quality of your prompts can make all the difference in the output of your LLM. You can significantly influence the model's response by asking the right questions and providing clear instructions. To take it to the next level, combine effective prompting with reinforcement learning and human feedback (RLHF) to achieve the desired outcomes.III. Simplifying PHI Protection with Low-Code/No-Code Solutions: By leveraging no-code tools like Ollama, Llamafile, or GPT4all, you can run open-source models like LLaMA3 or Mixtral on your workstation, ensuring HIPAA compliance without massive computation power.

### TABLE OF CONTENTS/OUTLINE

I. LLMs vs. String Searcho Limitations of String Search: Understanding the limitations of exact word matcheso The Advantages of LLMs: context understanding and summarizationo Real-World Applications: Identifying tumor recurrences, excluding false positives in radiology reportsII. Crafting Effective Prompts for LLMso How prompts influence LLM outputo Strategies for asking the right questions and providing clear instructionso Taking it to the Next Level: Combining effective prompting with RLHFIII. Simplifying PHI Protection with Low-Code/No-Code Solutionso Running Open-Source Models Locally

## USING ANATOMICAL SEGMENTATION ALGORITHMS FOR CONTEXT-SENSITIVE CT IMAGING RECONSTRUCTION

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Nathalie Mertens (*Abstract Co-Author*) Nothing to Disclose
Peter De Jaeger, PhD (*Abstract Co-Author*) Nothing to Disclose
Kristof De Smet, MD, MSc (*Abstract Co-Author*) Nothing to Disclose
Thomas Ryckaert (*Abstract Co-Author*) Nothing to Disclose
Stijn Schatteman, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

CT imaging workflows frequently entail the review of multiple reconstructions of the same anatomical region, customized to distinct structures. This process involves manipulating various image windows and applying different kernel reconstructions, which can be time-intensive.Context-Sensitive reconstruction represents an innovative method designed to alleviate this burden. Employing anatomical segmentation algorithms, this technique accurately identifies and delineates diverse organs and tissues within a standard CT scan. Subsequently, it adjusts reconstruction settings specific to each anatomical structure, including tailored windowing, kernel selection. This methodology was initially proposed by S. Dorn et al. in 2018.By enabling a single comprehensive image that integrates all necessary reconstructions, this approach significantly reduces redundancy. Context-Sensitive reconstruction not only streamlines the interpretation process but also enhances efficiency and diagnostic precision in CT imaging.We outline a practical application of this method using the MONAI framework. Utilizing the publicly accessible "total segmenter" tool by J. Wasserthal et al., we generate segmentation maps that inform customized reconstruction settings for each anatomical structure, culminating in a unified image.

### TABLE OF CONTENTS/OUTLINE

1) An overview of common reconstruction parameters.2) Introduce the concept of context-Sensitive reconstruction to streamline CT imaging interpretation.3) Demonstrate the practical implementation process using freely available tools.4) Case studies to illustrate the potential benefits and limitations of this technique in clinical settings.

## AN OVERVIEW OF THE APPLICATIONS OF ARTIFICIAL INTELLIGENCE/MACHINE LEARNING IN MEDICAL IMAGING AND THE PROCESS OF DEVELOPING SUPERVISED LEARNING MODELS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

William Fan (*Presenter*) Nothing to Disclose

### TEACHING POINTS

This education exhibit presentation covers some use-cases based on supervised machine learning models for medical imaging and provides a brief rationale for the impact of artificial intelligence in healthcare.It goes on to present a broad overview of the steps involved in the development of supervised machine learning projects, from problem selection all the way to model deployment and monitoring.An in-depth diagram describing the roles of different datasets used in the development process of a supervised model is also displayed.Finally, a mini-glossary with some of the key terms for projects of machine learning in healthcare is also presented.

### TABLE OF CONTENTS/OUTLINE

1) Will artificial intelligence replace or augment doctors?2) Use-cases based on supervised machine learning in medical imaging3) Development steps of supervised machine learning (ML) models4) Overview of datasets involved in a supervised machine learning diagnostic algorithm5) Mini-glossary of technical terms for projects of machine learning in healthcare

## STANDARDIZING IMAGING FINDINGS REPRESENTATION: HARNESSING COMMON DATA ELEMENTS SEMANTICS AND FAST HEALTHCARE INTEROPERABILITY RESOURCES STRUCTURES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Marc D. Kohli, MD (*Abstract Co-Author*) Founder, Alara Imaging;Stockholder, Alara Imaging
Teri M. Sippel Schmidt, MS (*Abstract Co-Author*) Nothing to Disclose
Kevin O'Donnell (*Abstract Co-Author*) Employee, Canon Medical Systems Corporation
Brian Bialecki (*Abstract Co-Author*) Nothing to Disclose
Tarik K. Alkasab, MD, PhD (*Abstract Co-Author*) Consultant, Nuance Communications, Inc;Medical Advisory Board, Nuance Communications, Inc
Ali S. Tejani, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Introduce joint Radiological Society of North America (RSNA)/American College of Radiology (ACR) Common Data Elements (CDEs) project 2. Outline the emerging framework using CDEs as the semantic labels on standard FHIR structures 3. Review relationship between CDE Sets/Elements and radiology finding attributes 4. Review examples of findings encoded as Health Level 7 Fast Healthcare Interoperability Resources (HL7 FHIR) Observations using CDE Set/Element identifiers as standardized semantic labels ?

### TABLE OF CONTENTS/OUTLINE

1. Introduction a. Limitations of integrating information in radiology reports i. Heterogeneous reporting styles ii. Absence of a uniformly accepted standard for structured data iii. Difficult to extract meaningful insight at scale b. Introduce joint RSNA/ACR CDE project c. Introduce Health Level 7 Fast Healthcare Interoperability Resources (HL7 FHIR) d. Role of standard ontologies i. RadLex ii. SNOMED CT iii. LOINC 2. Propose CDEs as a Data Model and review terminology a. Hierarchy of Sets/Elements/Values b. Role of Set/Element IDs c. Structure of a Set Definition d. Representing CDE Sets/Elements with HL7 FHIR Observations 3. “Anatomy” of an observation encoded as a CDE 4. Specific use cases demonstrating model in practice a. Example coding structures for radiology findings i. Pulmonary nodule (RDES195) ii. CT Stroke (RDES22) iii. Acute diverticulitis (RDES138) b. Longitudinal tracking of findings over time c. AI result integration and monitoring

## POST DEPLOYMENT MONITORING AND POST-MARKET SURVEILLANCE IN RADIOLOGY AI: CURRENT PRACTICES, POSSIBILITIES, AND MANDATES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Abhishek Gupta (*Abstract Co-Author*) Employee, CARPL.ai
Vasantha Kumar Venugopal, MD (*Presenter*) Officer, CARPL.AI Inc

### TEACHING POINTS

1. Continuous monitoring is crucial for ensuring that AI tools perform reliably and safely after deployment, aligning with both clinical needs and regulatory standards. 2. Critical metrics such as temporal stability and predictive divergence provide insights into an AI system's reliability and the necessity for periodic recalibration 3. Differentiating between what is currently required by law and what practices could be implemented to further enhance AI monitoring 4. Exploring how different levels of human involvement in monitoring (in-the-loop, out-of-the-loop, over-the-loop, on-the-loop) can impact the effectiveness and efficiency of AI systems 5. Identifying and addressing the practical challenges in implementing effective AI surveillance, including technological, operational, and regulatory hurdles

### TABLE OF CONTENTS/OUTLINE

Current Monitoring Practices in Radiology AI: Detailed examination of human-in-the-loop and human-out-of-the-loop systems.Use of human-over-the-loop and human-on-the-loop as supervisory and alert-based monitoring methods.Potential Advancements in AI Surveillance: Innovations in AI monitoring techniques that could enhance efficacy and safety. Discussion of predictive analytics and automated systems for real-time anomaly detection.Regulatory Frameworks and Mandatory Practices: Overview of global regulatory mandates for AI monitoring in healthcare.Specific requirements for continuous monitoring and performance reporting.Challenges and Solutions in Implementing Effective Surveillance

Matthias F. Froelich, MD (*Abstract Co-Author*) Consultant, Smart Reporting GmbH;Consultant, Guerbet SA
George S.K. Fung, PhD (*Abstract Co-Author*) Employee, Siemens AG
Parisa Kaviani, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Key elements of CT workflow from protocol selection, acquisition and reconstruction factors, image post-processing, and AI model selection 2. Manual workflow and importance of clinical context (reason for CT/prior radiology reports) for optimizing radiation dose and image processing 3. Application of large language model (Chat-GPT 4) extraction of relevant clinical context to automate radiology workflow based on customizable rules and guidelines.

### TABLE OF CONTENTS/OUTLINE

1. Visual summary of manual workflow and pain points in current radiology workflow for incorporating clinical indications for CT and prior CT reports. 2. Elements of radiology workflow automating LLM augmented with >300 clinical rules/guidelines 3. Case-based demonstration of how the proposed LLM uses clinical context for automating workflow by picking the right CT protocol, the acquisition and reconstruction factors, image post-processing, and AI model 4. Real-world examples of how LLM handles exception cases with prior contrast allergies, metal implants, large body habitus and motion artifacts 5. Uses, strengths and limitations of proposed LLM in radiology workflow

## NEEDLEPATH: AN OPEN SOURCE TOOL FOR OUT-OF-PLANE CT GUIDED NEEDLE PROCEDURES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Phillip M. Cheng, MD, MS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

CT-guided needle placement is a common initial task required for a variety ofinterventional radiology procedures including biopsy, drainage, ablation, injection, fiducial placement, and catheter deployment. Most commonly, the body entry point and target can be imaged in the same axial plane ("in-plane" procedures). However, sometimes an in-plane needle trajectory is either impossible or unsafe.In this exhibit, we illustrate the challenging 3D geometry of out-of-plane CT guided needle placements. We have created an open source software program called NeedlePath, which we designed to allow easy measurement of in-plane and out-of-plane needle angles for these procedures. The program retrieves a series of DICOM images from the PACS, and allows the user to mark the start position and the target on the images. NeedlePath shows the in-plane and out-of-plane needle angles and the projected needle path.

### TABLE OF CONTENTS/OUTLINE

1. In-plane versus out-of-plane CT procedures (biopsy, drain, fiducialplacement, ablation, injection). 3D geometry of out-of-plane procedures.2. Currently available solutions: patient repositioning, gantry tilt, optical or electromagnetic sensors, robotic systems, dead reckoning3. NeedlePath- open source software program we have created to easily calculate in- and out-of-plane angles, and 3D target distance. Details on mechanics of usage for planning out-of-plane CT procedures and calculating needle adjustments during procedures.

## UNDERSTANDING DICOM IMAGES AND PHI PROTECTION, OR "STAYING OUT OF JAIL", FOR CLINICAL AND RESEARCH PURPOSES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Cum Laude**

Gabe Lafond (*Presenter*) Nothing to Disclose

### TEACHING POINTS

DICOM (Digital Imaging Communications in Medicine) images play a vital role in medical diagnostics research. DICOM files contain metadata, a blend of neutral scientific data sensitive protected health information (PHI). Scientific data is interesting to researchers, anonymous safe to share, but the presence of PHI necessitates de-identification/anonymization to uphold patient privacy in accordance with HIPAA. We delve into understanding the DICOM standard, scrutinizing metadata content with knowledge of its use abuse in the wild, the execution of thorough PHI cleansing while retaining useful scientific data. We share insights from our institution's experience data gathered while developing a computer program for anonymization of DICOM images for advanced imaging research purposes. Anonymizing DICOM files entails removal of PHI from metadata, sometimes with provisions for authorized personnel to recover patient identities when necessary. While traditional anonymization methods remove all private tags, leaving only a set of standard tags known to be safe, our recommended approach selectively removes private tags with information matching values from standard tags known to contain PHI. We have validated this method on diverse DICOM datasets, ensuring thorough PHI elimination while preserving scientific data compatibility with popular medical image processing programs.

### TABLE OF CONTENTS/OUTLINE

1. Introduction to DICOM images Metadata2. Examples of HIPAA violations through DICOM Metadata its Consequences3. Understanding PHI in DICOM Metadata4. Anonymization Methods Challenges5. Selective Anonymization Approach6. Validation of the Method7. Conclusion Future Directions

Implement a road map to introduce AI/clinical informatics tools in radiology Review challenges with the initiation of AI implementation in a healthcare system Present the value of a team approach to establish a workflow for the validation of AI diagnostic and triage algorithms and future program growth

### TABLE OF CONTENTS/OUTLINE

Introducing AI tools into a radiology department involves several steps: 1-Needs assessment: Evaluating challenges faced by the evolving radiology department based on patient needs. 2-AI platform selection: Finding the best option based on department needs, priorities, and plans considering available platform features, AI tools menu, and pricing. 3-Stakeholder engagement: A collaborative approach among radiologists, informatics, quality and safety, clinicians, imaging operators, trainees, and research teams. 4-Integration: Defining a workflow for PACS/EHR integration. 5-Piloting: Testing AI tools to assess workflow, efficacy, and potential pitfalls. 6-Education: Training stakeholders for clinical adoption. 7-Communication: Establishing a communication and feedback loop for continued learning and improvement. 8-Data analytics and validation: Validation of AI algorithms with data analytics, with collection, processing, and analysis of large data volumes. 9-Evaluation and optimization: Continued review of AI performance to identify opportunities for improvement, fulfilling unmet needs, and track performance drift.

## PROPOSED MEDICAL SCHOOL CURRICULA FOR 3D PRINTING

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Richard L. Hallett II, MD (*Abstract Co-Author*) Consultant, Bracco Group
Summer J. Decker, PhD (*Abstract Co-Author*) Nothing to Disclose
Jonathan M. Ford, PhD (*Abstract Co-Author*) Nothing to Disclose
David H. Ballard, MD (*Abstract Co-Author*) Nothing to Disclose
Danielle Heiser, BS (*Abstract Co-Author*) Nothing to Disclose
Jonathan M. Morris, MD (*Abstract Co-Author*) Consultant, Medtronic plc;Speaker, Medtronic plc;Consultant, Merit Medical Systems, Inc;Speaker, Merit Medical Systems, Inc;Consultant, Landauer Inc;Speaker, Johnson & Johnson
Michael F. Morris, MD (*Abstract Co-Author*) Educator, Medtronic plc
Prashanth Ravi, PhD (*Abstract Co-Author*) Nothing to Disclose
Owais Salahudeen, BS (*Abstract Co-Author*) Nothing to Disclose
Rayna Debellevue (*Abstract Co-Author*) Nothing to Disclose
Liane Ruddy (*Abstract Co-Author*) Nothing to Disclose
Jordan Mackner (*Abstract Co-Author*) Nothing to Disclose
Garrett Trang (*Abstract Co-Author*) Nothing to Disclose
Taaha Adamji, BA (*Abstract Co-Author*) Nothing to Disclose
Kimberly Hatch, ARRT, BA (*Abstract Co-Author*) Nothing to Disclose
Stacy Ruther, BA (*Abstract Co-Author*) Nothing to Disclose
Frank J. Rybicki III, MD, PhD (*Presenter*) Medical Director, Imagia Cybernetics Inc

### TEACHING POINTS

1 Medical students should and want to learn 3D printing2 While there are abundant, disparate learning resources, this exhibit aims to fill the unmet need to integrate and standardize 3D printing and its appropriateness into US medical education3 The 3D printing community outside of medicine thrives on free, open exchange of ideas and tools4 The 3 proposed curricula will be open source using a website that welcomes evaluation of outside material

### TABLE OF CONTENTS/OUTLINE

1 LCME accredits US medical education, mandating content on modern biomedical sciences and organ systems; 3D printing aligns with LCME standards by supporting anatomy and organ system learning2 In response to student desire for learning and the need to align US medical education, multidisciplinary (medical leadership, radiologists, engineers, technologists) experts from five medical schools developed three curricula with medical students3 All curricula have common introduction slides, notes, and videos4 Clinically validated, deidentified .DCM .STL .OBJ files plus 3D PDFs and .JPG photos are available5 Primers focus on commonly used printers: material extrusion and inverted vat polymerization6 Hands-on learning will include end-to-end manufacturing: segmentation, Computer Aided Design, 3D printing, and post-processing. Troubleshooting will be emphasized7 Guidance for medical school leadership includes laboratory start-up and development to include space, technical support, and estimated costs8 Project ideas and proficiency testing will be openly shared9 Medical students will be provided the opportunity to learn how 3D printing is integrated into various specialtiesAll medical student authors contributed equally to this abstract

## AI STARTER: A BEGINNER'S GUIDE TO IMAGE ANALYSIS PROJECTS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Bradley J. Erickson, MD, PhD (*Abstract Co-Author*) Board of Directors, VoiceIt Technologies, LLC;Stockholder, VoiceIt Technologies, LLC;Board of Directors, FLOWSIGMA Inc;Officer, FLOWSIGMA Inc;Stockholder, FLOWSIGMA Inc;Officer, Yunu Inc;Stockholder, Yunu Inc
Tim Leiner, MD, PhD (*Abstract Co-Author*) Research support, Pie Medical Imaging BV;Advisory Board, Cart-Tech BV;Advisory Board, AI4MedImaging;Advisor, Quantib BV;Consultant, Guerbet SA
Yashbir Singh, PhD, MEng (*Abstract Co-Author*) Nothing to Disclose
Ivana Isgum, PhD (*Abstract Co-Author*) Research Grant, Pie Medical Imaging BV;Research Grant, 3mensio Medical Imaging BV;Research Grant, Koninklijke Philips NV;Research Grant, Esaote SpA;Co-founder, Quantib BV;Shareholder, Quantib BV;Researcher, Quantib BV;;;
Diana V. Vera-Garcia, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. To understand machine learning project requirements and to review the types of resources required for different projects2. To review how to set up the software environment for machine learning projects by guiding learners through the process of software installation and introducing programming languages3. To discuss data preprocessing, the fundamentals of machine learning algorithm creation and validation

### TABLE OF CONTENTS/OUTLINE

1. Introduction2. Defining the aim of your project3. What computer resources do you need?3.1 The kind of resources that your task requires- Small-scale projects using Machine Learning vs highly computational projects using Deep Learning- GPU, RAM, HARD DRIVE, cloud bases resources and tools4. What software do you need to install?4.1 Can I use the same software for different tasks? 5 How do you get started with coding?5.1 Selection of the best language for my task/project5.2 Which is the easiest way to learn coding? -Use development tools, start a coding project, or implement a use-case scenario problem 7. Preparing data for the project7.1 How much data do you need? 7.2 Data preprocessing, data collection, cleaning, splitting, transformation, and augmentation8. Creating your algorithm8.1 Training and fine-tuning the algorithm8.2 Creating the final model9. Validation and metrics for the algorithm9.1 Internal and external validation9.2 Determining the appropriate metrics for accuracy evaluation11. Code and data sharing11.1 Common platforms for sharing software code and data12. Implementation of already published algorithms12.1 Understanding the task and implementation details12.2 Compare your results with the original model

## THE PITFALLS OF UNDERSTANDING AI PRODUCTS - A RADIOLOGIST'S GUIDE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Bogdan Bercean (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Radiologists face an ever-increasing wide range of choices when comparing and selecting the right AI product. The lack of standardisation in technical specifications and the plethora of new AI-related technical terms could quickly become overwhelming and confusing. To this end, this exhibit uncovers some common pitfalls medical professionals are prone to make. After reviewing it, the radiologist will understand:1) When and how can AUROC be a misleading metric, and what to look for when understanding the quantitative performance of an AI product;2) How the overused "dataset size" selling point is not an absolute reference by itself;3) What types of research articles to look for and what distinctions are to be made;4) How to ask better questions when considering an AI product.

### TABLE OF CONTENTS/OUTLINE

1) Performance metrics and where does AUROC stand?a. continuous metrics;b. dichotomous metrics;2) Varying dataset sizes and types and their impact on different AI paradigms.3) Research types in radiological AI. Which ones are meant for radiologists?4) Top questions a radiologist should ask?

## A PRIMER ON THE FUNDAMENTALS OF GENERATIVE AI FOR MEDICAL IMAGING

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Spyridon Bakas, PhD (*Abstract Co-Author*) Nothing to Disclose
Szymon Mazurek (*Abstract Co-Author*) Nothing to Disclose
Sarthak Pati, MSc (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Recent advances in generative artificial intelligence (GenAI) have influenced nearly every industry, including healthcare. Their impact can be especially seen in the domain of medical imaging, where they enabled groundbreaking progress in the fields of denoising, data augmentation, and unsupervised feature extraction. Additionally, GenAI can be used to address clinical issues with a dataset, such as class imbalance. Finally, it can potentially add privacy guarantees in a collaborative training framework, such as federated learning. The landscape of possible approaches is massive, with each solution being characterized by its unique properties and requirements. Furthermore, GenAI often exhibits complex principles of operation and high sensitivity to the chosen hyperparameters. All these properties are potential obstacles for the users, especially the ones not deeply familiar with GenAI. We want to address these entry barriers by providing an overview of the available solutions, as well as showing practical examples of using such methodologies with various open-source frameworks. Additionally, we plan on highlighting specific methodologies (autoencoders, generative adversarial methods, diffusion models) along with their principles of operation using an extensive and open-source mammography dataset.

### TABLE OF CONTENTS/OUTLINE

The exhibit will present various techniques for the application of GenAI in medical imaging using open-source frameworks. Users will see practical examples of applying those methods to high-resolution mammography data, highlighting different aspects of using such models and properly configuring their architectures hyperparameters.

## AVOIDING AUTOMATION BIAS: CASE SERIES OF FALSE POSITIVES SEEN IN INTRACRANIAL HEMORRHAGE DETECTION ALGORITHMS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Steven A. Rothenberg, MD (*Abstract Co-Author*) Founder, Empower Therapeutics Inc ;Member, Translation Holdings LLC;Consultant, Radiostics LLC
Houman Sotoudeh, MD (*Abstract Co-Author*) Nothing to Disclose
Srini Tridandapani, MD, PhD (*Abstract Co-Author*) Co-founder, Camerad Technologies, LLC;Spouse, Co-founder, Camerad Technologies, LLC;Officer, Camerad Technologies, LLC;Spouse, Officer, Camerad Technologies, LLC
Jordan D. Perchik, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Background Intracranial hemorrhage (ICH) detection algorithms are some of the most widely used artificial intelligence (AI) applications in clinical radiology practice. These algorithms can assist radiologist in the detection of subtle ICH, and some algorithms interface with the worklist to triage positive exams. No algorithm is perfect, and when false positives occur, this can lead to inappropriate treatment, prolonged hospitalization, and misuse of hospital resources. Radiologists using these algorithms must know when to override the AI result and avoid automation bias. Teaching points The goal of this presentation is to demonstrate the different types of false positives that can be observed with ICH detection algorithms. Understanding how an AI algorithm determines true positives is key to understanding false positives. Examples of the different types of imaging artifacts, pathologic processes, and anatomic variants will be presented alongside an AI heatmap highlighting the image region contributing to the false positive finding.

### TABLE OF CONTENTS/OUTLINE

Example 1Presentation of the different types of imaging artifacts that can result in ICH false positives, including motion artifact and beam hardening. Example 2 Different pathologic processes can trigger a false positive ICH flag. These cases include cortical laminar necrosis, meningiomas, and cavernomas. Example 3 Some anatomic variants, and even normal anatomy, can sometimes cause ICH false positives. These include colloid cysts, the dural venous sinuses, and the choroid plexus.

## DEFINING AI MODELS AND DATASETS TO PROMOTE DISCOVERY AND INTEROPERABILITY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Hari Trivedi, MD (*Abstract Co-Author*) Founder, Lightbox AI ; Consultant, Sirona Medical, Inc ; Consultant, Flatiron Health ; Consultant, PMX Inc ; Research support, Kheiron Medical Technologies ; Research support, Clairity, Inc ; Research support, Nightingale Open Science ;
Charles E. Kahn JR, MD, MS (*Abstract Co-Author*) Nothing to Disclose
Safwan Halabi, MD (*Abstract Co-Author*) Advisor, Change Healthcare
Abhinav Suri, BA, MPH (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Describe ontologies and their role in radiology.2, Define the FAIR (Findability, Accessibility, Interoperability, and Reuse) principles.3. Identify gaps in current approaches to capture critical information about AI models and data.4. Understand how an ontology can make radiology AI models and datasets more discoverable and interoperable.

### TABLE OF CONTENTS/OUTLINE

1. Ontologies a. Overview and definitions b. Why ontologies are useful c. Examples (RadLex, SNOMED CT, etc.)2. FAIR principles a. Overview and definitions b. Applications to radiology AI3. Current approaches a. Model cards b. Datasheets for datasets c. Shortcomings for radiology AI applications4. Radiology Model and Dataset Ontology (RMDO) a. Overview b. Example RMDO-based documents5. Discussion and Next Steps

## ADVANCING RADIOLOGY EDUCATION WITH AI: ENHANCING CURRICULUM PLANNING, IMPLEMENTATION, AND EVALUATION IN RADIOLOGY TRAINING

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Bradley J. Erickson, MD, PhD (*Abstract Co-Author*) Board of Directors, VoiceIt Technologies, LLC;Stockholder, VoiceIt Technologies, LLC;Board of Directors, FLOWSIGMA Inc;Officer, FLOWSIGMA Inc;Stockholder, FLOWSIGMA Inc;Officer, Yunu Inc;Stockholder, Yunu Inc
Hillary W. Garner, MD (*Abstract Co-Author*) Nothing to Disclose
Bardia Khosravi, MD, MPH (*Abstract Co-Author*) Nothing to Disclose
Pouria Rouzrokh, MD, MPH (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Artificial intelligence (AI) applications in radiology practice have experienced exponential growth in recent years. Similarly, many radiology programs have incorporated AI education into their curricula. However, the potential impact of AI on radiology education itself remains underemphasized in current literature. While AI's contributions to medical education have been discussed for long, the recent emergence of advanced AI tools for imaging data and large language models holds the promise of significantly improving the quality of radiology education and automating its workflows. These AI tools may be as transformative as distance learning once was, reducing educational disparities and ultimately enhancing the quality of radiologist care and patient outcomes. This educational exhibit aims to provide a comprehensive review of possible strategies, opportunities, and limitations for applying AI to different aspects of radiology education.

### TABLE OF CONTENTS/OUTLINE

A) Context: A-1) What are the current gaps in terms of using AI to advance radiology education?A-2) The SWOT Analysis of applying AI to radiology education.B) What are the strategies for applying AI to different stages of radiology curriculum planning (examples are provided in the PDF file)?B-1) Needs assessmentB-2) Aims and Objectives Planning B-3) Content collection B-4) Content organization B-5) Learning strategies B-6) Teaching methods B-7) Assessment methods B-8) Curriculum communication B-9) Educational environment B-10) Curriculum managementC) Where to start? C-1) A stepwise roadmap for the gradual introduction of AI to radiology education. C-2) Lesson learned from previous experiences in applying AI to medical education.

Pedro Silva (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Present the main components (primary outcome, experimental design, and study population) of a randomized clinical trial (RCT) using illustrative examples. 2. Showcase the distinctions between RCTs for pharmacological interventions and AI-based screening tools, highlighting key differences in design and execution. 3. Discuss potential pitfalls encountered during the planning, execution, and analysis phases of RCTs for AI screening tools, along with strategies to mitigate these challenges. 4. Propose a comprehensive protocol for conducting an RCT evaluating an AI screening tool for the diagnosis of tuberculosis, emphasizing key considerations in study design and implementation. 5. Explore future perspectives of clinical trials for AI tools, including adaptations for remote conduct and potential advancements in trial methodologies. 6. Discuss future perspectives of clinical trials for AI tools and how they can adapt to be remotely conducted.

### TEACHING POINTS

Emerging literature underscores the transformative potential of Artificial Intelligence (AI) in healthcare. Ensuring robustness and evaluating the generalizability of AI methods necessitates ample and diverse multi-site patient datasets. Yet, access is often hindered by bureaucratic processes, data ownership issues, and legal considerations tied to patient privacy. To address these challenges, we present the Comprehensive Open Federated Ecosystem (COFE), a community-driven initiative featuring multiple open-source tools. COFE aims to democratize distributed healthcare AI by leveraging zero/low code principles, enabling models to learn across data silos via Federated Learning (FL), and assessing their performance on diverse, previously unseen datasets through Federated Evaluation (FE). The exhibit's objectives are to: 1) enhance the community's understanding of FL FE, 2) demonstrate how users can employ FL to train a model across multiple sites, 3) present results using COFE (the inaugural real-world federation evaluation challenge across 71 collaborating sites focusing on brain tumors multi-site breast cancer risk assessment), 4) discuss privacy data protection concerns and COFE's proposed solutions, and 5) illustrate how users can utilize FE to generate generalizable statistics for AI methods.

### TABLE OF CONTENTS/OUTLINE

This exhibit will present a community-driven open-source ecosystem to train evaluate AI models across multiple clinical sites in a data-private paradigm. Specific principles to protect data privacy will be described, along with common pitfalls to avoid when performing FL-based studies.

Pouria Rouzrokh, MD, MPH (*Presenter*) Nothing to Disclose

### TEACHING POINTS

De-identification (DiD) of radiology imaging studies is crucial for ensuring patient privacy during research endeavors, data transfers, and the development of artificial intelligence (AI) models. In this educational exhibit, we begin by reviewing what image DiD is, how it differs from image anonymization, and why it is an important step toward compliance with the Health Insurance Portability and Accountability Act (HIPAA) in radiology. We then review the most frequent formats for storing radiology imaging studies to set the scene for our main discussion. At the core of our content, we delve into four different levels of DiD: radiology reports, imaging file metadata, imaging markers, and morphological features. We will discuss what each of these steps involves and some of the most commonly used tools for implementing them. Most importantly, we will explore how AI algorithms can both threaten the reliability of such tools and be used to enhance each of these four levels. Finally, we wrap up by addressing several common questions and doubts about image DiD in radiology studies. We aim our presentation at general radiologists and strive to deliver our technical content in a language that is accessible to that audience.

### TABLE OF CONTENTS/OUTLINE

A) Introduction A-1 ) What is image de-identification (DiD)? A-2) How is DiD different from anonymization? A-3) Why is DiD important? B) Frequent file formats for storing image data (DICOM, NIfTI, NRRD, etc.) C) DiD levels-1) Radiology report level: C-2) Imaging file metadata level C-3) Imaging marker level C-4) Morphological features D) How can AI threaten image DiD) E) How can AI improve image DiD) F) Commonly asked questions regarding image DiD.

Benjamin Hamm (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The integration of artificial intelligence (AI) in medical imaging has been hindered by complexities in AI tool utilization. Streamlining the application process can lower barriers and enable broader adoption by practitioners. This work introduces an automated workflow implemented in Kaapana, designed to facilitate 2D and 3D medical image classification without requiring extensive technical knowledge. This workflow supports various classification settings with a focus on enhancing user accessibility and efficiency in medical AI applications. The Classification Workflow automates several critical aspects of AI model training and application, including hyperparameter setting, preprocessing, and data augmentation. The default parameters are optimized based on principles derived from the successful nnUnet framework. A user-friendly interface allows real-time monitoring and easy adjustment of hyperparameters without coding, enabling experimentation and customization. Additionally, Kaapana's Datasets View facilitates the tagging and annotation of image datasets, simplifying dataset creation. The Classification Workflow in Kaapana represents a significant step towards democratizing AI in medical imaging, offering a user-friendly tool that abstracts complex processes and allows medical practitioners to utilize the advantages of AI.

### TABLE OF CONTENTS/OUTLINE

- Introduction to Kaapana and AI in Medical Imaging- Overview of Automated Classification Workflow- Hyperparameter Automation, Preprocessing, and Data Augmentation- Showcasing Application Scenarios- User Interface for Hyperparameter Tuning- Real-Time Monitoring with Tensorboard- Dataset Creation via Datasets View

## EXTENDED REALITY RADIOLOGY EDUCATION AND IVR PRACTICE USING VIDEO PASS-THROUGH WEARABLE SPATIAL COMPUTING HEADSET

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Takuya Sueyoshi (*Abstract Co-Author*) Holoeyes Inc. : Employment RIVERFIELD Inc. : Research grant Fujitsu Ltd. : Research grant Japan Society for the Promotion of Science (JSPS) : Grant-in-Aid for Scientific Research (KAKENHI)
Maki Sugimoto, MD, PhD (*Presenter*) Officer, Holoeyes Inc

### TEACHING POINTS

The utilization of wearable spatial computing headsets with video pass-through functionality in IVR practice and radiology education enhances diagnostic capabilities, treatment outcomes, and safety. Understanding technical advantages, such as imaging and sensor analysis, facilitates spatial assistance in medical image diagnosis, surgical planning, and therapeutic support. Practical examples demonstrate spatial computing's role in clinical procedures like TAVI, endovascular aneurysm repair, and percutaneous ultrasound-guided liver biopsy. Guidance is provided on overcoming challenges associated with integrating spatial computing into radiology education and clinical interventions.

### TABLE OF CONTENTS/OUTLINE

1. Introduction to Spatial Computing and Video Pass-Through in Radiology Education and IVR Practice.2. Mechanism and Technical Advantages of Device (Apple Vision Pro). Enhancing Spatial Diagnosis: Utilizing augmented reality overlays and real-time image integration.3. Facilitating Surgical Planning and Intervention in IVR.Therapeutic Support in IVR: Utilizing immersive simulations and interactive scenarios.4. Practical Applications in Clinical Procedures: Case-based exploration.5. Addressing Challenges and Pitfalls in Adopting Spatial Computing in Radiology.

### TEACHING POINTS

Federated Learning (FL) enables collaborative model training while keeping data locally, holding immense potential to enhance radiological diagnosis and therapy for rare diseases with scarce data. Currently, the majority of FL studies in radiology are simulated due to various hurdles impeding the translation into practice. The few existing real-world FL initiatives rarely communicate measures taken to overcome hurdles, leaving behind a significant knowledge gap. We categorized insights from FL literature with our findings based on their phase of occurrence while establishing a FL initiative. We built our own FL infrastructure within the nation-wide German Radiological Cooperative Network (RACOON) and demonstrated its functionality by training a FL model on a lung pathology segmentation task across six university hospitals. We evaluated FL against less complex alternatives in three evaluation scenarios.From gathered insights, we propose a detailed guide outlining steps, hurdles, and solutions to establish successful FL initiatives conducting real-world experiments. Our experimental results demonstrate superior performance of FL in all evaluation scenarios, justifying itself despite the efforts of real-world FL.The proposed guide aims to aid future FL researchers in circumventing pitfalls, thereby speeding up the translation of FL into practice. Our investigations highlight FL's superiority over alternative approaches, and the importance of strategic organization, robust handling of distributed data and infrastructure in the real world.

### TABLE OF CONTENTS/OUTLINE

### TEACHING POINTS

Integrating advanced computational tools into clinical environments is a significant challenge, often requiring specialized technical skills and the use of various separate applications in a diverse infrastructural landscape. Kaapana addresses these challenges by providing a comprehensive, open-source and customizable medical image analysis platform that seamlessly incorporates AI capabilities into existing clinical infrastructures. Kaapana enables radiologists and data scientists to train and execute state-of-the-art segmentation algorithms, such as nnU-Net and TotalSegmentator. It also allows users to create, curate, and visualize datasets; manage numerous workflows running in parallel; and train and evaluate new models as ready-to-use solutions. In addition to offering these advanced research tools, by employing the DICOM standard, Kaapana also allows for direct PACS interactions on the platform. The platform’s design enables extensive customizations for specific use cases, and facilitates the integration of new tools and workflows. With robust data protection capabilities, the capacity to manage vast datasets, and support for federated learning, Kaapana is an ideal choice for conducting large-scale, multi-center, interdisciplinary studies that can lead to significant advancements in medical research and patient care.

## ELECTRONIC CLEANSING REIMAGINED: THE POWER OF DIFFUSION-BASED GENERATIVE AI IN CT COLONOGRAPHY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Hiroyuki Yoshida, PhD (*Abstract Co-Author*) Patent holder, Hologic, Inc;Patent holder, Median Technologies
Toru Hironaka (*Abstract Co-Author*) Nothing to Disclose
Janne J. Nappi, PhD (*Abstract Co-Author*) Patent holder, Median Technologies;Patent holder, Hologic, Inc;;
Masaki Okamoto (*Abstract Co-Author*) Stockholder, TOKYO analytica
Rie Tachibana, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The purpose of electronic cleansing (EC) is to subtract orally tagged fecal materials from CT colonography (CTC) images to improve the sensitivity of polyp detection in virtual endoscopic fly-through reading. Diffusion models are a powerful state-of-the-art generative AI technology that has recently achieved tremendous success in various computer vision tasks. This exhibit's teaching points are (1) to explain the role of EC in CTC, (2) to explain how generative AI can be used to perform EC, and (3) to demonstrate clinical outcomes of the state-of-the-art diffusion-based EC in CTC.

### TABLE OF CONTENTS/OUTLINE

1. Introduction: (1.1) the importance of colon cancer screening; (1.2) the role of EC in CTC; (1.3) A brief history of EC methodologies. 2. Generative AI for EC: how it differs from traditional EC. 3. Diffusion-based EC: how it works. 4. Case studies: using a phantom study and clinical CTC cases, demonstrate how the image quality of diffusion-based EC outperforms those of existing EC methods.

## CT IMAGING BIOMARKERS FOR PHENOTYPIC BIOLOGICAL AGING: OVERVIEW AND COMPARISON WITH OTHER RADIOLOGICAL AND NON-RADIOLOGICAL APPROACHES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Perry J. Pickhardt, MD (*Abstract Co-Author*) Advisor, Bracco Group;Advisor, Zebra Medical Vision Ltd;Advisor, Nano X Imaging;
John W. Garrett, PhD (*Abstract Co-Author*) Nothing to Disclose
Matthew H. Lee, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Chronological age (CA) and sex are drivers of important healthcare decisions (primary prevention, screening, intervention) but CA is an imperfect measure of "healthspan" and longevity. 2. Biological age (BA) attempts to capture the cumulative physiologic effect of genetic predisposition, lifestyle habits, genetic, and disease processes, and has been attempted for decades with limited success. 3. As opposed to existing "frailomics" used in existing BA models, CT-based tissue markers are accessible, reproducible, and reflect a "big picture" net effect of aging at the organ/tissue level. 4. Advances in technology, computing power, and emerging AI technologies make "explainable" and "black box" image-based BA models poised to revolutionize our understanding of aging and longevity. 5. CT-based, "phenotypic" cardiometabolic assessment shows potential for improved personalized prediction and augmentation of current models for predicting "healthspan" and longevity compared with typical demographics.

### TABLE OF CONTENTS/OUTLINE

1. Describe the difference between CA and BA as well as a brief overview of existing BA models. 2. Review common imaging and non-imaging-based models for determining BA. 3. Describe existing AI tools for deriving image-based tissue biomarkers. 4. Contrast "explainable" AI CT-based methodologies from more opaque "black box" deep learning approaches. 5. Discuss early experiences with image-based BA models using both explainable (e.g. fully-automated CT-based abdominal body composition markers) and "black box" AI tools (e.g. BA derived from CXRs). 6. Future directions - image-based AI tools allow for objective, large-scale, population-based investigation.

Majid Chalian, MD (*Abstract Co-Author*) Grant, The Boeing Company
Arash Azhideh, MD, MPH (*Abstract Co-Author*) Nothing to Disclose
Paul E. Kinahan, PhD (*Abstract Co-Author*) Co-founder, PET/X LLC
Gita Y. Karande, MMEd, FRCR (*Abstract Co-Author*) Nothing to Disclose
Ehsan Alipour, MD, MPH (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Understand what radiomics features are and how they are utilized in radiology research. 2. An exploration of what radiomic features look like in the context of soft tissue sarcoma imaging. 3. Look into some clinical cases in which an understanding of radiomics features can help with better assessment of the disease. 4. Look into some of the studies that used radiomics to predict various outcome in soft tissue sarcoma and what the most significant features from those studies mean.

### TABLE OF CONTENTS/OUTLINE

1. Introduction: a. Define radiomics features. b. Show example of the utility of radiomics features in assessment of soft tissue sarcoma. i. Radiomics in prediction of post-surgical tissue margin status. ii. Radiomics in prediction of treatment responsec. Explain the radiomics analysis pipeline. d. Overview of radiomics features families. 2. Imaging atlas of each major radiomics feature family a. First Order Statistics b. Shape Based c. Gray Level Co-occurrence Matrixd. Gray Level Run Length Matrixe. Gray Level Size Zone Matrix f. Neighboring Gray Tone Difference Matrixg. Gray Level Dependence Matrix 3. Example Clinical Cases a. Example cases of soft tissue sarcoma with positive and negative post-surgical tissue margin status and their respective radiomics features b. Example cases of soft tissue sarcoma with good and bad treatment response and their respective radiomics features 4. Conclusion a. Summarize the role of radiomics in soft tissue sarcoma assessment. b. Highlight the various families of radiomics features and their meaning.

## PRACTICAL GUIDE FOR CREATING 3D PRINTED MODELS FROM MEDICAL IMAGING STUDIES USING FREE SOFTWARE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Juan Francisco Sallaberry Vega, MD (*Abstract Co-Author*) Nothing to Disclose
Leticia Gutierrez Velasco, MD (*Abstract Co-Author*) Nothing to Disclose
Laura Garcia del Salto, MD (*Abstract Co-Author*) Nothing to Disclose
Patricia Fraga Rivas, MD (*Abstract Co-Author*) Investigator, General Electric Company
Jaime de Miguel Criado, MD (*Abstract Co-Author*) Nothing to Disclose
Sandra Robledo (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Introduction to 3D printing for medical imaging studies.Selection of suitable images. Description and illustration of data conversion and segmentation steps using open-source software.Overview of printing materials and techniques. Clinical and educational impact examples.

### TABLE OF CONTENTS/OUTLINE

3D printing has emerged as a revolutionary tool in radiology, significantly enhancing surgical planning and medical education.A practical and accessible guide is presented for creating 3D printed models from medical imaging studies using free software. The process begins with the selection of suitable images, emphasizing the need for high resolution and contrast in CT and MRI studies. Subsequently, the segmentation of anatomical structures using free specialized software and the conversion of data to formats suitable for 3D printing are explained.Additionally, we provide insights into different printing materials and techniques available, highlighting the importance of choosing appropriately according to the clinical or educational purpose. Finally, the utility of 3D printed models in various medical applications is examined through cases from our own service.

## APPLYING AI TO MEDICAL IMAGING: HOW TO BUILD A PROJECT FROM THE GROUND UP

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Christian Henriksen (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Aimed at radiologists with an interest in how to leverage AI for research but a lack of experience in machine learning, this presentation will use detailed but accessible language to provide an overview of the necessary steps to take a project from idea to full-fledged functional AI model. Teaching points will include an overview of current types of AI model and their capabilities as they relate to medical imaging, a review of current interpretability methods for imaging AI, an outline of the components of a project to develop an AI model, and a discussion of two real example projects that I myself have developed.

### TABLE OF CONTENTS/OUTLINE

1. What is AI? a. Deep Learning b. AI in Medical Imaging i. Convolutional Neural Networks ii. Vision Transformers 2. What Can AI Do? a. Classification b. Regression c. Segmentation. 3. What Can’t AI Do? 4. A Note on Interpretability a. Saliency Maps. 5. Anatomy of a Project a. The Idea b. The Dataset i. The Input Data ii. The Output Data Ground Truth c. The Hardware d. The Software e. The Training f. The Evaluation. 6. Example Projects a. Bone Mineral Density from Computed Tomography b. Diagnosis of Normal Pressure Hydrocephalus from Head CT

Bardia Khosravi, MD, MPH (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Derivative datasets, created by generative AI models, closely resemble real-world medical data while preserving patient privacy and enabling data diversity. This educational exhibit aims to:1. Understand the concept of derivative datasets and their role in medical imaging research2. Explore the potentials and promises of generative AI in creating diverse, privacy-preserving, and versatile datasets3. Discuss the challenges and ethical considerations associated with the use of derivative datasets

### TABLE OF CONTENTS/OUTLINE

1. Introduction to derivative datasets and generative models in medical imaging: (a) Definition and concept of derivative datasets (b) Types of generative models (VAEs, GANs, DDPMs)(c) Role of derivative datasets in medical imaging research2. Potentials and promises of derivative datasets:(a) Increased dataset size and diversity:(b) Privacy-preserving nature(c) Versatility across tasks(d) Modeling complex biological phenomena3. Challenges and considerations (a) Patient privacy and data copying(b) Identification of source dataset and disclosure(c) Interpretability and explainability(d) Potential biases4. Future directions and conclusions:(a) Development of robust and standardized evaluation frameworks(b) Exploration of novel architectures and training strategies(c) Integration with other AI techniques (d) Addressing ethical and regulatory challenges (e) Importance of collaboration and responsible utilization

Claire White-Dzuro (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The purpose of this exhibit is:- To review anatomy of transplanted kidneys- To identify common vascular and lymphatic complications post renal transplant- To discuss minimally invasive treatment options to manage vascular and lymphatic complications after renal transplant

### TABLE OF CONTENTS/OUTLINE

1. Anatomy of Transplanted Kidneysa) Location (RLQ v LLQ)b) Arterial and Venous Anastomosisc) Other normal structures in the region2. Common Vascular Complications a) Renal Artery Stenosis/Thrombosis b) Renal Vein Thrombosisc) Renal vascular complications related to native vascular anatomyi. Aortaii. Common/External Iliac Arteryiii. Inferior Vena Cavaiv. Common/External Iliac Vein3. Vascular Complications After Transplant Biopsy a) Bleedingb) AVFc) Pseudoaneurysm4. Endovascular Management of Vascular Complicationsa) Angiography/Venographyi. Contrastii. CO2b) Invasive Pressure Measurementsc) Stent Placementd) Thrombectomy/Thrombolysise) Embolizationi. Coilsii. Liquid Embolicf) Surgical Alternatives5. Lymphatic Complicationsa) Lymphatic Leakb) Lymphocele Formation6. Treatment of Lymphatic Complicationsa) Lymphangiogram and Embolization

## IREE-10 ENDOVASCULAR MANAGEMENT OF AORTOENTERIC FISTULA: NAVIGATING CHALLENGES AND ADVANCEMENTS

Beatriz Garcia Martinez (*Abstract Co-Author*) Nothing to Disclose
Celia Cantolla, MD (*Abstract Co-Author*) Nothing to Disclose
Ana Berasategui Criado, MD (*Abstract Co-Author*) Nothing to Disclose
Marina Arroyo Olmedo, MD (*Abstract Co-Author*) Nothing to Disclose
Pablo Sanz Bellon (*Abstract Co-Author*) Nothing to Disclose
Sofia Bretos Azcona, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To provide an overview of the evolving role of endovascular interventions in the management of Aortoenteric Fistula, highlighting the advantages, challenges, and emerging trends in this minimally invasive approach through our experience and literature review.

### TABLE OF CONTENTS/OUTLINE

Classification of Aortoenteric Fistula.Primary aortoenteric fistulaClinical manifestation/Diagnosis Secondary aortoenteric fistula.True secondary aortoenteric fistula/Secondary paraprosthetic fistula./Clinical manifestation( DiagnosisTreatment.Surgical optionsPrimary fistulae/ Secondary fistulae Endovascular treatment optionsStent graft deployment/Embolization techniquesAdvantages and Challenges of Endovascular Treatment. AdvantagesAlternative treatment for high surgical risk patients./Rapid bleeding control in unstable patients./Advantages associated with an earlier patient recovery./Mitigation of Surgical Intervention in a Challenging Abdominal Environment.Challenges Sepsis./Recurrent bleeding./ Patient selection./Is it a definitive treatment or a bridge to surgery?/Is it a feasible treatment for recurrent fistula?Our experience.Case 1: Recurrent Fistula treated with endoprosthesis placement and latter embolization./Case 2: Recurrent Fistula treated with embolization of the fistula's path and embolization of the aneurysmal sac./Case 3: Aorto-Esophageal Fistula (AEF) selected for embolization treatment who died during the procedure./Case 4: First episode of True Secondary AEF. Treated with endoprosthesis placement in a patient with melena, hypotension, and anemia./Case 5: Recurrent fistula treated with endoprosthesis and proximal cuff. Conclusion

## IREE-11 STREAMLINED RESIN Y90 RADIATION SEGMENTECTOMY FOR SMALL HEPATOCELLULAR CARCINOMA (HCC): ONE & DONE TRIAL

Nima Kokabi, MD (*Abstract Co-Author*) Research support, Sirtex Medical Ltd;Consultant, Sirtex Medical Ltd;;
Michael Mohnasky (*Abstract Co-Author*) Nothing to Disclose
Haneyeh Shahbazian, MD (*Abstract Co-Author*) Nothing to Disclose
Sandra Gad, BSc, MSc (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1-In patients with small (<5cm) hepatocellular carcinoma (HCC) and no radiographically aggressive feature, undergoing radiation segmentectomy with Y90, hepatopulmonary shunt evaluation can be safely eliminated without any additional adverse events.2-In such patients it is safe to eliminate Tc99-MAA hepatopulmonary scan and LSF calculation from treatment planning and condense the Y90 planning and treatment into 1 day as opposed to traditional 2-day period.

**TABLE OF CONTENTS/OUTLINE**

HCC is the 4th leading cause of cancer death worldwide. Conventionally, Y90 Transarterial Radioembolization (TARE) happens over 2 sessions. Mapping angiography and lung shunt calculation is the first session. The patient is then discharged home and returned approximately 2-3 weeks after for Y90 radioembolization. However, an increasing number of studies have shown that for small HCCs (<5 cm), and in the absence of macrovascular invasion and portosystemic shunt (TIPS), LSF is <10%.1,2Hence, based on typically administered activities and LSF, the projected dose to the lungs is significantly below the 30 Gy level, which is widely accepted as the dose to cause radiation-induced pneumonitis.3 Therefore, the LSF calculation can be safely omitted, which could, in turn, result in significant streamlining of Y90 TARE in patients with small HCC. This is particularly important to consider in patients who live in non-urban communities and commute long distances to undergo liver-directed therapy. The proposed exhibits highlight the safety and efficacy of streamlining the Y90 TARE procedure for patients with small HCC to a 1-day procedure.

## IREE-12 GASTROINTESTINAL VARICEAL BLEEDS: INTERVENTIONAL CONSIDERATIONS IN ACCESS AND TREATMENT

Kapil Wattamwar, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Recognize the portal-mesenteric venous system as a potential source of gastrointestinal bleeding. Illustrate case examples of varices in various locations along the gastrointestinal tract with multi-modality imaging. Highlight typical inflow and outflow vessels associated with varices in different locations. Discuss interventional approaches to access variceal bleeds based on their location as well as strategies for decompression and embolization. Review potential embolic agents for variceal bleeds and examine specific use cases based on anatomical and flow-related considerations.

**TABLE OF CONTENTS/OUTLINE**

It is important to recognize that upper and lower gastrointestinal bleeds can arise from a portal-mesenteric venous source. 1. This exhibit will illustrate cases of variceal bleeds at several points along the gastrointestinal tract from the esophagus to the anus and highlight typical inflow and outflow vessels associated with each location. 2. Interventional techniques to treat such bleeds may involve various methods of decompression and/or embolization. 3. Approaches to access the portal-mesenteric venous system for intervention include through a TIPS, transvenous through a systemic outflow vein, transsplenic, transhepatic, transcaval and direct percutaneous puncture. 4. Factors such as the direction of flow, portosystemic pressure gradient and the impact of balloon occlusion on flow should be considered prior to embolization. 5. The choice of embolic should be tailored to the patient's anatomy and flow dynamics. Embolic agents include coils, plugs, and liquid embolics such as n-Butyl cyanoacrylate, ethylene vinyl alcohol copolymer, and sodium tetradecyl sulfate sclerosant.

## IREE-13 IVC INTERVENTIONS: SEEING ALL THE INTERVENTIONS

**Awards**
**Certificate of Merit**

Carlos B. Ortiz, MD (*Abstract Co-Author*) Consultant, Argon Medical Devices, Inc
Arthur S. Joseph, DO (*Abstract Co-Author*) Nothing to Disclose
Andrew V. Chesley, MD (*Abstract Co-Author*) Nothing to Disclose
James J. Oh, DO (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Inferior vena cava (IVC) angioplasty, thrombolysis, mechanical thrombectomy, and stenting are important treatment options to recanalize an occluded or thrombosed IVC. Preprocedural evaluation and follow up are essential for postprocedural management of patient undergoing IVC recanalization. Long term indwelling IVC filters pose a risk of caval thrombosis and removal should be considered when clinically appropriate. Transcaval interventions provide alternate access for difficult to reach anatomic areas.

**TABLE OF CONTENTS/OUTLINE**

Introduction Pathogenesis of IVC occlusions in the setting of benign and malignant causes Imaging of IVC occlusion on US, CT, and diagnostic venogram, including review of collateral venous pathway formation Review of variant anatomy pertinent to IVC interventions. Current recanalization techniques employed in the treatment of IVC occlusions Use of transcaval access to perform lymph node biopsy and endoleak embolization Immediate complications and subsequent complications after IVC endovascular intervention Conclusion IVC and transcaval endovascular interventions are important therapies for a variety of pathologies. Knowledge of these advanced techniques is important for the interventionalist.

## IREE-14 A PRIMER ON APPROACHES FOR TRANSVENOUS BIOPSY OF INFERIOR VENA CAVA MASSES

Victoria Kim, MD (*Abstract Co-Author*) Nothing to Disclose
David R. Berezovsky, DO (*Abstract Co-Author*) Nothing to Disclose
Ilya Livshits (*Abstract Co-Author*) Nothing to Disclose
Francis Kang, MD (*Abstract Co-Author*) Nothing to Disclose
Camden MacDowell, MD,PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Inferior vena cava (IVC) masses often require a biopsy for a definitive diagnosis of the underlying pathology. IVC masses are often biopsied using a percutaneous approach. However, percutaneous biopsy is not always feasible, for example, when there is no safe biopsy trajectory due to surrounding structures or the patient's anatomy. In such situations, an endovascular approach is necessary. The purpose of this educational exhibit is to review endovascular biopsy approaches for IVC masses and address the following teaching points: 1. Review central venous anatomy and highlight CT/MRI/Fluoroscopy features of IVC masses. 2. Illustrate example indications for transvenous biopsy of IVC masses. 3. Detail transvenous biopsy of IVC masses using biopsy forceps under fluoroscopy. 4. Detail transvenous biopsy of IVC masses using a transjugular liver biopsy set under combined fluoroscopy and cone-beam CT guidance. 5. Detail alternative transvenous biopsy of IVC masses such as suction biopsy. 6. Discuss risks of transvenous biopsies, including bleeding and hematologic seeding.

**TABLE OF CONTENTS/OUTLINE**

1. Central venous anatomy. 2. CT/MRI/Fluoroscopy findings of example IVC masses (e.g., leiomyosarcoma, Wilms tumor, adrenal cortical carcinomas). 3. Indication for transvenous biopsy of IVC masses. 4. Example case of transvenous biopsy with forceps. 5. Example case of transvenous biopsy with a modified transjugular liver biopsy set. 6. Alternative biopsy approach using transvenous suction biopsy. 7. Safety profile of transvenous biopsies and comparison with percutaneous approaches.

## IREE-15 ROLE OF INTERVENTIONAL RADIOLOGY IN ACUTE MESO-PORTAL VENOUS THROMBOSIS (MPVT): A PICTORIAL REVIEW

Manoj K. Kathuria, MD,MBBS (*Abstract Co-Author*) Nothing to Disclose
Rakesh K. Varma, MD, MBBS (*Abstract Co-Author*) Speaker, Becton, Dickinson and Company
Seung Kwon Kim, MD (*Abstract Co-Author*) Nothing to Disclose
Anil K. Pillai, MD, MBA (*Abstract Co-Author*) Nothing to Disclose
Jayesh Soni, MD (*Abstract Co-Author*) Nothing to Disclose
Ahmad Arar (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1) Recognize key imaging characteristics associated with acute MPVT on cross-sectional imaging to facilitate early diagnosis2) Understand the clinical indications necessitating acute MPVT interventions and the goals of treatment3) Familiarize with treatment algorithms and the tips and tricks used to manage acute MPVT

**TABLE OF CONTENTS/OUTLINE**

1) Introduction and Clinical Impact2) Imaging findings of acute MPVT- Vascular: Absent flow on US and Doppler, filling defect, hyperdense clot, lack of portoportal collaterals- Non-Vascular: Hepatic necrosis, ascites, bowel wall thickening, lack of mural enhancement3) Indications for Endovascular Interventions:- Persistence of symptoms beyond 48-72 hours after anticoagulation initiation- Worsening symptoms- Extension of thrombus while on anticoagulation- Peritoneal signs on physical exam4) Comprehensive guide to endovascular techniques and algorithms for managing acute MPVT:- Systematic approach for treatment based on the location of the thrombus- Tips and tricksConclusion: Acute PV and SMV thrombosis pose risks of acute mesenteric ischemia or chronic portal hypertension. Endovascular interventions may be necessary for progression on anticoagulation or impending bowel infarction. Catheter Directed Thrombolysis is feasible but carries higher bleeding risks compared to anticoagulation alone. TIPS creation depends on post-intervention flow and PSG >10-12mmHg

## IREE-16 MULTIMODALITY IMAGING OF EMERGENT BILIARY DISORDERS

Naciye Turan, MD (*Abstract Co-Author*) Nothing to Disclose
Joanna Kee-Sampson, MD (*Abstract Co-Author*) Nothing to Disclose
Manuel Menendez, MD (*Abstract Co-Author*) Nothing to Disclose
Carlos I. Gonzalez Baerga, MD (*Abstract Co-Author*) Nothing to Disclose
Mayur K. Virarkar, MD (*Abstract Co-Author*) Nothing to Disclose
Sean Wehry (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Biliary emergencies present as a spectrum of pathologies, each with unique radiologic characteristics across various imaging modalities. Accurate imaging interpretation is critical for diagnosing these potentially life-threatening pathologies, underscoring the importance of radiologists' proficiency in identifying relevant imaging findings. It is also vital for radiologists to be familiar with image-guided interventions that can manage these emergencies. 1. Describe common pathologies that lead to emergent situations in various parts of the biliary system and discuss their clinical presentations and etiologies. 2. Recognize the imaging features across different imaging modalities for each emergent biliary condition. 3. Discuss image guided interventions that help bridge patients with various biliary emergencies to definitive treatment, or treat these pathologies.

**TABLE OF CONTENTS/OUTLINE**

- Review of multimodality imaging findings: o Inflammatory: § Gallbladder: • Acute Cholecystitis o Calculous and acalculous • Gangrenous Cholecystitis • Hemorrhagic Cholecystitis § Bile Ducts: • Ascending cholangitis § Pancreas: • Acute Pancreatitis o Non-Inflammatory § Obstructive Jaundice • Choledocholithiasis • Mirizzi Syndrome • Malignancy § Bile Leak • Traumatic • Iatrogenic - Review of image guided interventions o Biliary diversion § Cholecystostomy § Percutaneous transhepatic biliary drainage o Biliary stents o Percutaneous management of cholelithiasis or choledocholithiasis

## IREE-17 NON-TRANSPLANT PEDIATRIC HEPATOBILIARY INTERVENTIONS

Ali Husnain, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Describe congenital/acquired disease processes in the pediatric liver related to the portal, parenchymal, biliary, and lymphatic systems. 2. Diagnosis of these disease processes using various imaging modalities. 3. Highlight the techniques employed by interventional radiologists to treat these various conditions.

**TABLE OF CONTENTS/OUTLINE**

Portal Vein 1. Abernethy malformation a) Embryology b) Classification (anatomical variants) c) Clinical Presentation d) Diagnostic Imaging e) Treatment Options • Surgery (single session/staged closure) • Endovascular closure (single session/staged) • Combined surgical and endovascular closures2. Extrahepatic portal vein obstruction (EHPVO) a) Causes b) Clinical Presentation c) Diagnostic Imaging d) Treatment • Surgical Meso-Rex Shunt Creation • Endovascular options to treat malfunctioning shuntsParenchymal 1. Biopsies/Pressure Measurements a) Transjugular b) Percutaneous 2. Liver Tumors: Benign and Malignant a) Biopsies b) Hemangioma embolization c) RadioembolizationBiliary System1. Biliary Atresia a) Diagnostic Imaging b) Post-Kasai surveillance 2. Biliary Stricture a) Etiology b) Management • Percutaneous transhepatic cholangioplasty/stenting • Role of endoscopy 3. Biliary leak/biloma a) Etiology b) Management • Percutaneous drainage • Embolization of leaking duct 4. Stones/casts/debris a) Percutaneous endoscopic removal 5. Complications of biliary drainsLymphatic System 1. Protein-losing enteropathy (PLE) a) Pathophysiology of PLE in congenital heart disease patients b) Diagnostic Imaging c) Management • Percutaneous transhepatic lymphatic embolizationPeroral duodenal mucosal radiofrequency ablation

## IREE-19 A PRIMER ON RADIOGRAPHIC FEATURES AND MANAGEMENT OF ABERNETHY MALFORMATIONS

Natalie Y. Ring,

MD (*Abstract Co-Author*) Nothing to Disclose
Muhammad H. Malik, MD (*Abstract Co-Author*) Nothing to Disclose
Camden MacDowell, MD,PhD (*Abstract Co-Author*) Nothing to Disclose
Harjit Singh (*Abstract Co-Author*) Nothing to Disclose
Seulah Choi (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Abernethy malformation is a congenital extrahepatic portosystemic shunt associated with numerous sequalae including hepatic encephalopathy, hepatic malignances, and hepatopulmonary syndrome. Early diagnosis via imaging is critical for subsequent management of the malformation and sequalae. The purpose of this educational exhibit is to review the anatomy and imaging features of Abernethy malformations and to address the following teaching points: 1. Review central venous anatomy and collateral circulation. 2. Review the anatomy of Abernethy Malformation and the known anatomic variants. • Type Ia, Ib, and II 3. Detail the clinical presentation and management strategies of four example Abernethy cases. 4. Discuss the role of Diagnostic and Interventional Radiology in diagnosis and management of patients with Abernethy malformations.

**TABLE OF CONTENTS/OUTLINE**

TABLE OF CONTENTS/OUTLINE: I. Introduction and Anatomy of Abernethy Malformation A. Defining Abernethy Malformation and Its Prevalence B. The Anatomy of Type I and Type II Abernethy Malformations C. Understanding Physiology of Abernethy Malformation Variations and Associated Collateral Venous Drainage D. Investigating Implications of a Novel Abernethy Malformation Variant II. Case Studies (Examination of Type Ia case, Two Different Type II Cases, and Variant Type II Case) A. Clinical Presentation including Symptoms and Signs Associated with Abernethy Malformation B. Reviewing Surgical and Non-Surgical Approaches and Considerations Exploring Role of Interventional Radiology in both diagnosis and management

## IREE-2 SUPER-SELECTIVE SEGMENTAL ADRENAL VENOUS SAMPLING FOR PRIMARY ALDOSTERONISM: POSSIBILITIES AND LIMITATIONS

**Awards**
**Cum Laude**

Sota Oguro (*Abstract Co-Author*) Nothing to Disclose
Hiromitsu Tannai, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Adrenal venous sampling (AVS) is a diagnostic procedure for subtyping primary aldosteronism, which is a cause of secondary hypertension. Typically, blood is collected only from the main trunk of the adrenal vein. Segmental AVS, however, involves sampling blood from upstream tributaries using a microcatheter and can address certain diagnostic challenges. This presentation aims to: 1) Review the anatomy of the adrenal and surrounding venous structures, and identify diagnostic challenges associated with conventional AVS; 2) Describe the method of segmental AVS and provide examples where it is diagnostically beneficial; 3) Discuss techniques to manage challenging situations where achieving an accurate diagnosis remains difficult, even with segmental AVS.

**TABLE OF CONTENTS/OUTLINE**

1. Adrenal and surrounding venous anatomy, conventional AVS; 2. Adrenal tributaries and the practice of segmental AVS; 3. Cases where segmental AVS is diagnostically useful: High aldosterone levels detectable only in adrenal tributaries from adrenal adenomas, Dilution effects due to extrarenal veins joining the adrenal vein, Co-existing cortisol-producing tumors, Bilateral aldosterone-producing adenomas, Ipsilateral multiple adrenal nodules; 4. Sampling from venous routes other than the adrenal veins and considerations for CT during adrenal arteriovenography.

## IREE-20 POST HISTOTRIPSY IMAGING FINDINGS: WHAT TO EXPECT AS IT BEGINS CLINICAL ADOPTION

Joan Vidal-Jove, MD,PhD (*Abstract Co-Author*) Research Consultant, HistoSonics, Inc
Timothy J. Ziemlewicz, MD (*Abstract Co-Author*) Consultant, Johnson & Johnson;Research support, Johnson & Johnson;Consultant, HistoSonics, Inc;Shareholde, HistoSonics, Inc;

Allison B. Couillard, MD (*Abstract Co-Author*) Nothing to Disclose
Edwarda Golden, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Histotripsy is an emerging focal therapy for liver tumors that has a non-invasive, mechanical mechanism of action leading to unique imaging features.2. Histotripsy spares collagenous structures, which can lead to patent vessels and bile ducts within the treatment zone. These structures should not be confused for residual or recurrent tumor.3. Histotripsy treatments can be associated with a transient perfusion defect peripheral to the treatment site that undergoes reperfusion and can be confused for a larger than intended treatment.4. Histotripsy treatment zones involute rapidly compared with existing locoregional treatments, potentially allowing early identification of residual or recurrent tumor.

**TABLE OF CONTENTS/OUTLINE**

Introduction to Histotripsy:• Mechanism of action• Clinical workflow• Trials performed to date from which these imaging findings are available. Expected Imaging Findings:• Recommended Imaging follow-up timeframe• Normal appearance of treatment zone post-histotripsy at various follow-up timepoints out to 2 years• Common variants of normal findings to not mistake as complication or incomplete treatment, including perfusion defects and patent vessels and bile ducts. Other findings:• Incomplete treatment appearance• Off-target effects

## IREE-21 DON'T MISS IT!: ARTERIAL FISTULA IN URINARY DIVERTED PATIENTS, FROM CT TO THE INTERVENTIONAL SUITE

**Awards**
**Certificate of Merit**

Marta Barrios Lopez, MD (*Abstract Co-Author*) Nothing to Disclose
Beatriz Garcia Martinez (*Abstract Co-Author*) Nothing to Disclose
Sofia Bretos Azcona, MD (*Abstract Co-Author*) Nothing to Disclose
Silvia Revuelta Gomez, MD (*Abstract Co-Author*) Nothing to Disclose
Celia Cantolla Nates (*Abstract Co-Author*) Nothing to Disclose
Rodrigo Sutil (*Abstract Co-Author*) Nothing to Disclose
Ana Berasategui Criado, MD (*Abstract Co-Author*) Nothing to Disclose
Marina Arroyo Olmedo, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. To understand the pathophysiological mechanisms by which arteriourinary/arterioenteric fistulas develop and the risk factors for their formation. 2. Review the different forms of clinical presentation to know when to suspect them, the CT scan protocol and its findings. 3. Analyse the different forms of endovascular and surgical treatment.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction. 2. Pathophysiological mechanism of arteriourinary and arterioenteric fistulas. 3. Risk factors and clinical suspect: urinary diverted patients. The importance of clinical suspicion. 4. CT protocol and findings. 4.1. Other diagnostic tests: cystoscopy, pyelography. 5. The interventional suite: from CT findings to confirmation and treatment, a pictorial review. 6. Multidisciplinary management algorithm: analysis of endovascular and surgical management, as well as medical treatment. 7. Pictorial review of complications following interventional procedures, including diagnosis and management. 8. Conclusions. 9. Bibliography.

## IREE-22 ACUTE CHOLECYSTITIS; CURRENT DIAGNOSIS, MANAGEMENT, AND EMERGING ROLE OF INTERVENTIONAL RADIOLOGY

Katsuhiro Kobayashi, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1)Review current diagnosis of acute cholecystitis (AC) including imaging findings of AC. 2)Describe current management of AC according to Tokyo Guidelines 2018. 3)Discuss emerging role of interventional radiology in the management of AC.

**TABLE OF CONTENTS/OUTLINE**

1) Overview of AC. 2) Pathophysiology of AC. 3) Anatomy and anatomical variants of the gallbladder. 4) Imaging findings of AC and its complications (emphysematous/gangrenous cholecystitis, pericholecystic abscess, gallbladder rupture, etc.). 5) Diagnosis of AC and its severity grading according to Tokyo Guidelines 2018. 6) Initial management of AC according to Tokyo Guidelines 2018. 7) Technique used for cholecystostomy tube placement. 8) Complications associated with cholecystostomy. 9) Emerging techniques used following cholecystostomy for non-surgical patients.

## IREE-23 PRE-CLINICAL INVESTIGATION OF HISTOTRIPSY FOR TARGETING PANCREATIC TUMORS

Mina S. Makary, MD (*Abstract Co-Author*) Nothing to Disclose
Warren Campbell, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Histotripsy offers advantages in both target precision with non-invasive options, but is limited by the tissue depth and gas obstructing ultrasound waves. In mice and pigs, preliminary studies indicate that tumors and be effectively targeted without damaging surrounding tissue, and can promote local tumor shrinkage with a systemic immune response. However, the technique requires further optimization to minimize risks off-target tissue damage. This technique may prove be a valuable non-invasive adjuvant therapy for patient with pancreatic cancer.

**TABLE OF CONTENTS/OUTLINE**

1. The Histotripsy Technique A. Compare and contrast the ablation techniques targeting solid tumors using thermal stress. B. Review the limitations of thermal techniques such difficulty targeting tumors near sensitive structures, and inability to achieve uniform cell death. C. Discuss the mechanics of histotripsy and the equipment used to generate mechanical force to break cells apart with high-amplitude pulses. D. Explain why this technique may be beneficial in precise, rapid tissue ablation of pancreatic tumors.2. Clinical Findings supporting pancreatic tumor targeting A. Discuss literature on histotripsy for pancreatic cancer in mice and pig models. B. Discuss results showing efficacy in destroying Pan02 pancreatic tumors in an immunocompetent subcutaneous mouse model. C. Discuss porcine models ablating pancreatic tumors in a novel SCID-like pig D. Review results demonstrating histotripsy's ability to target and induce ablation within the pancreas of certain subjects and the limiting factors.3. Review the unique elements of histotripsy and why this technique may be beneficial in the patient population with pancreatic tumors.

## IREE-25 INTERCOSTAL INSIGHTS: INTERVENTIONAL RADIOLOGY'S ROLE IN MANAGING RIB RELATED COMPLICATIONS

Jorge E. Lopera, MD (*Abstract Co-Author*) Shareholder, Tecnostent SA;Consultant, Merit Medical Systems, Inc;Research Grant, AngioDynamics, Inc
Andrew Ni (*Abstract Co-Author*) Nothing to Disclose
Kimberly D. Coffman, MD, MPH (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Review complications associated with interventional radiology procedures involving the ribs and adjacent structures. Review management and prevention strategies for rib complications

**TABLE OF CONTENTS/OUTLINE**

IntroductionReviewing the anatomy of the ribsIntercostal artery and neurovascular bundleDiscussion of types of interventional radiology procedures that can lead to rib complicationsThoracentesisThoracostomyTransjugular liver biopsyHepatobiliary proceduresCommon types of complicationsHemothorax from intercostal artery injuryHematemesis Osteonecrosis of the ribRib fracturesComplications involving the ribs from interventional radiology procedures are poorly documented in existing literature. This presentation reviews common rib complications associated with IR procedures, focusing on key imaging findings and bringing awareness to these complications and management options.

## IREE-26 PREVENTION AND MANAGEMENT OF AIR EMBOLISM DURING IR PROCEDURES

**Awards**
**Certificate of Merit**

Ghazwan M. Kroma, MD (*Abstract Co-Author*) Nothing to Disclose
Bernard Cheng, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Discuss pathophysiology, clinical diagnosis of intra-procedural air embolismReview best practices for prevention of air embolismDiscuss immediate steps following diagnosis of air embolism and definitive treatment including hyperbaric oxygen

**TABLE OF CONTENTS/OUTLINE**

IntroductionPathogenesis of air embolism during lung biopsyTechniques to reduce air embolism development - Patient positioning, sampling technique, new devicesWhen to suspect an intra-procedural air embolism - Common symptoms and signsAir embolism treatment - immediate steps and treatment with hyperbaric oxygen including mechanism of action and discussion of efficacy

## IREE-27 WEDGED HEPATIC VENOUS PORTOGRAPHY FOR MESO-REX BYPASS PLANNING IN CHILDREN WITH EXTRA-HEPATIC PORTAL VEIN OBSTRUCTION: WHY AND HOW TO DO IT, WHAT ARE THE FINDINGS, AND DOES IT MATTER?

**Awards**
**Certificate of Merit**

Dimitri A. Parra, MD, MMEd (*Abstract Co-Author*) Nothing to Disclose
Maria Gladkikh, MD,BSC (*Abstract Co-Author*) Nothing to Disclose
Afsaneh Amirabadi, PhD (*Abstract Co-Author*) Nothing to Disclose
Victoria Vaughan (*Abstract Co-Author*) Nothing to Disclose
Maria F. Dien Esquivel, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Learning Objectives: 1. Define the indications for wedged hepatic venous portography (WHVP) in children with extra hepatic portal vein obstruction. 2. Describe the WHPE technique.3. Illustrate the WHPE findings and their interpretation in the context of surgical planning.4. Correlate specific cases with clinical and surgical outcomes.

**TABLE OF CONTENTS/OUTLINE**

• Introduction/Background• Learning Objectives• Normal Anatomy of the Intrahepatic Portal Venous System and Bertocchini Classification• Indications/Contraindications• Technique Description• Technical Tipso To improve the procedure planning and diagnostic accuracyo To obtain an adequate mapping of the patent intrahepatic portal system, by performing injections in different regions of the major hepatic veins .o To perform an adequate interpretation of findings and description of findings in the radiological report.• Illustrative Cases/Case Examples with surgical and clinical correlation.• Conclusions.

## IREE-28 NERVE BLOCKS: A PRIMER FOR INTERVENTIONAL RADIOLOGISTS

Christina Boyd, MD (*Abstract Co-Author*) Nothing to Disclose
Kenneth N. Huynh, DO (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. To review the nerve distributions typically targeted for blockade and their relevant anatomy, from head to toe. 2. To review indications, techniques, technical considerations, pharmacology, and complications of nerve blocks. 3. To achieve a basic understanding of billing and coding for nerve block procedures.

**TABLE OF CONTENTS/OUTLINE**

As the complexity of interventional radiology (IR) procedures increase, the need for adequate sedation and analgesia becomes more critical to ensure patient comfort and procedural success. Nerve blocks involve the injection of local anesthetic near targeted nerves to temporarily interrupt pain signals to the brain, offering regional pain relief that can be both diagnostic and therapeutic. These techniques are helpful in acute pain management, particularly peri-operative pain, chronic pain conditions including cancer-related pain. They have been shown to enhance quality of life, reduce opioid consumption, and facilitate earlier mobilization. Using these techniques, interventional radiologists can readily provide targeted analgesia, optimize therapeutic outcomes, and mitigate the need for general anesthesia in high-risk patients. This educational exhibit will (1) review commonly targeted nerves and distributions, and relevant anatomy including intercostal, pudendal nerves, erector spinae, transverse abdominis plane, stellate ganglion, celiac plexus, superior hypogastric plexus, and ganglion impar, (2) discuss techniques, technical considerations, and pharmacologic agents used for nerve blocks, as well as managing complications such as local anesthetic systemic toxicity (LAST), and (3) discuss basic billing and coding for nerve block procedures.

## IREE-29 NOT JUST TACE. USE OF TACE GUIDANCE SOFTWARE PRODUCED

Naoki Hosoda (*Abstract Co-Author*) Nothing to Disclose
Hirotoshi Murakami (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To learn about the IVR in the Gastrointestinal Tract. To learn about the TACE Guidance Software Produced. To learn about the gastrointestinal IVR using TACE Guidance. To learn about the Benefits of TACE Guidance.

**TABLE OF CONTENTS/OUTLINE**

A. Gastrointestinal IVR and its Precaution B. TACE Guidance Software Produced C. About Appendiceal Bleeding CASE D. Benefits of TACE Guidance

## IREE-3 OVERVIEW OF PERCUTANEOUS TRANSHEPATIC BILIARY INTERVENTIONS: INDICATIONS AND BEST PRACTICES

Nicholas Voutsinas, MD (*Abstract Co-Author*) Speaker, Koninklijke Philips NV
Meaghan Dendy Case, MD (*Abstract Co-Author*) Nothing to Disclose
Demetrios Geanon, MD (*Abstract Co-Author*) Nothing to Disclose
Omar Abdalla, BS (*Abstract Co-Author*) Nothing to Disclose

William R. Winter, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Atlee Witt (*Abstract Co-Author*) Nothing to Disclose
Nate D. Kelm, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The purpose of this exhibit is:1. To review normal and abnormal biliary tree anatomy2. To discuss types of biliary obstruction3. To provide an overview of percutaneous interventions for benign and malignant biliary pathology, including indications and best practices for each

**TABLE OF CONTENTS/OUTLINE**

1. Normal and Abnormal Biliary Tree Anatomya. Normalb. Post Roux-en-Y Gastric Bypassc. Hepaticojejunostomyd. Situs Inversuse. Intestinal Malrotation2. Indicationsa. Obstructioni. Benign (stone, stricture, PSC, PBC)ii. Malignantiii. High vs Low Biliary Obstructioniv. Symptoms (pruritus, jaundice)b. Leakc. Infection3. Transhepatic Cholangiographya. Right vs Left-sided Accessb. Dilated vs Non-Dilated4. Transhepatic Biliary Drainagea. External vs Internal/External Drainb. Drain Upsizingc. Drain Externalization and Removal5. Potential Biliary Interventionsa. Cholangioplastyb. Stent (plastic, metal)c. Biopsy (brush, forceps, FNA)d. Cholangioscopye. Lithotripsyf. Ablationg. Rendezvous with ERCP

## IREE-31 IMAGING CHARACTERISTICS OF A NEWLY APPROVED NANOCOMPOSITE HYDROGEL BASED EMBOLIC AGENT WITH TANTALUM MICROPARTICLES

Johannes Du Pisanie, MD (*Abstract Co-Author*) Nothing to Disclose
Nima Kokabi, MD (*Abstract Co-Author*) Research support, Sirtex Medical Ltd;Consultant, Sirtex Medical Ltd;;
Andrew Caddell (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Introductions: A new conformable embolic (OBSIDIO Boston Scientific, Marlborough, MA), received 510(k) approval for the embolization of hypervascular tumors and peripheral blood vessel as of July 20221. This nanocomposite hydrogel based embolic agent with tantalum microparticles (NHTM) produces unique imaging characteristics as compared to preexisting commonly utilized embolics.Teaching points: To describe the imaging characteristics of NHTM on various imaging modalities.

**TABLE OF CONTENTS/OUTLINE**

Angiographic Characteristics Dynamic Visualizations: NHTM is radio-opaque resulting in good visualization of the embolic during fluoroscopy and on radiographs2.CT Characteristics Reduced Streak Artifact: NHTM attenuates streak artifact compared to coil embolization. Contrast Differentiation: The K-edge of Tantalum is 67.4 keV, Iodine is 33.2 keV, Barium is 37.4 keV, Calcium is 4.0 keV, and Gadolinium 10.4 keV3. These differences may allow for differentiation on CT and dual energy CT based on Hounsfield unit density.MRI Characteristics Streak Artifact: NHTM does not produce streak artifact on MRI2. Variation Between Sequences: Based on the MRI properties of the hydrogel and the paramagnetic properties of tantalum sequence intensity is as follows. T2 High intensity. T1 Low intensity.https://www.accessdata.fda.gov/cdrh_docs/pdf21/K213385.pdfdoi:10.1002/advs.202003327skuld.bmsc.washington.edu/scatter/AS_periodic.html

## IREE-32 SYNERGY OF CAR-T THERAPY WITH INTERVENTIONAL RADIOLOGY: HOW IR PROCEDURES CAN IMPROVE IMMUNOTHERAPY OUTCOMES

Mina S. Makary, MD (*Abstract Co-Author*) Nothing to Disclose
Warren Campbell, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Interventional radiology has the capability to improve CAR-T therapy by improving efficacy and reducing systemic toxicity in treating solid tumors. Vascular therapy can administer localized delivery of CAR-T cells beyond the barriers of the tumor microenvironment or areas of poor vasculature.Priming tumors with ablation can improve antigen presentation to immune cells and degrade extracellular matrix barriers to immune infiltration.Interventional delivered adjuvant therapy may help T-cells function for longer durations. IR also has a role in continued surveillance of therapy and tumor monitoring. Collectively, the role of IR procedures should continue to be studied to improve solid tumor targeting with CAR-T therapy.

**TABLE OF CONTENTS/OUTLINE**

1. review of T-cell therapy2. Locoregional therapies to deliver CAR-T therapy3. Evidence behind priming and adjuvant therapy of solid tumors in CAR-T therapy4. Role of IR in monitoring the efficacy of CAR-T therapy5. Conclusions

## IREE-33 MANAGEMENT OF COMPLICATIONS ASSOCIATED WITH TRANSJUGULAR INTRAHEPATIC PORTOSYSTEMIC SHUNT: TIPS FOR SUCCESSFUL TIPS

Jamaal Benjamin, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Girish Kumar, MD (*Abstract Co-Author*) Nothing to Disclose
Samuel L. Rice, MD (*Abstract Co-Author*) Nothing to Disclose
Anil K. Pillai, MD, MBA (*Abstract Co-Author*) Nothing to Disclose
Rakesh K. Varma, MD, MBBS (*Abstract Co-Author*) Speaker, Becton, Dickinson and Company
Seth Toomay, MD (*Abstract Co-Author*) Nothing to Disclose
Husameddin El Khudari, MBChB (*Abstract Co-Author*) Nothing to Disclose
Ahmad Arar (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. To recognize the potential technical complications related to TIPS creation, in a stepwise manner.2. To understand the causes of TIPS related complications and recognize the corresponding imaging findings.3. To learn how to prevent and address complications associated with TIPS, thereby enhancing patient safety and optimizing outcomes

**TABLE OF CONTENTS/OUTLINE**

Outline: 1) Nonvascular and vascular complications prior to TIPS creation: Prevention is better than cure2) Handling Intraprocedural complications of TIPS- Nontarget TIPS insertion- Liver capsule Transgression3) TIPS device-related complications: Blame the fellow- Maldeployment- Migration- Biliary obstruction- Tipsitis4) TIPS malfunctioning: Early Occlusion, Stenosis, and Thrombosis5) Managing post-TIPS complications: Clearing the confusion- Acute Hepatic Encephalopathy- Spontaneous Shunts- Acute Hepatic Failure6) Variceal and arterial embolization in portal hypertension: Hemostasis beyond TIPS7) Miscellaneous Complications: Systemic and Radiation related

## IREE-34 MACHINE LEARNING (ML) VS CT/MRI-BASED VASCULAR MODEL FOR ASSESSING PORTAL HYPERTENSION: NON-INVASIVE ALTERNATIVE FOR PREDICTING HEPATIC VENOUS PRESSURE GRADIENT (HVPG)

Priya Mody, MD (*Abstract Co-Author*) Nothing to Disclose
Haneyeh Shahbazian, MD (*Abstract Co-Author*) Nothing to Disclose
Fahad S. Mohammed (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To educate radiologists on two non-invasive alternatives for predicting clinically significant portal hypertension (CSPH).

### TABLE OF CONTENTS/OUTLINE

IntroductionThe current gold standard for diagnosing clinically significant portal hypertension (CSPH) is the hepatic venous portal gradient (HVPG) procedure. Non-invasive models that predict CSPH would be a valuable tool for physicians assessing decompensation in patients with advanced chronic liver disease (ACLD). Two predictive models have recently been released to predict CSPH with either laboratory parameters using ML or imaging data from CT/MRI using a support vector machine. ML model• Readily Available Parameters- The 3P model uses platelet count, bilirubin, and international normalized ratio.• Online Tool- The study's online calculator calculates the probability of HPVG=10 and =16.• High AUC- When combined with liver stiffness measurement, the 3P model had an AUC of 0.858 for predicting portal pressure =10 mmHg, and the 5P model had an AUC of 0.901 for predicting portal pressure =16 mmHg.CT/MRI model• Usage of Imaging- The model utilizes geometric parameters extracted from segmented vessels within contrast-enhanced CT and MRIs to predict HPVG=10 using a support vector machine.• Detect Vasculature Changes: The model detects variations of the hepatic vascular systems (portal/hepatic vein) in CSPH, including reductions in mean whole-vessel volumes and length.• High AUC: The model had an AUC of 0.90 on the internal test set and 0.84-0.87 on external test sets.ConclusionsThe ML model predicts HPVG=10 and =16, while the CT/MRI model only predicts HPVG=10. Overall, both modalities are excellent non-invasive alternatives to HVPG procedures.

## IREE-35 CONTEMPORARY PRIMER ON THROMBECTOMY DEVICES IN THE MANAGEMENT OF LOWER EXTREMITY DVT: CURRENT STATE OF AFFAIRS AND EVOLVING APPLICATIONS

Mensur Koso, MD (*Abstract Co-Author*) Nothing to Disclose
Gavin Wu, BA (*Abstract Co-Author*) Nothing to Disclose
Mina S. Makary, MD (*Abstract Co-Author*) Nothing to Disclose
Nojan Bajestani, BS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Deep vein thrombosis (DVT) has high morbidity and potential mortality that can lead to post-thrombotic syndrome in approximately 50% of patients, characterized by chronic pain, swelling, and walking difficulties. Catheter-directed interventional therapies such as percutaneous mechanical thrombectomy (PMT), catheter-directed thrombolysis (CDT), and pharmacomechanical CDT (PCDT), and others have been developed to alleviate symptoms, restore venous flow, and preserve valve function sooner and more effectively than conventional treatment. Appropriate device selection is paramount and depends on clinical context.After this exhibit, viewers will:1) Explore the clinical indications for thrombectomy and thrombolysis in DVT management2) Learn about all thrombolytic devices including aspiration, rotational, rheolytic, and ultrasound-assisted techniques3) Understand proper device selection and their advantages and disadvantages

### TABLE OF CONTENTS/OUTLINE

1) Introduction to DVT and Endovascular Management2) Overview of Thrombectomy Devices, including Mechanical, Aspiration, Rotational, Rheolytic, and Ultrasound-assisted techniques3) Mechanisms of Actions and Indications4) Guidelines for Device SelectionTechnique Benefits and Risks5) Evidence-Based Outcomes and recent national guidelines6) Case-based and Device-Specific Reviews7) Current Research and Future Directions8) Summary and Conclusions

## IREE-36 DISTAL TRANSRADIAL ACCESS FOR NON-CARDIAC INTERVENTIONS IN THE ERA OF MINIMALLY INVASIVE ENDOVASCULAR THERAPY

**Awards**
**Certificate of Merit**

Kondo Hiroshi (*Abstract Co-Author*) Nothing to Disclose
Yamamoto Masayoshi, MD (*Abstract Co-Author*) Nothing to Disclose
Takeshi Wada, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The purposes of this exhibit are the following.1. To describe recent advances of distal transradial access in non-cardiac interventions, including its indications, feasibility, and safety 2. To illustrate the basic anatomy and techniques of distal transradial access 3. To demonstrate practical interventional procedures and complications of distal transradial access through case-based review

### TABLE OF CONTENTS/OUTLINE

1. Indication and patient selection of distal transradial access for non-cardiac interventions 2. Anatomy of the radial artery and surrounding structures in the snuff box to explain the techniques of distal transradial access and complications associated with the puncture 3. Details of the procedure presented through case-based review: angiography suite settings, device selection, puncture of the distal radial artery, cannulation for the targeted arteries, and navigation of microcatheters 4. Complications associated with distal transradial artery access and how to handle them

## IREE-37 ALL YOU NEED TO KNOW ABOUT SELECTIVE ARTERIAL CALCIUM INJECTIONS AND VENOUS SAMPLING FOR PANCREATIC NEUROENDOCRINE TUMORS

Nobuyuki Shiraga, MD (*Abstract Co-Author*) Nothing to Disclose
Masaaki Hori, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Fuyuki Washizuka (*Abstract Co-Author*) Nothing to Disclose
Masahiro Kobayashi, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To understand the indications and objectives of selective arterial calcium injection (SACI) test for pancreatic neuroendocrine tumors (NETs).To review the anatomical vascular variations in pancreas.To understand how to perform SACI test including the appropriate injection sites according to patient's anatomical vascular variations and blood flow domination in pancreas.To learn how to interpret the sampling results for determining the localization of pancreatic NETs.

**TABLE OF CONTENTS/OUTLINE**

A. Diagnosis and imaging findings of pancreatic NETs.B. How to perform SACI test including the injection sites, sampling sites, and the sampling times.C. Appropriate injection sites according to the types of blood flow domination.D. Evaluation of the sampling results with case presentations.

## IREE-38 BRONCHIAL ARTERY INFUSION CHEMOTHERAPY: TIPS AND TRICKS

Dayhane H. De Souza, MD (*Abstract Co-Author*) Nothing to Disclose
Rayssa A. Melo, MD (*Abstract Co-Author*) Nothing to Disclose
Luiz T. Siqueira, MD (*Abstract Co-Author*) Nothing to Disclose
Maria Luiza Teixeira (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To discuss and illustrate a Bronchial artery infusion of chemotherapy for lymphangitic carcinomatosis, that to our knowledge has never been published.

**TABLE OF CONTENTS/OUTLINE**

1 - To review the bibliography about Bronchial artery infusion of chemotherapy.2- To illustrate a case of pulmonary lymphangitic carcinomatosis, focusing on aspects related to imaging, procedures, treatments, and interventions.3 - Summary and take home messages.

## IREE-39 ABLATION OF OSSEOUS TUMORS: ESSENTIAL REVIEW OF NEURAL ANATOMY TO AVOID INJURY

Jemianne Bautista, MD (*Abstract Co-Author*) Nothing to Disclose
Jea Ho S. Yu, BS (*Abstract Co-Author*) Nothing to Disclose
Anthony Zamary (*Abstract Co-Author*) Nothing to Disclose
Kevin Zhou (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

: Percutaneous ablation of osseous tumors followed by kyphoplasty/cementoplasty offers a targeted, minimally invasive option for patients with symptomatic disease and can be performed as an adjunct treatment to Surgery and Radiation. However, damage to critical neural anatomy represents a significant risk, and avoiding complications requires a detailed understanding of neural anatomy. This exhibit will provide:(1) Detailed review of neural anatomy relevant to the most common sites of osseous tumor ablation, including spinal, pelvic, and lower extremities. (2) Review of specific nerve function. (3) Cases highlighting successful navigation of complex neural pathways during ablation procedures. (4) Specific considerations for each ablation modality (RFA, cryoablation, thermoablation, etc.) including placement of ablation probes and the monitoring of heat spread or ice formation to prevent neural damage.

**TABLE OF CONTENTS/OUTLINE**

(1) Overview of osseous tumors and indication for ablation therapy.(2) Neural anatomy associated with common sites of osseous tumor ablation.(3) Workup and procedural techniques to minimize the risk of neural injury.(4) High yield review of different ablation modalities (radiofrequency, cryoablation, microwave, and IRE) and their specific considerations regarding neural safety.(5) Case examples.

## IREE-4 PELVIC VENOUS REBUILDING: ILIOCAVAL RECONSTRUCTION TIPS, TRICKS AND CURRENT STANDARDS OF PRACTICE

LeAnn S. Stokes, MD (*Abstract Co-Author*) Nothing to Disclose
Nicholas Voutsinas, MD (*Abstract Co-Author*) Speaker, Koninklijke Philips NV
Demetrios Geanon, MD (*Abstract Co-Author*) Nothing to Disclose
Claire White-Dzuro (*Abstract Co-Author*) Nothing to Disclose
Reza Imani-Shikhabadi, MD, MS (*Abstract Co-Author*) Nothing to Disclose
Lena Khanolkar (*Abstract Co-Author*) Nothing to Disclose
Oliver S. Zhao (*Abstract Co-Author*) Nothing to Disclose
Nate D. Kelm, PhD (*Abstract Co-Author*) Nothing to Disclose
Brian M. Fagel, MD (*Abstract Co-Author*) Nothing to Disclose
Atlee Witt (*Abstract Co-Author*) Nothing to Disclose
Tony Borgmann (*Abstract Co-Author*) Nothing to Disclose
Omar Abdalla, BS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Exhibit viewers should be able to (A) understand indications and contraindications for iliocaval reconstruction, (B) review the imaging and anatomy to determine patient eligibility, (C) define the intervention techniques and equipment for iliocaval reconstruction, and (D) discuss short and long-term postoperative complications of the reconstruction

**TABLE OF CONTENTS/OUTLINE**

A. Indications and contraindications for iliocaval reconstitution a. Indications for Reconstruction i. Venous occlusion in the setting of recurrent deep venous thrombosis ii. Post-thrombotic syndrome iii. Limitations in activities of daily living b. Contradictions i. Hypersensitive to stent compounds ii. Contraindication to anticoagulation (relative) c. Alternatives i. Conservative therapy B. Imaging and Anatomy a. Duplex ultrasonography b. CTV or MRV c. Venography C. Intervention techniques and equipment a. Equipment i. Access sheath, various guide catheters, and guidewires ii. Stents iii. Intravascular ultrasound b. Access and Positioning i. Vascular access points depend on the level and extent of occlusion/inflow - common femoral, popliteal, greater saphenous, internal jugular ii. Prone positioning to facilitate popliteal access iii. Supine positioning for more proximal access c. Recanalization i. Blunt ii. Sharp d. Reconstruction i. Indications of indwelling catheter-directed thrombolysis ii. Indications for thrombectomy iii. Stent choice, location, and measurements D. Complications and Post-Procedure Care a. Complications i. Access site hematoma ii. Stent migration iii. Stent thrombosis occlusion b. Post Procedure care i. Anticoagulation ii. Clinic and imaging follow-up recommendations

## IREE-40 MR-GUIDED CRYOABLATION OF PROSTATE CANCER BONE METASTASES: A COMPREHENSIVE GUIDE

Scott M. Thompson, MD, PhD (*Abstract Co-Author*) Research Consultant, Boston Scientific Corporation
Aiming Lu, PhD (*Abstract Co-Author*) Nothing to Disclose
Setayesh Sotoudehnia Korani, MD (*Abstract Co-Author*) Nothing to Disclose
Aliza Mushtaq, MD (*Abstract Co-Author*) Nothing to Disclose
Bradley J. Erickson, MD, PhD (*Abstract Co-Author*) Board of Directors, VoiceIt Technologies, LLC;Stockholder, VoiceIt Technologies, LLC;Board of Directors, FLOWSIGMA Inc;Officer, FLOWSIGMA Inc;Stockholder, FLOWSIGMA Inc;Officer, Yunu Inc;Stockholder, Yunu Inc
Lance A. Mynderse, MD (*Abstract Co-Author*) Researcher, Koninklijke Philips NV;Equipment support, Koninklijke Philips NV;Investigator, Nanospectra Biosciences, Inc;Researcher, Nanospectra Biosciences, Inc
Daniel A. Adamo, MD (*Abstract Co-Author*) Nothing to Disclose
Ali Ganjizadeh, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

• The advantages of MR-guided cryoablation over CT-guided cryoablation in treating prostate cancer bone metastases• Effective patient selection and interpretation of MR and PET scans for accurate diagnosis and treatment planning• Optimal treatment planning and follow-up strategies for successful outcomes

**TABLE OF CONTENTS/OUTLINE**

Introduction• Overview of MR-guided cryoablation: A minimally invasive, image-guided therapy for bone metastases• Advantages of MR guidance: Precision, safety, and efficacy in targeting bone metastasesPatient Selection and Imaging• Inclusion criteria for MR-guided cryoablation: Patient selection and evaluation• Role of PET/CT scans (11-C Choline and PSMA) in identifying metastatic sites• MR imaging characteristics of bone metastases: Visualization and interpretationTreatment Planning and Procedure• Procedure details: Utilization of 3-4 freeze/thaw cycles per session, with MRI and ultrasound assistance for needle placement• Importance of real-time monitoring of the ablation zone for complete treatmentFollow-up and Recurrence Management• Imaging schedule: Pre-operative planning and post-ablation follow-ups at 3, 6, and 12 months• Classification and management of recurrences:o In-field recurrences: Definition, examples, and treatment strategieso Out-of-field recurrences: Definition, instances, and treatment approaches

## IREE-41 THE SPECTRUM OF MOLECULAR IMAGING IN Y90 MICROSPHERE SELECTIVE INTERNAL RADIATION THERAPY (SIRT) FOR PRIMARY AND METASTATIC LIVER TUMORS

Shima Tafreshi, MD (*Abstract Co-Author*) Nothing to Disclose
Mehdi Djekidel, MD (*Abstract Co-Author*) Nothing to Disclose
Jonathan Weinstein, MD (*Abstract Co-Author*) Nothing to Disclose
Amna Aslam (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

• Pre Y90 selective internal radiation therapy (SIRT) abnormal biodistribution will determine adjustment in therapy delivery planning• High yield radiolabeling of Tc99m MAA for pretherapy mapping is also essential in avoiding confounding extrahepatic stomach and duodenal uptake due to free pertechnetate.• SPECT-CT is essential to map extrahepatic uptake• Gallbladder uptake of Y90 typically occurs due to either non-target embolization or reflux of the microspheres. • Close assessment of falciform ligament uptake is essential and requires expertise and the use of advanced SPECT-CT techniques. • Post-treatment assessment via SPECT-CT allows for early detection of gallbladder uptake which can lead to radiation-induced cholecystitis and allows for prompt management of such potential complications.• The application of dosimetry techniques pre and post SIRT is crucial in optimizing patient outcomes.

**TABLE OF CONTENTS/OUTLINE**

Y90 SIRT has seen a huge increase in clinical utilization. Owing to numerous studies demonstrating outcome benefits for different indications it has gained in clinical acceptance and application. However, proper use requires expertise and a multilayered approach to patient selection and management. Molecular imaging plays an essential role in the overall successful delivery of this therapy. Optimized workflows and high-quality standards require expertise and knowledge of various aspects of the molecular imaging paradigm pre, during and post treatment. We offer to review the different aspects of molecular imaging involved in the care for Y90 liver SIRT patients including normal and abnormal biodistribution pre-, during and post-treatment, and dosimetry assessments.

## IREE-42 CYSTIC DUCT STENTING IN BENIGN DISEASE: AN OVERVIEW

Patrick D. Sutphin, MD, PhD (*Abstract Co-Author*) Stockholder, Gilead Sciences, Inc;Stockholder, Editas Medicine;Stockholder, CRISPR Therapeutics AG;Stockholder, Intellia Therapeutics;Stockholder, Amwell;Stockholder, Teladoc Health Inc;Stockholder, Jazz Pharmaceuticals plc;Stockholder, ViewRay, Inc;Research funded, TriSalus Life Sciences
Kausthubh Hegde, MBBS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Review indications and techniques of cystic duct stenting in benign gall bladder disease as an alternative to surgery
- Evaluating technical success and complications: efficacy and safety of the procedure and common complications
- Long-term outcomes of patients' post-cystic duct stenting and feasibility of transitioning to surgery if the patient's condition improves

**TABLE OF CONTENTS/OUTLINE**

- Introduction to cystic duct stenting:- Indication and patient selection criteria for choosing stenting over traditional surgical methods in benign gall-bladder disease- Techniques of stenting and devices used during the procedure- Protocols for pre- and post-procedure care
- Evaluating technical success: clinical outcomes from recent studies and case series
- Complications and management:- Review common and serious complications and how to prevent them- Strategies to manage complications and improve patient outcomes- Case studies (image-based) highlighting specific incidents
- Overview of follow-up protocols and long-term care with a focus on transitioning from stenting to surgery: criteria and case examples

## IREE-43 VISUAL GUIDE TO THE MEDICAL MANAGEMENT OF SITUS INVERSUS

Husameddin El Khudari, MBChB (*Abstract Co-Author*) Nothing to Disclose
Ahmed Abdelgawad (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1- describe be the situs inversus spectrum and its radiologic findings2- To identify the implication of the altered anatomy on performing interventional procedures3- To present a case-by-case review of the common interventional procedures performed on situs inversus patients

**TABLE OF CONTENTS/OUTLINE**

Background: Situs solitus is the normal arrangement of the human viscera. Situs inversus is a rare genetic condition in which the organs of the chest and abdomen are positioned in a mirror image of normal human anatomy. The incidence of situs inversus totalis is approximately 1:10,000. Despite its rarity, these patient are still encountered in the IR world. Performing procedures on patients with situs inversus poses a unique challenge to interventionalist. Knowledge of the anatomical alterations and its implications on performing these interventions is very important for safe and successful performance of these procedures.Clinical Findings/Procedure Details:We present a case-by-case review of some of the common IR procedures performed on patients with situs inversus with special emphasis on technical aspects, tips and tricks to safely perform these procedures.We present the following cases:Angiogram and embolization in patient with GI bleeding
- Transarterial Chemoembolization/Y-90
- TIPS placement
- Gastrostomy placement
- Tunneled hemodialysis catheter placement
- Percutaneous transhepatic cholangiography
- IVC filter placementConclusion or Teaching Points: Situs inversus is a rare genetic condition that poses unique challenges to interventionalist. Understanding of the anatomic alteration and proper techniques is crucial to perform procedures safely and successfully on patient with situs inversus.

## IREE-44 LIVER HISTOTRIPSY: TIPS AND TRICKS FOR CLINICAL TREATMENT OF LIVER TUMORS

Mishal Mendiratta-Lala, MD (*Abstract Co-Author*) Nothing to Disclose
Giovanna Fox (*Abstract Co-Author*) Nothing to Disclose
Neehar Parikh, MD (*Abstract Co-Author*) Grant, Bayer AG;Consultant, Bayer AG;Grant, Boston Scientific Corporation;Grant, Exact Imaging Inc;Consultant, Exact Imaging Inc;Grant, Glycotest, Inc;Grant, Exelixis, Inc;Consultant, Bristol-Myers Squibb Company;Consultant, Eli Lilly and Company;Advisory Board, Eisai Co, Ltd;Advisory Board, F. Nathan E. Loudon, MD (*Abstract Co-Author*) Nothing to Disclose
Alex Oserowsky, MD (*Abstract Co-Author*) Nothing to Disclose
Andrew Navarro, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Histotripsy is a new non-invasive locoregional therapy for liver tumors using mechanical cavitation for tissue destruction. 2. Histotripsy treatment configuration can be adapted per tumor, so that each ablation zone is unique per patient and per tumor, allowing for a personalized approach. 3. Histotripsy ablation spares collagenous structures, such as vessels and bile ducts, allowing for treatment of tumors that may otherwise be risky with invasive thermal ablation procedures. 4. There are restrictions to the application of histotripsy secondary to device limitations, the most critical being the inability to target tumors from an intercostal approach, which markedly limits clinical applicability of this technology. 5. Techniques such as pre-planning, patient positioning and coordination with anesthesiology can expand the scope of histotripsy by permitting treatment of lesions that would usually be precluded secondary to device limitations.

**TABLE OF CONTENTS/OUTLINE**

Introduction to Histotripsy Technology Mechanism of action Introduction to the Clinical Workflow for Histotripsy Evaluation Patient referral process Selection process of appropriate candidates for treatment Tips and Tricks to expand the scope of histotripsy treatment Pre-treatment evaluation of liver tumors How to perform histotripsy via an intercostal approach Optimal patient positioning Coordination with anesthesiology team

## IREE-45 SECTORAL ECHOBRONCHOSCOPY DEMYSTIFIED. ESSENTIAL KNOWLEDGE FOR DOCTORS

Rodrigo Gobbo (*Abstract Co-Author*) Nothing to Disclose
Marcia Jacomelli (*Abstract Co-Author*) Nothing to Disclose
Victor Arthur Ohannesian (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

-Preparation involves smears and Reaction of Other Excluding Substances (ROSE), emphasizing initial cytopathological analysis for identifying lymphocytes and adjacent lesions. -ROSE crucial for mediastinal staging in lung neoplasia, guiding therapeutic decisions with minimal complications, but high sensitivity and cost.-Sectoral echobronchoscopy is clinically relevant for diagnosing peribronchial lesions and lymph nodes, staging pulmonary and extrathoracic neoplasms precisely.-Its established use ensures accuracy in diagnosing peritracheal lesions and staging, influencing therapeutic decisions in lung neoplasia management.-Despite its high cost, sectoral echobronchoscopy proves indispensable in coagulation disorders, hemodynamic instability, and ventilatory contraindications, ensuring precise staging and management.

**TABLE OF CONTENTS/OUTLINE**

1.ANATOMY2.EQUIPMENT3.EXAM SYSTEMATIZATION4.MAIN INDICATIONS5.DIAGNOSTIC INCOME and SUMMARY OF EVIDENCE 6.CASES

## IREE-47 BREATHING NEW LIFE INTO BRONCHIAL ARTERY EMBOLIZATION (BAE): RECENT TECHNICAL AND CLINICAL OUTCOMES

Clayton W. Commander, MD,PhD (*Abstract Co-Author*) Nothing to Disclose
Thomas Turner (*Abstract Co-Author*) Nothing to Disclose
Estefania Gonzales, BA, MPH (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Indications for BAE include hemoptysis causing airway or respiratory compromise, moderate hemoptysis with 3 episodes within a week each over 100 mL, increasing blood volumes from chronic bleeding or sudden bloody sputum, and as a bridge treatment for lung transplant patients with moderate hemoptysis due to chronic inflammatory lung disease. Advanced imaging techniques, like MDCT angiography, enhance detection by providing more precise mapping of bronchial and systemic vascular anatomy sometimes missed by standard imaging, improving procedural safety. A pleural thickness >3 mm and enlarged extrapleural vessels suggest non-bronchial systemic artery bleeding. Predictive factors for recurrent hemoptysis post-BAE in idiopathic bronchiectasis include pseudomonas infection, massive sputum production, and aberrant bronchial arteries. Factors such as AV fistulas, systemic shunts, and underlying lung diseases also contribute to recurrence in non-specific cases. The 2022 CIRSE Standards of Practice have spurred advances in

microcatheter technology, enabling superselective coil embolizations in 98% of cases with lower risks of spinal cord infarction compared to agents like Gelfoam and NBCA. Early embolization reduces hospital stays and recurrence risks. Common embolic agents for BAE include NBCA, PVA, and coils, sometimes with Gelfoam. Recent studies suggest NBCA and coils outperform particles. Success rates vary based on hemoptysis presentation and vascular abnormalities. Embolic choice should prioritize patient safety and be tailored to individual clinical needs.

**TABLE OF CONTENTS/OUTLINE**

Introduction to BAE; Indications with Updates; Advancements in Techniques and Embolizations; Frontiers

## IREE-48 MIGRATION OF VASCULAR AND NON-VASCULAR STENTS: INCIDENCE, PRESENTATION, CONTRIBUTING FACTORS AND MANAGEMENT

**Awards**
**Certificate of Merit**

Dyda Dao, MD (*Abstract Co-Author*) Nothing to Disclose
Brian S. Funaki, MD (*Abstract Co-Author*) Consultant, Okami Medical;Advisory Board, Balt USA
Wojciech Cwikiel, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Ramin Midia, MD (*Abstract Co-Author*) Nothing to Disclose
Mehran Midia, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Although not frequent, vascular and non-vascular stent migration can occur in IR practice and could be associated with significant morbidity and mortality. The incidence of stent migration is likely underreported. Clinically patient could be asymptomatic and in symptomatic patients' presentation largely depends on the stent location. Stent deployment is a dynamic process and there are many device, host and operator technique factor that could contribute to stent migration at time of deployment and thereafter. Management of stent migration ranges from close monitoring to interventional radiology management, open surgery and combination of the later. Interventional radiology management is the most commonly used method, with a high success rate. Interventional radiology techniques range from temporary anchoring (such as with balloons and snares), permanent anchoring (including with the use of overlapping or bridging stents), repositioning and retrieval of the migrated stent.

**TABLE OF CONTENTS/OUTLINE**

1. To review the incidence and clinical presentation of stent migration.2. To understand the contributing factors for the development of stent migration and discuss technical considerations for stent migration prevention.3. To highlight current techniques and strategies for managing migrated stents.

## IREE-5 REDEFINING VASCULAR PLUGS: RADIOLOGIST INTERPRETATION OF TECHNOLOGY AND TECHNIQUES FOR OPTIMAL EMBOLIZATION

Yasutoshi Ohta, MD, PhD (*Abstract Co-Author*) Nothing to Disclose

**TEACHING POINTS**

The Vascular Plug (VP) is a cutting-edge embolization technology designed to precisely and effectively occlude a targeted vessel. The device efficiently occludes vessels with minimal impact on surrounding tissues by utilizing the body's natural processes that reduce blood flow and promote thrombus formation. Amplatzer Vascular Plugs (AVPs) are the traditional and most widely used devices. AVPs use a combination of density and radial force to induce thrombus formation, allowing for controlled and strategic embolization. This exhibit will focus on the important role of AVPs in treating aneurysms and parent vessel occlusions. It will detail their embolization techniques and how they differ from other embolic materials. It also aims to understand AVPs, evaluate their imaging properties and effects on blood flow reduction, explore their strategic use, and discuss evidence-based future directions in vascular embolization.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction to Vascular Embolization - Overview of embolization principles - The advent and importance of vascular plugs2. Physiological Basis for Thrombosis in Embolization -Role of embolic density and radial force3. AVPs in Clinical Practice: Aneurysmal vs. Parent Vessel Embolization - Criteria for embolization strategy selection4. Evidence-Based Application of AVPs - Clinical applications: Visceral artery aneurysms, vascular malformations5. Challenges and Solutions in AVP's Embolization - Learning from complex cases and failed placements6. Advanced Embolization Techniques with AVPs - Plug anchor (stabilizer) technique - Coil-in-plug technique7. Future Directions in Vascular Embolization with VPs

## IREE-50 THE ART OF THE SPLEMBO: SPLENIC ARTERY EMBOLIZATION TIPS, TRICKS, AND CURRENT STANDARDS OF PRACTICE

**Awards**
**Cum Laude**

Oliver S. Zhao (*Abstract Co-Author*) Nothing to Disclose
Claire White-Dzuro (*Abstract Co-Author*) Nothing to Disclose
Atlee Witt (*Abstract Co-Author*) Nothing to Disclose
Reza Imani-Shikhabadi, MD, MS (*Abstract Co-Author*) Nothing to Disclose

Demetrios Geanon, MD (*Abstract Co-Author*) Nothing to Disclose
Omar Abdalla, BS (*Abstract Co-Author*) Nothing to Disclose
Nate D. Kelm, PhD (*Abstract Co-Author*) Nothing to Disclose
Lena Khanolkar (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Exhibit viewers should be able to (A) understand some indications for traumatic and non-traumatic splenic embolization, (B) recognize key anatomy for splenic embolization on angiography, (C) appreciate various techniques available to perform splenic embolization and (D) understand how patients are managed post-procedurally/monitored for potential complications.

**TABLE OF CONTENTS/OUTLINE**

A. Indications for Splenic Embolization a. Traumatic Spleen Embolization i. Signs of Splenic Trauma and AAST Grades on Diagnostic Imaging (CT and angiography) ii. Splenic embolization versus splenectomy: Indications and long-term outcomes. iii. Prophylactic embolization b. Non-traumatic Spleen Embolization i. Immune thrombocytopenia ii. Splenic artery aneurysm iii. Splenomegaly and importance for chemotherapy iv. Cirrhosis v. Post-liver transplantation (splenic steal) B. Procedural anatomy: celiac and splenic artery anatomy visualized on angiography C. Approach to embolization a. Choice of embolic agent (coils, plugs, gelatin sponge, Onyx, glue) b. Traumatic embolization i. Vascular access points ii. Proximal versus Distal embolization: advantages/disadvantages of each approach iii. Important collaterals to assess and preserve c. Non-traumatic embolization i. Preparation for embolization, including diagnostic imaging, antibiotics, and vaccination practices ii. Lower and mid pole embolization targets iii. Controversies in target infarction rate D. Post-embolization Outcomes and Follow-up a. Major and minor complications and their radiologic findings i. Access site complication ii. Splenic necrosis iii. Infection b. Follow-up imaging and management guidelines i. Dependent on indication

## IREE-51 TINY SPARKS: EXPLORING ABLATION IN PEDIATRIC ONCOLOGY

Renata Nabeiro Dias Angelo, MD (*Abstract Co-Author*) Nothing to Disclose
Patricia Rosseto Franco, MD (*Abstract Co-Author*) Nothing to Disclose
Matheus Fritzen, MD (*Abstract Co-Author*) Nothing to Disclose
Barbara d. Nunes, MD (*Abstract Co-Author*) Nothing to Disclose
Marcio d. Meira, MD,MSc (*Abstract Co-Author*) Nothing to Disclose
Marcello Giovanni Messias Da Silva, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1- Understand the clinical indications and decision-making processes for pediatric ablation procedures.2- Explore the safety and efficacy of ablation technologies in pediatric applications.

**TABLE OF CONTENTS/OUTLINE**

1- IntroductionDiscuss the relevance of ablation therapy in pediatric care, highlighting the current need of adapting adult techniques for pediatric use.2- Indications for Pediatric AblationOverview of conditions in pediatric patients that may benefit from ablation, including both common and rare indications.3- Techniques and TechnologiesBrief description of the ablation methods used in pediatric cases, focusing on adaptations for smaller anatomies and lower tolerance levels.4- Cases Presentation of selected cases to illustrate successful outcomes and the critical thinking involved in treatment planning.5- Safety and Efficacy EvaluationAnalysis of safety measures, complication management, and efficacy assessments, according to established literature.6- Management and Follow-UpSuggestions on post-procedure care, emphasizing the unique aspects of pediatric patient management and long-term follow-up.7- ConclusionReinforce the importance of specialized training in pediatric ablation, and suggested directions for future research.

## IREE-52 SHAM PROCEDURES IN INTERVENTIONAL RADIOLOGY INVESTIGATIVE TRIALS: ESSENTIAL FOR RIGOROUS RESEARCH

Hyeon Yu, MD (*Abstract Co-Author*) Nothing to Disclose
Elaine M. Caoili, MD, MS (*Abstract Co-Author*) Steering Committee, ProKidney, LLC
Joseph M. Stavas, MD, MPH (*Presenter*) Employee, ProKidney;Speaker, ProKidney;Research Consultant, Excelerate Health Ventures

**TEACHING POINTS**

Sham procedures provide critical control in Interventional Radiology (IR) trials, minimizing bias and ensuring the true efficacy and safety of new treatments. This presentation explores the history, implementation, and challenges of sham procedures in IR research. We will review our experience with sham procedures in a novel autologous cell-based therapy investigative trial to treat chronic kidney disease and other blinding methods which require risk versus benefit assessment, consistency, and validation .

**TABLE OF CONTENTS/OUTLINE**

- The Importance of Sham Procedures
- Why they are necessary for unbiased results in IR trials.
- Examples where their absence has led to misleading findings.
- Examples of IR trials with sham procedures:
- Catheter-directed renal artery denervation for hypertension
- Vertebroplasty for osteoporosis fracture pain
- Prostatic artery embolization for benign prostatic hypertrophy
- Geniculate and shoulder artery embolization for pain
- Cell-based therapies for kidney disease
- Implementing Sham Procedures in IR
- Specific procedural and training methods to ensure blinding
- Ethical and regulatory considerations (regulatory agency guidance, Institutional Review Board approval)
- Challenges and Best Practices
- Addressing patient recruitment barriers
- Overcoming ethical barriers and concerns
- Strategies for maintaining consistency and minimizing unblinding
- Key point Emphasize the need for wider use of rigorous sham-controlled research methodologies within the IR community to drive innovation and ensure evidence-based treatments.

## IREE-53 INTERVENTIONAL RADIOLOGY IN THE MANAGEMENT OF TRANSPLANT-ASSOCIATED COMPLICATIONS

Sophie Chheang, MD (*Abstract Co-Author*) Medical Director, Agamon Technologies Limited
William Baker (*Abstract Co-Author*) Nothing to Disclose
Emily June Zolfaghari (*Abstract Co-Author*) Nothing to Disclose
Ryan Bitar, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Recognize the common/basic surgical techniques and imaging appearances of allograft placement in transplant recipients
- Review critical post-transplant complications and their associated presentations on imaging.
- Discuss the role of interventional radiology in the management in such pathologies.

**TABLE OF CONTENTS/OUTLINE**

- Liver transplant
- Common transplant techniques
- Arterial complications
- Arterial stenosis
- Imaging: Ultrasound (US) and CT angiogram
- angioplasty/stenting +/- splenic artery embolization
- Biliary complications
- Leak
- Imaging: CT and HIDA
- Stenting and sclerotherapy
- anastomotic stricture:
- Imaging: MRCP
- Angioplasty/stenting
- Venous complications
- Deep venous thrombosis
- Imaging: CT and US
- thrombectomy
- IVC stenosis/occlusion
- Imaging: CT and US
- Angioplasty/stenting
- Intrahepatic and extrahepatic fluid collections
- Imaging: MRI and CT
- Drainage/aspiration
- Biopsy
- Specimen specifics
- Kidney transplant
- Common renal transplant techniques
- Arterial complications
- Renal arterial stenosis:
- Imaging: CT angiogram and US
- angioplasty/stenting
- Pseudoanuerysm/trauma
- Imaging: CT and US
- Intervention: embolization
- Venous complications
- Deep venous thrombosis
- Imaging: US
- Thrombectomy
- Urinary complications
- Ureteral stricture
- Imaging: CT and US
- angioplasty and nephroureterostomy placement
- Pyelonephritis
- Imaging: CT and US
- nephrostomy
- Perinephric collections
- Imaging: US and CT
- Drainage/aspiration
- Biopsy
- Specimen specifics

## IREE-54 EX-VIVO MODELS FOR IR PROCEDURAL TRAINING. TAKING SIMULATION TO NEW LEVELS

John A. Walker, MD, PhD (*Abstract Co-Author*) Speaker, Shionogi & Co, Ltd;Consultant, Shionogi & Co, Ltd
Rajeev Suri, MD, MBA (*Abstract Co-Author*) Nothing to Disclose
Carlos B. Ortiz, MD (*Abstract Co-Author*) Consultant, Argon Medical Devices, Inc
Marina Borrego, BS (*Abstract Co-Author*) Nothing to Disclose
Jorge E. Lopera, MD (*Presenter*) Shareholder, Tecnostent SA;Consultant, Merit Medical Systems, Inc;Research Grant, AngioDynamics, Inc

**TEACHING POINTS**

Simulation in IR is very limited due to the high cost of computer base simulators and the lack of realistic experience when using plastic and 3- D models.Ex-vivo organs are very inexpensive and offer an unique opportunity to develop several models to teach, train and do research in a low cost, safe and reproducible manner.We have successfully created several models using ex- vivo organs to teach and train on several basic and advanced IR techniques.The purpose of this exhibit is to teach other educational institutions how to start a simulation program using ex vivo organs.

**TABLE OF CONTENTS/OUTLINE**

How to get started: procuring the organs and the getting the basic materials.US guided kidney and liver biopsies Percutaneous Transhepatic Cholangiogram and cholecystostomy tube Models. PCN Double J ureteral stent placement and retrograde exchange Models. Portal vein and renal artery embolization models. Transjugular liver biopsy and TIPS placement- ICE guided model.

## IREE-55 RADIOEMBOLIZATION FOR LIVER CANCER : CONSIDERATION OF NON-HEPATIC ARTERY ORIGINATING FROM THE HEPATIC ARTERY

Hyo-Cheol Kim, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To ensure the safety and efficacy of radioembolization procedures, a thorough comprehension of hepatic artery anatomy is imperative. This is particularly crucial due to the potential for several non-hepatic arteries to arise from the hepatic artery, necessitating careful consideration to avoid their inadvertent treatment or to provide appropriate protection. Oversight or unintended treatment of non-hepatic arteries during radioembolization can result in a spectrum of adverse consequences, ranging from mild postembolization syndrome to severe gastrointestinal radiation ulceration. The primary objectives of this presentation are as follows: 1. Enumeration of non-hepatic arteries originating from the hepatic artery. 2. Acquisition of techniques for identifying and managing non-hepatic arteries before and during radioembolization. 3. Review of potential complications associated with the inadvertent treatment of these arteries.

**TABLE OF CONTENTS/OUTLINE**

1. Cystic artery, right gastric artery, accessory left gastric artery, hepatic falciform artery, left inferior phrenic artery, and supraduodenal artery. 2. Vascular anatomy visualization of non-hepatic arteries using CT/MR, DSA, and cone-beam CT. 3. Strategies for detecting non-hepatic arteries using cone-beam CT, planning angiography, and SPECT/CT. 4. Technical considerations including permanent embolization, temporary embolization, and bypass procedures. 5. Management of complications related to non-hepatic artery treatment, such as ischemic cholecystitis, radiation cholecystitis, radiation gastroduodenal ulceration, radiation dermatitis, and epigastric pain.

## IREE-56 INTRA-ARTERIAL TREATMENT FOR HEPATOCELLULAR CARCINOMAS : HOW TO MANAGE SHUNTING FROM THE ARTERY

Jin Woo Choi, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

In the treatment of hepatocellular carcinomas, intra-arterial therapy such as chemoembolization and radioembolization is commonly used. However, operators may encounter shunts from the artery (such as arterioportal, arteriovenous, and arteriopulmonary shunts) that can hinder effective treatment. These shunts can be caused by various factors such as tumor invasion, previous percutaneous procedures, chronic inflammation, or congenital acquisition. If not properly occluded, embolic material can pass through the shunt and cause non-target embolization or serious complications. This exhibit aims to achieve three goals: (1) Review the radiologic appearance of arterioportal, arteriovenous, and arteriopulmonary shunts; (2) Learn how to manage these shunts with proper embolic materials; and (3) List the possible complications and their management.

**TABLE OF CONTENTS/OUTLINE**

1) List of shunts Arterioportal shunt (hepatic artery - portal vein), Arteriovenous shunt (hepatic artery - hepatic vein), Arteriopulmonary shunt (hepatic artery - pulmonary artery/vein), 2) Imaging findings on CT/MR and angiography according to the cause (tumorous vs non-tumorous condition) 3) Embolization strategy and materials for shunts 4) Complications related with non-target embolization and their management

## IREE-57 EMBOLIZATION WITH N-BUTYL CYANOACRYLATE : PROPERTIES, TECHNIQUE, PITFALLS, AND APPLICATIONS

Jin Woo Choi, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

N-Butyl cyanoacrylate is a commonly used liquid embolic material for managing various medical conditions, such as vascular malformation, gastrointestinal bleeding, portal vein embolization, and tumor embolization. This material can be mixed with iodized oil to provide radiopacity and control the polymerization time. However, beginners may find it challenging to handle liquid embolic material compared to coils, plugs, and particles. The purpose of this exhibit is : (1) To describe the properties and mechanism of action of N-butyl cyanoacrylate. (2) To learn diverse injection techniques and potential pitfalls associated with its use. (3) To review various clinical indications and appropriate techniques for the use of N-butyl cyanoacrylate in interventional procedures.

**TABLE OF CONTENTS/OUTLINE**

1) N-butyl cyanoacrylate A. Chemical properties B. Effects on tissues C. Polymerization D. Mixture with iodized oil E. Mixture with iodized oil and alcohol 2) Injection technique and pitfalls A. flow-dependent injection B. pressure-dependent injection C. Balloon-occluded injection D. Potential pitfalls 3) Clinical indications A. Arteriovenous malformation B. Diverse bleeding embolization C. Vein embolization D. Tumor embolization E. Endoleak embolization F. Lymphatic embolization

## IREE-59 SUPERSELECTIVE RADIOEMBOLIZATION FOR HEPATOCELLULAR CARCINOMA : RADIATION SEGMENTECTOMY AND BEYOND

Hyo-Cheol Kim, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Radioembolization is an established treatment for unresectable hepatocellular carcinoma. Radioactive microspheres are preferentially deposited into the hypervascular tumor by siphoning effect so that injection of microspheres are commonly performed at the lobar artery level. However, superselective radioembolization is the best way to improve tumor response and to prevent potential complications. The purpose of this exhibit is : (1) To review the rationale of radiation segmentectomy. (2) To learn when superselective radioembolization is needed, (3) technical tips for superselective radioembolization.

**TABLE OF CONTENTS/OUTLINE**

1) Radiation segmentectomy : rationale and evidence 2) Dosimetry : Practical guide for dosimetry of superselective radioembolization3) When superselective radioembolization is needed A. small single tumor : radiation segmentectomyB. Large single tumor saddling on both lobesC. Small remnant liverD. Hepatic artery branching at acute angleE. Extrahepatic collateral artery supplying the tumor4) Technical consideration of superselective radioembolization A. Protection of distal normal liver by using balloon microcatheter and detachable coil B. Combination treatment of lobar and segmental arteryC. Combination treatment of 1st and 2nd week dosing of glass microsphere5) Follow-up imaging after superselective radioembolizationA. Early loss of arterial enhancement of the tumor B. Focal radiation necrosis mimicking new hypovascular tumor

Ryota Shindo (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

-To understand the importance of eye protection by lead glasses during Interventional radiology (IR) procedures. -To discuss the radiation-shielding effects of over-glasses-type eyewear. -To compare the protection afforded by over-glasses-type and regular eyewear. -To encourage the user of prescription glasses to wear over-glasses-type eyewear. -To understand the importance of the combination use of radiation protection tools during IR procedures.

**TABLE OF CONTENTS/OUTLINE**

•Characteristics of over-glasses-type eyewear •Radiation protection effect of over-glasses-type eyewear in a phantom experiment •Covered area by lead glasses and recommendation for combination use of protection tools OUTLINE: In response to the new occupational eye lens dose limit, the use of radiation protection tools such as Pb eyewear is important in IR. Over-glasses-type eyewear has a large frame and lens to fit over prescription glasses. In recent years, 0.07 mm Pb eyewear has been used. It is more lightweight and comfortable than existing 0.75 mm one. The shielding effects of lead-equivalent glasses (over-glasses-type and regular) were evaluated by placing radiophotoluminescence dosimeters inside and outside the glasses, and on the surface of the eye. The over-glasses-type eyewear exhibited better protection than regular eyewear at the irradiation angles of clinical settings. According to our phantom study, 0.07 mm Pb over-glasses-type eyewear protected left eye effectively. However, the covered area of right eye was insufficient. Further improvements of its shape and combination use of radiation protection tools are needed.

## IREE-61 PARADIGM SHIFT FROM TREATMENT TO PREVENTION IN TYPE 2 ENDOLEAK POST ENDOVASCULAR AORTIC REPAIR: CURRENT EVIDENCE AND TECHNICAL TIPS

Masashi Tamura, MD (*Abstract Co-Author*) Nothing to Disclose
Masahiro Jinzaki, MD, PhD (*Abstract Co-Author*) Support, Canon Medical Systems Corporation;Support, General Electric Company
Manabu Misu (*Abstract Co-Author*) Nothing to Disclose
Shintaro Senda, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Endovascular aortic repair (EVAR) offers a minimally invasive solution for aortic aneurysms, yet introduces the unique complication called endoleaks (ELs). Type 2 (T2) ELs, characterized by low pressure, necessitate monitoring due to their potential to trigger or worsen type 1 ELs, leading to rupture. T2ELs are traditionally treated with endovascular embolization; however, this approach is frequently difficult and ineffective. Recently, preemptive branch embolization has surfaced as a promising alternative strategy. This exhibit aims to achieve three goals: (1) Reviewing the basics and recent topics of T2ELs; (2) Learning the latest evidence supporting the shift from treatment to prevention for T2ELs post EVAR; and (3) Exploring techniques of preemptive embolization to mitigate T2ELs.

**TABLE OF CONTENTS/OUTLINE**

(1) Introduction: Types of endoleaks, pathophysiology, and imaging evaluation of T2ELs. (2) Treatment of T2ELs: Indications, overview of interventional techniques, treatment limitations, and case presentation. (3) Transitioning from Treatment to Prevention: Rationale, indications, review of efficacy studies, ongoing research, and future directions. (4) Techniques for Preemptive Embolization: Procedural considerations, and data on catheter selection from our institution.

## IREE-62 CT-GUIDED CRYOABLATION FOR RENAL CELL CARCINOMA: PITFALLS, AND TIPS TO ENSURE ACCURACY AND SAFETY

**Awards**
**Cum Laude**

Nobuhiro Fujita, MD,PhD (*Abstract Co-Author*) Nothing to Disclose
Daisuke Okamoto, MD (*Abstract Co-Author*) Nothing to Disclose
Kousei Ishigami, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Keisuke Ishimatsu, MD (*Abstract Co-Author*) Nothing to Disclose
Satoshi Makise (*Abstract Co-Author*) Nothing to Disclose
Kousuke Tabata (*Abstract Co-Author*) Nothing to Disclose
Yasuhiro Ushijima, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To review the basics of CT-guided cryoablation and its indications for renal cell carcinoma.To learn the practice of CT-guided cryoablation for renal cell carcinoma and how to improve effective treatment.To learn about the potential complications of CT-guided cryoablation for renal cell carcinoma and how to prevent them.

**TABLE OF CONTENTS/OUTLINE**

A. Basics of CT-guided cryoablation. Principles of cryoablation Imaging modalities for targeting lesions and monitoring the treatment areaB. Indications for CT-guided cryoablation for renal cell carcinoma. Tumor size, Location, Single or multiple, Initial or secondary, Hereditary disease, Elderly patient, Patient with comorbiditiesC. Practice of CT-guided cryoablation for renal cell carcinoma. Anesthesia, Puncture under CT fluoroscopy, Positioning of the cryoprobes and monitoring of the treatment area by CT reconstruction imagingD. To ensure more effective cryoablation for renal cell carcinoma. Transarterial lipiodol marking before cryoablationE. Possible complications and how to prevent them. Hemorrhage, Renal dysfunction, Infection/abscess, Bowel injury, Ureteral injury, Pneumothroax, Abdominal pseudohernia, Dissemination, Hydrodissection for surrounding organs, Ureteral stenting to prevent ureteral injuryF. Percutaneous biopsy for histological diagnosis. Biopsy separate from cryoablationG. Pitfalls. Ice-ball crack during cryoablation, Mimicking of a recurrent lesion

## IREE-63 APPLICATIONS OF TRANSARTERIAL EMBOLIZATION IN MUSCULOSKELETAL PAIN MANAGEMENT

Stuart E. Braverman, MD (*Abstract Co-Author*) Nothing to Disclose
Robert G. Dionisio, MD (*Abstract Co-Author*) Nothing to Disclose
Kori A. Higashiya, MD (*Abstract Co-Author*) Nothing to Disclose
Chase Glenn, MD (*Abstract Co-Author*) Nothing to Disclose
Catherine Ho, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To review the efficacy and safety of Transarterial Embolization (TAE) in managing chronic musculoskeletal pain.

**TABLE OF CONTENTS/OUTLINE**

Background: Chronic musculoskeletal pain affects up to 30% of people worldwide, often necessitating interventions beyond NSAIDs and lifestyle modifications. Transarterial embolization (TAE) is a viable option for those with persistent, refractory pain despite pharmacologic therapy or are ineligible/averse to surgery.Pathophysiology/Technique: Angiogenesis, neurogenesis, and resulting inflammation underlie many MSK pain syndromes, such as osteoarthritis (OA). TAE targets these processes by selectively embolizing major arterial supplies, mitigating inflammation and pain.Application and Results:OA and OA related bone marrow lesions (knee, hands, shoulder, facet, and SI joints)Non Osteoarthritic Synovitis (Adhesive Capsulitis and Hip Synovitis)Tendonopathy/EnthesopathyOther (Chronic Myalgia and Fibroids)Conclusion: Multiple studies demonstrate TAE as a safe and effective way to manage chronic musculoskeletal pain. Further studies are warranted to elucidate long term efficacy and broaden our understanding of chronic MSK pain pathogenesis.

## IREE-64 STOP THE BLEEDING: THERE'S MORE THAN ONE WAY TO DO IT

Ryo Toya, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Hideki Ishimaru (*Abstract Co-Author*) Nothing to Disclose
Tomoki Nakano, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Effective control of bleeding is crucial to prevent severe anemia or exsanguination. In various situations, interventional radiologists frequently manage hemostasis. The methods used to achieve bleeding control have their own advantages and disadvantages. In some cases, organ ischemia is acceptable to achieve hemostasis. The skills and equipment of interventional radiologists performing hemostatic techniques can vary, and there is no standard method for achieving hemostasis. Nevertheless, any available technique can be used to control bleeding if performed correctly. This educational exhibit illustrates the different treatment options for various bleeding scenarios, emphasizing how hemostasis can be achieved based on the skill level of each interventional radiologist.

**TABLE OF CONTENTS/OUTLINE**

Ischemic susceptibility of bleeding organs- Knowledge of embolic material properties: temporary / permanent- Tips for successful use of each embolic material- Hemostatic methods other than embolization: manual compression / stentgraft / thrombin- Contraindications in each situation

## IREE-65 LIVER VENOUS DEPRIVATION TO INDUCE LIVER HYPERTROPHY BEFORE MAJOR HEPATECTOMY: MATERIALS AND TECHNIQUES

Cristina Mosconi, MD (*Abstract Co-Author*) Nothing to Disclose
Lorenzo Braccischi, MD (*Abstract Co-Author*) Nothing to Disclose
Maria Vittoria Bazzocchi, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Liver venous deprivation (LVD) is a safe and effective technique with low complications and rapid growth rates before major liver hepatectomy. The learning object of this educational are: to analyze different radiological interventional strategies to induce liver hypertrophy prior to surgery and explain how to perform LVD, focusing on different approaches and embolic materials, to understand the importance of maintaining a sufficient future liver remnant (FLR) volume for optimal liver function before surgery and to explain the techniques to calculate FLR.

**TABLE OF CONTENTS/OUTLINE**

Careful patient selection to assess FLR before surgery is a key factor for clinical outcomes to avoid post-hepatectomy liver failure (PHLF) and mortality. CT segmentation and (99m)Tc-mebrofenin-hepatobiliary scintigraphy (HBS) are valid alternatives for evaluating remnant percentage in order to plan the need for LVD. For portal embolization, access is usually transhepatic; several embolic materials have been used, including N-Butyl-Cyanoacrylate, Ethanol, PVA microparticles, Gelfoam Sponge, Coils and Plugs. Additional embolization of the hepatic vein allows significant hypertrophy, emphasizing the potential efficacy and safety of the combined approach in hepatic interventions. Access can be percutaneous trans-hepatic, jugular or femoral, and cyanoacrylate, plugs or coils are usually employed. Other techniques include radioembolization lobectomy with Yttrium-90 or Olmium-166.

## IREE-66 THE ENHANCED MYOMETRIAL VASCULARITY - IS IT AN AVM? REVIEWING DEFINITIONS, IMAGING FINDINGS, AND INTERVENTIONAL TREATMENT

Gustavo V. Andrade, MD (*Abstract Co-Author*) Nothing to Disclose
Francisco Donato JR, MD (*Abstract Co-Author*) Nothing to Disclose
Otavio Augusto Ferreira Dalla Pria, MD (*Abstract Co-Author*) Nothing to Disclose
Carolina A. Heming, MD (*Abstract Co-Author*) Nothing to Disclose
Camila Gadens Zamboni, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Arteriovenous malformations (AVMs) are congenital abnormalities that can affect any organ or tissue in the human body, with myriad presentations in radiological studies. True uterine AVM is extremely rare, with very few cases reported worldwide. Some acquired pathologies can lead to dilated and tangled vessels, with low-resistance turbulent high-flow, mimicking an AVM. Recently described, Enhanced Myometrial Vascularity (EMV) has imaging findings very similar to uterine AVM but is acquired and usually occurs in the context of a recent pregnancy or abortion. Nevertheless, correct diagnosis is crucial for appropriate treatment. This exhibit aims: 1. To review the literature concerning this entity, depicting clinical presentation; 2. To describe imaging findings that help to diagnose them among their differentials, focusing on the importance of the Radiologist; 3. To demonstrate over 15 cases of EMVs treated by catheter embolization, discuss findings and techniques, and focus on the role of the Interventional Radiologist; 4. To highlight essential teaching points to become familiar with the diagnosis and embolization treatment of EMVs.

**TABLE OF CONTENTS/OUTLINE**

1. Brief review of AVM and EMV concepts and radiological importance; 2. EMV definition, diagnostic criteria, and differentials among different radiologic imaging modalities; 3. Illustration of EMV cases treated by embolization, focusing on diagnosis and Interventional approach; 4. Conclusion and take-home messages, 5. References

## IREE-67 UNLOCKING INSIGHTS: THE ROLE OF FISTULOGRAPHY IN PERIPANCREATIC COLLECTIONS

Trinidad Castro (*Abstract Co-Author*) Nothing to Disclose
Marcelo Castro, MD, MD (*Abstract Co-Author*) Nothing to Disclose

Maximiliano Klinkert (*Abstract Co-Author*) Nothing to Disclose
Diana Saavedra Bissett (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Acute necrotizing pancreatitis (ANP) affects 15% of cases and raise mortality to 30%, often requiring intensive care, readmissions, and invasive treatments.The management of complex fluid collections in ANP has evolved, with many medical centers adopting a "Step-up approach". This strategy begins with percutaneous drainage and minimally invasive techniques, succeeding approximately 50-60% of the time. This step can serve as both a definitive treatment or a bridge to more invasive procedures.Fistulization is a feared complication, being necrosis and infection a risk factor. Pancreatic cutaneous fistulas initially involves conservative measures, as many may spontaneously close. However, communication with surrounding structures as gastrointestinal tract, can lead to malnutrion, bleeding, and infections.While fistulography via CT is valuable for detecting postoperative pancreatic fistulas after pancreaticoduodenectomy, its efficacy for fistulas related to ANP during the percutaneous drainage stage is not well established. Nevertheless, this procedure aids in diagnosing and monitoring fistulas, providing crucial anatomical insights.This presentation aims to diagram the technique and showcase cases where CT fistulography is performed during percutaneous drainage of peripancreatic collections, enhancing the efficacy and safe of it for future studies.

**TABLE OF CONTENTS/OUTLINE**

1. Teaching points 2. Overview of Acute Pancreatitis - Role of Imaging3. Updates on Pancreatitis Necrosis Management: Step-Up Approach4. The Significance of Fistulography in Pancreatitis5. Case Review6. Conclusion and Future Directions in Imaging and Management of Peripancreatic collections 7. References

## IREE-68 PRECISION WITHOUT INCISION: EXPLORING ABLATION TECHNIQUES IN UTERINE FIBROID TREATMENT

Patricia Rosseto Franco, MD (*Abstract Co-Author*) Nothing to Disclose
Marcio d. Meira, MD,MSc (*Abstract Co-Author*) Nothing to Disclose
Barbara d. Nunes, MD (*Abstract Co-Author*) Nothing to Disclose
Matheus Fritzen, MD (*Abstract Co-Author*) Nothing to Disclose
Renata Nabeiro Dias Angelo, MD (*Abstract Co-Author*) Nothing to Disclose
Marcello Giovanni Messias Da Silva, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1- Discuss the different minimally invasive techniques available for treating uterine fibroids.2- Evaluate the effectiveness and safety profiles of each technique.3- Review patient selection criteria and outcomes for fibroid ablation.

**TABLE OF CONTENTS/OUTLINE**

1) Introduction1a: Overview of uterine fibroids and the burden of disease.1b: Introduction to minimally-invasive ablation techniques as treatment options.2) Ablation Techniques2a: Exploration of MRgFUS, RFA, and other emerging ablation technologies.2b: Mechanism of action and important procedural details for each technique.3) Effectiveness and Safety3a: Explore effectiveness and safety data across different ablation methods.3b: Brief discussion of common and rare complications associated with each technique.4) Patient Selection4a: Criteria for selecting suitable candidates for minimally-invasive procedures.4b: Considerations based on fibroid size, location, and patient symptoms.5) Clinical Outcomes5a: Long-term outcomes and quality of life improvements post-ablation.6) Future Directions6a: Recent advancements and ongoing research in fibroid ablation.6b: Possible recommendations for patient selection.6c: Potential future technologies and their expected impact on treatment paradigms.7) Conclusion7a: Summary of current knowledge on fibroid ablation as a safe and effective treatment option.

## IREE-69 CENTRAL VENOUS ENDOVASCULAR RECONSTRUCTION FOR SVC OBSTRUCTION

Nicholas Voutsinas, MD (*Abstract Co-Author*) Speaker, Koninklijke Philips NV
Brian M. Fagel, MD (*Abstract Co-Author*) Nothing to Disclose
LeAnn S. Stokes, MD (*Abstract Co-Author*) Nothing to Disclose

Omar Abdalla, BS (*Abstract Co-Author*) Nothing to Disclose
Nate D. Kelm, PhD (*Abstract Co-Author*) Nothing to Disclose
Oliver S. Zhao (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The purpose of this exhibit is:1. To review the clinical indications of central venous endovascular reconstruction of the superior vena cava and brachiocephalic vein2. To demonstrate proper techniques for central venous endovascular reconstruction in cases of benign SVC syndrome3. To review complications of central venous endovascular reconstruction

**TABLE OF CONTENTS/OUTLINE**

1. Indications for central venous reconstructiona. Patients with symptoms (facial swelling, orthopnea) from SVC/central venous occlusion due to:i. Chronic indwelling pacemakers, hemodialysis catheters, central venous cathetersii. Benign tumors - thyroid goiteriii. Fibrosing mediastinitisiv. Sarcoidosisb. Prior to placement of central venous catheters/dialysis catheters in patients with chronic central venous occlusionc. Malignant causes of SVC syndrome refractory to tumor treatmenti. Bronchogenic carcinoma, lymphoma, sarcoma, metastatic disease, among others2. Approach to central venous reconstructiona. Venous access site selection - typically internal jugular or subclavian, possibly with femoral accessb. Venographyc. Wire and/or sharp recanalizationd. Balloon venoplasty and stent placement3. Complicationsa. Immediate/Short term:i. Localized pain, puncture site hematomaii. Arrhythmiaiii. Hemoptysis, hematemesisiv. Pulmonary edemav. Pulmonary embolismvi. Cardiac tamponade due to iatrogenic SVC perforationb. Intermediate/Long term:i. Restenosisii. Stent occlusioniii. SVC syndrome recurrence

## IREE-7 FROM SUBJECTIVE TO OBJECTIVE: REDEFINING CATHETER EMBOLIZATION SUCCESS WITH BLOOD FLOW VELOCITY VALIDATION

Masaru Shiotani, RT (*Abstract Co-Author*) Nothing to Disclose
Keizo Murakawa (*Abstract Co-Author*) Nothing to Disclose
Tetsuya Fukuda, MD, PhD (*Abstract Co-Author*) Research Grant, Canon Medical Systems Corporation;Research Grant, General Electric Company
Akiyuki Kotoku, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Hiroki Horinouchi (*Abstract Co-Author*) Nothing to Disclose

Teruhito Hayashi (*Abstract Co-Author*) Nothing to Disclose
Kazuki Hara, RT (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Though the emergence of novel endovascular therapeutic devices like the Amplatzer Vascular Plug (AVP) and the Woven EndoBridge (WEB) has expanded our options for embolization procedures, we still rely on subjective analysis of angiography to determine completion, based on our experience. However, sometimes vessel flow recanalization occurs during follow-up, highlighting the need for a more precise, quantitative approach to angiography. In response, we developed a quantitative analysis method called mqDSA. In this presentation, we aim to compare the pros and cons of various methods, including MRI, ultrasound, and quantitative DSA. Our perspective underscores the necessity of adopting quantitative methodologies like mqDSA, which offer a more objective and reliable assessment, ultimately enhancing treatment outcomes and patient care.

**TABLE OF CONTENTS/OUTLINE**

1. Angiography (DSA) for Flow Velocity EvaluationPros: In-room feasibility and instant assessment and new quantitative method (mqDSA)Cons: Ionizing radiation exposure and contrast medium requirement.2. MRI-Based Flow Velocity EvaluationPros: Spatial resolution and non-invasiveness.Cons: Inaccessibility during procedures and susceptibility to artifacts.3. Ultrasound for Flow Velocity EvaluationPros: Portability and real-time measurement.Cons: Operator skill dependency and limited acoustic windows.4.Comparative Analysis of Flow Velocity Measurement TechniquesUsing graphical representations, we compare flow velocity measurement techniques (MRI, ultrasound, and angiography), showing their relationship to actual flow, for accuracy assessment.5.Clinical ApplicationsCase Studies: Practical implementations of mqDSA.

## IREE-70 UNDER PRESSURE: THE TOOLS AND TECHNIQUES TO A SUCCESSFUL ANGIOGRAPHY

Shane N. Newberger, MD (*Abstract Co-Author*) Nothing to Disclose
Arif Musa, MD, MS (*Abstract Co-Author*) Research Grant, Stryker Corporation;Contract, WebMD Health Corp (WebMD, Inc)
Ali N. Harb, MD (*Abstract Co-Author*) Nothing to Disclose
Brigitte Berryhill, DO (*Abstract Co-Author*) Nothing to Disclose
Shriya Veluri (*Abstract Co-Author*) Nothing to Disclose
Carson Middlebrook (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

This exhibit aims to educate on mesenteric angiography in emergency settings. The focus of this exhibit will be an overview of the conventional and suture techniques to form a reverse curve for access into the mesenteric aortic branches to capture an angiogram. It will also include a background on mesenteric angiography, common curve catheters and their respective characteristics guiding selection, and a review of the mesenteric vasculature with examples of extravasation.

**TABLE OF CONTENTS/OUTLINE**

Background/Indications:The purpose of mesenteric angiography in diagnosing and treating active gastrointestinal (GI) bleeds with indications for performing angiography in such cases.Catheter Selection:Review of catheter properties that help guide selection for angiography. The catheters discussed: Cobra, Headhunter, Angle Taper, Simmons, and Mikaelsson.Techniques:Discussion of two mesenteric angiography techniques - conventional angiography technique over the aortic arch and the suture angiography technique. This will include step-by-step images for each technique and their advantages and disadvantages.Anatomy Overview:Presentation of angiogram cases on the Celiac, SMA, and IMA arteries and their branches with labeled anatomy and examples of extravasation. Additionally, a demonstration of a helpful tip to confirm proper catheter positioning before contrast injection will be provided.Conclusion:Participants will gain the necessary skills to select appropriate catheters for angiography, effectively use various mesenteric angiography techniques to form a reverse curve for obtaining quality and timely results, and develop a comprehensive understanding of mesenteric vascular anatomy.

## IREE-71 INTERVENTIONAL TREATMENT OF SYMPTOMATIC CHRONIC EXTRA-HEPATIC PORTAL VEIN OBSTRUCTION (EHPVO) IN NON CIRRHOTIC PATIENTS: TIPS AND TRICKS

**Awards**
**Certificate of Merit**

Alban L. Denys, MD (*Abstract Co-Author*) Consultant, BTG International LtdGrant, BTG International LtdConsultant, Terumo Corporation
IGNACIO ANDRES CANO, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- To review the indications of interventional management of EHPVO.- To know the different steps and tips and tricks to perform a successful portal vein recanalization (PVR).- To review the results and complications that can occur during and after PVR.

**TABLE OF CONTENTS/OUTLINE**

EHPVO is a challenging condition frequently associated with portal prehepatic hypertension that can lead to variceal bleeding, portal biliopathy and ascites. In recent years, PVR alone or associated to TIPS has emerged as a promising treatment option for non cirrhotic patients with chronic EHPVO.Interventional treatment should be reserved to symptomatic patients, therefore a careful evaluation including gastroscopy for variceal staging, liver blood tests and an anatomical evaluation of the hepatic, portal, mesenteric and splenic veins which is usually performed by contrast enhanced CT with or without abdominal ultrasound and Doppler evaluation.PVR without TIPS is the preferred option when intrahepatic branches are patent (Marot classification 1 or 2). The access route to the portal system depends on the anatomical situation but is preferably done through the anterior sector oh the portal veins. TIPS is added to PVR only if the intrahepatic branches have a poor quality and if the portosystemic pressure gradient remains high after PVR.Direct access via the mesenteric or splenic vein is a problem solving when the liver access is failed or is not possible. Catheters, techniques and tips to recanalize the occluded atrophic portal vein will be discussed.In conclusion, PVR is a valuable option for patients with chronic PVT. Operators should be familiar with the indications, pre-procedural planning, and techniques for performing a successful PVR.

## IREE-72 "ICE, ICE BABY": REVIEW OF BEST PRACTICES OF CRYOABLATION FROM HEAD TO TOE

Lena Khanolkar (*Abstract Co-Author*) Nothing to Disclose

Atlee Witt (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The purpose of this exhibit is: 1. To detail different cryotherapy techniques dependent on anatomy of interest 2. To explore the indications, contraindications, and potential complications of cryotherapy 3. To analyze the efficacy of cryotherapy versus alternative treatments

**TABLE OF CONTENTS/OUTLINE**

1. Introduction a. Mechanism of action i. Cellular destruction via rapid freezing and thawing [1. Mechanical 2. Osmotic 3. Ischemic] b. Indications for cryotherapy i. Non-surgical candidate for local control of primary tumor or metastasis ii. Salvage therapy for locally recurrent disease iii. Palliative therapy c. Contraindications for cryotherapy i. Relative [1. Underlying coagulopathy 2. Bowel, vasculature, or other structures at high risk for non-target injury] ii. Absolute [1. Extensive local tumor volume] d. Alternative treatment approaches i. Radiofrequency ablation ii. Microwave ablation iii. Chemical ablation iv. Open surgical resection 2. Procedure a. Equipment i. 14g/17g cryoprobes ii. Biopsy supplies iii. Hydro-dissection supplies, if needed [1. 21g Chiba needle 2. Saline vs. contrast]) b. Pre-procedure i. Consent ii. Foley catheter or pyleoperfusion iii. Pre-operative embolization (if needed) iv. Preliminary CT v. Site identification and preparation c. Potential Sites i. Kidney ii. Lung iii. Bone iv. Soft Tissues (Desmoid, Endometrioma) v. Lymph Nodes vi. Adrenal Gland vii. Nerves d. Technique (site dependent) i. Freeze-thaw cycles ii. The "stick" technique iii. Track ablation e. Post-procedure i. Recovery ii. Infection prevention f. Complications i. Post-procedure bleeding ii. "Cryoshock" cytokine release iii. Pain and swelling iv. Incomplete therapy

## IREE-73 AN EX-VIVO TRAINING MODEL FOR KIDNEY EMBOLIZATION UTILIZING DIFFERENT EMBOLIC MATERIALS

Jorge E. Lopera, MD (*Abstract Co-Author*) Shareholder, Tecnostent SA;Consultant, Merit Medical Systems, Inc;Research Grant, AngioDynamics, Inc
John A. Walker, MD, PhD (*Abstract Co-Author*) Speaker, Shionogi & Co, Ltd;Consultant, Shionogi & Co, Ltd
Carlos B. Ortiz, MD (*Abstract Co-Author*) Consultant, Argon Medical Devices, Inc
Marina Borrego, BS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Discuss the benefits of simulation-based training. Discuss current training models available for kidney embolization. Describe a new teaching model for learning kidney embolization using different embolic materials.

**TABLE OF CONTENTS/OUTLINE**

Introduction. Discuss current embolization training models. Review a kidney embolization clinical case to compare training model similarities. Set-up for a newly developed ex vivo porcine kidney model. Review different embolic materials that can be used to teach kidney embolization utilizing the training model (Gelfoam, Glue, Microspheres , Obsidio, Coils). Conclusion: Incorporating simulation into medical training can provide an opportunity for additional hands-on training, without patient risk. This training model exposes operators to the techniques for kidney embolization using a variety of embolic materials.

## IREE-74 INTERVENTIONAL MANAGEMENT OF PULMONARY ARTERIOVENOUS MALFORMATIONS : TRICKS OF THE TRADE

**Awards**
**Magna Cum Laude**

Eric Therasse, MD (*Abstract Co-Author*) Research Consultant, SoundBite Medical Solutions
Pierre Perreault, MD (*Abstract Co-Author*) Consultant, Abbott Laboratories
Marie-France Giroux, MD (*Abstract Co-Author*) Stockholder, Abbott Laboratories
Louis Bouchard, MD (*Abstract Co-Author*) Nothing to Disclose

Soulez, MD, MSc (*Abstract Co-Author*) Speaker, Siemens AG;Research Grant, Siemens AG;Research Grant, Cook Group Incorporated;Advisory Board, Cook Group Incorporated;Patent agreement, Cook Group Incorporated;Research Grant, ViTAA Medical Solutions Inc;Advisory Board, ViTAA Medical Solutions Inc
Ricardo H. Do Amaral (*Abstract Co-Author*) Nothing to Disclose
Marin Halut, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Learn imaging findings of pulmonary arteriovenous malformations (PAVM) and present the PAVM classification based on angioarchitecture.Highlight the physiopathology of PAVM, the association with hereditary hemorrhagic telangiectasia and the need for screening.Recognize the indication for PAVM embolization.Learn how to embolize PAVM safely and prevent paradoxical embolization.Understand how to prevent and treat PAVM persistence after embolization.Assess the results of PAVM embolization on follow-up imaging and detect reperfusion.

**TABLE OF CONTENTS/OUTLINE**

PAVMs angioarchitecture and classification.PAVM and hereditary hemorrhagic telangiectasia.PAVM pathophysiology and associated complications.Clinical and imaging evaluation before PAVM treatment.Presentation of the relative role of the different imaging modalities chest X-Ray, echocardiography, chest CT, chest Angio-CT and DSA.Indications for PAVMs treatment.PAVM management in pregnant women.Embolization techniques:Presentation of the different embolization material and their use according to the PAVM angioarchitecture (simple PAVM, complex PAVM, and diffuse PAVM).Presentation of the material and techniques to prevent complication.Identification of the different types of PAVM persistence and how to treat them.The safe use of mechanical agent regarding the risk of paradoxical migration.Navigation techniques to access PAVMs safely and to prevent hemoptysis.Clinical and imaging follow-up protocol and criteria to assess outcome.

## IREE-75 CREATION OF A MULTIDISCIPLINARY CARE APPROACH FOR TREATMENT OF METASTATIC SPINAL TUMORS: A SINGLE-CENTER INSTITUTIONAL EXPERIENCE

Nima Kokabi, MD (*Abstract Co-Author*) Research support, Sirtex Medical Ltd;Consultant, Sirtex Medical Ltd;;
Nicole A. Keefe, MD (*Abstract Co-Author*) Nothing to Disclose
Sandra Gad, BSc, MSc (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Creation of a multidisciplinary care framework for patients with spinal tumor.Understanding how Interventional radiology fits into a multidisciplinary care framework for patients with spinal tumors.

**TABLE OF CONTENTS/OUTLINE**

Sixteen percent of all patients with metastatic cancer develop metastasis to the spine in their lifetime,which is often painful.Additionally, 1 out of 8 patients with spinal metastases develop pathologic vertebral compression fractures.While there are several effective therapies for metastatic bony spinal tumors, optimal care requires a multidisciplinary approach for individualized patient care. Interventional radiology plays an increasingly critical role in the management of patients with metastatic bony spinal tumors. At our institution, we have established a spine oncology Center of Excellence further supported with a Spine Oncology Tumor Program. A fellowship-trained spine oncology neurosurgeon leads the program and includes neurooncology, interventional radiology, radiation oncology, neuroradiology, pain anesthesia and medical oncology. The specialists meet twice monthly to discuss optimal treatment strategies. Management options may include biopsy, surgical resection, radiation treatment,chemotherapeutic agents, and interventional procedures such as include vertebral augmentation plus radiofrequency ablation (RFA). Spinal Tumor boards are not widely implemented across the country, and there are no set standards regarding which specialists are invited to be part of the spinal tumor board. This broad group of spine oncology specialists has proven to provide well-rounded streamlined care which fosters collaboration and interdisciplinary education.

## IREE-76 BENIGN THYROID NODULES: A COMPREHENSIVE ANALYSIS OF THERMAL ABLATION AS AN EFFECTIVE TREATMENT ALTERNATIVE

Rodrigo G. Garcia, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Erivelto M. Volpi (*Abstract Co-Author*) Nothing to Disclose
Victor Arthur Ohannesian (*Abstract Co-Author*) Nothing to Disclose
Marcos R. Queiroz, MD, MBA (*Abstract Co-Author*) Nothing to Disclose
Antonio Rahal Junior (*Abstract Co-Author*) Nothing to Disclose
Luiz Nascimento (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Benign Thyroid Nodules and Symptoms: Benign thyroid nodules are common and can cause symptoms like dysphagia and dysphonia due to their size and location.- Autonomous Nodules: Some thyroid nodules exhibit autonomous behavior, producing excess thyroid hormone and resulting in hyperthyroidism.- Traditional Treatments vs Thermal Ablation (TA): Historically, thyroid nodules were managed with surgery or radioiodine therapy, often leading to gland removal and subsequent need for thyroid hormone replacement. TA techniques like radiofrequency ablation (RFA) or microwave ablation (MW) are emerging as minimally invasive alternatives that preserve gland function.- Advantages of Thermal Ablation (TA): TA offers benefits such as no visible scars, local anesthesia, sedation during the procedure, and quick recovery time, while maintaining hormonal function.- Efficacy of Thermal Ablation (TA): TA typically achieves a significant reduction in nodule volume, with a 50% volume reduction within 3 to 6 months and up to 90-95% reduction within 12 months. For autonomous nodules causing hyperthyroidism, thyroid-stimulating hormone (TSH) levels normalize within 60 days post-ablation.

**TABLE OF CONTENTS/OUTLINE**

I. Introduction: Prevalence of Benign Thyroid Nodules Symptoms and Complications, Treatment Options: Surgery, Radioiodine Therapy, Thermal Ablation (TA).II. Methods: Use of Departmental Images, Extensive Bibliographic Review.III. Discussion: Presentation of Symptomatic Benign Thyroid Nodules and Traditional Treatment Approaches.IV. Conclusion: Recognition of TA as First-Line Treatment for Symptomatic Benign Thyroid Nodules.V. Limitations and Eligibility Factors for Thermal Ablation (TA).

## IREE-77 RENAL ABLATION COMPLICATIONS: WHAT TO EXPECT AND HOW TO HANDLE

Marcos R. Menezes, MD (*Abstract Co-Author*) Nothing to Disclose
Regis Otaviano Bezerra, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Guilherme L. Martins, MD (*Abstract Co-Author*) Nothing to Disclose
Vitor Nascimento, MD (*Abstract Co-Author*) Nothing to Disclose
Matheus Fritzen, MD (*Abstract Co-Author*) Nothing to Disclose
Amr Kalander, MD (*Abstract Co-Author*) Nothing to Disclose
Rodrigo Vivas Cardoso, MD (*Abstract Co-Author*) Nothing to Disclose
Joao S. Pais, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

A brief review of renal ablation techniques, indications and normal imaging evolution;To understand the incidence of the main complications, when to expect each type and how to handle each one.

**TABLE OF CONTENTS/OUTLINE**

Renal ablation has become a pivotal intervention in the management of renal masses, due to an escalating incidence of incidentally detected lesions, which account for approximately 67% of cases.Renal ablation offers numerous advantages, including reduced morbidity, enhanced parenchymal preservation and shorter hospital stays. The main therapeutic armamentarium encompass thermal ablation techniques such as Radiofrequency Ablation (RFA), Microwave Ablation (MWA), and Cryoablation (CRYO), without significant disparities in complication rates between them.Treatment assessment post-ablation involves meticulous evaluation of the ablation zone, characterized by a hypoattenuating area without enhancements, with a recommended margin of 5-10 mm to ensure complete lesion eradication. Complications, with an incidence of up to 12.9%, such as hemorrhage, hematuria, collecting system injury and pneumothorax, predominantly manifest as Clavien-Dindo grade I events.In conclusion, renal ablation is a cornerstone in renal oncology, representing a valuable therapeutic options, offering favorable outcomes with minimal morbidity. Understanding the nuances of treatment assessment, complication prediction, and management is imperative for optimizing patient care.

## IREE-78 CHOLANGIOSCOPY - WHEN IS IT TIME TO SCOPE THE BILIARY TREE?

Mina S. Makary, MD (*Abstract Co-Author*) Nothing to Disclose
Kenechukwu Okoye, MEng, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Cholangioscopy allows for direct visualization of the biliary tree via the use of an endoscope during ERCP 2. Cholangioscopy is a safe and effective approach for the treatment and diagnosis of pancreaticobiliary disease, as well as for surgical planning in cases of cholangiosarcoma. 3. While regarded as safe, there are known risks. In addition to standard practices, there are strategies and technique that can be considered to minimize risk and maximize chances of success depending on the intervention. Alternative methods to cholangioscopy may be considered for each aforementioned indication, based on clinical factors.

**TABLE OF CONTENTS/OUTLINE**

1. Background: The varying indications for cholangioscopy - why perform one? When is it time to reach for one? a. Diagnosis of biliary pathology - typically following equivocal ERCP i. Radiolucent or otherwise unseen stones on cholangiography ii. Advanced biliary disease ie PSC making other

diagnostic procedures difficult iii. Concern for malignancy iv. Comparison to other diagnostic approaches, methods, indications, risk/benefit profile v. Decision algorithm(s) for diagnostic cholangioscopy b. Treatment of gallstones (eg electrohydraulic, laser lithotripsy) c. Deployment of stents d. Collecting biopsy e. Preoperative planning 2. Technical steps including patient preparation, details, equipment, 3. Case(s) review from The Ohio State University Wexner Medical CenterPatient safety, contraindications, pearls and pitfalls.

## IREE-8 DEVELOPING ARTERIAL EMBOLIZATION IN LOW-INCOME COUNTRIES: THE FAIREMBO PROJECT

**Awards**
**Certificate of Merit**

Julien Panneau (*Abstract Co-Author*) Nothing to Disclose
Pauline Brige (*Abstract Co-Author*) Nothing to Disclose
Vincent Vidal Sr, MD (*Abstract Co-Author*) Nothing to Disclose
MATHIEU DI BISCEGLIE (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Describe the main limitations to the development of interventional radiology in low-income countries. - Propose an embolization agent that is available, effective, and safe.- Promote the formation of interventional radiology teams.

### TABLE OF CONTENTS/OUTLINE

1. Main limitations to the development of interventional radiology in low-income countries.• Significant morbidity and mortality due to the lack of development of IR techniques in low-income countries• A lack of material resources in particular on embolic agents• A lack of interventional radiologists resources2. Suture as an available, effective and safe embolic agent• Suture fragment as torpedo for proximal embolization in a preclinical model• Suture-based microparticles for distal embolization in a preclinical model• Absorbable suture for transient embolization in postpartum preclinical model• Reported clinical cases of suture use as an embolic agent : renal pseudoaneurysm embolization and postpartum hemorrhage embolization3. Formation of interventional Radiology teams• On-site missions (Senegal, Ivory Coast, Cameroon) to train local radiologists and X-ray technicians: hands-on and clinical cases• Autonomous implementation and execution of IR procedures

## IREE-9 RADIOFREQUENCY ABLATION (RFA) AND ETHANOL ABLATION FOR BENIGN THYROID NODULES

Matthew Abad-Santos (*Abstract Co-Author*) Nothing to Disclose
Harneet Sangha (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Radiofrequency ablation (RFA) and ethanol ablation are two minimally invasive procedures that target benign nodules of the thyroid. Treatment is aimed at ablating abnormal cells via heat created by high frequency electric current in (RFA) and Alcohol injections result in dehydration and destruction of benign mass. The purpose of this exhibit is to provide a brief history and role of Thyroid Ablation (RFA) / alcohol injections for treatment of benign nodules by reviewing existing literature, while also using cases to emphasize the importance of (RFA) and alcohol ablation. Additionally, expressing the indications, contradictions and outcomes of (RFA) and alcohol ablation. Finally reviewing the preoperative and postoperative guidelines for patients undergoing (RFA).

### TABLE OF CONTENTS/OUTLINE

1. History of (RFA) and ethanol ablation and mechanism 2. Assessment of cases, including key management strategies and indications for ablation procedures and alcohol injections. 3. pre-procedural imaging and investigations, procedural techniques, outcomes, post-procedural follow-up, and complications. 4. Preoperative and postoperative guidelines as well as description of procedure. 5. Case based discussion and contraindications.

IREE-11

## STREAMLINED RESIN Y90 RADIATION SEGMENTECTOMY FOR SMALL HEPATOCELLULAR CARCINOMA (HCC): ONE & DONE TRIAL

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Nima Kokabi, MD (*Abstract Co-Author*) Research support, Sirtex Medical Ltd;Consultant, Sirtex Medical Ltd;;
Michael Mohnasky (*Abstract Co-Author*) Nothing to Disclose
Haneyeh Shahbazian, MD (*Abstract Co-Author*) Nothing to Disclose
Sandra Gad, BSc, MSc (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1-In patients with small (<5cm) hepatocellular carcinoma (HCC) and no radiographically aggressive feature, undergoing radiation segmentectomy with Y90, hepatopulmonary shunt evaluation can be safely eliminated without any additional adverse events.2-In such patients it is safe to eliminate Tc99-MAA hepatopulmonary scan and LSF calculation from treatment planning and condense the Y90 planning and treatment into 1 day as opposed to traditional 2-day period.

### TABLE OF CONTENTS/OUTLINE

HCC is the 4th leading cause of cancer death worldwide. Conventionally, Y90 Transarterial Radioembolization (TARE) happens over 2 sessions. Mapping angiography and lung shunt calculation is the first session. The patient is then discharged home and returned approximately 2-3 weeks after for Y90 radioembolization. However, an increasing number of studies have shown that for small HCCs (<5 cm), and in the absence of macrovascular invasion and portosystemic shunt (TIPS), LSF is <10%.1,2Hence, based on typically administered activities and LSF, the projected dose to the lungs is significantly below the 30 Gy level, which is widely accepted as the dose to cause radiation-induced pneumonitis.3 Therefore, the LSF calculation can be safely omitted, which could, in turn, result in significant streamlining of Y90 TARE in patients with small HCC. This is particularly important to consider in patients who live in non-urban communities and commute long distances to undergo liver-directed therapy. The proposed exhibits highlight the safety and efficacy of streamlining the Y90 TARE procedure for patients with small HCC to a 1-day procedure.

IREE-12

## GASTROINTESTINAL VARICEAL BLEEDS: INTERVENTIONAL CONSIDERATIONS IN ACCESS AND TREATMENT

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Kapil Wattamwar, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Recognize the portal-mesenteric venous system as a potential source of gastrointestinal bleeding. Illustrate case examples of varices in various locations along the gastrointestinal tract with multi-modality imaging. Highlight typical inflow and outflow vessels associated with varices in different locations. Discuss interventional approaches to access variceal bleeds based on their location as well as strategies for decompression and embolization. Review potential embolic agents for variceal bleeds and examine specific use cases based on anatomical and flow-related considerations.

### TABLE OF CONTENTS/OUTLINE

It is important to recognize that upper and lower gastrointestinal bleeds can arise from a portal-mesenteric venous source. 1. This exhibit will illustrate cases of variceal bleeds at several points along the gastrointestinal tract from the esophagus to the anus and highlight typical inflow and outflow vessels associated with each location. 2. Interventional techniques to treat such bleeds may involve various methods of decompression and/or embolization. 3. Approaches to access the portal-mesenteric venous system for intervention include through a TIPS, transvenous through a systemic outflow vein, transsplenic, transhepatic, transcaval and direct percutaneous puncture. 4. Factors such as the direction of flow, portosystemic pressure gradient and the impact of balloon occlusion on flow should be considered prior to embolization. 5. The choice of embolic should be tailored to the patient’s anatomy and flow dynamics. Embolic agents include coils, plugs, and liquid embolics such as n-Butyl cyanoacrylate, ethylene vinyl alcohol copolymer, and sodium tetradecyl sulfate sclerosant.

## IVC INTERVENTIONS: SEEING ALL THE INTERVENTIONS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Carlos B. Ortiz, MD (*Abstract Co-Author*) Consultant, Argon Medical Devices, Inc
Arthur S. Joseph, DO (*Abstract Co-Author*) Nothing to Disclose
Andrew V. Chesley, MD (*Abstract Co-Author*) Nothing to Disclose
James J. Oh, DO (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Inferior vena cava (IVC) angioplasty, thrombolysis, mechanical thrombectomy, and stenting are important treatment options to recanalize an occluded or thrombosed IVC. Preprocedural evaluation and follow up are essential for postprocedural management of patient undergoing IVC recanalization. Long term indwelling IVC filters pose a risk of caval thrombosis and removal should be considered when clinically appropriate. Transcaval interventions provide alternate access for difficult to reach anatomic areas.

### TABLE OF CONTENTS/OUTLINE

Introduction Pathogenesis of IVC occlusions in the setting of benign and malignant causes Imaging of IVC occlusion on US, CT, and diagnostic venogram, including review of collateral venous pathway formation Review of variant anatomy pertinent to IVC interventions. Current recanalization techniques employed in the treatment of IVC occlusions Use of transcaval access to perform lymph node biopsy and endoleak embolization Immediate complications and subsequent complications after IVC endovascular intervention Conclusion IVC and transcaval endovascular interventions are important therapies for a variety of pathologies. Knowledge of these advanced techniques is important for the interventionalist.

IREE-14

## A PRIMER ON APPROACHES FOR TRANSVENOUS BIOPSY OF INFERIOR VENA CAVA MASSES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Victoria Kim, MD (*Abstract Co-Author*) Nothing to Disclose
David R. Berezovsky, DO (*Abstract Co-Author*) Nothing to Disclose
Ilya Livshits (*Abstract Co-Author*) Nothing to Disclose
Francis Kang, MD (*Abstract Co-Author*) Nothing to Disclose
Camden MacDowell, MD,PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Inferior vena cava (IVC) masses often require a biopsy for a definitive diagnosis of the underlying pathology. IVC masses are often biopsied using a percutaneous approach. However, percutaneous biopsy is not always feasible, for example, when there is no safe biopsy trajectory due to surrounding structures or the patient's anatomy. In such situations, an endovascular approach is necessary. The purpose of this educational exhibit is to review endovascular biopsy approaches for IVC masses and address the following teaching points: 1. Review central venous anatomy and highlight CT/MRI/Fluoroscopy features of IVC masses. 2. Illustrate example indications for transvenous biopsy of IVC masses. 3. Detail transvenous biopsy of IVC masses using biopsy forceps under fluoroscopy. 4. Detail transvenous biopsy of IVC masses using a transjugular liver biopsy set under combined fluoroscopy and cone-beam CT guidance. 5. Detail alternative transvenous biopsy of IVC masses such as suction biopsy. 6. Discuss risks of transvenous biopsies, including bleeding and hematologic seeding.

### TABLE OF CONTENTS/OUTLINE

1. Central venous anatomy. 2. CT/MRI/Fluoroscopy findings of example IVC masses (e.g., leiomyosarcoma, Wilms tumor, adrenal cortical carcinomas). 3. Indication for transvenous biopsy of IVC masses. 4. Example case of transvenous biopsy with forceps. 5. Example case of transvenous biopsy with a modified transjugular liver biopsy set. 6. Alternative biopsy approach using transvenous suction biopsy. 7. Safety profile of transvenous biopsies and comparison with percutaneous approaches.

IREE-15

## ROLE OF INTERVENTIONAL RADIOLOGY IN ACUTE MESO-PORTAL VENOUS THROMBOSIS (MPVT): A PICTORIAL REVIEW

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Manoj K. Kathuria, MD,MBBS (*Abstract Co-Author*) Nothing to Disclose
Rakesh K. Varma, MD, MBBS (*Abstract Co-Author*) Speaker, Becton, Dickinson and Company
Seung Kwon Kim, MD (*Abstract Co-Author*) Nothing to Disclose
Anil K. Pillai, MD, MBA (*Abstract Co-Author*) Nothing to Disclose
Jayesh Soni, MD (*Abstract Co-Author*) Nothing to Disclose
Ahmad Arar (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1) Recognize key imaging characteristics associated with acute MPVT on cross-sectional imaging to facilitate early diagnosis2) Understand the clinical indications necessitating acute MPVT interventions and the goals of treatment3) Familiarize with treatment algorithms and the tips and tricks used to manage acute MPVT

### TABLE OF CONTENTS/OUTLINE

1) Introduction and Clinical Impact2) Imaging findings of acute MPVT- Vascular: Absent flow on US and Doppler, filling defect, hyperdense clot, lack of portoportal collaterals- Non-Vascular: Hepatic necrosis, ascites, bowel wall thickening, lack of mural enhancement3) Indications for Endovascular Interventions:- Persistence of symptoms beyond 48-72 hours after anticoagulation initiation- Worsening symptoms- Extension of thrombus while on anticoagulation- Peritoneal signs on physical exam4) Comprehensive guide to endovascular techniques and algorithms for managing acute MPVT:- Systematic approach for treatment based on the location of the thrombus- Tips and tricksConclusion: Acute PV and SMV thrombosis pose risks of acute mesenteric ischemia or chronic portal hypertension. Endovascular interventions may be necessary for progression on anticoagulation or impending bowel infarction. Catheter Directed Thrombolysis is feasible but carries higher bleeding risks compared to anticoagulation alone. TIPS creation depends on post-intervention flow and PSG >10-12mmHg

## MULTIMODALITY IMAGING OF EMERGENT BILIARY DISORDERS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Naciye Turan, MD (*Abstract Co-Author*) Nothing to Disclose
Joanna Kee-Sampson, MD (*Abstract Co-Author*) Nothing to Disclose
Manuel Menendez, MD (*Abstract Co-Author*) Nothing to Disclose
Carlos I. Gonzalez Baerga, MD (*Abstract Co-Author*) Nothing to Disclose
Mayur K. Virarkar, MD (*Abstract Co-Author*) Nothing to Disclose
Sean Wehry (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Biliary emergencies present as a spectrum of pathologies, each with unique radiologic characteristics across various imaging modalities. Accurate imaging interpretation is critical for diagnosing these potentially life-threatening pathologies, underscoring the importance of radiologists' proficiency in identifying relevant imaging findings. It is also vital for radiologists to be familiar with image-guided interventions that can manage these emergencies. 1. Describe common pathologies that lead to emergent situations in various parts of the biliary system and discuss their clinical presentations and etiologies. 2. Recognize the imaging features across different imaging modalities for each emergent biliary condition. 3. Discuss image guided interventions that help bridge patients with various biliary emergencies to definitive treatment, or treat these pathologies.

### TABLE OF CONTENTS/OUTLINE

- Review of multimodality imaging findings: o Inflammatory: § Gallbladder: • Acute Cholecystitis o Calculous and acalculous • Gangrenous Cholecystitis • Hemorrhagic Cholecystitis § Bile Ducts: • Ascending cholangitis § Pancreas: • Acute Pancreatitis o Non-Inflammatory § Obstructive Jaundice • Choledocholithiasis • Mirizzi Syndrome • Malignancy § Bile Leak • Traumatic • Iatrogenic - Review of image guided interventions o Biliary diversion § Cholecystostomy § Percutaneous transhepatic biliary drainage o Biliary stents o Percutaneous management of cholelithiasis or choledocholithiasis

### TEACHING POINTS

Abernethy malformation is a congenital extrahepatic portosystemic shunt associated with numerous sequalae including hepatic encephalopathy, hepatic malignances, and hepatopulmonary syndrome. Early diagnosis via imaging is critical for subsequent management of the malformation and sequalae. The purpose of this educational exhibit is to review the anatomy and imaging features of Abernethy malformations and to address the following teaching points: 1. Review central venous anatomy and collateral circulation. 2. Review the anatomy of Abernethy Malformation and the known anatomic variants. • Type Ia, Ib, and II 3. Detail the clinical presentation and management strategies of four example Abernethy cases. 4. Discuss the role of Diagnostic and Interventional Radiology in diagnosis and management of patients with Abernethy malformations.

### TABLE OF CONTENTS/OUTLINE

TABLE OF CONTENTS/OUTLINE: I. Introduction and Anatomy of Abernethy Malformation A. Defining Abernethy Malformation and Its Prevalence B. The Anatomy of Type I and Type II Abernethy Malformations C. Understanding Physiology of Abernethy Malformation Variations and Associated Collateral Venous Drainage D. Investigating Implications of a Novel Abernethy Malformation Variant II. Case Studies (Examination of Type Ia case, Two Different Type II Cases, and Variant Type II Case) A. Clinical Presentation including Symptoms and Signs Associated with Abernethy Malformation B. Reviewing Surgical and Non-Surgical Approaches and Considerations Exploring Role of Interventional Radiology in both diagnosis and management

## SUPER-SELECTIVE SEGMENTAL ADRENAL VENOUS SAMPLING FOR PRIMARY ALDOSTERONISM: POSSIBILITIES AND LIMITATIONS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Cum Laude**

Sota Oguro (*Abstract Co-Author*) Nothing to Disclose
Hiromitsu Tannai, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Adrenal venous sampling (AVS) is a diagnostic procedure for subtyping primary aldosteronism, which is a cause of secondary hypertension. Typically, blood is collected only from the main trunk of the adrenal vein. Segmental AVS, however, involves sampling blood from upstream tributaries using a microcatheter and can address certain diagnostic challenges. This presentation aims to: 1) Review the anatomy of the adrenal and surrounding venous structures, and identify diagnostic challenges associated with conventional AVS; 2) Describe the method of segmental AVS and provide examples where it is diagnostically beneficial; 3) Discuss techniques to manage challenging situations where achieving an accurate diagnosis remains difficult, even with segmental AVS.

### TABLE OF CONTENTS/OUTLINE

1. Adrenal and surrounding venous anatomy, conventional AVS; 2. Adrenal tributaries and the practice of segmental AVS; 3. Cases where segmental AVS is diagnostically useful: High aldosterone levels detectable only in adrenal tributaries from adrenal adenomas, Dilution effects due to extrarenal veins joining the adrenal vein, Co-existing cortisol-producing tumors, Bilateral aldosterone-producing adenomas, Ipsilateral multiple adrenal nodules; 4. Sampling from venous routes other than the adrenal veins and considerations for CT during adrenal arteriovenography.

### TEACHING POINTS

1. Histotripsy is an emerging focal therapy for liver tumors that has a non-invasive, mechanical mechanism of action leading to unique imaging features.2. Histotripsy spares collagenous structures, which can lead to patent vessels and bile ducts within the treatment zone. These structures should not be confused for residual or recurrent tumor.3. Histotripsy treatments can be associated with a transient perfusion defect peripheral to the treatment site that undergoes reperfusion and can be confused for a larger than intended treatment.4. Histotripsy treatment zones involute rapidly compared with existing locoregional treatments, potentially allowing early identification of residual or recurrent tumor.

### TABLE OF CONTENTS/OUTLINE

Introduction to Histotripsy:• Mechanism of action• Clinical workflow• Trials performed to date from which these imaging findings are available. Expected Imaging Findings:• Recommended Imaging follow-up timeframe• Normal appearance of treatment zone post-histotripsy at various follow-up timepoints out to 2 years• Common variants of normal findings to not mistake as complication or incomplete treatment, including perfusion defects and patent vessels and bile ducts. Other findings:• Incomplete treatment appearance• Off-target effects

## ACUTE CHOLECYSTITIS; CURRENT DIAGNOSIS, MANAGEMENT, AND EMERGING ROLE OF INTERVENTIONAL RADIOLOGY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Katsuhiro Kobayashi, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1)Review current diagnosis of acute cholecystitis (AC) including imaging findings of AC. 2)Describe current management of AC according to Tokyo Guidelines 2018. 3)Discuss emerging role of interventional radiology in the management of AC.

### TABLE OF CONTENTS/OUTLINE

1) Overview of AC. 2) Pathophysiology of AC. 3) Anatomy and anatomical variants of the gallbladder. 4) Imaging findings of AC and its complications (emphysematous/gangrenous cholecystitis, pericholecystic abscess, gallbladder rupture, etc.). 5) Diagnosis of AC and its severity grading according to Tokyo Guidelines 2018. 6) Initial management of AC according to Tokyo Guidelines 2018. 7) Technique used for cholecystostomy tube placement. 8) Complications associated with cholecystostomy. 9) Emerging techniques used following cholecystostomy for non-surgical patients.

## PRE-CLINICAL INVESTIGATION OF HISTOTRIPSY FOR TARGETING PANCREATIC TUMORS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Mina S. Makary, MD (*Abstract Co-Author*) Nothing to Disclose
Warren Campbell, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Histotripsy offers advantages in both target precision with non-invasive options, but is limited by the tissue depth and gas obstructing ultrasound waves. In mice and pigs, preliminary studies indicate that tumors and be effectively targeted without damaging surrounding tissue, and can promote local tumor shrinkage with a systemic immune response. However, the technique requires further optimization to minimize risks off-target tissue damage. This technique may prove be a valuable non-invasive adjuvant therapy for patient with pancreatic cancer.

### TABLE OF CONTENTS/OUTLINE

1. The Histotripsy Technique A. Compare and contrast the ablation techniques targeting solid tumors using thermal stress. B. Review the limitations of thermal techniques such difficulty targeting tumors near sensitive structures, and inability to achieve uniform cell death. C. Discuss the mechanics of histotripsy and the equipment used to generate mechanical force to break cells apart with high-amplitude pulses. D. Explain why this technique may be beneficial in precise, rapid tissue ablation of pancreatic tumors.2. Clinical Findings supporting pancreatic tumor targeting A. Discuss literature on histotripsy for pancreatic cancer in mice and pig models. B. Discuss results showing efficacy in destroying Pan02 pancreatic tumors in an immunocompetent subcutaneous mouse model. C. Discuss porcine models ablating pancreatic tumors in a novel SCID-like pig D. Review results demonstrating histotripsy's ability to target and induce ablation within the pancreas of certain subjects and the limiting factors.3. Review the unique elements of histotripsy and why this technique may be beneficial in the patient population with pancreatic tumors.

## NERVE BLOCKS: A PRIMER FOR INTERVENTIONAL RADIOLOGISTS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Christina Boyd, MD (*Abstract Co-Author*) Nothing to Disclose
Kenneth N. Huynh, DO (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. To review the nerve distributions typically targeted for blockade and their relevant anatomy, from head to toe. 2. To review indications, techniques, technical considerations, pharmacology, and complications of nerve blocks. 3. To achieve a basic understanding of billing and coding for nerve block procedures.

### TABLE OF CONTENTS/OUTLINE

As the complexity of interventional radiology (IR) procedures increase, the need for adequate sedation and analgesia becomes more critical to ensure patient comfort and procedural success. Nerve blocks involve the injection of local anesthetic near targeted nerves to temporarily interrupt pain signals to the brain, offering regional pain relief that can be both diagnostic and therapeutic. These techniques are helpful in acute pain management, particularly peri-operative pain, chronic pain conditions including cancer-related pain. They have been shown to enhance quality of life, reduce opioid consumption, and facilitate earlier mobilization. Using these techniques, interventional radiologists can readily provide targeted analgesia, optimize therapeutic outcomes, and mitigate the need for general anesthesia in high-risk patients. This educational exhibit will (1) review commonly targeted nerves and distributions, and relevant anatomy including intercostal, pudendal nerves, erector spinae, transverse abdominis plane, stellate ganglion, celiac plexus, superior hypogastric plexus, and ganglion impar, (2) discuss techniques, technical considerations, and pharmacologic agents used for nerve blocks, as well as managing complications such as local anesthetic systemic toxicity (LAST), and (3) discuss basic billing and coding for nerve block procedures.

## IMAGING CHARACTERISTICS OF A NEWLY APPROVED NANOCOMPOSITE HYDROGEL BASED EMBOLIC AGENT WITH TANTALUM MICROPARTICLES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Johannes Du Pisanie, MD (*Abstract Co-Author*) Nothing to Disclose
Nima Kokabi, MD (*Abstract Co-Author*) Research support, Sirtex Medical Ltd;Consultant, Sirtex Medical Ltd;;
Andrew Caddell (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Introductions: A new conformable embolic (OBSIDIO Boston Scientific, Marlborough, MA), received 510(k) approval for the embolization of hypervascular tumors and peripheral blood vessel as of July 20221. This nanocomposite hydrogel based embolic agent with tantalum microparticles (NHTM) produces unique imaging characteristics as compared to preexisting commonly utilized embolics.Teaching points: To describe the imaging characteristics of NHTM on various imaging modalities.

### TABLE OF CONTENTS/OUTLINE

Angiographic Characteristics Dynamic Visualizations: NHTM is radio-opaque resulting in good visualization of the embolic during fluoroscopy and on radiographs2.CT Characteristics Reduced Streak Artifact: NHTM attenuates streak artifact compared to coil embolization. Contrast Differentiation: The K-edge of Tantalum is 67.4 keV, Iodine is 33.2 keV, Barium is 37.4 keV, Calcium is 4.0 keV, and Gadolinium 10.4 keV3. These differences may allow for differentiation on CT and dual energy CT based on Hounsfield unit density.MRI Characteristics Streak Artifact: NHTM does not produce streak artifact on MRI2. Variation Between Sequences: Based on the MRI properties of the hydrogel and the paramagnetic properties of tantalum sequence intensity is as follows. T2 High intensity. T1 Low
intensity.https://www.accessdata.fda.gov/cdrh_docs/pdf21/K213385.pdfdoi:10.1002/advs.202003327skuld.bmsc.washington.edu/scatter/AS_periodic.html

## SYNERGY OF CAR-T THERAPY WITH INTERVENTIONAL RADIOLOGY: HOW IR PROCEDURES CAN IMPROVE IMMUNOTHERAPY OUTCOMES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Mina S. Makary, MD (*Abstract Co-Author*) Nothing to Disclose
Warren Campbell, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Interventional radiology has the capability to improve CAR-T therapy by improving efficacy and reducing systemic toxicity in treating solid tumors. Vascular therapy can administer localized delivery of CAR-T cells beyond the barriers of the tumor microenvironment or areas of poor vasculature.Priming tumors with ablation can improve antigen presentation to immune cells and degrade extracellular matrix barriers to immune infiltration.Interventional delivered adjuvant therapy may help T-cells function for longer durations. IR also has a role in continued surveillance of therapy and tumor monitoring. Collectively, the role of IR procedures should continue to be studied to improve solid tumor targeting with CAR-T therapy.

### TABLE OF CONTENTS/OUTLINE

1. review of T-cell therapy2. Locoregional therapies to deliver CAR-T therapy3. Evidence behind priming and adjuvant therapy of solid tumors in CAR-T therapy4. Role of IR in monitoring the efficacy of CAR-T therapy5. Conclusions

## MACHINE LEARNING (ML) VS CT/MRI-BASED VASCULAR MODEL FOR ASSESSING PORTAL HYPERTENSION: NON-INVASIVE ALTERNATIVE FOR PREDICTING HEPATIC VENOUS PRESSURE GRADIENT (HVPG)

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Priya Mody, MD (*Abstract Co-Author*) Nothing to Disclose
Haneyeh Shahbazian, MD (*Abstract Co-Author*) Nothing to Disclose
Fahad S. Mohammed (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To educate radiologists on two non-invasive alternatives for predicting clinically significant portal hypertension (CSPH).

### TABLE OF CONTENTS/OUTLINE

IntroductionThe current gold standard for diagnosing clinically significant portal hypertension (CSPH) is the hepatic venous portal gradient (HVPG) procedure. Non-invasive models that predict CSPH would be a valuable tool for physicians assessing decompensation in patients with advanced chronic liver disease (ACLD). Two predictive models have recently been released to predict CSPH with either laboratory parameters using ML or imaging data from CT/MRI using a support vector machine. ML model• Readily Available Parameters- The 3P model uses platelet count, bilirubin, and international normalized ratio.• Online Tool- The study's online calculator calculates the probability of HPVG=10 and =16.• High AUC- When combined with liver stiffness measurement, the 3P model had an AUC of 0.858 for predicting portal pressure =10 mmHg, and the 5P model had an AUC of 0.901 for predicting portal pressure =16 mmHg.CT/MRI model• Usage of Imaging- The model utilizes geometric parameters extracted from segmented vessels within contrast-enhanced CT and MRIs to predict HPVG=10 using a support vector machine.• Detect Vasculature Changes: The model detects variations of the hepatic vascular systems (portal/hepatic vein) in CSPH, including reductions in mean whole-vessel volumes and length.• High AUC: The model had an AUC of 0.90 on the internal test set and 0.84-0.87 on external test sets.ConclusionsThe ML model predicts HPVG=10 and =16, while the CT/MRI model only predicts HPVG=10. Overall, both modalities are excellent non-invasive alternatives to HVPG procedures.

Gavin Wu, BA (*Abstract Co-Author*) Nothing to Disclose
Mina S. Makary, MD (*Abstract Co-Author*) Nothing to Disclose
Nojan Bajestani, BS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Deep vein thrombosis (DVT) has high morbidity and potential mortality that can lead to post-thrombotic syndrome in approximately 50% of patients, characterized by chronic pain, swelling, and walking difficulties. Catheter-directed interventional therapies such as percutaneous mechanical thrombectomy (PMT), catheter-directed thrombolysis (CDT), and pharmacomechanical CDT (PCDT), and others have been developed to alleviate symptoms, restore venous flow, and preserve valve function sooner and more effectively than conventional treatment. Appropriate device selection is paramount and depends on clinical context.After this exhibit, viewers will:1) Explore the clinical indications for thrombectomy and thrombolysis in DVT management2) Learn about all thrombolytic devices including aspiration, rotational, rheolytic, and ultrasound-assisted techniques3) Understand proper device selection and their advantages and disadvantages

### TABLE OF CONTENTS/OUTLINE

1) Introduction to DVT and Endovascular Management2) Overview of Thrombectomy Devices, including Mechanical, Aspiration, Rotational, Rheolytic, and Ultrasound-assisted techniques3) Mechanisms of Actions and Indications4) Guidelines for Device SelectionTechnique Benefits and Risks5) Evidence-Based Outcomes and recent national guidelines6) Case-based and Device-Specific Reviews7) Current Research and Future Directions8) Summary and Conclusions

## DISTAL TRANSRADIAL ACCESS FOR NON-CARDIAC INTERVENTIONS IN THE ERA OF MINIMALLY INVASIVE ENDOVASCULAR THERAPY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Kondo Hiroshi (*Abstract Co-Author*) Nothing to Disclose
Yamamoto Masayoshi, MD (*Abstract Co-Author*) Nothing to Disclose
Takeshi Wada, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The purposes of this exhibit are the following.1. To describe recent advances of distal transradial access in non-cardiac interventions, including its indications, feasibility, and safety 2. To illustrate the basic anatomy and techniques of distal transradial access 3. To demonstrate practical interventional procedures and complications of distal transradial access through case-based review

### TABLE OF CONTENTS/OUTLINE

1. Indication and patient selection of distal transradial access for non-cardiac interventions 2. Anatomy of the radial artery and surrounding structures in the snuff box to explain the techniques of distal transradial access and complications associated with the puncture 3. Details of the procedure presented through case-based review: angiography suite settings, device selection, puncture of the distal radial artery, cannulation for the targeted arteries, and navigation of microcatheters 4. Complications associated with distal transradial artery access and how to handle them

## ABLATION OF OSSEOUS TUMORS: ESSENTIAL REVIEW OF NEURAL ANATOMY TO AVOID INJURY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Jemianne Bautista, MD (*Abstract Co-Author*) Nothing to Disclose
Jea Ho S. Yu, BS (*Abstract Co-Author*) Nothing to Disclose
Anthony Zamary (*Abstract Co-Author*) Nothing to Disclose
Kevin Zhou (*Presenter*) Nothing to Disclose

### TEACHING POINTS

: Percutaneous ablation of osseous tumors followed by kyphoplasty/cementoplasty offers a targeted, minimally invasive option for patients with symptomatic disease and can be performed as an adjunct treatment to Surgery and Radiation. However, damage to critical neural anatomy represents a significant risk, and avoiding complications requires a detailed understanding of neural anatomy. This exhibit will provide:(1) Detailed review of neural anatomy relevant to the most common sites of osseous tumor ablation, including spinal, pelvic, and lower extremities. (2) Review of specific nerve function. (3) Cases highlighting successful navigation of complex neural pathways during ablation procedures. (4) Specific considerations for each ablation modality (RFA, cryoablation, thermoablation, etc.) including placement of ablation probes and the monitoring of heat spread or ice formation to prevent neural damage.

### TABLE OF CONTENTS/OUTLINE

(1) Overview of osseous tumors and indication for ablation therapy.(2) Neural anatomy associated with common sites of osseous tumor ablation.(3) Workup and procedural techniques to minimize the risk of neural injury.(4) High yield review of different ablation modalities (radiofrequency, cryoablation, microwave, and IRE) and their specific considerations regarding neural safety.(5) Case examples.

### TEACHING POINTS

• Pre Y90 selective internal radiation therapy (SIRT) abnormal biodistribution will determine adjustment in therapy delivery planning• High yield radiolabeling of Tc99m MAA for pretherapy mapping is also essential in avoiding confounding extrahepatic stomach and duodenal uptake due to free pertechnetate.• SPECT-CT is essential to map extrahepatic uptake• Gallbladder uptake of Y90 typically occurs due to either non-target embolization or reflux of the microspheres. • Close assessment of falciform ligament uptake is essential and requires expertise and the use of advanced SPECT-CT techniques. • Post-treatment assessment via SPECT-CT allows for early detection of gallbladder uptake which can lead to radiation-induced cholecystitis and allows for prompt management of such potential complications.• The application of dosimetry techniques pre and post SIRT is crucial in optimizing patient outcomes.

### TABLE OF CONTENTS/OUTLINE

Y90 SIRT has seen a huge increase in clinical utilization. Owing to numerous studies demonstrating outcome benefits for different indications it has gained in clinical acceptance and application. However, proper use requires expertise and a multilayered approach to patient selection and management. Molecular imaging plays an essential role in the overall successful delivery of this therapy. Optimized workflows and high-quality standards require expertise and knowledge of various aspects of the molecular imaging paradigm pre, during and post treatment. We offer to review the different aspects of molecular imaging involved in the care for Y90 liver SIRT patients including normal and abnormal biodistribution pre-, during and post-treatment, and dosimetry assessments.

## CYSTIC DUCT STENTING IN BENIGN DISEASE: AN OVERVIEW

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Patrick D. Sutphin, MD, PhD (*Abstract Co-Author*) Stockholder, Gilead Sciences, Inc;Stockholder, Editas Medicine;Stockholder, CRISPR Therapeutics AG;Stockholder, Intellia Therapeutics;Stockholder, Amwell;Stockholder, Teladoc Health Inc;Stockholder, Jazz Pharmaceuticals plc;Stockholder, ViewRay, Inc;Research funded, TriSalus Life Sciences
Kausthubh Hegde, MBBS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Review indications and techniques of cystic duct stenting in benign gall bladder disease as an alternative to surgery
- Evaluating technical success and complications: efficacy and safety of the procedure and common complications
- Long-term outcomes of patients’ post-cystic duct stenting and feasibility of transitioning to surgery if the patient's condition improves

### TABLE OF CONTENTS/OUTLINE

- Introduction to cystic duct stenting:- Indication and patient selection criteria for choosing stenting over traditional surgical methods in benign gall-bladder disease- Techniques of stenting and devices used during the procedure- Protocols for pre- and post-procedure care
- Evaluating technical success: clinical outcomes from recent studies and case series
- Complications and management:- Review common and serious complications and how to prevent them- Strategies to manage complications and improve patient outcomes- Case studies (image-based) highlighting specific incidents
- Overview of follow-up protocols and long-term care with a focus on transitioning from stenting to surgery: criteria and case examples

## VISUAL GUIDE TO THE MEDICAL MANAGEMENT OF SITUS INVERSUS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Husameddin El Khudari, MBChB (*Abstract Co-Author*) Nothing to Disclose
Ahmed Abdelgawad (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1- describe be the situs inversus spectrum and its radiologic findings2- To identify the implication of the altered anatomy on performing interventional procedures3- To present a case-by-case review of the common interventional procedures performed on situs inversus patients

### TABLE OF CONTENTS/OUTLINE

Background: Situs solitus is the normal arrangement of the human viscera. Situs inversus is a rare genetic condition in which the organs of the chest and abdomen are positioned in a mirror image of normal human anatomy. The incidence of situs inversus totalis is approximately 1:10,000. Despite its rarity, these patient are still encountered in the IR world. Performing procedures on patients with situs inversus poses a unique challenge to interventionalist. Knowledge of the anatomical alterations and its implications on performing these interventions is very important for safe and successful performance of these procedures.Clinical Findings/Procedure Details:We present a case-by-case review of some of the common IR procedures performed on patients with situs inversus with special emphasis on technical aspects, tips and tricks to safely perform these procedures.We present the following cases:Angiogram and embolization in patient with GI bleeding
- Transarterial Chemoembolization/Y-90
- TIPS placement
- Gastrostomy placement
- Tunneled hemodialysis catheter placement
- Percutaneous transhepatic cholangiography
- IVC filter placementConclusion or Teaching Points: Situs inversus is a rare genetic condition that poses unique challenges to interventionalist. Understanding of the anatomic alteration and proper techniques is crucial to perform procedures safely and successfully on patient with situs inversus.

### TEACHING POINTS

1. Histotripsy is a new non-invasive locoregional therapy for liver tumors using mechanical cavitation for tissue destruction. 2. Histotripsy treatment configuration can be adapted per tumor, so that each ablation zone is unique per patient and per tumor, allowing for a personalized approach. 3. Histotripsy ablation spares collagenous structures, such as vessels and bile ducts, allowing for treatment of tumors that may otherwise be risky with invasive thermal ablation procedures. 4. There are restrictions to the application of histotripsy secondary to device limitations, the most critical being the inability to target tumors from an intercostal approach, which markedly limits clinical applicability of this technology. 5. Techniques such as pre-planning, patient positioning and coordination with anesthesiology can expand the scope of histotripsy by permitting treatment of lesions that would usually be precluded secondary to device limitations.

### TABLE OF CONTENTS/OUTLINE

Introduction to Histotripsy Technology Mechanism of action Introduction to the Clinical Workflow for Histotripsy Evaluation Patient referral process Selection process of appropriate candidates for treatment Tips and Tricks to expand the scope of histotripsy treatment Pre-treatment evaluation of liver tumors How to perform histotripsy via an intercostal approach Optimal patient positioning Coordination with anesthesiology team

## BREATHING NEW LIFE INTO BRONCHIAL ARTERY EMBOLIZATION (BAE): RECENT TECHNICAL AND CLINICAL OUTCOMES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Clayton W. Commander, MD,PhD (*Abstract Co-Author*) Nothing to Disclose
Thomas Turner (*Abstract Co-Author*) Nothing to Disclose
Estefania Gonzales, BA, MPH (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Indications for BAE include hemoptysis causing airway or respiratory compromise, moderate hemoptysis with 3 episodes within a week each over 100 mL, increasing blood volumes from chronic bleeding or sudden bloody sputum, and as a bridge treatment for lung transplant patients with moderate hemoptysis due to chronic inflammatory lung disease. Advanced imaging techniques, like MDCT angiography, enhance detection by providing more precise mapping of bronchial and systemic vascular anatomy sometimes missed by standard imaging, improving procedural safety. A pleural thickness >3 mm and enlarged extrapleural vessels suggest non-bronchial systemic artery bleeding. Predictive factors for recurrent hemoptysis post-BAE in idiopathic bronchiectasis include pseudomonas infection, massive sputum production, and aberrant bronchial arteries. Factors such as AV fistulas, systemic shunts, and underlying lung diseases also contribute to recurrence in non-specific cases. The 2022 CIRSE Standards of Practice have spurred advances in microcatheter technology, enabling superselective coil embolizations in 98% of cases with lower risks of spinal cord infarction compared to agents like Gelfoam and NBCA. Early embolization reduces hospital stays and recurrence risks. Common embolic agents for BAE include NBCA, PVA, and coils, sometimes with Gelfoam. Recent studies suggest NBCA and coils outperform particles. Success rates vary based on hemoptysis presentation and vascular abnormalities. Embolic choice should prioritize patient safety and be tailored to individual clinical needs.

Wojciech Cwikiel, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Ramin Midia, MD (*Abstract Co-Author*) Nothing to Disclose
Mehran Midia, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Although not frequent, vascular and non-vascular stent migration can occur in IR practice and could be associated with significant morbidity and mortality. The incidence of stent migration is likely underreported. Clinically patient could be asymptomatic and in symptomatic patients' presentation largely depends on the stent location. Stent deployment is a dynamic process and there are many device, host and operator technique factor that could contribute to stent migration at time of deployment and thereafter. Management of stent migration ranges from close monitoring to interventional radiology management, open surgery and combination of the later. Interventional radiology management is the most commonly used method, with a high success rate. Interventional radiology techniques range from temporary anchoring (such as with balloons and snares), permanent anchoring (including with the use of overlapping or bridging stents), repositioning and retrieval of the migrated stent.

### TABLE OF CONTENTS/OUTLINE

1. To review the incidence and clinical presentation of stent migration.2. To understand the contributing factors for the development of stent migration and discuss technical considerations for stent migration prevention.3. To highlight current techniques and strategies for managing migrated stents.

### TEACHING POINTS

The Vascular Plug (VP) is a cutting-edge embolization technology designed to precisely and effectively occlude a targeted vessel. The device efficiently occludes vessels with minimal impact on surrounding tissues by utilizing the body's natural processes that reduce blood flow and promote thrombus formation. Amplatzer Vascular Plugs (AVPs) are the traditional and most widely used devices. AVPs use a combination of density and radial force to induce thrombus formation, allowing for controlled and strategic embolization. This exhibit will focus on the important role of AVPs in treating aneurysms and parent vessel occlusions. It will detail their embolization techniques and how they differ from other embolic materials. It also aims to understand AVPs, evaluate their imaging properties and effects on blood flow reduction, explore their strategic use, and discuss evidence-based future directions in vascular embolization.

### TABLE OF CONTENTS/OUTLINE

1. Introduction to Vascular Embolization - Overview of embolization principles - The advent and importance of vascular plugs2. Physiological Basis for Thrombosis in Embolization -Role of embolic density and radial force3. AVPs in Clinical Practice: Aneurysmal vs. Parent Vessel Embolization - Criteria for embolization strategy selection4. Evidence-Based Application of AVPs - Clinical applications: Visceral artery aneurysms, vascular malformations5. Challenges and Solutions in AVP’s Embolization - Learning from complex cases and failed placements6. Advanced Embolization Techniques with AVPs - Plug anchor (stabilizer) technique - Coil-in-plug technique7. Future Directions in Vascular Embolization with VPs

## SHAM PROCEDURES IN INTERVENTIONAL RADIOLOGY INVESTIGATIVE TRIALS: ESSENTIAL FOR RIGOROUS RESEARCH

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Hyeon Yu, MD (*Abstract Co-Author*) Nothing to Disclose
Elaine M. Caoili, MD, MS (*Abstract Co-Author*) Steering Committee, ProKidney, LLC
Joseph M. Stavas, MD, MPH (*Presenter*) Employee, ProKidney;Speaker, ProKidney;Research Consultant, Excelerate Health Ventures

### TEACHING POINTS

Sham procedures provide critical control in Interventional Radiology (IR) trials, minimizing bias and ensuring the true efficacy and safety of new treatments. This presentation explores the history, implementation, and challenges of sham procedures in IR research. We will review our experience with sham procedures in a novel autologous cell-based therapy investigative trial to treat chronic kidney disease and other blinding methods which require risk versus benefit assessment, consistency, and validation .

### TABLE OF CONTENTS/OUTLINE

- The Importance of Sham Procedures
- Why they are necessary for unbiased results in IR trials.
- Examples where their absence has led to misleading findings.
- Examples of IR trials with sham procedures:
- Catheter-directed renal artery denervation for hypertension
- Vertebroplasty for osteoporosis fracture pain
- Prostatic artery embolization for benign prostatic hypertrophy
- Geniculate and shoulder artery embolization for pain
- Cell-based therapies for kidney disease
- Implementing Sham Procedures in IR
- Specific procedural and training methods to ensure blinding
- Ethical and regulatory considerations (regulatory agency guidance, Institutional Review Board approval)
- Challenges and Best Practices
- Addressing patient recruitment barriers
- Overcoming ethical barriers and concerns
- Strategies for maintaining consistency and minimizing unblinding
- Key point Emphasize the need for wider use of rigorous sham-controlled research methodologies within the IR community to drive innovation and ensure evidence-based treatments.

Ryan Bitar, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Recognize the common/basic surgical techniques and imaging appearances of allograft placement in transplant recipients
- Review critical post-transplant complications and their associated presentations on imaging.
- Discuss the role of interventional radiology in the management in such pathologies.

### TABLE OF CONTENTS/OUTLINE

- Liver transplant
- Common transplant techniques
- Arterial complications
- Arterial stenosis
- Imaging: Ultrasound (US) and CT angiogram
- angioplasty/stenting +/- splenic artery embolization
- Biliary complications
- Leak
- Imaging: CT and HIDA
- Stenting and sclerotherapy
- anastomotic stricture:
- Imaging: MRCP
- Angioplasty/stenting
- Venous complications
- Deep venous thrombosis
- Imaging: CT and US
- thrombectomy
- IVC stenosis/occlusion
- Imaging: CT and US
- Angioplasty/stenting
- Intrahepatic and extrahepatic fluid collections
- Imaging: MRI and CT
- Drainage/aspiration
- Biopsy
- Specimen specifics
- Kidney transplant
- Common renal transplant techniques
- Arterial complications
- Renal arterial stenosis:
- Imaging: CT angiogram and US
- angioplasty/stenting
- Pseudoanuerysm/trauma
- Imaging: CT and US
- Intervention: embolization
- Venous complications
- Deep venous thrombosis
- Imaging: US
- Thrombectomy
- Urinary complications
- Ureteral stricture
- Imaging: CT and US
- angioplasty and nephroureterostomy placement
- Pyelonephritis
- Imaging: CT and US
- nephrostomy

- Perinephric collections
- Imaging: US and CT
- Drainage/aspiration
- Biopsy
- Specimen specifics

IREE-55

## RADIOEMBOLIZATION FOR LIVER CANCER : CONSIDERATION OF NON-HEPATIC ARTERY ORIGINATING FROM THE HEPATIC ARTERY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Hyo-Cheol Kim, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To ensure the safety and efficacy of radioembolization procedures, a thorough comprehension of hepatic artery anatomy is imperative. This is particularly crucial due to the potential for several non-hepatic arteries to arise from the hepatic artery, necessitating careful consideration to avoid their inadvertent treatment or to provide appropriate protection. Oversight or unintended treatment of non-hepatic arteries during radioembolization can result in a spectrum of adverse consequences, ranging from mild postembolization syndrome to severe gastrointestinal radiation ulceration. The primary objectives of this presentation are as follows: 1. Enumeration of non-hepatic arteries originating from the hepatic artery. 2. Acquisition of techniques for identifying and managing non-hepatic arteries before and during radioembolization. 3. Review of potential complications associated with the inadvertent treatment of these arteries.

### TABLE OF CONTENTS/OUTLINE

1. Cystic artery, right gastric artery, accessory left gastric artery, hepatic falciform artery, left inferior phrenic artery, and supraduodenal artery. 2. Vascular anatomy visualization of non-hepatic arteries using CT/MR, DSA, and cone-beam CT. 3. Strategies for detecting non-hepatic arteries using cone-beam CT, planning angiography, and SPECT/CT. 4. Technical considerations including permanent embolization, temporary embolization, and bypass procedures. 5. Management of complications related to non-hepatic artery treatment, such as ischemic cholecystitis, radiation cholecystitis, radiation gastroduodenal ulceration, radiation dermatitis, and epigastric pain.

## INTRA-ARTERIAL TREATMENT FOR HEPATOCELLULAR CARCINOMAS : HOW TO MANAGE SHUNTING FROM THE ARTERY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Jin Woo Choi, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

In the treatment of hepatocellular carcinomas, intra-arterial therapy such as chemoembolization and radioembolization is commonly used. However, operators may encounter shunts from the artery (such as arterioportal, arteriovenous, and arteriopulmonary shunts) that can hinder effective treatment. These shunts can be caused by various factors such as tumor invasion, previous percutaneous procedures, chronic inflammation, or congenital acquisition. If not properly occluded, embolic material can pass through the shunt and cause non-target embolization or serious complications. This exhibit aims to achieve three goals: (1) Review the radiologic appearance of arterioportal, arteriovenous, and arteriopulmonary shunts; (2) Learn how to manage these shunts with proper embolic materials; and (3) List the possible complications and their management.

### TABLE OF CONTENTS/OUTLINE

1) List of shunts Arterioportal shunt (hepatic artery - portal vein), Arteriovenous shunt (hepatic artery - hepatic vein), Arteriopulmonary shunt (hepatic artery - pulmonary artery/vein), 2) Imaging findings on CT/MR and angiography according to the cause (tumorous vs non-tumorous condition) 3) Embolization strategy and materials for shunts 4) Complications related with non-target embolization and their management

## EMBOLIZATION WITH N-BUTYL CYANOACRYLATE : PROPERTIES, TECHNIQUE, PITFALLS, AND APPLICATIONS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Jin Woo Choi, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

N-Butyl cyanoacrylate is a commonly used liquid embolic material for managing various medical conditions, such as vascular malformation, gastrointestinal bleeding, portal vein embolization, and tumor embolization. This material can be mixed with iodized oil to provide radiopacity and control the polymerization time. However, beginners may find it challenging to handle liquid embolic material compared to coils, plugs, and particles. The purpose of this exhibit is : (1) To describe the properties and mechanism of action of N-butyl cyanoacrylate. (2) To learn diverse injection techniques and potential pitfalls associated with its use. (3) To review various clinical indications and appropriate techniques for the use of N-butyl cyanoacrylate in interventional procedures.

### TABLE OF CONTENTS/OUTLINE

1) N-butyl cyanoacrylate A. Chemical properties B. Effects on tissues C. Polymerization D. Mixture with iodized oil E. Mixture with iodized oil and alcohol 2) Injection technique and pitfalls A. flow-dependent injection B. pressure-dependent injection C. Balloon-occluded injection D. Potential pitfalls 3) Clinical indications A. Arteriovenous malformation B. Diverse bleeding embolization C. Vein embolization D. Tumor embolization E. Endoleak embolization F. Lymphatic embolization

## SUPERSELECTIVE RADIOEMBOLIZATION FOR HEPATOCELLULAR CARCINOMA : RADIATION SEGMENTECTOMY AND BEYOND

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Hyo-Cheol Kim, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Radioembolization is an established treatment for unresectable hepatocellular carcinoma. Radioactive microspheres are preferentially deposited into the hypervascular tumor by siphoning effect so that injection of microspheres are commonly performed at the lobar artery level. However, superselective radioembolization is the best way to improve tumor response and to prevent potential complications. The purpose of this exhibit is : (1) To review the rationale of radiation segmentectomy. (2) To learn when superselective radioembolization is needed, (3) technical tips for superselective radioembolization.

### TABLE OF CONTENTS/OUTLINE

1) Radiation segmentectomy : rationale and evidence 2) Dosimetry : Practical guide for dosimetry of superselective radioembolization3) When superselective radioembolization is needed A. small single tumor : radiation segmentectomyB. Large single tumor saddling on both lobesC. Small remnant liverD. Hepatic artery branching at acute angleE. Extrahepatic collateral artery supplying the tumor4) Technical consideration of superselective radioembolization A. Protection of distal normal liver by using balloon microcatheter and detachable coil B. Combination treatment of lobar and segmental arteryC. Combination treatment of 1st and 2nd week dosing of glass microsphere5) Follow-up imaging after superselective radioembolizationA. Early loss of arterial enhancement of the tumor B. Focal radiation necrosis mimicking new hypovascular tumor

### TEACHING POINTS

-To understand the importance of eye protection by lead glasses during Interventional radiology (IR) procedures. -To discuss the radiation-shielding effects of over-glasses-type eyewear. -To compare the protection afforded by over-glasses-type and regular eyewear. -To encourage the user of prescription glasses to wear over-glasses-type eyewear. -To understand the importance of the combination use of radiation protection tools during IR procedures.

### TABLE OF CONTENTS/OUTLINE

•Characteristics of over-glasses-type eyewear •Radiation protection effect of over-glasses-type eyewear in a phantom experiment •Covered area by lead glasses and recommendation for combination use of protection tools OUTLINE: In response to the new occupational eye lens dose limit, the use of radiation protection tools such as Pb eyewear is important in IR. Over-glasses-type eyewear has a large frame and lens to fit over prescription glasses. In recent years, 0.07 mm Pb eyewear has been used. It is more lightweight and comfortable than existing 0.75 mm one. The shielding effects of lead-equivalent glasses (over-glasses-type and regular) were evaluated by placing radiophotoluminescence dosimeters inside and outside the glasses, and on the surface of the eye. The over-glasses-type eyewear exhibited better protection than regular eyewear at the irradiation angles of clinical settings. According to our phantom study, 0.07 mm Pb over-glasses-type eyewear protected left eye effectively. However, the covered area of right eye was insufficient. Further improvements of its shape and combination use of radiation protection tools are needed.

## PARADIGM SHIFT FROM TREATMENT TO PREVENTION IN TYPE 2 ENDOLEAK POST ENDOVASCULAR AORTIC REPAIR: CURRENT EVIDENCE AND TECHNICAL TIPS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Masashi Tamura, MD (*Abstract Co-Author*) Nothing to Disclose
Masahiro Jinzaki, MD, PhD (*Abstract Co-Author*) Support, Canon Medical Systems Corporation;Support, General Electric Company
Manabu Misu (*Abstract Co-Author*) Nothing to Disclose
Shintaro Senda, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Endovascular aortic repair (EVAR) offers a minimally invasive solution for aortic aneurysms, yet introduces the unique complication called endoleaks (ELs). Type 2 (T2) ELs, characterized by low pressure, necessitate monitoring due to their potential to trigger or worsen type 1 ELs, leading to rupture. T2ELs are traditionally treated with endovascular embolization; however, this approach is frequently difficult and ineffective. Recently, preemptive branch embolization has surfaced as a promising alternative strategy. This exhibit aims to achieve three goals: (1) Reviewing the basics and recent topics of T2ELs; (2) Learning the latest evidence supporting the shift from treatment to prevention for T2ELs post EVAR; and (3) Exploring techniques of preemptive embolization to mitigate T2ELs.

### TABLE OF CONTENTS/OUTLINE

(1) Introduction: Types of endoleaks, pathophysiology, and imaging evaluation of T2ELs. (2) Treatment of T2ELs: Indications, overview of interventional techniques, treatment limitations, and case presentation. (3) Transitioning from Treatment to Prevention: Rationale, indications, review of efficacy studies, ongoing research, and future directions. (4) Techniques for Preemptive Embolization: Procedural considerations, and data on catheter selection from our institution.

Yasuhiro Ushijima, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To review the basics of CT-guided cryoablation and its indications for renal cell carcinoma.To learn the practice of CT-guided cryoablation for renal cell carcinoma and how to improve effective treatment.To learn about the potential complications of CT-guided cryoablation for renal cell carcinoma and how to prevent them.

### TABLE OF CONTENTS/OUTLINE

A. Basics of CT-guided cryoablation. Principles of cryoablation Imaging modalities for targeting lesions and monitoring the treatment areaB. Indications for CT-guided cryoablation for renal cell carcinoma. Tumor size, Location, Single or multiple, Initial or secondary, Hereditary disease, Elderly patient, Patient with comorbiditiesC. Practice of CT-guided cryoablation for renal cell carcinoma. Anesthesia, Puncture under CT fluoroscopy, Positioning of the cryoprobes and monitoring of the treatment area by CT reconstruction imagingD. To ensure more effective cryoablation for renal cell carcinoma. Transarterial lipiodol marking before cryoablationE. Possible complications and how to prevent them. Hemorrhage, Renal dysfunction, Infection/abscess, Bowel injury, Ureteral injury, Pneumothroax, Abdominal pseudohernia, Dissemination, Hydrodissection for surrounding organs, Ureteral stenting to prevent ureteral injuryF. Percutaneous biopsy for histological diagnosis. Biopsy separate from cryoablationG. Pitfalls. Ice-ball crack during cryoablation, Mimicking of a recurrent lesion

## APPLICATIONS OF TRANSARTERIAL EMBOLIZATION IN MUSCULOSKELETAL PAIN MANAGEMENT

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Stuart E. Braverman, MD (*Abstract Co-Author*) Nothing to Disclose
Robert G. Dionisio, MD (*Abstract Co-Author*) Nothing to Disclose
Kori A. Higashiya, MD (*Abstract Co-Author*) Nothing to Disclose
Chase Glenn, MD (*Abstract Co-Author*) Nothing to Disclose
Catherine Ho, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To review the efficacy and safety of Transarterial Embolization (TAE) in managing chronic musculoskeletal pain.

### TABLE OF CONTENTS/OUTLINE

Background: Chronic musculoskeletal pain affects up to 30% of people worldwide, often necessitating interventions beyond NSAIDs and lifestyle modifications. Transarterial embolization (TAE) is a viable option for those with persistent, refractory pain despite pharmacologic therapy or are ineligible/averse to surgery.Pathophysiology/Technique: Angiogenesis, neurogenesis, and resulting inflammation underlie many MSK pain syndromes, such as osteoarthritis (OA). TAE targets these processes by selectively embolizing major arterial supplies, mitigating inflammation and pain.Application and Results:OA and OA related bone marrow lesions (knee, hands, shoulder, facet, and SI joints)Non Osteoarthritic Synovitis (Adhesive Capsulitis and Hip Synovitis)Tendonopathy/EnthesopathyOther (Chronic Myalgia and Fibroids)Conclusion: Multiple studies demonstrate TAE as a safe and effective way to manage chronic musculoskeletal pain. Further studies are warranted to elucidate long term efficacy and broaden our understanding of chronic MSK pain pathogenesis.

## STOP THE BLEEDING: THERE'S MORE THAN ONE WAY TO DO IT

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Ryo Toya, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Hideki Ishimaru (*Abstract Co-Author*) Nothing to Disclose
Tomoki Nakano, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Effective control of bleeding is crucial to prevent severe anemia or exsanguination. In various situations, interventional radiologists frequently manage hemostasis. The methods used to achieve bleeding control have their own advantages and disadvantages. In some cases, organ ischemia is acceptable to achieve hemostasis. The skills and equipment of interventional radiologists performing hemostatic techniques can vary, and there is no standard method for achieving hemostasis. Nevertheless, any available technique can be used to control bleeding if performed correctly. This educational exhibit illustrates the different treatment options for various bleeding scenarios, emphasizing how hemostasis can be achieved based on the skill level of each interventional radiologist.

### TABLE OF CONTENTS/OUTLINE

Ischemic susceptibility of bleeding organs- Knowledge of embolic material properties: temporary / permanent- Tips for successful use of each embolic material- Hemostatic methods other than embolization: manual compression / stentgraft / thrombin- Contraindications in each situation

## LIVER VENOUS DEPRIVATION TO INDUCE LIVER HYPERTROPHY BEFORE MAJOR HEPATECTOMY: MATERIALS AND TECHNIQUES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Cristina Mosconi, MD (*Abstract Co-Author*) Nothing to Disclose
Lorenzo Braccischi, MD (*Abstract Co-Author*) Nothing to Disclose
Maria Vittoria Bazzocchi, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Liver venous deprivation (LVD) is a safe and effective technique with low complications and rapid growth rates before major liver hepatectomy. The learning object of this educational are: to analyze different radiological interventional strategies to induce liver hypertrophy prior to surgery and explain how to perform LVD, focusing on different approaches and embolic materials, to understand the importance of maintaining a sufficient future liver remnant (FLR) volume for optimal liver function before surgery and to explain the techniques to calculate FLR.

### TABLE OF CONTENTS/OUTLINE

Careful patient selection to assess FLR before surgery is a key factor for clinical outcomes to avoid post-hepatectomy liver failure (PHLF) and mortality. CT segmentation and (99m)Tc-mebrofenin-hepatobiliary scintigraphy (HBS) are valid alternatives for evaluating remnant percentage in order to plan the need for LVD. For portal embolization, access is usually transhepatic; several embolic materials have been used, including N-Butyl-Cyanoacrylate, Ethanol, PVA microparticles, Gelfoam Sponge, Coils and Plugs. Additional embolization of the hepatic vein allows significant hypertrophy, emphasizing the potential efficacy and safety of the combined approach in hepatic interventions. Access can be percutaneous trans-hepatic, jugular or femoral, and cyanoacrylate, plugs or coils are usually employed. Other techniques include radioembolization lobectomy with Yttrium-90 or Olmium-166.

## THE ENHANCED MYOMETRIAL VASCULARITY - IS IT AN AVM? REVIEWING DEFINITIONS, IMAGING FINDINGS, AND INTERVENTIONAL TREATMENT

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Gustavo V. Andrade, MD (*Abstract Co-Author*) Nothing to Disclose
Francisco Donato JR, MD (*Abstract Co-Author*) Nothing to Disclose
Otavio Augusto Ferreira Dalla Pria, MD (*Abstract Co-Author*) Nothing to Disclose
Carolina A. Heming, MD (*Abstract Co-Author*) Nothing to Disclose
Camila Gadens Zamboni, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Arteriovenous malformations (AVMs) are congenital abnormalities that can affect any organ or tissue in the human body, with myriad presentations in radiological studies. True uterine AVM is extremely rare, with very few cases reported worldwide. Some acquired pathologies can lead to dilated and tangled vessels, with low-resistance turbulent high-flow, mimicking an AVM. Recently described, Enhanced Myometrial Vascularity (EMV) has imaging findings very similar to uterine AVM but is acquired and usually occurs in the context of a recent pregnancy or abortion. Nevertheless, correct diagnosis is crucial for appropriate treatment. This exhibit aims: 1. To review the literature concerning this entity, depicting clinical presentation; 2. To describe imaging findings that help to diagnose them among their differentials, focusing on the importance of the Radiologist; 3. To demonstrate over 15 cases of EMVs treated by catheter embolization, discuss findings and techniques, and focus on the role of the Interventional Radiologist; 4. To highlight essential teaching points to become familiar with the diagnosis and embolization treatment of EMVs.

### TABLE OF CONTENTS/OUTLINE

1. Brief review of AVM and EMV concepts and radiological importance; 2. EMV definition, diagnostic criteria, and differentials among different radiologic imaging modalities; 3. Illustration of EMV cases treated by embolization, focusing on diagnosis and Interventional approach; 4. Conclusion and take-home messages, 5. References

### TEACHING POINTS

Acute necrotizing pancreatitis (ANP) affects 15% of cases and raise mortality to 30%, often requiring intensive care, readmissions, and invasive treatments.The management of complex fluid collections in ANP has evolved, with many medical centers adopting a "Step-up approach". This strategy begins with percutaneous drainage and minimally invasive techniques, succeeding approximately 50-60% of the time. This step can serve as both a definitive treatment or a bridge to more invasive procedures.Fistulization is a feared complication, being necrosis and infection a risk factor. Pancreatic cutaneous fistulas initially involves conservative measures, as many may spontaneously close. However, communication with surrounding structures as gastrointestinal tract, can lead to malnutrion, bleeding, and infections.While fistulography via CT is valuable for detecting postoperative pancreatic fistulas after pancreaticoduodenectomy, its efficacy for fistulas related to ANP during the percutaneous drainage stage is not well established. Nevertheless, this procedure aids in diagnosing and monitoring fistulas, providing crucial anatomical insights.This presentation aims to diagram the technique and showcase cases where CT fistulography is performed during percutaneous drainage of peripancreatic collections, enhancing the efficacy and safe of it for future studies.

### TEACHING POINTS

The purpose of this exhibit is:1. To review the clinical indications of central venous endovascular reconstruction of the superior vena cava and brachiocephalic vein2. To demonstrate proper techniques for central venous endovascular reconstruction in cases of benign SVC syndrome3. To review complications of central venous endovascular reconstruction

### TABLE OF CONTENTS/OUTLINE

1. Indications for central venous reconstructiona. Patients with symptoms (facial swelling, orthopnea) from SVC/central venous occlusion due to:i. Chronic indwelling pacemakers, hemodialysis catheters, central venous cathetersii. Benign tumors - thyroid goiteriii. Fibrosing mediastinitisiv. Sarcoidosisb. Prior to placement of central venous catheters/dialysis catheters in patients with chronic central venous occlusionc. Malignant causes of SVC syndrome refractory to tumor treatmenti. Bronchogenic carcinoma, lymphoma, sarcoma, metastatic disease, among others2. Approach to central venous reconstructiona. Venous access site selection - typically internal jugular or subclavian, possibly with femoral accessb. Venographyc. Wire and/or sharp recanalizationd. Balloon venoplasty and stent placement3. Complicationsa. Immediate/Short term:i. Localized pain, puncture site hematomaii. Arrhythmiaiii. Hemoptysis, hematemesisiv. Pulmonary edemav. Pulmonary embolismvi. Cardiac tamponade due to iatrogenic SVC perforationb. Intermediate/Long term:i. Restenosisii. Stent occlusioniii. SVC syndrome recurrence

Kazuki Hara, RT (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Though the emergence of novel endovascular therapeutic devices like the Amplatzer Vascular Plug (AVP) and the Woven EndoBridge (WEB) has expanded our options for embolization procedures, we still rely on subjective analysis of angiography to determine completion, based on our experience. However, sometimes vessel flow recanalization occurs during follow-up, highlighting the need for a more precise, quantitative approach to angiography. In response, we developed a quantitative analysis method called mqDSA. In this presentation, we aim to compare the pros and cons of various methods, including MRI, ultrasound, and quantitative DSA. Our perspective underscores the necessity of adopting quantitative methodologies like mqDSA, which offer a more objective and reliable assessment, ultimately enhancing treatment outcomes and patient care.

### TABLE OF CONTENTS/OUTLINE

1. Angiography (DSA) for Flow Velocity EvaluationPros: In-room feasibility and instant assessment and new quantitative method (mqDSA)Cons: Ionizing radiation exposure and contrast medium requirement.2. MRI-Based Flow Velocity EvaluationPros: Spatial resolution and non-invasiveness.Cons: Inaccessibility during procedures and susceptibility to artifacts.3. Ultrasound for Flow Velocity EvaluationPros: Portability and real-time measurement.Cons: Operator skill dependency and limited acoustic windows.4.Comparative Analysis of Flow Velocity Measurement TechniquesUsing graphical representations, we compare flow velocity measurement techniques (MRI, ultrasound, and angiography), showing their relationship to actual flow, for accuracy assessment.5.Clinical ApplicationsCase Studies: Practical implementations of mqDSA.

Shriya Veluri (*Abstract Co-Author*) Nothing to Disclose
Carson Middlebrook (*Presenter*) Nothing to Disclose

### TEACHING POINTS

This exhibit aims to educate on mesenteric angiography in emergency settings. The focus of this exhibit will be an overview of the conventional and suture techniques to form a reverse curve for access into the mesenteric aortic branches to capture an angiogram. It will also include a background on mesenteric angiography, common curve catheters and their respective characteristics guiding selection, and a review of the mesenteric vasculature with examples of extravasation.

### TABLE OF CONTENTS/OUTLINE

Background/Indications:The purpose of mesenteric angiography in diagnosing and treating active gastrointestinal (GI) bleeds with indications for performing angiography in such cases.Catheter Selection:Review of catheter properties that help guide selection for angiography. The catheters discussed: Cobra, Headhunter, Angle Taper, Simmons, and Mikaelsson.Techniques:Discussion of two mesenteric angiography techniques - conventional angiography technique over the aortic arch and the suture angiography technique. This will include step-by-step images for each technique and their advantages and disadvantages.Anatomy Overview:Presentation of angiogram cases on the Celiac, SMA, and IMA arteries and their branches with labeled anatomy and examples of extravasation. Additionally, a demonstration of a helpful tip to confirm proper catheter positioning before contrast injection will be provided.Conclusion:Participants will gain the necessary skills to select appropriate catheters for angiography, effectively use various mesenteric angiography techniques to form a reverse curve for obtaining quality and timely results, and develop a comprehensive understanding of mesenteric vascular anatomy.

## INTERVENTIONAL TREATMENT OF SYMPTOMATIC CHRONIC EXTRA-HEPATIC PORTAL VEIN OBSTRUCTION (EHPVO) IN NON CIRRHOTIC PATIENTS: TIPS AND TRICKS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Alban L. Denys, MD (*Abstract Co-Author*) Consultant, BTG International LtdGrant, BTG International LtdConsultant, Terumo Corporation
IGNACIO ANDRES CANO, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- To review the indications of interventional management of EHPVO.- To know the different steps and tips and tricks to perform a successful portal vein recanalization (PVR).- To review the results and complications that can occur during and after PVR.

### TABLE OF CONTENTS/OUTLINE

EHPVO is a challenging condition frequently associated with portal prehepatic hypertension that can lead to variceal bleeding, portal biliopathy and ascites. In recent years, PVR alone or associated to TIPS has emerged as a promising treatment option for non cirrhotic patients with chronic EHPVO.Interventional treatment should be reserved to symptomatic patients, therefore a careful evaluation including gastroscopy for variceal staging, liver blood tests and an anatomical evaluation of the hepatic, portal, mesenteric and splenic veins which is usually performed by contrast enhanced CT with or without abdominal ultrasound and Doppler evaluation.PVR without TIPS is the preferred option when intrahepatic branches are patent (Marot classification 1 or 2). The access route to the portal system depends on the anatomical situation but is preferably done through the anterior sector oh the portal veins. TIPS is added to PVR only if the intrahepatic branches have a poor quality and if the portosystemic pressure gradient remains high after PVR.Direct access via the mesenteric or splenic vein is a problem solving when the liver access is failed or is not possible. Catheters, techniques and tips to recanalize the occluded atrophic portal vein will be discussed.In conclusion, PVR is a valuable option for patients with chronic PVT. Operators should be familiar with the indications, pre-procedural planning, and techniques for performing a successful PVR.

## AN EX-VIVO TRAINING MODEL FOR KIDNEY EMBOLIZATION UTILIZING DIFFERENT EMBOLIC MATERIALS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Jorge E. Lopera, MD (*Abstract Co-Author*) Shareholder, Tecnostent SA;Consultant, Merit Medical Systems, Inc;Research Grant, AngioDynamics, Inc
John A. Walker, MD, PhD (*Abstract Co-Author*) Speaker, Shionogi & Co, Ltd;Consultant, Shionogi & Co, Ltd
Carlos B. Ortiz, MD (*Abstract Co-Author*) Consultant, Argon Medical Devices, Inc
Marina Borrego, BS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Discuss the benefits of simulation-based training. Discuss current training models available for kidney embolization. Describe a new teaching model for learning kidney embolization using different embolic materials.

### TABLE OF CONTENTS/OUTLINE

Introduction. Discuss current embolization training models. Review a kidney embolization clinical case to compare training model similarities. Set-up for a newly developed ex vivo porcine kidney model. Review different embolic materials that can be used to teach kidney embolization utilizing the training model (Gelfoam, Glue, Microspheres , Obsidio, Coils). Conclusion: Incorporating simulation into medical training can provide an opportunity for additional hands-on training, without patient risk. This training model exposes operators to the techniques for kidney embolization using a variety of embolic materials.

Creation of a multidisciplinary care framework for patients with spinal tumor.Understanding how Interventional radiology fits into a multidisciplinary care framework for patients with spinal tumors.

### TABLE OF CONTENTS/OUTLINE

Sixteen percent of all patients with metastatic cancer develop metastasis to the spine in their lifetime,which is often painful.Additionally, 1 out of 8 patients with spinal metastases develop pathologic vertebral compression fractures.While there are several effective therapies for metastatic bony spinal tumors, optimal care requires a multidisciplinary approach for individualized patient care. Interventional radiology plays an increasingly critical role in the management of patients with metastatic bony spinal tumors. At our institution, we have established a spine oncology Center of Excellence further supported with a Spine Oncology Tumor Program. A fellowship-trained spine oncology neurosurgeon leads the program and includes neurooncology, interventional radiology, radiation oncology, neuroradiology, pain anesthesia and medical oncology. The specialists meet twice monthly to discuss optimal treatment strategies. Management options may include biopsy, surgical resection, radiation treatment,chemotherapeutic agents, and interventional procedures such as include vertebral augmentation plus radiofrequency ablation (RFA). Spinal Tumor boards are not widely implemented across the country, and there are no set standards regarding which specialists are invited to be part of the spinal tumor board. This broad group of spine oncology specialists has proven to provide well-rounded streamlined care which fosters collaboration and interdisciplinary education.

## BENIGN THYROID NODULES: A COMPREHENSIVE ANALYSIS OF THERMAL ABLATION AS AN EFFECTIVE TREATMENT ALTERNATIVE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Rodrigo G. Garcia, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Erivelto M. Volpi (*Abstract Co-Author*) Nothing to Disclose
Victor Arthur Ohannesian (*Abstract Co-Author*) Nothing to Disclose
Marcos R. Queiroz, MD, MBA (*Abstract Co-Author*) Nothing to Disclose
Antonio Rahal Junior (*Abstract Co-Author*) Nothing to Disclose
Luiz Nascimento (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Benign Thyroid Nodules and Symptoms: Benign thyroid nodules are common and can cause symptoms like dysphagia and dysphonia due to their size and location.- Autonomous Nodules: Some thyroid nodules exhibit autonomous behavior, producing excess thyroid hormone and resulting in hyperthyroidism.- Traditional Treatments vs Thermal Ablation (TA): Historically, thyroid nodules were managed with surgery or radioiodine therapy, often leading to gland removal and subsequent need for thyroid hormone replacement. TA techniques like radiofrequency ablation (RFA) or microwave ablation (MW) are emerging as minimally invasive alternatives that preserve gland function.- Advantages of Thermal Ablation (TA): TA offers benefits such as no visible scars, local anesthesia, sedation during the procedure, and quick recovery time, while maintaining hormonal function.- Efficacy of Thermal Ablation (TA): TA typically achieves a significant reduction in nodule volume, with a 50% volume reduction within 3 to 6 months and up to 90-95% reduction within 12 months. For autonomous nodules causing hyperthyroidism, thyroid-stimulating hormone (TSH) levels normalize within 60 days post-ablation.

### TABLE OF CONTENTS/OUTLINE

I. Introduction: Prevalence of Benign Thyroid Nodules Symptoms and Complications, Treatment Options: Surgery, Radioiodine Therapy, Thermal Ablation (TA).II. Methods: Use of Departmental Images, Extensive Bibliographic Review.III. Discussion: Presentation of Symptomatic Benign Thyroid Nodules and Traditional Treatment Approaches.IV. Conclusion: Recognition of TA as First-Line Treatment for Symptomatic Benign Thyroid Nodules.V. Limitations and Eligibility Factors for Thermal Ablation (TA).

Amr Kalander, MD (*Abstract Co-Author*) Nothing to Disclose
Rodrigo Vivas Cardoso, MD (*Abstract Co-Author*) Nothing to Disclose
Joao S. Pais, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

A brief review of renal ablation techniques, indications and normal imaging evolution;To understand the incidence of the main complications, when to expect each type and how to handle each one.

### TABLE OF CONTENTS/OUTLINE

Renal ablation has become a pivotal intervention in the management of renal masses, due to an escalating incidence of incidentally detected lesions, which account for approximately 67% of cases.Renal ablation offers numerous advantages, including reduced morbidity, enhanced parenchymal preservation and shorter hospital stays. The main therapeutic armamentarium encompass thermal ablation techniques such as Radiofrequency Ablation (RFA), Microwave Ablation (MWA), and Cryoablation (CRYO), without significant disparities in complication rates between them.Treatment assessment post-ablation involves meticulous evaluation of the ablation zone, characterized by a hypoattenuating area without enhancements, with a recommended margin of 5-10 mm to ensure complete lesion eradication. Complications, with an incidence of up to 12.9%, such as hemorrhage, hematuria, collecting system injury and pneumothorax, predominantly manifest as Clavien-Dindo grade I events.In conclusion, renal ablation is a cornerstone in renal oncology, representing a valuable therapeutic options, offering favorable outcomes with minimal morbidity. Understanding the nuances of treatment assessment, complication prediction, and management is imperative for optimizing patient care.

## CHOLANGIOSCOPY - WHEN IS IT TIME TO SCOPE THE BILIARY TREE?

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Mina S. Makary, MD (*Abstract Co-Author*) Nothing to Disclose
Kenechukwu Okoye, MEng, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Cholangioscopy allows for direct visualization of the biliary tree via the use of an endoscope during ERCP 2. Cholangioscopy is a safe and effective approach for the treatment and diagnosis of pancreaticobiliary disease, as well as for surgical planning in cases of cholangiosarcoma. 3. While regarded as safe, there are known risks. In addition to standard practices, there are strategies and technique that can be considered to minimize risk and maximize chances of success depending on the intervention. Alternative methods to cholangioscopy may be considered for each aforementioned indication, based on clinical factors.

### TABLE OF CONTENTS/OUTLINE

1. Background: The varying indications for cholangioscopy - why perform one? When is it time to reach for one? a. Diagnosis of biliary pathology - typically following equivocal ERCP i. Radiolucent or otherwise unseen stones on cholangiography ii. Advanced biliary disease ie PSC making other diagnostic procedures difficult iii. Concern for malignancy iv. Comparison to other diagnostic approaches, methods, indications, risk/benefit profile v. Decision algorithm(s) for diagnostic cholangioscopy b. Treatment of gallstones (eg electrohydraulic, laser lithotripsy) c. Deployment of stents d. Collecting biopsy e. Preoperative planning 2. Technical steps including patient preparation, details, equipment, 3. Case(s) review from The Ohio State University Wexner Medical CenterPatient safety, contraindications, pearls and pitfalls.

## DEVELOPING ARTERIAL EMBOLIZATION IN LOW-INCOME COUNTRIES: THE FAIREMBO PROJECT

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Julien Panneau (*Abstract Co-Author*) Nothing to Disclose
Pauline Brige (*Abstract Co-Author*) Nothing to Disclose
Vincent Vidal Sr, MD (*Abstract Co-Author*) Nothing to Disclose
MATHIEU DI BISCEGLIE (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Describe the main limitations to the development of interventional radiology in low-income countries. - Propose an embolization agent that is available, effective, and safe.- Promote the formation of interventional radiology teams.

### TABLE OF CONTENTS/OUTLINE

1. Main limitations to the development of interventional radiology in low-income countries.• Significant morbidity and mortality due to the lack of development of IR techniques in low-income countries• A lack of material resources in particular on embolic agents• A lack of interventional radiologists resources2. Suture as an available, effective and safe embolic agent• Suture fragment as torpedo for proximal embolization in a preclinical model• Suture-based microparticles for distal embolization in a preclinical model• Absorbable suture for transient embolization in postpartum preclinical model• Reported clinical cases of suture use as an embolic agent : renal pseudoaneurysm embolization and postpartum hemorrhage embolization3. Formation of interventional Radiology teams• On-site missions (Senegal, Ivory Coast, Cameroon) to train local radiologists and X-ray technicians: hands-on and clinical cases• Autonomous implementation and execution of IR procedures

## RADIOFREQUENCY ABLATION (RFA) AND ETHANOL ABLATION FOR BENIGN THYROID NODULES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Matthew Abad-Santos (*Abstract Co-Author*) Nothing to Disclose
Harneet Sangha (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Radiofrequency ablation (RFA) and ethanol ablation are two minimally invasive procedures that target benign nodules of the thyroid. Treatment is aimed at ablating abnormal cells via heat created by high frequency electric current in (RFA) and Alcohol injections result in dehydration and destruction of benign mass. The purpose of this exhibit is to provide a brief history and role of Thyroid Ablation (RFA) / alcohol injections for treatment of benign nodules by reviewing existing literature, while also using cases to emphasize the importance of (RFA) and alcohol ablation. Additionally, expressing the indications, contradictions and outcomes of (RFA) and alcohol ablation. Finally reviewing the preoperative and postoperative guidelines for patients undergoing (RFA).

### TABLE OF CONTENTS/OUTLINE

1. History of (RFA) and ethanol ablation and mechanism 2. Assessment of cases, including key management strategies and indications for ablation procedures and alcohol injections. 3. pre-procedural imaging and investigations, procedural techniques, outcomes, post-procedural follow-up, and complications. 4. Preoperative and postoperative guidelines as well as description of procedure. 5. Case based discussion and contraindications.

**Sub-Events**

## MKEE-1 ADVANCED APPROACHES TO AN AGGRAVATING ARTHROPATHY: DIAGNOSING GOUT WITH US, DECT, AND MRI

Takeshi Fukuda, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Helen Kwon (*Abstract Co-Author*) Nothing to Disclose
Alexander H. Dills, DO (*Abstract Co-Author*) Nothing to Disclose
Robert Freund, MD (*Abstract Co-Author*) Nothing to Disclose
Akira M. Murakami, MD (*Abstract Co-Author*) Nothing to Disclose
Daichi Hayashi, MD, PhD (*Abstract Co-Author*) Author with royalties, Wolters Kluwer nv
Megan Kenway, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1 - Review the pathophysiology of gout and the typical findings on planar imaging2 - Review the principles of DECT and mapping of monosodium urate (MSU) crystal deposits3 - Show the classic findings of gout on US, dual-energy CT (DECT), and MRI4 - Demonstrate common artifacts and mimics of gout on US, DECT, and MRI5 - Outline methods of reducing artifact and distinguishing gout from mimics on US, DECT, and MRI6 - Compare and contrast the utility of US, DECT, and MRI in detecting Gout

### TABLE OF CONTENTS/OUTLINE

- Epidemiology and history of gout, including typical presentation, diagnosis, and management- Classic examples of early and advanced gout on radiograph- Alternative imaging options, and the body regions they are the most useful in- Review of DECT physics and examples of the resultant MSU maps- Examples of typical findings of gout on DECT in soft-tissue windows and MSU maps- Examples of mild disease and atypical locations of gouty tophi- Overview of DECT artifacts that cause incorrect mapping of MSU deposits- Keratin in nailbeds and callous- Metal foreign bodies, implanted hardware, and external devices- Methods of reducing artifact and troubleshooting incorrect MSU mapping- Examples of typical findings of gout on US, nonspecific and specific- Artifacts and mimics of gout on US- Examples of typical findings of gout on MRI- Limits of MRI for evaluation of gout, and tools to increase specificity- Final comparison of DECT, US, and MRI, strengths, vs weaknesses

## MKEE-10 AGING AND INFLAMMATION: INSIGHTS INTO INFLAMMATORY MUSCULOSKELETAL DISEASES IN THE ELDERLY

Marcelo A. Nico, MD (*Abstract Co-Author*) Nothing to Disclose

Leticia dos Reis Morimoto, MD (*Abstract Co-Author*) Nothing to Disclose
Alipio Ormond Filho, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The demographic shift towards an aging population presents novel healthcare challenges, notably in diagnosing and managing musculoskeletal conditions. Advanced age heightens susceptibility to various inflammatory musculoskeletal disorders, due to a chronic pro-inflammatory status and immune system dysregulation. Additionally, the elderly population are susceptible to adverse effects from polypharmacy, immunosuppressive responses, and drug-induced myopathies. Furthermore, tumors can predispose individuals to musculoskeletal inflammatory responses via the secretion of inflammatory cytokines and modulation of the immune system (paraneoplastic syndromes).The initial presentation of inflammatory conditions in elderly often presents lacking conventional radiological markers or prominent laboratory abnormalities. Discriminating between the insidious onset of inflammatory musculoskeletal disorders and degenerative changes poses a radiological challenge. Radiologists play a pivotal role in this scenario, serving as key contributors to the recognition of such conditions, thereby preventing irreversible disability and preserving the quality of life in the elderly population.

### TABLE OF CONTENTS/OUTLINE

1. Introduction2. The immune system of the elderly3. Multimodality imaging and approach4. Rheumatological Diseasesa) Rheumatoid Arthritisb) Enthesopathiesc) Rheumatica Polymyalgia5. Crystal Arthropathies a) Goutb) Calcium Pyrophosphate Deposition Disease 6. Inflammatory Myopathies a) Polymyositis and Dermatomyositis b) Inclusion Body Myositis 7. Paraneoplastic Syndromes a) Paraneoplastic Arthritis b) Hypertrophic Osteoarthropathy8. Miscellaneous 9. Conclusion

## MKEE-100 GLUTEAL CONTOUR IMPROVEMENTS FOR MUSCULOSKELETAL RADIOLOGY

**Awards**
**Certificate of Merit**

Adham A. Castro, MD (*Abstract Co-Author*) Nothing to Disclose
Guilherme B. Rocha, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The purpose of this exhibit is:1. To review normal anatomy of the buttocks; 2. To discuss the possibilities of gluteal contour improvements, including lipoinjection and implantation; 3. To discuss some of the post treatment complications and their imaging correspondence

### TABLE OF CONTENTS/OUTLINE

Normal gluteal anatomyLipoinjectionGluteal implantationComplications of gluteal contouring surgical procedures, focusing on imaging findings

## MKEE-101 IMAGING OF KNEE ARTHROPLASTY: WHAT THE RADIOLOGIST NEEDS TO KNOW

**Awards**
**Certificate of Merit**

Avneesh Chhabra, MD, MBA (*Abstract Co-Author*) Consultant, ICON plc;Consultant, Treace Medical Concepts, Inc;Author with royalties, Wolters Kluwer nv;Author with royalties, Jaypee Brothers Medical Publishers Ltd;Speaker, Siemens AG;Medical Advisor, ImageBiopsy Lab;Research Grant, ImageBiopsy Lab
Flavio Duarte Silva (*Abstract Co-Author*) Nothing to Disclose
Dhilip Andrew, MBBS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Learn about different types of knee arthroplasties and arthroplasty implants used in routine practice.
- Gain knowledge of the pre-operative planning and measurements for knee arthroplasty including AI-generated automated limb angular and linear measurements.
- Improve knowledge and understanding about knee arthroplasty-related complications and their various imaging appearances.

### TABLE OF CONTENTS/OUTLINE

- Review relevant clinical anatomy, indications, surgical details of different types of arthroplasties.
- Discuss the role of multimodality imaging and role of validated AI-generated measurements for preoperative planning of knee arthroplasty and follow-up imaging for monitoring of complications.
- Case-based illustration of normal and abnormal findings on knee radiographs and cross-sectional images for monitoring such patients post-operatively.
- Normal appearances
- Common complications
- Implant specific complications.

## MKEE-102 THE ISSUE IS THE TISSUE: CT FINDINGS OVERLOOKED ON SOFT TISSUE WINDOWS IN LOWER EXTREMITY IMAGING

Cornelia B. Wenokor, MD (*Abstract Co-Author*) Nothing to Disclose
Douglas Ardekani, DO (*Abstract Co-Author*) Nothing to Disclose
Justin Newman, DO (*Abstract Co-Author*) Nothing to Disclose
Garrett Yoon, MD, MS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Reviewing commonly overlooked soft tissue pathology that can be clearly demonstrated with soft tissue window settings, particularly in cases of traumatic musculoskeletal injuries. 2. Illustrating and discussing the clinical significance of these findings; for instance, reporting tendon entrapment to aid in surgical planning. 3. Advocating for the use of CT imaging in making early time-sensitive findings on soft tissue windows, potentially avoiding the use of costly additional imaging modalities including MRI.

### TABLE OF CONTENTS/OUTLINE

1. Bone Marrow Pathology (Fracture, Marrow Infiltrative Disease). 2. Subcutaneous and Muscle Pathology (Compartment Syndrome, Morel-Lavallée Lesion, Muscle Tear, Hematoma, Thoracolumbar Fascia Tear, Accessory Soleus Muscle). 3. Ligament Pathology (Ligament Tears, Avulsion Injuries). 4. Meniscal and Knee Capsular Pathology. 5. Tendon Pathology (Entrapment, Rupture, Dislocation). 6. Nerve Pathology (Baxter's Neuropathy, Nerve Transection, Fibrolipomatous Hamartoma).

## MKEE-103 RECTUS FEMORIS: ANATOMY, PATTERNS OF INJURY AND IMAGING FEATURES

Brady K. Huang, MD (*Abstract Co-Author*) Nothing to Disclose
Tatiane C. Rodrigues, MD (*Abstract Co-Author*) Nothing to Disclose
Milanne Trottier, MD (*Abstract Co-Author*) Nothing to Disclose
Dyan V. Flores, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Rectus femoris injuries are common in many sports particularly soccer and rugby, and are the second or third most common thigh muscle strains after hamstring tears. Articles have described the complex anatomy and patterns of injury to various components of the rectus femoris, although lesser known entities like pseudodegloving and posterior fascia injuries have not been described.The objectives of this education exhibit are:1. Review the anatomy of the rectus femoris tendon muscle complex2. Describe and illustrate imaging features of injury to each component 3. Understand patterns of injury, implications to management and return to play

**TABLE OF CONTENTS/OUTLINE**

ANATOMYSITES OF INJURY AND IMAGING FEATURES Origin (bony and soft tissue avulsion) Direct head myofascialIndirect head myotendinous junction(feathery and bull's eye appearances)Muscle bellyIntramuscular degloving PseudodeglovingPosterior fasciaINJURY GRADING IMPLICATIONS TO RETURN TO PLAY

## MKEE-104 SCAPHOID FRACTURE: CLASSIFICATION, IMAGING, COMPLICATIONS AND TREATMENT

**Awards**
**Certificate of Merit**

Kawanpreet S. Rakhra, MD, FRCPC (*Abstract Co-Author*) Nothing to Disclose
Juvel Lee, MD (*Abstract Co-Author*) Nothing to Disclose
Dyan V. Flores, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The scaphoid is the most commonly fractured carpal bone, typically following a fall on an outstretched hand in a young or middle-aged adult. Majority (65%) of scaphoid fractures involve the waist, with the next most common location (15%) being the proximal pole. The unique distal-to-proximal flow of the scaphoid's blood supply predisposes the larger proximal pole to complications to avascular necrosis. Other complications like delayed union or non-union can also occur. The radiologists plays an instrumental role in scaphoid fractures from diagnosis, detection of complications, to preoperative and postoperative assessment. The objectives of this educational exhibit are:1. To review scaphoid anatomy, particularly those unique to the bone (i.e., dual blood supply, lack of periosteum)2. To illustrate scaphoid fracture complications and their imaging appearances 3. To discuss treatment options and indications

**TABLE OF CONTENTS/OUTLINE**

SCAPHOID ANATOMY • Blood supply SCAPHOID FRACTURE • Mayo classification • Herbert and Fisher classification • ACR criteria for imaging of a scaphoid fracture • Complication: Malunion (delayed union and non-union) • Complication: Avascular necrosis • Complication: Scaphoid non-union advanced collapse • Imaging of complications TREATMENT • Management considerations for proximal versus distal scaphoid fracture • Casting versus internal fixation • Bone grafts: nonvascularized versus vascularized • Post-operative imaging evaluation OTHER TRAUMATIC CONDITIONS • Scapholunate instability • Other forms of carpal instability involving the scaphoid

## MKEE-105 WHAT'S IN A NAME? EPONYMOUS FRACTURES: IDENTIFICATION, SURGICAL IMPLICATIONS, AND HISTORICAL RELEVANCE

Parker Brown, MD (*Abstract Co-Author*) Nothing to Disclose
Anisha Shetty, MD (*Abstract Co-Author*) Nothing to Disclose
Jeremiah R. Long, MD (*Abstract Co-Author*) Nothing to Disclose
Paul Chroneos, MD (*Abstract Co-Author*) Nothing to Disclose
Logan Haug, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Demonstrate the named fractures and fracture-dislocation injuries of the upper and lower extremities. Differentiate similar fracture or fracture-dislocation patterns (Essex-Lopresti, Monteggia, and Galeazzi and Rolando, Bennett, and Pseudo-Bennett) and fractures occurring in close anatomic proximity such as at the 5th metatarsal base: stress fractures, Jones, and pseudo-Jones injuries. Emphasize injuries that can occur concurrently with eponymous fractures such as ACL and meniscal injury with Segond fractures. Highlight imaging findings (degree of displacement, articular surface involvement, articular step off, comminution, and degree of dislocation) relevant to clinical or orthopedic management and decision-making. Briefly note the historical individuals credited with the original descriptions of these fractures.

**TABLE OF CONTENTS/OUTLINE**

Upper Extremity: Thumb Base: Rolando, Bennett, Pseudo-Bennett Wrist: Barton, Colles, Hutchinson, and Smith Forearm: Essex-Lopresti, Galleazi, and Monteggia Shoulder: Hill-Sachs and Bankart. Lower Extremity: 5th Metatarsal Base: Stress, Jones, Pseudo-Jones (avulsion) Midfoot: Chopart, Lisfranc Talus: Cedell and Shepherd Ankle: Cotton, Dupuytren, Gosselin, Pilon, Tillaux, Maissoneuve Knee: Pelligrini-Stieda, Segond, Reverse Segond, Maissoneuve.

## MKEE-106 IMAGING PATTERNS OF SPONDYLODISCITIS: A PICTORIAL REVIEW

Trang T. Dam, MD,PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Spondylodiscitis is an infection involved disc-endplate complex, vertebral body, paravertebral tissue and epidural space. Diagnosis and treatment of spondylodiscitis can be delayed due to nonspecific signs and symptoms. 2. Magnetic resonance imaging (MRI), due to its high sensitivity and specificity, can help in early-phase detection, and differentiate between infectious spondylodiscitis versus inflammatory or degenerative spinal changes. 3. Computed tomography (CT) aids in evaluating bone erosions, calcifications, bone quality and CT-guided biopsy help to obtain causative organisms. 4. This exhibit describes the role of MRI and CT on the assessment of spondylodiscitis and other mimicking disorders in clinical practice

**TABLE OF CONTENTS/OUTLINE**

Spondylodiscitis: introduction.Pyogenic spondylodiscitis: typical and atypical imaging patterns. Tuberculosis spondylodiscitis: typical and atypical imaging patterns. Postoperative spondylodiscitis.Non-infectious spinal disorders mimicking infections: how MRI can help? Diagnostic work-up in suspicious spondylodiscitis.

## MKEE-107 DECIPHERING ORTHOPEDIC HIP HARDWARE IMAGING: HOW TO RECOGNIZE AND WHAT SURGEONS NEED TO KNOW

Danielle B. Rumi, MD (*Abstract Co-Author*) Nothing to Disclose
Ingrid D. Caridade, MD (*Abstract Co-Author*) Nothing to Disclose
Erica D. Cruz, MD (*Abstract Co-Author*) Nothing to Disclose
Bruna Maria Lobato Vaughan, MD (*Abstract Co-Author*) Nothing to Disclose
Diego A. Garcia, MD (*Abstract Co-Author*) Nothing to Disclose
Gabriela Lauar, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Interpreting hip orthopedic materials through imaging methods can be challenging for the radiologist, as it is crucial knowledge due to its essential role in postoperative evaluation and diagnosing complications related to these devices. Plain radiographs are often the initial method of choice due to their availability, low cost, and ability to provide an overview of implant position, bone integrity, and joint alignment. However, other imaging methods such as computed tomography (CT) and magnetic resonance imaging (MRI) may be necessary for a more detailed assessment of the prosthesis-bone interface, surrounding soft tissues, and complications such as loosening, osteolysis, periprosthetic fractures, and infection. Ultrasonography also plays an important role in detecting peri-implant fluid collections and assessing adjacent soft tissues. The combination of these imaging methods allows for a comprehensive and accurate approach in interpreting hip orthopedic materials, assisting the medical team in making appropriate treatment decisions and improving patient outcomes post-surgery.

**TABLE OF CONTENTS/OUTLINE**

Through a pictorial essay, we will review the normal anatomy of the hip, indications for orthopedic materials, how to assess them through imaging methods, and what their main complications are.

## MKEE-108 MRI FINDINGS OF THE IDIOPATHIC INFLAMMATORY MYOPATHIES

Emad S. Allam, MD (*Abstract Co-Author*) Nothing to Disclose
Hongmin Xu, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Describe MRI findings of major subtypes of idiopathic inflammatory myopathies (IIM) and associated comorbidities.Clarify differentiating features among key IIM variants to enhance diagnosis confidence among radiologists.Highlight the connection between IIM and cancer, advocating for prompt cancer screening in IIM cases.

**TABLE OF CONTENTS/OUTLINE**

Exhibit major IIM cases including dermatomyositis, polymyositis, paraneoplastic fasciitis/myositis, and anti-synthetase syndrome myositis.Imaging features including the extent and pattern of muscle involvement and disease activity on MRI are described.Summary of differential diagnosis of the major subtypes of IIM. Highlights the importance of a comprehensive approach involving medical history, physical examination, laboratory testing, and advanced imaging techniques like MRI in differentiating between subtypes of myositis and guiding muscle biopsy.

## MKEE-109 A RADIOLOGICAL OVERVIEW OF SHOULDER ARTHROPLASTY. PRACTICAL KEYS IN THE ASSESSMENT OF SHOULDER REPLACEMENT

Rosa M. Lorente-Ramos, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Paz Azpeitia Hernandez (*Abstract Co-Author*) Nothing to Disclose
Javier Azpeitia-Hernandez, MD (*Abstract Co-Author*) Nothing to Disclose
Jose Maria Martinez Gomiz (*Abstract Co-Author*) Nothing to Disclose
Carlos Oliva Fonte (*Abstract Co-Author*) Nothing to Disclose
Javier Azpeitia Arman, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To know the different types of shoulder replacement. To review the role of imaging techniques (plain radiograph, CT, MRI, US, scintigraphy) in the evaluation of shoulder prostheses. To understand the usefulness and limitations of plain radiographs and CT in the evaluation of shoulder replacements, emphasizing useful parameters and illustrating image analysis and interpretation. To become familiar with normal and abnormal postoperative imaging findings and signs of complications

**TABLE OF CONTENTS/OUTLINE**

We review imaging of shoulder replacement, highlighting key concepts perceived as important variables by the surgeon and correlating images with clinical considerations and functional outcomes. We present: A review of types of replacement. Surgery aims. Imaging. Plain radiographs -Technique and views. Standard image acquisition: beam and anatomical landmarks -Parameters that should be evaluated: description of the components and alignment relative to normal anatomic alignment. Imaging. CT -Technique. -Parameters that should be evaluated. -Imaging of complications Early complications include instability or dislocation, hematoma, ulnar nerve dysfunction, deep infection, heterotopic ossification, and scapular spine fracture. Late complications include humeral and glenoid fractures, metaglene loosening, and scapular notching. Role of MRI, US and scintigraphy.

## MKEE-11 THE DIGITAL NERVE: MR AND US OF NORMAL ASPECT AND PATHOLOGIES

**TEACHING POINTS**

- Understanding the anatomy of digital nerves in the upper limb;
- Navigating the anatomy of digital nerves in the lower limb;

- Correlating imaging findings with pathological changes in digital nerves;
- Analyzing ultrasonographic and magnetic resonance imaging findings across digital nerve pathologies.

**TABLE OF CONTENTS/OUTLINE**

Introduction:
- Anatomy of digital nerves
- Upper limb
- Lower limb
- Structure of the digital nerve
- Clinical presentationOverview of Magnetic Resonance Imaging (MRI) and Ultrasonography (US) in nerve evaluation:
- Normal imaging characteristics on MRI and US
- Techniques and protocols for digital nerves MRI
- US imaging techniques and considerations for digital nerve evaluationCase-based review:
- Traumatic lesions
- Inflammatory conditions
- Tumors
- Extrinsic compressionSummaryTake home messages

## MKEE-110 ELBOW IMAGING - HOW TO MASTER ITS COMPLEXITIES

Jan P. Grunz, MD (*Abstract Co-Author*) Research Consultant, Siemens AG
Andreas Kunz, MD (*Abstract Co-Author*) Nothing to Disclose
Theresa Sophie Patzer, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Dislocations and fractures of the elbow joint are a common finding following trauma. At the same time, osseous lesions are often associated with injuries of the ligaments and tendons, in particular concerning the lateral and medial collateral ligament complex, as well as the distal insertion of the biceps tendon. Diagnostic work-up requires a profound understanding of anatomy, biomechanics and typical injury patterns. While conventional radiography oftentimes represents the primary imaging modality, additional cross-sectional examinations with high spatial resolution are often required in order to address the fracture pattern and associated soft tissue pathologies in detail.

**TABLE OF CONTENTS/OUTLINE**

1. Elbow joint anatomy a. Biomechanical properties b. Medial and lateral collateral ligament complex c. Muscles i. Extensors originating from lateral humeral epicondyle ii. Flexors originating from medial humeral epicondyle iii. Biceps tendon inserting at radial tuberosity d. Chiasma antebrachia 2. Imaging a. MRI with and without intravenous contrast enhancement b. Advantages of cone-beam CT over multidetector CT c. Postoperative Imaging 3. Pathologies a. Rupture of lateral collateral ligament complex b. Rupture of medial collateral ligament complex c. Lateral epicondylitis (tennis elbow) d. Medial epicondylitis (golfer's elbow) e. Rupture of the biceps tendon f. Osborne-Cotterill lesion 4. Discussion

Joy Li, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Overview of perineuriomas and other peripheral nerve sheath tumors including histology/pathology and associated conditions2. Review of the sonographic findings characteristic of perineuriomas and other peripheral nerve sheath tumors with MRI and histologic correlation3. Differential diagnoses including malignancies, intraneural ganglia, and traumatic neuromas4. Ultrasound-guided biopsy technique

**TABLE OF CONTENTS/OUTLINE**

1. Introduction and overviewa) Types and nomenclatureb) Pathophysiologyc) Epidemiologyd) Histologic Findingse) Associated conditionsf) Clinical Findings2.Ultrasound evaluationa) Transducer selection and settingsb) Sonographic imaging technique and pearlsc) Characteristic sonographic findingsd) Differential diagnoses (including malignancies, intraneural ganglia, and traumatic neuromas) and ways to differentiate sonographically3. MRI evaluationa) MRI protocol and the use of intravenous gadolinium contrastb) Characteristic MRI featuresc) Examples of US/MRI correlation4.Ultrasound-guided biopsya) Technique detailsb) Procedure pearls and the use of local anesthetic versus sedation5.Summary

## MKEE-112 BEFORE AND AFTER: EVALUATING RESPONSE TO TREATMENT IN MULTIPLE MYELOMA - WHOLE BODY MR IMAGING AND PET/CT

Jesus D. Aquerreta, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Maria J. Garcia-Velloso, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Alberto Paternain, MD (*Abstract Co-Author*) Nothing to Disclose
Pablo Del Nido Recio (*Abstract Co-Author*) Nothing to Disclose
Marcos Jimenez Vazquez, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

• Whole-body MR Imaging (WB-MRI) and FDG-PET/CT have a crucial role in the follow-up of Multiple Myeloma.• It is important to correlate the morphology of the lesions with diffusion-weighted imaging values (MRI) and with up-take values (FDG-PET/CT).• FDG-PET/CT is the gold standard for studying extramedullary disease, whereas WB-MRI has more sensitivity in depicting diffuse disease and non-secretor myeloma.

**TABLE OF CONTENTS/OUTLINE**

The Myeloma Response Assessment and Diagnosis System (MY-RADS) characterizes the disease state on MRI, at diagnosis and during follow-up. It is aimed to standardize reports and minimize variations. 5 Response Assessment Categories (RAC) have been described:• RAC 1 (Highly likely to be responding): previously evident lesion shows increase in ADC values from = 1400 to >1400 μm2/sec or = 40% increase in ADC from baseline.• RAC 2 (Likely to be responding): an increase in ADC from = 1000 to <1400, or >25% but <40% increase in ADC from baseline.• RAC 3: No observable change.• RAC 4 (Likely to be progressing): no change in size but increasing signal intensity with ADC values <1400.• RAC 5 (Highly likely to be progressing): new regions of hyperintensity with ADC values between 600-1000.On the other hand, the Italian myeloma criteria for PET use (IMPetUs) has standardized PET interpretation. FDG uptake is graded by the five-point scale of Deauville score (DS):1) No up-take is observed.2) Uptake = mediastinum.3) Uptake > mediastinum but = liver.4) Uptake moderately increased compared to the liver.5) Uptake markedly increased compared to the liver.Bone marrow non-focal uptake, focal bone lesions (site, number and uptake), paramedullary and extramedullary lesions are also studied.

## MKEE-113 MR NEUROGRAPHY OF THE OCCIPITAL NERVES - TECHNICAL CONSIDERATIONS AND INJURY PATTERNS

**Awards**
**Certificate of Merit**

Ek Tsoon Tan, PhD (*Abstract Co-Author*) Research Grant, General Electric Company Research Grant, Siemens AG Research Grant, Medtronic Inc Research Grant, AMAG Pharmaceuticals
Lisa Gfrerer (*Abstract Co-Author*) Nothing to Disclose
Darryl B. Sneag, MD (*Abstract Co-Author*) Researcher, General Electric Company;Researcher, Siemens AG;Research support, AMAG Pharmaceuticals, Inc
Yen Po Lin, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

• Occipital neuralgia is a common pain syndrome that often occurs in combination with other headache disorders, such as migraines and tension headaches. An overlap in symptoms presents a diagnostic challenge for clinicians. Additionally, the small size and neighboring dermatomal territories of the occipital nerves often limit conventional MRI from accurately localizing pathology.• MR neurography (MRN) has not traditionally been used for occipital nerve evaluation. New technical advancements, including deep learning reconstruction techniques that enable higher spatial resolution, particularly for 3D isotropic sequences, now enable MRN as a modality to visualize these small nerves. • When performing MRN, it is crucial for the radiologist to be familiar with occipital nerve anatomy and technical considerations to optimize image quality.

**TABLE OF CONTENTS/OUTLINE**

• Background• Anatomy Overview o Greater, lesser and third occipital nerves• Technical Considerations o Magnet: high field strengtho RF Coils: conventional head and neck coil or newly-developed conformable neck coil o Protocol/Sequences & 7; Anatomical 2D sequences: proton density sequences& 7; MR neurography 2D sequences: T2 Dixon and T2 fat-saturated sequences& 7; MR neurography 3D sequences: double echo steady state& 7; Fat and vascular suppression techniques & 7; Deep learning reconstruction& 7; Zero-to-echo time (ZTE) sequences: for anatomical reference and rendering • Case exampleso Normal anatomy demonstration o Unilateral occipital neuropathy/ entrapmento Traumatic injuryo Iatrogenic injury/neuromao Treatment: decompression surgery, nerve block/injection, radiofrequency ablation

## MKEE-114 LEVEL UP BONE TUMOR DIAGNOSIS FOR RADIOLOGISTS: MALIGNANT TRANSFORMATION OF BONE WITH IMAGING-PATHOLOGY CORRELATION

Hyang-Sook Jeong (*Abstract Co-Author*) Nothing to Disclose
Jee-Young Kim, MD (*Abstract Co-Author*) Nothing to Disclose
Seul Ki Lee, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Common bone lesions, initially benign or low-grade malignant, have the potential to transform into higher-grade of malignancies. 2. Although typical imaging features of common bone lesions are well-established, malignant transformation is rare and can be easily missed. Additionally, sampling errors during biopsies can lead to inaccurate diagnoses. 3. Benign bone tumors that can transform into malignancies include osteochondroma, enchondroma, fibrous dysplasia, and giant cell tumor of bone. Non-tumorous conditions that may undergo malignant transformation include Paget's disease of bone, bone infarction, chronic osteomyelitis, and bone that has received radiation therapy. 4. Low-grade malignancies that can progress to higher grades include low-grade central osteosarcoma, and atypical cartilaginous tumor/low-grade chondrosarcoma. 5. Early recognition of malignant transformation in bone lesions is crucial. Combining clinical presentation, imaging findings, and accurate pathology is essential for planning appropriate management strategies.

**TABLE OF CONTENTS/OUTLINE**

1. Typical Imaging Features of Common Bone Tumors 1-1. Bone Matrix: Osseous, Chondroid, and Fibrous 1-2. Benign vs. Malignant 2. Atypical Imaging Features and Diagnostic Challenges: Pearls and Pitfalls 2-1. Benign Bone Lesions Showing Malignant Transformation (Tumorous and Non-Tumorous Conditions) 2-2. Low-Grade Malignancies Progressing to Higher-Grades 3. The Importance of Precise Biopsy for Accurate Pathologic Diagnosis 4. Patients at Risk for Malignant Transformation of Bone Lesions 4-1. Impact of Prior treatment (Denosumab, Surgery, or Radiation) 4-2. Treatment Options: Timely Surgery vs. Watchful Follow-Up

## MKEE-115 APPLICATION OF 320-DETECTOR-ROW UPRIGHT CT IN ORTHOPEDIC AREAS

Orito Ikeda (*Abstract Co-Author*) Nothing to Disclose
Taiki Nozaki, MD (*Abstract Co-Author*) Nothing to Disclose
Takeo Nagura (*Abstract Co-Author*) Nothing to Disclose
Mohammed Alshahri (*Abstract Co-Author*) Nothing to Disclose

Yoichi Yokoyama, MD (*Abstract Co-Author*) Nothing to Disclose
Fumiko Yagi, MD (*Abstract Co-Author*) Nothing to Disclose
Yoshitake Yamada, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The purposes of our exhibit are as follows: (1) To explain the development, background, and performance of 320-detector-row upright computed tomography (CT) for whole-body scans, (2) To describe the anatomical changes in each musculoskeletal structure due to differences in body position, that is, the direction of gravity, and (3) To illustrate the clinical applications and usefulness of upright CT in various orthopedic diseases with clinical case presentations.

**TABLE OF CONTENTS/OUTLINE**

(1) Development and advantages of upright CT with an area detector for whole-body scans (2) Performance of 320-detector-row upright CT: Physical characteristics, workflow improvement, safety, and remote operation during the infectious disease pandemic (3) Effects of gravity on the shoulder girdle, upper extremities, thorax, vertebrae, hip, knee, foot, and muscles in various parts of the body (4) Clinical applications of upright CT for various orthopedic diseases such as knee osteoarthritis, hip osteoarthritis, scoliosis/spinal deformity, lumbar spondylolisthesis, orbital wall fracture, and pectus excavatum (5) Upright 4D-CT (6) More accurate evaluation of seatbelt safety for autopilot driving with upright CT (7) Limitation (8) Conclusion

**TEACHING POINTS**

- MSK TB is rare (1-3% of cases of TB) and most commonly affects the spine (50%), followed by TB arthritis, and tenosynovitis is very rare. Concurrent intrathoracic TB occurs in ~ < 50% of cases. [Yukie Rodriguez-Takeuchi et al 2019, Pattamapaspong et al 2024, Burrill 2007]. -Symptom onset is insidious over weeks to months with progressive pain, night sweats, fatigue, weight loss and low grade fever. This leads to a significant delay in diagnosis (reportedly 3 -24 months).-Spinal involvement occurs via haematogenous spread usually infecting the anterior and central vertebral body. Infection can spread over multiple levels with sparing of the disc through subligamentous spread. With time, vertebral destruction and cold abscess formation may occur. -Disc involvement is usually late. Spread to paraspinal tissues may be in the form of a psoas abscess with calcification highly suggestive of TB. Epidural phlegmon can also extend to compress the spinal cord / cauda equina. -TB osteomyelitis is often misdiagnosed as multiple bone metastases. -TB Arthritis occurs from osteomyelitis or hematogenous spread and is typically a chronic granulomatous monoarthritis affecting weight bearing joints and typically demonstrates Phemister triad (juxta-articular osteoporosis, peripheral osseous erosion and gradual narrowing of the joint space).-TB Tenosynovitis occurs from hematogenous spread or extension from TB arthritis and most commonly occurs in the wrist and hand, usually involving the flexor tendon sheath.

**TABLE OF CONTENTS/OUTLINE**

1) Introduction to MSK TB2) Spondylodiscitis 3) Psoas Abscess 4) Osteomyelitis 5) Septic arthritis 6) Synovitis 7) Tenosynovitis 8) Bursitis 9) Intramuscular / subcutaneous10) Conclusion

## MKEE-117 ON THE MOVE: DYNAMIC ULTRASOUND FOR THE ASSESSMENT OF LOWER EXTREMITY MUSCULOSKELETAL DISORDERS

**Awards**
**Certificate of Merit**

Steven B. Soliman, DO (*Abstract Co-Author*) Consultant, General Electric Company;Speaker, General Electric Company
Preethi Kesavan, MD (*Abstract Co-Author*) Nothing to Disclose
Gunjan B. Malhotra, MD (*Abstract Co-Author*) Nothing to Disclose

Erika Ysabelle E. Mojica, MD (*Presenter*) Shareholder, Catalyst Pharmaceuticals

**TEACHING POINTS**

1. Ultrasound (US) is a valuable tool in assessing for musculoskeletal conditions due to the real-time assessment and isolation of specific pathologies using dynamic maneuvers.2. Dynamic musculoskeletal US should be considered for pathologic conditions that present with snapping, clicking, or pain with joint movement.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction of dynamic US for musculoskeletal pathologies, including its advantages, specific dynamic maneuvers, and additional considerations.2. Lower extremity pathologies assessed on dynamic US with accompanying cine clips, key static images, and teaching points on scanning technique, patient positioning, and sonographic findings. Selected pathologies include:a. Snapping iliopsoas tendonb. Meniscal extrusionc. Peroneal tendon subluxation/dislocation over the lateral malleolusd. Peroneal tendon intrasheath subluxation (types A and B)e. Achilles tendon tearsf. Morton neuroma and intermetatarsal bursitis3. Summarya. Review of teaching points

## MKEE-118 RADIAL WRIST PAIN - KEYS FOR THE GENERAL RADIOLOGIST

Noelia Arevalo (*Abstract Co-Author*) Nothing to Disclose

Noelia Bravo Alcobendas, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Upon reviewing this exhibit, the reader should:• Be familiar with the pathologies that can present with radial wrist pain. A brief overview will be provided detailing each pathology, including epidemiology and clinical presentation, essential for the differential diagnosis.• Be able to select the appropriate imaging modality in each case (plain film, ultrasound, CT, MRI) based on the patient's history, clinical context and symptoms, taking into account the utility and limitations of each modality.• Accurately describe the findings in studies performed on patients affected by the mentioned pathologies.•

Recognize the complications associated with each disease and their representation in imaging.• Understand the available therapeutic options, including interventions involving radiologists.

**TABLE OF CONTENTS/OUTLINE**

• Wrist anatomy• Differential diagnosis o Due to overuse:? De Quervain's stenosing tenosynovitis.? Proximal and distal intersection syndromes.o Acute traumatic origin:? Fracture of the distal end of the radius.? Carpal fractures: scaphoid, trapezius.? Fractures of the base of the first metacarpal: Bennett, Rolando and pseudo-Bennett.o Degenerative arthropathy:? Trapeziometacarpal osteoarthritis.? Trapezio-scapho-trapezoid osteoarthritis.? Radiocarpal osteoarthritis.o Nerve entrapment and injury:? Cheiralgia paresthetica - Wartenberg syndrome.? Post-traumatic neuroma.• Conclusions

## MKEE-119 PORTABLE LOW-FIELD MRI FOR IMPROVED MUSCULOSKELETAL DISORDERS DIAGNOSTICS - METHODS, CHALLENGES AND FUTURE POTENTIAL

Shira Nemirovsky-Rotman (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Medical imaging is a key component for diagnostics of musculoskeletal (MSK) conditions, currently considered a significant national public health issue - due to ageing population as well as prevalence of sport injuries. The growing need for accurate and fast examinations has resulted in a bottleneck in medical diagnostics and treatment. MRI exhibits superior soft-tissue contrast and resolution compared to other modalities; specifically, it is considered the gold-standard for diagnostics of a range of MSK injuries and disorders. Recently, research has focused on portable and low-field MRI scanners, which may be applied for various applications, including MSK. Low-field MRI provides invaluable opportunities for lower maintenance costs, as well as portable and accessible imaging; however, it produces images that suffer from reduced resolution and signal-to-noise ratios compared to their high-field counterparts. To address this issue, recent deep-learning-based methods have been applied to translate images acquired with low-field scanners to images with perceived high-field quality. Such methods show proof-of-concept in translating from low to high resolution; however, further research is needed to determine the diagnostic integrity of the obtained images for specific clinical applications.

**TABLE OF CONTENTS/OUTLINE**

1. Principles of AI-based algorithms for image translation from low- to high-field MRI scanners;2. The challenge of image registration and domain adaptation when training AI-based low-to-high-field translation algorithms;3. Clinical/diagnostic evaluation criteria vs. computer vision measures for assessment of reconstructed high-field images (as obtained from low-field).

## MKEE-12 GIANT CELL-RICH LESIONS OF BONE: BEYOND GIANT CELL TUMOR OF BONE

Xavier Sanjuan (*Abstract Co-Author*) Nothing to Disclose
Jose A. Narvaez, MD (*Abstract Co-Author*) Nothing to Disclose
Karen Perez Alfonso, MD (*Abstract Co-Author*) Nothing to Disclose
Juan Carlos Sardinas (*Abstract Co-Author*) Nothing to Disclose
German G. Ratto, MD (*Abstract Co-Author*) Nothing to Disclose
Javier Hernandez Ganan (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Giant cell-rich bone lesions comprize heterogeneous neoplastic and non-neoplastic disorders with diverse clinical, radiological and pathological presentations. They are characterized by the presence of conspicuous osteoclast-type giant cells as a component of the presenting entity. Giant cell tumor of bone is probably the best known of this group of lesions. The objectives of this review are: - To explain the molecular background in the formation of osteoclast-type giant cells (role of RANK ligand). - To analyze the radiological features of giant cell tumor of bone and post-treatment changes with denosumab. - To review the different tumors that can present giant cells, analyzing the relevant radiological features. - To review the molecular alterations that help to differentiate these entities, especially the H3.3 mutations.

**TABLE OF CONTENTS/OUTLINE**

- Cell biology in the formation of osteoclast-like giant cells. - Giant cell tumor of bone: imaging features, microscopic and molecular pathology features. - Imaging and pathologic features of GCTB after denosumab treatment. - Variants of GCTB: malignant GCTB, multicentric GCTB, metastatic GCTB. - Imaging and patholiogic features of other giant cell-rich lesions: o Aneurymal bone cyst (ABC) o Giant cell granuloma of the jaws (GCG). o Giant cell-rich osteosarcoma. o Giant Cell Reparative Granuloma (Solid ABC) o Benign fibrous histiocytoma of the bone (GCTB with regressive changes). o Non-ossifying fibroma of bone (NOF). o Chondroblastoma. o Chondromyxoid fibroma. o Brown tumor of hyperparathyroidism.

## MKEE-120 REVEALING RADIOGRAPHS: KEY REPORTS FOR THE ORTHOPEDIST IN FRACTURE MANAGEMENT

Sonia Carolina Hernandez Sanchez (*Abstract Co-Author*) Nothing to Disclose
Gustavo Rozo (*Abstract Co-Author*) Nothing to Disclose
Guillermo A. Granados Gonzalez, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Recognize the different stages of bone healing, understand primary and secondary orthopedic management options.Identify complications such as non-union, pseudoarthrosis, and malunion.Accurate diagnosis and early intervention prevent long-term complications.Understand the process of bone transport and its clinical applications in correcting bone defects.Know what findings to include in radiological reports for effective decision-making.Recognize the importance of clear and concise communication in reports to ensure optimal patient care.

**TABLE OF CONTENTS/OUTLINE**

Table of Contents1. The Natural History of Fracture and Its Management - Orthopedic and Surgical Management of Fractures2. Alterations and Complications in Consolidation - Is pseudoarthrosis the same as non-union? - Types of non-union3. Functional Basis of External Fixation and Bone Transport4. Useful Reports for the Orthopedist5. Cases6. Teaching Points

## MKEE-121 ANALYSIS OF MUSCLE VIABILITY USING MAGNETIC RESONANCE IMAGING IN COMPARTMENT SYNDROME

Ana Belen Barba Arce, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Describe the study protocol using magnetic resonance imaging (MRI) in the assessment of compartment syndrome. 2. Determine the structural changes in the muscles affected by compartment syndrome, both acute and chronic. 3. Obtain objective and precise data on muscle viability that can help in treatment planning and patient follow-up. 4. Analyze the acute and chronic complications of this syndrome. 5. Perform a differential diagnosis with other entities.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction. 2. Acute compartment syndrome. 2.1. Etiology. 2.2. Pathophysiology. 2.3. Clinical manifestations. 2.4. Diagnostic tests. 2.5. Treatment. 2.6. MRI study protocol. 2.6.1. Findings. 2.6.2. Muscle viability analysis. 3. Chronic compartment syndrome. 3.1. Chronic exertional compartment syndrome. 3.2. MRI study protocol. 3.2.1. Findings. 3.2.2. Muscle viability analysis. 4. Complications of compartment syndrome. 4.1. Infection. 4.2. Myonecrosis. 4.3. Calcifying myonecrosis. 4.4. Fibrous contractures. 4.5. Rhabdomyolysis. 5. Differential diagnosis. 6. Conclusions.

## MKEE-122 SQUEEZE THE DAY: AN IMAGING-BASED REVIEW OF DENERVATION SYNDROMES

Alejandra Cardona Del Valle, MD (*Abstract Co-Author*) Nothing to Disclose
Gabriel Camareno-Soto, BSc (*Abstract Co-Author*) Nothing to Disclose
Carol Sanchez Santana (*Abstract Co-Author*) Nothing to Disclose
Kevin Hornedo, BS (*Abstract Co-Author*) Nothing to Disclose
Elizabeth Trullenque, MD (*Abstract Co-Author*) Nothing to Disclose
Santiago A. Saldana Mendez, MD, BS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

A. Review relevant anatomy, pathophysiology, and clinical presentation of Denervation Syndromes. B. Showcase the most common denervation syndromes and epidemiology. C. Discuss key imaging findings on Ultrasound (US) and Magnetic Resonance Images (MRI) for diagnosis. D. Examine the role of imaging in treatment planning.Denervation syndromes, resulting from diverse causes such as trauma, infection, tumors, or autoimmune disorders, frequently manifest as pain and weakness. While traditional diagnosis relied on clinical assessment and electromyography, MRI and ultrasound now play pivotal roles. These imaging modalities aid in identifying injury sites, duration of denervation, and underlying causes. This exhibit comprehensively reviews common denervation syndromes, showcasing MRI and ultrasound images to elucidate diagnosis and develop optimal treatment strategies.

**TABLE OF CONTENTS/OUTLINE**

I. Introduction Objectives II. Anatomy and Pathophysiology III. Clinical Presentation IV. Showcase Common Denervation Syndromes A. Upper extremity 1. Subcapsular N. 2. Axillary N. 3. Radial N. 4. Median N. 5. Ulnar N. B. Lower extremity 1. Femoral N. 2. Obturator N. 3. Sciatic N. 4. Tibial 5. N. V. Diagnosis Key imaging findings on US and MRI evaluations VI. Treatment VII. Conclusion

## MKEE-123 DISCOID LATERAL MENISUCUS: HELPFUL FINDINGS IN X-RAY AND MAGNETIC RESONANCE IMAGING, AND NEW INSIGHTS ON SHAPE FEATURES OF BONE AND CARTILAGE

Keita Nagawa (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The major radiographical findings of discoid lateral meniscus (DLM) have been reported to be widening of the lateral joint line, cupping of the lateral tibial plateau, squaring of the lateral femoral condyle, widening of the tibial eminence, elevation of the fibular head, and condylar cutoff sign. To diagnose DLM on magnetic resonance imaging (MRI), several findings are important; the meniscal width is over 15 mm on the coronal slice. Continuity of the meniscus between the anterior and posterior horns on three or more 5-mm thick consecutive sagittal slices. In the recent studies, new insights for DLM concerning bone and cartilage morphology have been reported, including hypoplasia of the posterior lateral femoral condyle, and thin lateral tibial cartilage. In our analysis for DLM concerning the volume of subchondral bone and cartilage, the volume of lateral femoral epiphyseal bone and the cartilage volume of lateral tibial plateau were significantly smaller in the DLM group compared to the control group.

**TABLE OF CONTENTS/OUTLINE**

1. Basics of DLM2. Important X-ray findings for DLM3. To diagnose DLM with MRI4. New insights for DLM: bone and cartilage morphology5. Our findings for DLM: volume of subchondral bone and cartilage

## MKEE-124 VIRTUAL NON CALCIUM IMAGING IN CONTRAST ENHANCED DUAL-ENERGY CT IMPROVES DETECTION OF BONE METASTASES AND MAY ALSO REFLECT ACTIVITY OF BONE METASTASES

Shunsuke Itaya, RT (*Abstract Co-Author*) Nothing to Disclose
Yasuo Sakurai, MD (*Abstract Co-Author*) Nothing to Disclose
Yoshihisa Kodama, MD,PhD (*Abstract Co-Author*) Nothing to Disclose
Hirotaka Nakashima, MSc, RT (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Deep learning imaging reconstruction (DLIR) based virtual non-calcium (VNCa) images were created using a two-material decomposition process based on dual-energy CT acquisition with fast kV switching.2. The diagnostic performance of contrast-enhanced CT imaging and VNCa imaging was compared in 53 patients with clinically confirmed bone metastases.3. Three substance pairs were used for VNCa images in contrast-enhanced dual-energy CT: Iodine (Hydroxyapatite), Water (Hydroxyapatite), and Water (Calcium).4. Evaluation of metastatic bone tumors using VNCa imaging on contrast-enhanced dual-energy CT demonstrated superior diagnostic performance compared to conventional CT imaging.

**TABLE OF CONTENTS/OUTLINE**

Bone metastasis is a possible complication of all cancers and reduces the quality of life of patients. CT is difficult to diagnose osteoblastic bone metastases without destruction and is often missed. Virtual non calcium (VNCa) images are material-dense images obtained with dual-energy CT, which enhances the water component and removes the bone component. Using VNCa images in contrast-enhanced dual-energy CT may improve the identification of bone metastases and evaluate the activity of bone metastases by assessing the presence of contrast uptake. In this exhibition, we compared the diagnostic performance of bone metastases in contrast-enhanced dual-energy CT when evaluated with VNCa images plus bone and soft tissue conditions and when evaluated with bone and soft tissue conditions images only. The results showed that VNCa imaging had a higher discriminative ability for metastatic bone tumors. Furthermore, it was suggested that evaluating the activity of bone metastases is also feasible.

## MKEE-125 ALL THAT GLITTERS IS GOLD UNRAVELLING THE MAIN CONCEPTS OF THE CHRONIC RECURRENT MULTIFOCAL OSTEOMYELITIS IN WHOLE-BODY MAGNETIC RESONANCE IMAGING IN CHILDREN

**TEACHING POINTS**

Chronic Recurrent Multifocal Osteomyelitis (CRMO) is an idiopathic inflammatory disorder of the bones, typically seen in children and adolescents. Whole-body magnetic resonance imaging (WB - MRI) is a very useful imaging tool in the detection and follow-up of such alterations. Therefore, the aim of this exhibit is to:Describe the main points related to the protocol of WB - MRI in children, including the particularities of the age group and the techniques used.Expose the main concepts of CRMO, including its pathophysiology and its main radiographic features.Demonstrate the main imaging findings of CRMO in WB-MRI and ways to identify such alterations in all sequences.Identify pitfalls and potential confounding imaging findings in WB-MRI.

**TABLE OF CONTENTS/OUTLINE**

Introduction: the importance of WB-MRI in the diagnosis and follow-up of CRMO.WB-MRI in childrenProtocolParticularities in childrenCRMODefinition and epidemiologyPathophysiologyMain radiographic featuresPitfalls in WB-MRINormal versus pathologic signal alterations.

## MKEE-126 DYNAMIC SPINE FLEXIBILITY EVALUATION WITH DYNAMIC DIGITAL RADIOGRAPHY FOR ADOLESCENT IDIOPATHIC SCOLIOSIS

Zhiwei Wang, MD (*Abstract Co-Author*) Nothing to Disclose
Man Wang (*Abstract Co-Author*) Nothing to Disclose
Wu Liu (*Abstract Co-Author*) Nothing to Disclose
Shuo Ma (*Abstract Co-Author*) Nothing to Disclose
Zhe Zhao (*Abstract Co-Author*) Nothing to Disclose
Ruiyao Qin (*Abstract Co-Author*) Nothing to Disclose
Yun Wang (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To demonstrate a new way to evaluate spine flexibility with dynamic digital radiography.To design motion for supine bending, fulcrum bending and suspension, the general principle, and special points for each position. To suggest the exposure parameters and effect dose follow the ALARA principle. To show the case of each position movement, the trajectory and dynamic Cobb’s angle changes and stretch distance changes.

**TABLE OF CONTENTS/OUTLINE**

1. Background: -limits of static spine flexible evaluation - new technique of dynamic digital radiography (DDR) 2. Key aspects of DDR position acquisition: - Posture designing - Movement training 3. Exposure conditions for DDR: - Exposure parameters - Effective radiation dose 4. The dynamic changes of Cobb’s angle, spinal flexibility, and subject's stability during different DDR positions: - Cobb’s angle variations during different bending motion - Stretch distance changes during suspension motion

## MKEE-127 THE NEGLECTED HORNS: VARIANTS, PITFALLS AND PATHOLOGIES OF THE ANTERIOR HORNS OF THE MENISCI

**Awards**
**Certificate of Merit**

Michael Brown, MD (*Abstract Co-Author*) Nothing to Disclose
Thomas S. Truong, MD (*Abstract Co-Author*) Nothing to Disclose
Pamela J. Walsh, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The anterior horns of the menisci are less frequently considered than the body and posterior horns when assessing and studying meniscal appearance and pathology. The anterior horns of the medial and lateral menisci possess variant anatomy and at times may mimic pathologies. True tears and pathologic processes do occur in the anterior horn, and at times are subtle and may be overlooked. This educational exhibit is designed to demonstrate the traditional and variant anatomy of the medial and lateral menisci's anterior horns with examples of how to discern variant anatomy from pathology. The exhibit will also show examples of true pathology of the anterior horn, highlighting subtleties not to be overlooked.

**TABLE OF CONTENTS/OUTLINE**

Background Medial Meniscus Anatomy Variant Anatomy/Pathology mimics Far anterior insertion of the anterior horn Anterior meniscofemoral ligament of the medial meniscus Oblique meniscomeniscal ligament Lateral Meniscus Anatomy Variant Anatomy/Pathology mimics Striated/speckled appearance of the root attachment Mucoid degeneration of the anterior root/relationship to the ACL insertion Transverse ligament mimicking tear Pathology Meniscal contusions Tears Radial tears (more commonly seen at the lateral meniscus) Flap tears Complex tears Parameniscal cysts

## MKEE-128 BEND AND SNAP! DYNAMIC ULTRASOUND EVALUATION OF THE ELBOW AND SHOULDER

Erika Ysabelle E. Mojica, MD (*Abstract Co-Author*) Shareholder, Catalyst Pharmaceuticals

## MKEE-129 SPRINT TO DIAGNOSIS: UNRAVELING LOWER LIMB MUSCULOSKELETAL INJURIES IN RUNNERS

Danielle B. Rumi, MD (*Abstract Co-Author*) Nothing to Disclose
Diego A. Garcia, MD (*Abstract Co-Author*) Nothing to Disclose
Felipe C. Ferreira Dionisio, MD (*Abstract Co-Author*) Nothing to Disclose
Jose F. Neto, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Anatomy Understanding: Reviewing the anatomy of the structures of the lower limb to get a precise diagnosis.Early Recognition: Highlight the importance of prompt identification of lower limb musculoskeletal injuries in runners to prevent chronicity and optimize outcomes.Multimodal Imaging: Discuss the role of advanced imaging modalities such as MRI, CT, and ultrasound in providing detailed anatomical assessment and accurate diagnosis of soft tissue and bone injuries.Clinical Correlation: Emphasize the integration of imaging findings with clinical history and physical examination to enhance diagnostic precision.Injury Patterns: Explore common patterns of lower limb injuries encountered in runners, including stress fractures, muscle strains, tendinopathies, and ligamentous injuries, to aid radiologists in targeted evaluation.Conclusion: After this education exhibit you should be able to correctly diagnose the most prevalent injuries in runners.

**TABLE OF CONTENTS/OUTLINE**

I. IntroductionII. Anatomy reviewIII. Types of Bone Lower Limb Injuries in RunnersIV. Types of Muscle Lower Limb Injuries in RunnersV. Types of Tendon Lower Limb Injuries in RunnersVI. ConclusionVII. References

## MKEE-13 FIRM GRASP OF ANKLE INSTABILITY: UNDERSTANDING MRI FEATURES OF FAILURE MODES OF THE LATERAL ANKLE LIGAMENTS WITH SURGICAL AND FLUOROSCOPIC CORRELATION

Dhiren Shah, MBBS, FRCR (*Abstract Co-Author*) Nothing to Disclose
Andrew Goldberg (*Abstract Co-Author*) Nothing to Disclose
Dimitri Amiras, MBBS, FRCR (*Abstract Co-Author*) Clinical Advisory Board, Medical iSight
Rikin Hargunani, FRCR, MBBS (*Abstract Co-Author*) Nothing to Disclose
Jedrzej Krawczyk, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. How to image and identify the CFL, superior and inferior ATFL bundles on imaging2. Why these are important for management in suspected ankle instability.3. Injury to the lateral ligament complex involving the fibula / inferior ATFL can lead to subtalar joint instability4. This can be detected both during on-able fluoroscopy and intra-operatively and most importantly - correlated with MR appearances.

**TABLE OF CONTENTS/OUTLINE**

Lateral fibulotalocalcaneal ligament complex (LFTCL) is formed by the inferior fascicle of the anterior talofibular ligament (ATFL), connected with the calcaneofibular ligament (CFL) by arciform fibres ; it plays an important role in inversion injury prevention. This ligament complex is distinct from the superior fascicle of the ATFL - an intra-articular ligament unlikely to heal. An isolated repair of ATFL results in great outcomes if the complex is intact.In our exhibit, we outline:1. The anatomy and biomechanics of the lateral ligaments of the ankle.2. Injury mechanisms and related failure modes of the ligaments.3. MRI sequences used in our practice.4. Subsequent MRI appearances related to different failure models.5. Dynamic instability demonstrated by dynamic fluoroscopy.6. Correlation of example MRI cases with intra-operative videos.

## MKEE-130 OPERATIONALIZING CLINICAL KNEE MRI AT 7T: THE GOOD, THE BAD, AND THE UGLY

Aaron J. Wyse, MD (*Abstract Co-Author*) Nothing to Disclose
Michael G. Fox, MD (*Abstract Co-Author*) Royalties, RELX
Jeremiah R. Long, MD (*Abstract Co-Author*) Nothing to Disclose
David M. Melville, MD (*Abstract Co-Author*) Nothing to Disclose
Jonathan A. Flug, MD, MBA (*Abstract Co-Author*) Nothing to Disclose
ANTHONY HANNON (*Abstract Co-Author*) Nothing to Disclose
Jason Tilque (*Abstract Co-Author*) Nothing to Disclose
Samuel J. Fahrenholtz, PhD (*Presenter*) Stockholder, Nano X Imaging

**TEACHING POINTS**

1) Though 7T represents a new technology with incredible capabilities, the current hardware and software requires intense optimization to reach an operational level of clinical abilities comparable with current 3T and 1.5T imaging. 7T clearance by the Food and Drug Administration is limited to knee and brain. 2) The primary advantage of 7T knee magnetic resonance imaging (MRI) is increased signal-to-noise ratio (SNR) which can be used for better resolution, less noise appearance, and/or faster imaging. 3) The primary disadvantages are heating and inhomogeneities in B0 and B1+. The inhomogeneities most significantly make chemical shift selective fat saturation fail, sometimes in the same anatomical regions across the acquisition planes. 4) Key technologies, e.g., deep learning reconstruction algorithms, are being deployed at 7T. MRI transmit and receive coil design is important. 5) The logistics of 7T are difficult. It is an expensive system with increased MR safety efforts and the possibility to induce bioeffects in patients.

**TABLE OF CONTENTS/OUTLINE**

1) Patient eligibility and safety at 7T; 2) Balancing SNR, acquisition time, and resolution; 3) Effects of B0 and B1+ inhomogeneities; 4) 3D MRI; 5) Deep learning reconstruction

**TEACHING POINTS**

1. Dynamic ultrasound of the hand and wrist is a valuable tool and can help answer clinical questions which are not well evaluated by CT or MR.2. Identification of abnormal movement of anatomic structures in relation to patient symptoms.

**TABLE OF CONTENTS/OUTLINE**

Introduction of dynamic ultrasound Advantages and challenges Upper extremity case examples with an explanation of scanning technique, pathology, and accompanying dynamic ultrasound cine clips and still images. Cases include 1. Intra-sheath subluxation of flexor digitorum tendons 2. De Quervain tenosynovitis and intra-sheath subluxation of abductor pollicus longus and extensor pollicus brevis 3. Extensor retinacular ligament injury/snapping of lateral band 4. Hardware/screws abutting flexor tendons and extensor compartments 5. Stenosing tenosynovitis 6. Stener lesion 7. Radial sagittal band tear with extensor tendon dislocation Summary/Key points

## MKEE-132 THE MANY FACES OF SOFT-TISSUE FIBROBLASTIC TUMORS

**Awards**
**Certificate of Merit**

Jesus D. Aquerreta, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Alberto Paternain, MD (*Abstract Co-Author*) Nothing to Disclose
Pablo Del Nido Recio (*Abstract Co-Author*) Nothing to Disclose
Marcos Jimenez Vazquez, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

; Soft tissue tumors of fibrous origin are one of the most common tumors found in clinical practice.; They may have different biological behavior and imaging appearance, depending on the type. Some of these lesions may be reactive to a primary process, such as elastofibroma dorsi and myositis ossificans.; Tumors with high cellularity show higher signal on T2-weighted imaging (WI) and more enhancement, whereas tumors with dense internal collagen content show low signal intensity and less enhancement.

**TABLE OF CONTENTS/OUTLINE**

Fibroblastic and myofibroblastic tumors can be classified according to their biological behavior:
• **Benign lesions**:
○ Elastofibroma dorsi: it is located between the scapula and the posterior chest wall and it has heterogeneous appearance (fibrous and fatty tissue).
○ Myositis Ossificans: it shows a heterogeneous appearance on imaging and has calcified areas.
○ Fibromatosis Colli: it is found on the sternocleidomastoid muscle and it is secondary to trauma during childbirth.
○ Other lesions are: Nodular Fasciitis and Fibroma of the Tendon Sheath.
• **Intermediate lesions**: Palmar (Dupuytren) and Plantar (Ledderhose) Fibromatosis, Dermatofibrosarcoma, Solitary Fibrous Tumor.
• **Malignant lesions**:
○ Fibrosarcoma (not otherwise specified): it is hypointense on T1 WI and iso- to hyperintense on T2 WI, with peripheral enhancement.
○ Myxofibrosarcoma: it has a heterogeneous appearance with hyperintense foci on T2. Osseous involvement is frequent.
○ Sclerosing Epitheloid Fibrosarcoma: it produces cortical destruction and it shows variable signal intensity on T1 WI, with variable enhancement.
○ Other tumors are: Undifferentiated Pleomorphic Sarcoma or Low-grade Fibromyxoid Sarcoma.

## MKEE-133 ONCOLOGIC AND NON-ONCOLOGIC SKELETAL MUSCLE UPTAKE PATTERNS ON 18F FDG PET-CT: A CASE BASED MULTI-MODALITY PICTORIAL REVIEW WITH TEACHING PEARLS

Pokhraj P. Suthar, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Nicholas Magill (*Abstract Co-Author*) Nothing to Disclose
Iryna Kostirko (*Abstract Co-Author*) Nothing to Disclose
Sumeet Virmani, MD, MS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

F18 FDG PET-CT is a well-established imaging modality with applications in cancer staging, cardiology and neurology. Skeletal muscle FDG uptake seen on whole-body PET-CT may be physiologic or pathologic. Physiologic/normal FDG uptake in skeletal muscles is usually mild and homogeneous. This case-based pictorial review highlights the spectrum of physiologic and pathologic skeletal muscle uptake patterns on F-18 FDG PET-CT, some of which are very specific and virtually diagnostic. Our case-based pictorial review aims to review:1) Expected physiologic distribution and intensity of FDG uptake in skeletal muscles.2) Various physiologic variants (FDG injection in a postprandial state, use of insulin before FDG injection, vigorous muscle exercise, stress-induced muscle tension, spastic paresis, talking, chewing, clenching of fist, use of accessory muscles of respiration, use of crutches, altered biomechanics, etc.)3. Various non-oncologic pathologic patterns of skeletal muscle uptake (elastofibroma dorsi, post-vaccination, Baastrup's disease, hot spot sign in acetabular fossa etc.)4. Various focal and diffuse oncologic patterns of skeletal muscle uptake (leiomyosarcoma, rhabdomyosarcoma, lymphoma, metastasis)

**TABLE OF CONTENTS/OUTLINE**

Our case-based pictorial review of 20 interesting cases, highlights the spectrum of physiologic and pathologic skeletal muscle uptake patterns on F-18 FDG PET-CT, some of which are very specific and virtually diagnostic. Increased awareness of such patterns helps in avoiding misdiagnosis and unnecessary further interventions minimizing morbidity and mortality.

## MKEE-134 SPECTRUM OF UNDIFFERENTIATED SMALL ROUND CELL SARCOMAS— A RADIOLOGIC-PATHOLOGIC CORRELATION IN THE ERA OF WHO CLASSIFICATION 5TH EDITION (2020)

Ryo Kurokawa, MD,PhD (*Abstract Co-Author*) Nothing to Disclose
Mariko Kurokawa, MD (*Abstract Co-Author*) Nothing to Disclose

Yasunobu Takaki (*Abstract Co-Author*) Nothing to Disclose
Koichiro Mori (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

• Familiarize yourself with the new category, "undifferentiated small round cell sarcoma of bone and soft tissue," introduced in the WHO Classification of Tumors 5th edition (2020). • Recognize that these tumors primarily affect young individuals, exhibit high malignancy, and have a poor prognosis, emphasizing the importance of early and accurate diagnosis. • Understand the role of molecular genetic analysis in the accurate differential diagnosis of these tumors, as they often present with overlapping clinical and imaging features. • Learn to identify the characteristic imaging features of Ewing sarcoma and its related entities, which can help narrow down the differential diagnosi. • Keep in mind other small round cell tumors that should be considered in the differential diagnosis.

**TABLE OF CONTENTS/OUTLINE**

- Introduction
- Overview of the WHO Classification of Tumors 5th edition (2020) and the new category of "undifferentiated small round cell sarcoma of bone and soft tissue"
- Ewing sarcoma
- Clinical features, imaging findings, and pathological findings
- Treatment and imaging assessment after therapy
- New histological types such as Ewing like sarcoma
- Clinical features, imaging findings, and pathological findings
- Differentiation from Ewing sarcoma on imaging
- Differential diagnosis of small round cell tumors
- Malignant lymphoma, embryonal rhabdomyosarcoma, alveolar rhabdomyosarcoma, neuroblastoma, and desmoplastic small round cell tumor (DSRCT)
- Conclusion
- Significance of understanding the spectrum of undifferentiated small round cell sarcomas in the era of the WHO Classification 5th edition (2020)

## MKEE-135 UNLOCKING THE MYSTERIES OF PELVIC FLOOR DISORDERS: A UNIQUE PERSPECTIVE THROUGH MUSCULOSKELETAL ULTRASOUND

Pritika Panchal (*Abstract Co-Author*) Nothing to Disclose
Santosh Patil (*Abstract Co-Author*) Nothing to Disclose
S. Sindhura, MBBS (*Abstract Co-Author*) Nothing to Disclose
Shah S Sameerkumar (*Abstract Co-Author*) Nothing to Disclose
Vijay Halagappanavar Vamadevappa (*Abstract Co-Author*) Nothing to Disclose
Y C. Manjunatha, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The purposes of this exhibit are:- Highlight the role of musculoskeletal ultrasound, provide comprehensive overview of pelvic floor anatomy, common disorders, and the utility of musculoskeletal ultrasound in their evaluation. Demonstrate imaging techniques, discuss clinical applications and illustrate ultrasound findings in diagnosing and managing pelvic floor disorders. Highlight the advantages of musculoskeletal ultrasound over traditional imaging modalities. Emphasis on elastography and USG guided interventions.

**TABLE OF CONTENTS/OUTLINE**

Exhibit will be organized under the following headings: Introduction.
- Anatomy of pelvic floor.
- Indications of pelvic floor ultrasound.
- Equipment and technique.
- Common pelvic floor disorders
- Anterior compartment
- Stress urinary incompetence.
- Post sling surgery.
- Fowler syndrome- external urethral sphincter thickening.
- Pelvic organ prolapse.
- Cystocele.
- Central compartment
- Tricompartmental disease.
- Pneumovagina.
- Varicose veins.
- Angioneurotic edema.
- Barthrolin cyst.
- Sebaceous cyst
- Epidermoid.
- Posterior compartment
- Rectocele.
- Enterocele.
- Rectal intussusception.
- Rectoanal intussusception.
- Rectoenterocele.
- Anorectal dyssynergia.
- Fecal incontinence.
- Obstetric anal sphincter injury.
- Vulvar cellulitis.
- Male Pelvic Floor disorders
- Urinary incontinence.
- Peyronie’s disease.
- Painful pelvic floor disorders.
- Myofascial pain syndrome.
- Pudendal canal syndrome.
- Pyriformis syndrome.
- Rectus adductor symphysis syndrome.
- Athletic pubalgia.

- Lipedema.
- Ultrasound guided procedures.
- Elastography in pelvic floor disorders.
- Conclusion.

## MKEE-136 IMAGING OF THE PEDIATRIC ELBOW: AN OVERVIEW AND UPDATE

### TEACHING POINTS

1. Radiographic Evaluation of the Pediatric ElbowThe pediatric elbow presents unique challenges in radiographic assessment due to the ongoing development of ossification centers and growth plates. Key considerations include:Assessment of Growth Plates;Alignment and Joint Spaces;Ossification Centers (CRITOE);2. Trauma and Sports Related PainRecognize the main types of fractures that occur in the pediatric elbow, their most prevalent mechanism of injury, classification (when necessary), pitfalls in interpretation in different imaging methods, and the main complications.3. Non-Traumatic ConditionsAcquire understanding regarding the variances between the musculoskeletal systems of pediatric and adult patients. Explore the clinical and radiological manifestations of musculoskeletal disorders in children. To discuss the optimal imaging strategies for specific disease entities.

### TABLE OF CONTENTS/OUTLINE

1) RADIOGRAPHIC EVALUATION OF THE PEDIATRIC ELBOW2) TRAUMA AND SPORTS RELATED PAINACUTE TRAUMA:Fracture of the distal humeral epiphysis; Radial head dislocation; Supracondylar fracture; Lateral condyle fracture; Monteggia fracture-dislocation;Medial epicondyle fracture; Posterolateral elbow dislocation.OVERUSE INJURIESPanner's disease / Osteochondrosis of the capitellum; Osteochondral lesion (osteochondritis dissecans) in the capitellum; Osteochondral lesion (osteochondritis dissecans) in the trochlea; Traction apophysitis (medial epicondyle; olecranon)3) NON-TRAUMATIC CONDITIONS: Infection; Inflammatory (JIA); Tumors; Hemophilia

## MKEE-137 FIRE IN THE HOLE: REVIEW OF BLAST-RELATED HAND INJURIES

Roozbeh Houshyar, MD (*Abstract Co-Author*) Nothing to Disclose
Kasha Chen (*Abstract Co-Author*) Nothing to Disclose
Christopher Sahagian (*Abstract Co-Author*) Nothing to Disclose
Cassidy Tung (*Abstract Co-Author*) Nothing to Disclose
Kenneth N. Huynh, DO (*Abstract Co-Author*) Nothing to Disclose
Lawrence Wang, DO (*Abstract Co-Author*) Nothing to Disclose
Erwin Ho (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. To review the epidemiology of varying hand-blast injuries. 2. To discuss typical injury patterns of firework-related hand-blast injuries and highlight the key imaging findings with consideration of the hand anatomy and mechanism of injury. 3. To discuss corresponding injury complications and treatment options.

### TABLE OF CONTENTS/OUTLINE

Each year, roughly 3,000 hand-blast injuries occur in the United States and the incidence continues to rise. Such a trend is concerning because those affected are often young, with blast injuries causing soft tissue, neurovascular, bone, and joint damage that result in significant hand impairment and amputation. Only a few studies have specifically investigated firework-related injuries and have proposed injury mechanisms and severity classifications. The extensive nature of blast injuries combined with the increasing incidence underscores the urgent need for a better understanding of the mechanism of injury, pertinent radiologic findings, and treatment options. This exhibit will aim to (1) describe the growing public health issue of hand blast injuries, (2) review relevant anatomy of the hand, (3) discuss firework-related injury patterns with respect to the injury mechanism and anatomic considerations, and (4) illustrate our institution’s cases of hand blast injuries along a spectrum of severity with annotated radiographic images. An understanding of the typical injury pattern can help radiologists discern the often-complex radiographic appearance of blast injuries.

## MKEE-138 THUMBS UP FOR ULTRASOUND OF THE RADIAL WRIST

**Awards**
**Cum Laude**

Andrew J. Grainger, MD (*Abstract Co-Author*) Speakers Bureau, General Electric Company
Lisa Billone, BSc (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. High resolution ultrasound can be used as a first line imaging modality for patients presenting with radial wrist pain, whether traumatic or non-traumatic in nature.2. The sonoanatomy of the radial wrist, including joints, ligaments, tendons, and nerves will be illustrated and described allowing participants to evaluate these structures in a protocol driven manner.3. The dynamic capabilities, superior spatial resolution, and direct patient interaction of ultrasound which provide unique advantages over MRI will be highlighted.4. Real case examples of pathologies causing radial wrist symptoms will be considered, including:a. Bone and joint disorders, such as synovitis, osteoarthritis, ligament injury, scaphoid fracturesb. Tendon pathologies, such as DeQuervain’s disease, intersection syndromes, tenosynovitis, partial and complete tears, post-operative complicationsc. Nerve disorders, such as

Wartenberg's syndrome, impingement, venipuncture injury, transectiond. Miscellaneous disorders, such as ganglion cysts, pseudoaneurysms, cystic adventitial disease

**TABLE OF CONTENTS/OUTLINE**

A. IntroductionB. Anatomy, ultrasound technique, pathology with case examples for thea. Bone and Joint i. Radiocarpal and midcarpal jointsii. Scapho-trapezium-trapezoid and 1st carpometacarpal jointsiii. Scapholunate ligamentiv. Scaphoid boneb. Tendon i. Abductor pollicis longus and extensor pollicis brevisii. Extensor carpi radialis longus and extensor carpi radialis brevisiii. Extensor pollicis longusiv. Flexor carpi radialisv. Flexor pollicis longusc. Nerve i. Superficial radial nerved. Miscellaneous i. Ganglion cystsii. Radial artery disordersiii. Accessory musclesC. Take home points

## MKEE-139 LUMBAR SPINE PARASPINAL MUSCLES ON MRI: ANATOMY, DERANGEMENTS, CONSENSUS RECOMMENDATIONS AND NEW HORIZONS

Robert D. Boutin, MD (*Abstract Co-Author*) Nothing to Disclose
Eddy Zandee van Rilland, MD (*Abstract Co-Author*) Nothing to Disclose
John Kleimeyer (*Abstract Co-Author*) Nothing to Disclose
Akshay Chaudhari, PhD (*Abstract Co-Author*) Research support, General Electric Company;Research support, Koninklijke Philips NV;Research Consultant, Subtle Medical, Inc
Jennifer A. Padwal, MD, MS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1) Imaging evaluation of paraspinal muscles, particularly the multifidus which has been most thoroughly studied, requires an understanding of muscle anatomy and innervation that can help inform patterns of pathologic muscle changes. 2) Paraspinal muscle derangements have important implications for muscle function and low back pain in nonoperative, preoperative, and postoperative settings. 3) Current grading systems/methodologies for lumbar spine muscle measurements of cross-sectional area (CSA) and fatty infiltration (FI) are variable and generally qualitative. Automated AI techniques can be used for accurate, quantitative measurements of CSA and FI, facilitating longitudinal evaluation over time.

**TABLE OF CONTENTS/OUTLINE**

I. Paraspinal muscle anatomy: muscle composition, innervation, vascularity, attachments, and function. II. Review MRI findings of paraspinal muscle derangements based on physiological mechanism, including single or multilevel involvement, distribution, and time course. Discussion of the contribution of paraspinal muscle derangements to low back pain and decreased function. III. Current MRI methodologies of evaluating paraspinal muscle, including MRI-derived measurements of CSA and FI using chemical-shift MRI. Challenges of translating research into clinical practice and future directions, including potential added value of AI tools in the clinical setting and opportunistic implementation of International Society for the Study of the Lumbar Spine (ISSLS) consensus recommendations.

## MKEE-14 MUSCLING IN ON THE ACTION - ACCESSORY MUSCLES OF THE UPPER EXTREMITY

**Awards**
**Certificate of Merit**

Kathryn J. Stevens, MBBS, FRCR (*Abstract Co-Author*) Nothing to Disclose
Jennifer A. Padwal, MD, MS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1) Multiple accessory muscles exist within the upper extremity, and have a widely varying prevalence 2) Accessory muscles are often overlooked but can have a significant clinical impact and present intraoperative challenges if not identified on preoperative imaging 3) Accessory muscles are best identified on MRI, particularly on T1 or PD-weighted images without fat suppression, where they can be confidently separated from the adjacent fat 4) Detailed knowledge of upper extremity muscle anatomy and awareness of these normal variants will help the practicing radiologist correctly identify these accessory muscles and become familiar with their contribution to upper extremity pathology

**TABLE OF CONTENTS/OUTLINE**

I) Accessory muscles of the shoulder/upper arm: case-based anatomic review and clinical impact II) Accessory muscles of the elbow/forearm: case-based anatomic review and clinical impact III) Accessory muscles of the wrist/hand: case-based anatomic review and clinical impact

## MKEE-140 TRAUMATIC AND SPORTS MUSCULAR INJURIES, WHAT TO LOOK FOR

**TEACHING POINTS**

Anatomy and BiomechanicsInjury mechanisms and patternsSpecific ConditionsInjury Grading

**TABLE OF CONTENTS/OUTLINE**

Muscles can be classified based on fiber orientation. In parallel muscles, fibers run parallel to the tendons, allowing larger ranges of excursion. Injuries typically affect the tendons and cause retraction. Pennate muscles, where fibers are oriented at an angle, generate greater force and are more susceptible to strains.Acute muscle injuries result from strain, contusion, laceration or compartment syndrome. The lower extremities are more frequently affected, especially the hamstring muscles, rectus femoris, and calf muscles. In the upper extremities, the most commonly injured are the rotator cuff and biceps brachii. Typically, the myotendinous junction is the most vulnerable. In older patients, the tendinous regions become the primary weak points. In skeletally immature patients, the apophysis is often affected, leading to apophysitis and avulsive fractures.DOMS is delayed muscular response to unaccustomed exertion, characterized, in MRI, by reversible enlargement and increased signal intensity in one or more muscles. Myositis ossificans is an abdormal response to trauma, resulting in nodular swelling, edema and peripheric calcifications.Various grading systems for muscle injury exist, primarily based on the type and size of lesion, the percentage of the cross-sectional area affected, and the presence of an intramuscular hematoma.

## MKEE-141 RISK VERSUS BENEFIT OF PERCUTANEOUS IMAGE-GUIDED BIOPSY FOR PERIPHERAL NERVE SHEATH TUMORS: UPDATED RECOMMENDATIONS FOR WHO, WHAT, WHEN AND HOW

Marco G. Aru, MD (*Abstract Co-Author*) Nothing to Disclose
Barry G. Hansford, MD (*Abstract Co-Author*) Nothing to Disclose
Kolade D. Odetoyinbo, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

After viewing this exhibit the learner will be able to:- Understand general imaging characteristics of benign versus malignant nerve sheath tumors (PNSTs), as well as the limitations of imaging- Identify appropriate indications and pre-procedural work up for PNST biopsy based on lesion characteristics: benign, indeterminate, and malignant- Recognize "do not touch" PNSTs to avoid potentially deleterious consequences of biopsy-Describe techniques to optimize biopsy yield while maintaining patient comfort-List the frequency and types of postprocedural complications for image-guided biopsy of PNSTs-Be familiar with the diagnostic yield for different types of PNSTs-Triage non-diagnostic biopsies and repeat biopsy when warranted

**TABLE OF CONTENTS/OUTLINE**

-Introduction/Background-Brief case-based review of benign and malignant nerve sheath tumors including:--Clinical vignette--Multimodality key imaging features--Relevant histopathology- Clinical indications and preprocedural workup of PNSTs based on suspected type (benign, indeterminate, malignant)-Discussion of "do not touch" PNSTs-Techniques for PNST biopsy to maximize diagnostic yield and patient comfort-Post-procedural complications for PNST biopsies: benign, indeterminate, malignant-Literature review of expected diagnostic yield for PNST biopsies-Management of non-diagnostic biopsies-Summary

## MKEE-142 IF THE SHOE FITS, CALL IT: A LUMPY BUMPY CASE REVIEW OF BENIGN FOOT AND ANKLE SOFT TISSUE TUMORS AND MIMICS

Cornelia B. Wenokor, MD (*Abstract Co-Author*) Nothing to Disclose
Garrett Yoon, MD, MS (*Abstract Co-Author*) Nothing to Disclose
Christopher Azzam, MD (*Abstract Co-Author*) Nothing to Disclose
Justin Newman, DO (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Soft tissue tumors of the foot and ankle are rare, making diagnosis often difficult and delayed. Adding to this challenge is the multitude of tumor mimics, placing us in a diagnostic dilemma. Fortunately, the vast majority of these pathologies are benign. However, our ability to distinguish between them and generate a differential diagnosis is imperative for optimal management, directing treatment, and avoiding unnecessary interventions. We present common, as well as rare and interesting cases of benign foot and ankle soft tissue tumors and tumor mimics on imaging, including radiographs, CT, and MRI. We highlight demographics, etiology, salient characteristics, and important differential considerations. The selected cases encompass a wide range of tissue types, including fibrous, pericytic, vascular, adipocytic, fibrohistiocytic, and neural. This exhibit aims to facilitate accurate diagnosis of foot and ankle soft tissue tumors and tumor mimics, as well as raise awareness of several rare lumps and bumps.

**TABLE OF CONTENTS/OUTLINE**

IntroductionDesmoplastic fibroblastomaPlantar fibromatosis/Ledderhose diseaseGlomangiomatosisHemangiomaAngiofibrolipomaFibrolipomatous hamartomaTenosynovial giant cell tumorSchwannomaNeurofibromaTumor Mimics (calcific myonecrosis, tumoral calcinosis, posterior tibial neuritis, Morton's neuroma, Haglund's syndrome, saphenous vein thrombophlebitis, foreign body and pyogenic granuloma, ganglion cyst, heterotopic bone, keloid, Dupuytren's)Conclusion

## MKEE-143 POST-TRAUMATIC ENTITIES MIMICKING SOFT TISSUE AND BONE NEOPLASMS: WHAT THE RADIOLOGIST NEEDS TO KNOW

Barry G. Hansford, MD (*Abstract Co-Author*) Nothing to Disclose
Keshawn Pope, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

After viewing this exhibit, the learner will be able to: 1. List bone and soft tissue post-traumatic entities mimicking neoplastic disease 2. Identify entity specific multimodality key imaging features 3. Describe entity specific histories and clinical findings 4. Appreciate basic histopathology for select entities 5. Recognize post-traumatic "do not touch" lesions 6. Discuss entity specific treatment options/outcomes 7. Triage indeterminate entities necessitating image-guided biopsy

**TABLE OF CONTENTS/OUTLINE**

Introduction/background:• Pearls and pitfalls to distinguish between pathologic and bland fracturesCase-based review of post-traumatic entities mimicking neoplasm based on anatomic structures and type of trauma:• Osseous-Single traumatic episode: Healing fracture, apophyseal avulsion, subperiosteal hematoma, traumatic Schmorl's node, BPOP spectrum of lesions, etc.-Repetitive microtrauma: Stress fracture, enthesopathy, transient osteoporosis, subpubic cartilaginous cyst, hemophilia pseudotumor, intraosseous ganglion, osteochondrosis, etc. o Clinical vignette o Key imaging findings o Treatment options/outcomes• Soft tissues (muscle, fat, and fascial based): Morell Lavallee, myositis ossificans, chronic expanding hematoma, muscle herniation, adventitial bursa, torn tendon, nodular cystic fat necrosis, ganglion/cysts, etc. o Clinical vignette o Key imaging findings o Treatment options/outcomes• Neurovascular: Pseudoaneurysm, neuroma, and microgeodic disease o Clinical vignette o Key imaging findings o Treatment options/outcomes• Review of "do not touch" post-traumatic entities• Utilization of image-guided biopsy for indeterminate lesions Summary

Jasmine Zhao, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Utilizing data from two energy spectra, dual energy CT (DECT) enables the detection and quantification of materials, which helps identify crystal arthropathy, bone marrow edema, tendon/ligament injuries, while also reducing metal artifacts in musculoskeletal imaging. 2. DECT findings often lead to significant changes in management, bolster diagnostic confidence, enhance incidental lesion characterization, and minimize the need for invasive interventions. 3. Despite its advantages, DECT adoption faces hurdles such as cost implications, data overload, and the need for additional education among clinicians and radiologists. 4. Stepwise implementation methods and education initiatives to increase familiarity with DECT are necessary to streamline its integration into routine practice.

**TABLE OF CONTENTS/OUTLINE**

1. Learning Objectives 2. Basic overview of DECT: Acquisition, Post-processing, and Interpretation 3. Applications of DECT in Musculoskeletal Imaging 4. Clinical Benefits of DECT Utilization 5. Impact of DECT on Clinical Management: Illustrated Though Emergency Department Cases 6. Barriers to DECT: Cost and Data Overload 7. Solutions and Steps to DECT implementation (3 Prong Approach) 8. Summary and Key Takeaways

## MKEE-145 CASE-BASED REVIEW OF ATYPICAL GOUT MIMICKERS USING DUAL-ENERGY CT IN THE EMERGENCY SETTING

Anderanik Tomasian, MD (*Abstract Co-Author*) Nothing to Disclose
Maryam Golshan Momeni, MD (*Abstract Co-Author*) Nothing to Disclose
Arash Anavim, MD, MBA (*Abstract Co-Author*) Nothing to Disclose
Peter H. Pham, MD (*Abstract Co-Author*) Nothing to Disclose
Lawrence Wang, DO (*Abstract Co-Author*) Nothing to Disclose
Jasmine Zhao, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Despite its prevalence, diagnosing gout can be challenging due to its resemblance to other acute medical conditions. 2. Dual energy CT (DECT) utilizes attenuation data at two energy spectra to detect monosodium urate crystals, facilitating accurate gout diagnosis. 3. DECT offers practicality for emergency room settings, boasts high sensitivity and specificity, and expedites diagnosis, particularly in atypical cases or when traditional methods are inconclusive. 4. False positives, attributed to beam hardening and motion artifacts, are potential drawbacks. Additionally, false negatives may occur in the early stages of gout (<6 weeks). 5. DECT should be integrated into routine emergency imaging protocols to aid in diagnosing acute and challenging gout presentations, thereby guiding appropriate management.

**TABLE OF CONTENTS/OUTLINE**

1. Learning Objectives 2. Background: Clinical Presentation of Acute Gout 3. DECT Applications in Musculoskeletal Imaging 4. Utility of DECT for Gout in the Emergency Department: Advantages and Pitfalls 5. Ten Case-Based Examples of Atypical Gout Presentations 6. Summary and Key Takeaways

## MKEE-146 EXPLORATION OF BONE EDEMA: SPECTRAL ANALYSIS VIA DUAL-ENERGY COMPUTED TOMOGRAPHY FOR URGENT EVALUATION

Yeni Fernandez de Lara Barrera, MD (*Abstract Co-Author*) Nothing to Disclose
Estefania Murrieta Peralta, MD (*Abstract Co-Author*) Nothing to Disclose
Maria M. Salazar Osorio, MD (*Abstract Co-Author*) Nothing to Disclose
Karina I. Holguin Andrade, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Enhanced Characterization: Explore how the use of a bone edema map with dual-energy computed tomography (DECT) can improve fracture characterization, providing a more detailed and accurate assessment. 2. Identification of Hidden Fractures: 3. Reduced Diagnostic Time: Explain how DECT's ability to characterize fractures can decrease the time needed for diagnosing injuries, especially in emergency situations. 4. Differentiation between Acute and Chronic Fractures. 5. Utility of Bone Edema in DECT: Showcase the advantages of using bone edema as an indicator in DECT, such as its ability to detect fractures in early stages, precision in fracture localization, and its usefulness in treatment monitoring and surgical planning.

**TABLE OF CONTENTS/OUTLINE**

Background: Dual-energy computed tomography (DECT) is a sophisticated imaging technique that utilizes two distinct kilovoltages to assess X-ray absorption in tissues.Bone Marrow Edema: Bone marrow edema is a common feature in traumatic injuries and pathological conditions.Main Applications: Identification and diagnosis of fractures in the carpal and wrist bones.Compression vertebral fractures, distinguishing between acute and chronic fractures. Oncological evaluation.Hidden hip fractures and identification of periprosthetic fractures.Limitations and Pitfalls: Metallic Artifacts and Soft Tissue Limitations.Conclusion: Dual-energy computed tomography represents a significant advancement in the evaluation of bone marrow edema.

## MKEE-147 UPPER EXTREMITY NERVES AND THEIR BRANCHES - A MAGNETIC RESONANCE IMAGING AND SONOGRAPHIC ATLAS

Gregory S. Stacy, MD (*Abstract Co-Author*) Nothing to Disclose
Katie L. Nguyen, MD,BS (*Abstract Co-Author*) Nothing to Disclose
Braden Anderson, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

We have received growing numbers of requests to evaluate nerves of the upper extremity (e.g., in the setting of penetrating trauma) in order to assess the degree of nerve damage and potential for repair. These requests have included the major nerves as well as various cutaneous branches, which might not be as familiar to the radiologist. Dedicated ultrasound imaging has been particularly useful in the setting of ballistic fragments and orthopedic hardware. The purpose of this exhibit is to provide an atlas of upper extremity nerves using magnetic resonance images alongside corresponding sonographic images. Supplementary sonographic videos will be provided to aid in anatomic localization. We will review the origin of the major nerves (median, radial, ulnar, and musculocutaneous) at the distal brachial plexus, discuss their separate paths in the arm, and highlight several key and lesser-known branches along their respective courses. Discussion will feature key osseous, muscular, and vascular landmarks.

**TABLE OF CONTENTS/OUTLINE**

Introduction Ultrasound Technique Proximal Anatomy: Brachial Plexus Cords Median Nerve: Arm, Elbow, Forearm, and Wrist Anterior Interosseous Nerve Palmar Cutaneous Branch Ulnar Nerve: Arm, Elbow, Forearm, and Wrist Dorsal Cutaneous Branch Radial Nerve: Arm, Elbow, and Forearm Posterior Antebrachial Cutaneous Nerve Superficial Branch Deep Branch/Posterior Interosseous Nerve Musculocutaneous Nerve Lateral Antebrachial Cutaneous Nerve Medial Cutaneous Nerves Conclusion

## MKEE-148 MULTIMODALITY IMAGING EVALUATION OF MUSCULOSKELETAL MANIFESTATIONS IN RHEUMATOID ARTHRITIS: ADDRESSING RHEUMATOLOGISTS' NEEDS

To understand the pathophysiology of bone formation and resorption and its role in the pathophysiology of rheumatoid arthritis. To recognize the pathophysiology behind the imaging features in rheumatoid arthritis. To distinguish the primarily affected joints in rheumatoid arthritis and their main imaging features. To comprehend the indications and best acquisition protocols for rheumatoid arthritis in different imaging modalities. To understand the different scoring systems used to grade the disease.

**TABLE OF CONTENTS/OUTLINE**

Overview Definition and criteria according to ACR/EULAR 2010 Epidemiology Pathophysiology Bone cells. Bone formation and bone resorption processes. Rheumatoid arthritis pathophysiology Primarily affected joints. Imaging features Pathophysiology of imaging findings Plain radiograph Radiographic projections (Hand, foot, knee, ankle, spine) Findings Scoring systems CT Acquisition protocol Indications Findings Ultrasound Protocols Indications Findings Scoring systems MRI Acquisition protocol Indications Findings Scoring systems Test yourself! Summary (Take-home points).

## MKEE-149 REVOLUTIONIZING PREOPERATIVE PLANNING FOR MSK BONE TUMORS: INTEGRATING RADIOMICS AND 3D PRINTING FOR ENHANCED SURGICAL PRECISION

Matthias F. Froelich, MD (*Abstract Co-Author*) Consultant, Smart Reporting GmbH;Consultant, Guerbet SA
Lorenzo Muntaner, MD (*Abstract Co-Author*) Nothing to Disclose
Mara Villargordo Gonzalez, MD (*Abstract Co-Author*) Nothing to Disclose
Reda Britel, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Advancements in musculoskeletal oncology, incorporating 3D segmentation, radiomics, and printing, notably enhance surgical planning. 1-Segmentation in 3D involves the division of medical images into regions of interest, enabling precise manipulation and visualization of anatomical structures. 2-Radiomics, a rapidly evolving field, involves the extraction and analysis of quantitative features from medical images, offering valuable insights into tumor characteristics and behavior. 3-Additionally, 3D printing allows for the creation of physical models from medical imaging data, facilitating preoperative visualization and planning. Integration of these technologies improves surgical precision, reduces operative times, and enhances postoperative outcomes.However, challenges like specialized training persist. Future advancements promise further enhancements in musculoskeletal oncology surgical planning.

**TABLE OF CONTENTS/OUTLINE**

- Introduction
- Clinical Characteristics and Surgical Considerations
- Principles of 3D Segmentation
- Applications of Radiomics in MSK Bone Tumors
- Applications of 3D Printing in Preoperative Planning
- Clinical and Economic Benefits of Implementing 3D Technologies
- Challenges and Limitations in Clinical Practice
- Future Perspectives and Technological Advances
- Conclusion

## MKEE-15 UNUSUAL AND CHALLENGING CT-GUIDED BONE BIOPSIES: NAVIGATING COMPLEX CASES WITH PRECISION AND INSIGHT

Mateus A. Hernandes, MD (*Abstract Co-Author*) Nothing to Disclose
Edgard E. Engel, MD, PhD (*Abstract Co-Author*) Nothing to Disclose

Marcello H. Nogueira-Barbosa, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Leonor Savarese, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Bone biopsies are a critical element in the diagnostic pathway for various bone diseases, including primary bone tumors, metastatic conditions, infections, and other non-neoplastic disorders. In numerous instances, image-guided percutaneous biopsy is the preferred procedure due to its minimally invasive nature, high diagnostic yield, cost-effectiveness, and lower morbidity compared to surgical biopsy. Among image-guided techniques, computed tomography (CT) provides the benefit of superior spatial resolution and precise needle placement, thereby enhancing the success rate of the biopsy. Nevertheless, some skeletal sites can pose particular challenges, even with CT guidance, owing to anatomically intricate lesions, closeness to vital structures, lesions that are not visible on CT, or sclerotic lesions. Understanding the complexity of bone biopsies can represent an important resource for managing such cases effectively and safely.

**TABLE OF CONTENTS/OUTLINE**

Case-based review of various unusual and challenging cases of CT-guided bone biopsies, illustrating technical challenges, potential complications and practical strategies to increase the safety and diagnostic yield of the procedure.

## MKEE-150 POST HIP ARTHROSCOPY FINDINGS; WHAT THE RADIOLOGIST NEEDS TO KNOW

Peter J. Haar, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
William Whiteside, BS (*Abstract Co-Author*) Nothing to Disclose
Deividas Gustainis, MD (*Abstract Co-Author*) Nothing to Disclose
Brandon Tran (*Abstract Co-Author*) Nothing to Disclose
Rafael M. Jimenez, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. To review normal and abnormal findings of MRIs status post hip arthroscopy.2. To review complications of the labrum after first hip arthroscopy. 3. To review complications and dehiscence of the capsule after arthroscopy. 4. To review techniques of capsulotomy and capsulorraphy and their MRI

appearance. 5. To review techniques of labral reconstruction vs labral repair and their MRI appearance. 6. To review additional extra-articular MRI findings that account for failed arthroplasty. 7. To review findings of the cartilage after hip arthroscopy.

**TABLE OF CONTENTS/OUTLINE**

1. Normal hip anatomy on CR and MRI2. Hip labral tears and their classification.3. Hip labral tears and their MRI appearance using the MAHORN classification. 4. Labral re tear status post labral repair. 5. Labral reconstruction and the concept of the "spacer" adjacent to the capsule. 6. Imaging after failed labral repair and reconstruction. 7. Cartilage imaging and MRI classification of cartilage injuries. 8. Cartilage injuries after arthroscopy including "carpet" lesion. 9. Capsular imaging. 10. Capsular dehiscence after arthroscopy.11. Types of capsulotomy and capsular repairs. 12 Other MRI findings for persistent pain after arthroscopy including medial stress fracture of the calcar.

## MKEE-151 GLENOHUMERAL ARTHROSIS: DOES YOUR REPORT TRULY ADDRESS THE SURGEON'S QUERIES?

Diego A. Garcia, MD (*Abstract Co-Author*) Nothing to Disclose
Ezir Lima Neto, MD (*Abstract Co-Author*) Nothing to Disclose
Danielle B. Rumi, MD (*Abstract Co-Author*) Nothing to Disclose
Fernanda Yukari H. Takahashi, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Shoulder osteoarthritis is an extremely important condition, especially in aging adults, which justifies its high and increasing prevalence. Furthermore, it has a strong correlation with chondral injuries, and it is the most frequent cause of disability in the USA as a consequence of decreased motion and pain. Secondary causes are more common, such as trauma or repeated microtrauma in throwing athletes, chondrolysis, avascular necrosis, inflammatory arthropathy, and joint instability. Management depends on various aspects, including symptoms, radiological findings, and staging. This study’s goal is to review the key points that the radiological report must address for surgical planning using examples from our service.

**TABLE OF CONTENTS/OUTLINE**

- Introduction
- Objective
- Glenoid morphology alterations: deficiency of glenoid bone stock, glenoid version, and modified Walch classification
- Humeral head alterations: glenohumeral subluxation index and humeral head medialization
- Glenohumeral degenerative changes
- Conclusion
- References

## MKEE-152 BROKEN BONES IN LITTLE ONES: THE PLAYFUL PATH TO EVALUATING CHILDREN'S FRACTURES

Erica D. Cruz, MD (*Abstract Co-Author*) Nothing to Disclose
Diego A. Garcia, MD (*Abstract Co-Author*) Nothing to Disclose
Felipe C. Ferreira Dionisio, MD (*Abstract Co-Author*) Nothing to Disclose
Danielle B. Rumi, MD (*Abstract Co-Author*) Nothing to Disclose
Fernanda Yukari H. Takahashi, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Fractures in children constitute a common entity in medical practice, especially for radiologists. However, this age group presents particularities compared to the adult population, such as in epidemiology, presentation, and classification. Therefore, understanding the development and maturation of the skeleton is necessary to comprehend the different types of pediatric fractures. Although the prognosis for most fractures is excellent, knowledge about children’s fractures and their accurate description is of utmost importance for therapeutic success. This study aims to provide a didactic review of the most prevalent pediatric fractures, correlate them with different imaging methods, and describe their main radiological findings and classifications.

**TABLE OF CONTENTS/OUTLINE**

- Introduction
- Objective
- Review of normal pediatric skeleton development
- Cases of pediatric fractures in different joints and different imaging methods, detailing common radiological findings and classifications
- Conclusion
- References

## MKEE-153 STRUCTURED REPORTING FOR GLENOID-TRACK: ASSESSING SHOULDER STABILITY

Danielle B. Rumi, MD (*Abstract Co-Author*) Nothing to Disclose
Bianca Bianco, MD (*Abstract Co-Author*) Nothing to Disclose
Diego A. Garcia, MD (*Abstract Co-Author*) Nothing to Disclose
Yuree M. Herenio SR, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The shoulder is the most frequently dislocated joint in the body, largely due to its extensive range of motion, which is unmatched in humans. Between 1% and 2% of people will endure a glenohumeral dislocation in their lifetime, with anterior dislocations comprising over 95% of these cases. Such dislocations often result from falls onto an extended arm or shoulder. A significant portion of those who suffer an initial anterior shoulder dislocation, specifically 20% to 48%, will face recurrences. This risk is especially high among younger individuals, where recurrence rates soar to 66% to 94% in those under 20 years old.

**TABLE OF CONTENTS/OUTLINE**

Introduction; Objective; Glenoid-Track: Assessing Shoulder Stability; Measurement Parameters; Discussion; Radiological Cases; Conclusion; References.

## MKEE-154 DECODING PATELLOFEMORAL INSTABILITY: A STRUCTURED REPORT APPROACH

Roberto Froeder Oliveira, MD (*Abstract Co-Author*) Nothing to Disclose
Danielle B. Rumi, MD (*Abstract Co-Author*) Nothing to Disclose
Diego A. Garcia, MD (*Abstract Co-Author*) Nothing to Disclose
Bianca Bianco, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Patellofemoral instability represents a significant clinical challenge, directly influencing knee functionality and patient well-being. This study addresses the four main etiological determinants of patellofemoral instability: the Caton-Deschamps index for the quantification of high patella, Dejour's classification of trochlear dysplasia, the measurement of the tibial tubercle-trochlear groove (TT-TG) length, and the analysis of patellar tilt. We employed advanced imaging methods to draw direct correlations between these anatomical variables and episodes of patellar instability, demonstrating the interrelationship of these factors in the pathogenesis of femoropatellar instability, as well as providing insights for the development of more effective interventions. This study highlights the importance of an in-depth assessment of anatomical factors in the clinical management of patellofemoral instability, proposing an integrative model for risk prediction and treatment personalization. The clinical relevance lies in improving therapeutic outcomes and reducing the recurrence of pathologies, reinforcing the need for precise and individualized surgical planning.

**TABLE OF CONTENTS/OUTLINE**

Introduction; Objective; Determinants of patellofemoral instability: the Caton-Deschamps index, Dejour's classification, measurement of the tibial tubercle-trochlear groove length and patellar tilt; Discussion; Radiological Cases; Conclusion; References.

## MKEE-155 A RADIOLOGICAL WALK THROUGH RHEUMATOID ARTHRITIS

Carlos Suevos, MD (*Abstract Co-Author*) Nothing to Disclose
Alba Fernandez-Rodriguez, MD (*Abstract Co-Author*) Nothing to Disclose

Lucia Martinez De Vega, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Review the pathophysiology of rheumatoid arthritis.Explain the different articular and extra-articular radiological manifestations using illustrative cases.Review the usefulness of the different imaging techniques in this pathology: plain radiography, ultrasound, CT and MRI.Differential diagnoses of peripheral arthropathies.

**TABLE OF CONTENTS/OUTLINE**

Rheumatoid arthritis is a chronic autoimmune disease that mainly affects the musculoskeletal system and can become highly disabling during its evolution. Early diagnosis is essential to establish treatment in the initial stages of the disease, which can delay its progression and improve the life quality of these patients. For this, it is essential to know the articular and extra-articular radiological findings of this pathology and the utilities of the different imaging techniques for its diagnosis. In this exhibit we review the typical signs of rheumatoid arthritis with plain radiography, ultrasound, CT, and MRI and show the diagnostic imaging tips. Typically, this disease affects small joints with characteristic signs that allow to differentiate it from other peripheral arthropathies.

## MKEE-156 TUMOR TRAILS: NAVIGATING SOFT TISSUE LESIONS THROUGH STRUCTURED REPORTS

Danielle B. Rumi, MD (*Abstract Co-Author*) Nothing to Disclose
Janaina Moreira (*Abstract Co-Author*) Nothing to Disclose
Diego A. Garcia, MD (*Abstract Co-Author*) Nothing to Disclose
Roberto Froeder Oliveira, MD (*Abstract Co-Author*) Nothing to Disclose
Bianca Bianco, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

A medical report on soft tissue tumors must be clear, detailed, and comprehensive, ensuring a deep understanding of the case and enabling the medical community to assess and compare different therapeutic approaches. It is crucial to provide precise information about location, size, involvement of critical structures, and the presence of necrosis, as these characteristics are essential for determining prognosis and guiding clinical decisions. A well-crafted report significantly contributes to the advancement of medicine and the improvement of patient outcomes.

**TABLE OF CONTENTS/OUTLINE**

Introduction to Soft Tissue Tumor; Objectives; Location and Depth; Size of the Tumor; Involvement of Critical Structures; Presence of Necrosis; Diagnostic Methods; Radiological Cases; Conclusion; References.

## MKEE-157 BONE MARROW IMAGING: UNRAVELING VARIATIONS AND IDENTIFYING PATHOLOGIES

Andre Y. Aihara, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Ana Carolina D. Augusto, MD, MSc (*Abstract Co-Author*) Nothing to Disclose
Beatriz Benetti, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The purpose of this study is to improve understanding of the different normal patterns of bone marrow conversion and reconversion, as well as pathological changes, using systematic analysis of the T1 signal to guide differentiation between the pathologies. Additionally, advanced MR techniques, including chemical shift imaging, diffusion-weighted imaging, dynamic contrast-enhanced MRI, and whole-body MRI, may be utilized in cases warranting further investigation, and will also be explored.

**TABLE OF CONTENTS/OUTLINE**

The most common MRI signal variations observed in adult patients' bone marrow encompass a spectrum ranging from normal variants to benign pathologies and malignancies. Understanding the normal appearance and the physiological (re)conversion pattern is crucial for identifying and categorizing these entities effectively. Typically, in benign variations, the signal intensity of the lumbar vertebral bodies on T1-weighted SE images should be higher than that of adjacent intervertebral discs. Similarly, the signal intensity of appendicular red marrow areas on T1-weighted SE images should be higher than that of adjacent muscles. A systematic approach to analyzing T1 signal intensity aids in classifying the most common alterations. However, attention should also be paid to additional signs, such as contralateral involvement, periosteal reaction, cortical extension, and post-contrast enhancement.

## MKEE-16 TIPS AND TRICKS TO IDENTIFY ENDOMETRIOSIS FOR MUSCULOSKELETAL RADIOLOGISTS: DIAGNOSTIC FEATURES AND RECOMMENDATIONS

Michael D. Ringler, MD (*Abstract Co-Author*) Nothing to Disclose
Myra K. Feldman, MD (*Abstract Co-Author*) Nothing to Disclose
Liina Poder, MD (*Abstract Co-Author*) Nothing to Disclose
Luciana P. Chamie, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Brian T. Welch, MD (*Abstract Co-Author*) Nothing to Disclose
Christin A. Tiegs-Heiden, MD (*Abstract Co-Author*) Nothing to Disclose
Priyanka Jha, MBBS (*Abstract Co-Author*) Nothing to Disclose
Wendaline M. VanBuren, MD (*Abstract Co-Author*) Nothing to Disclose
Ceylan Colak, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Endometriosis is a common condition, affecting one in 10 premenopausal women, impacting approximately 200 million women globally. 2. Early diagnosis remains a challenge. The most common clinical presentation is pelvic pain, but patients may be asymptomatic or present with infertility. The average delay in diagnosis ranges from 4 to 11 years, and 65% of patients are initially misdiagnosed. 3. Contributing to the delay in diagnosis, patients may undergo multiple studies related to the musculoskeletal (MSK) system including lumbar, sacroiliac, pelvic and hip MRI studies. While endometriosis may involve nerves and soft tissues, MSK MRI protocols are not typically optimized for adequate mapping of disease in the pelvis, which may involve the bowel, bladder, ureters, and the diagnosis itself may not be established without a dedicated protocol. 4. Imaging studies, especially MRI, have a critical role in the noninvasive diagnosis of endometriosis. Endometriosis specific MRI protocols are important for the identification of disease as recommended by evidence-based consensus guidelines by the European Society of Urogenital Radiology and the Society of Abdominal Radiology Endometriosis disease-focused panel. In daily practice, it is important to recognize common MRI findings of endometriosis on MSK studies and to identify when to recommend a dedicated endometriosis imaging and gynecological evaluation.

**TABLE OF CONTENTS/OUTLINE**

1. Title 2. Disclosures 3. What is endometriosis? 4. Learning objectives 5. Common MR imaging findings of endometriosis 6. MRI protocol considerations 7. Treatment options 8. Case examples with imaging findings 9. Conclusion 10. References

## MKEE-17 KOOSH IT: USING GOLDEN-ANGLE RADIAL KOOSHBALL SAMPLING FOR 4D DYNAMIC MRI OF JOINTS

Joshua Auger (*Abstract Co-Author*) Nothing to Disclose
Sarah D. Bixby, MD, MBA (*Abstract Co-Author*) Nothing to Disclose

Fatih Calakli (*Abstract Co-Author*) Nothing to Disclose
Musa Tunc Arslan (*Abstract Co-Author*) Nothing to Disclose
Giovani Schulte Farina, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Joints are moving structures by nature and motion abnormalities should be evaluated by assessing the full anatomy dynamically. Biomechanical parameters from static or quasi-static MRI scans are different from moving motion. - Most of the dynamic imaging techniques are 2D over time. - There is still a need for improved dynamic imaging with 4D (3D+time), submillimeter isotropic (<1mm3), relatively artifact-free, and contrast changeable to the different MSK tissues of interest to better characterize motion joint motion abnormalities. - Golden-angle radial kooshball sampling in combination with sliding window reconstruction can provide dynamic and motion-robust images of the joints during real-time motion in 4D using high-field 3T scanners. - The 4D dynamic radial kooshball technique can be implemented for different joints, such as ankles and knees. - Full anatomy of the joints can be visualized dynamically in the 3 planes throughout the maximum range of motion.

**TABLE OF CONTENTS/OUTLINE**

- Dynamic MRI Imaging in MSK: current techniques- K-space sampling - 3D golden-angle radial kooshball - Basis and concepts - Applications in dynamic imaging - Cartesian sampling- Reconstruction algorithms for dynamic imaging - Sliding window reconstruction- Patient preparation - Movement training and patient positioning- 4D dynamic imaging of joints - Knee - Ankle- Challenges and limitations - Potential clinical applications - Impingement phenomenon - Patellofemoral tracking - Hindfoot motion in tarsal coalition - Microinstability

## MKEE-18 BASIC AND ADVANCED WRIST MRI FOR EVALUATION OF TRIANGULAR FIBROCARTILAGE COMPLEX (TFCC) INJURY

Akimoto Nimura (*Abstract Co-Author*) Nothing to Disclose
Yoichi Yokoyama, MD (*Abstract Co-Author*) Nothing to Disclose
Yoshitake Yamada, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Masahiro Jinzaki, MD, PhD (*Abstract Co-Author*) Support, Canon Medical Systems Corporation;Support, General Electric Company

Masahiro Hashimoto, MD (*Abstract Co-Author*) Nothing to Disclose
Yuko Tsujioka, MD,PhD (*Abstract Co-Author*) Nothing to Disclose
Taiki Nozaki, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The purposes of this exhibit are 1) To demonstrate the new anatomical findings of radioulnar ligaments. 2) To know basic 2D and 3D MR imaging findings of TFCC injuries. 3) To introduce the latest MR techniques for evaluation of TFCC including high-resolution images using deep learning reconstruction and CT-like images for bony structure.

**TABLE OF CONTENTS/OUTLINE**

1) Introduction 2) Clinical aspects of TFCC injury 3) Latest anatomical knowledges of TFCC comparing with MRI 4) Pearls and pitfalls in wrist MR when evaluating TFCC injuries 5) Latest MR techniques for precise evaluation of TFCC i) High-resolution MRI with deep learning reconstruction ii) CT-like images

## MKEE-2 A RADIOLOGICAL GUIDE TO HAND INFLAMMATION: HANDY TIPS TO UNRAVEL DIAGNOSIS

**Awards**
**Certificate of Merit**

Firat Atak, MD (*Abstract Co-Author*) Nothing to Disclose
Ustun Aydingoz, MD (*Abstract Co-Author*) Nothing to Disclose
Sevtap Arslan (*Abstract Co-Author*) Nothing to Disclose

Adalet E. Yildiz, MD (*Abstract Co-Author*) Nothing to Disclose
Yasin Yarasir, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Inflammatory diseases of the hand are a diagnostic challenge both clinically and radiological. 2. Although many conditions do not have specific imaging findings, some clinical and radiological clues can help narrow down the differential considerations and reach the correct diagnosis. 3. Accurate diagnosis is critical to initiating appropriate treatment before inflammation causes long-term harm to the hand.

**TABLE OF CONTENTS/OUTLINE**

A. An overview of inflammatory hand conditions. B. Imaging modalities and protocols. C. The spectrum of hand inflammation - a. Autoimmune (rheumatoid arthritis, seronegative spondyloarthritis, systemic lupus erythematosus, scleroderma, polyarteritis nodosa); b. Depositional (gout, CPPD, ochronosis); c. Infectious (Whipple disease, Mycobacterial, septic arthritis, osteomyelitis, necrotizing fasciitis, paronychia, cellulitis); d. Traumatic/degenerative (De Quervain tenosynovitis, post-traumatic inflammation, erosive osteoarthritis); e. Miscellaneous (sarcoidosis, foreign body-related inflammation, complex regional pain syndrome) D. Summary chart. E. Conclusion.

## MKEE-20 SOFT TISSUE MASSES OF THE HAND AND FOOT: AN EDUCATIONAL REVIEW

Noelia Arevalo (*Abstract Co-Author*) Nothing to Disclose
Javier Blazquez Sanchez (*Abstract Co-Author*) Nothing to Disclose
Lucia Martinez De Vega, MD (*Abstract Co-Author*) Nothing to Disclose
Raquel Acosta Hernandez, MD (*Abstract Co-Author*) Nothing to Disclose
Santiago Resano Pardo SR (*Abstract Co-Author*) Nothing to Disclose
Maria D. Lopez Parra, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

In the evaluation of soft tissue lesions the goal of imaging ,is to confidently identify lesions that exhibit typical diagnostic imaging features and do not need further studies.When a solid soft tissue tumor is encountered and malignancy cannot be excluded, a histology study is mandatory.Although the imaging characteristics of several of the lesions discussed are non-specific,combining them with clinical features and lesion location allows the radiologist to suggest a specific type of tumor

**TABLE OF CONTENTS/OUTLINE**

Soft tissue tumors are frequently encountered in clinical practice.They include benign and malignant neoplasms, as well as pseudotumoural lesions.The differential diagnosis of soft tissue lesions can be narrowed significantly with the aid of imaging .Radiographs are critical in determining the presence or absence of mineralization and setting whether soft tissue mineralization are chondral or ossific in nature and to evaluate cortical involvement versus isolated soft tissue lesion in order to narrow the differential diagnosis.The US seems well suited for screening soft tissue masses, allowing us to differentiate cystic from solid nature of soft-tissue lesions.The cystic nature can be confirmed with sonography or MR imaging avoiding further studies.In non cystic lesion, the location and signal characteristics can suggest the diagnosis of some specific pathologies.Equally, and based on the presence or absence of mineralization, lesion density/signal intensity,and enhancement pattern synovial based lesions can be suggested. Finally,knowledge of the incidence of specific neoplasms of the foot and hand based on patient age aids radiologists in providing a limited differential diagnosis.

## MKEE-21 POSTOPERATIVE IMAGING OF THE PERIPHERAL NERVES: SURGERY AND IMAGING CONCEPTS

Marcos Felippe D. Correa, MD (*Abstract Co-Author*) Nothing to Disclose

**TEACHING POINTS**

The aim of this exhibition is to: a) Review the main surgical procedures in peripheral nerves and postoperative imaging b) Highlight the most important topics for the surgeon c) Show illustrative and didactic cases from our service

**TABLE OF CONTENTS/OUTLINE**

INTRODUCTION a) Advances in peripheral nerve surgery b) Imaging modalities c) Surgical techniques and their indicationsIMAGING INTERPRETATION Main types of nerve injury and surgery, expected imaging findings and potential complications: 1) Neural compressive syndromes: 1a) Decompression: removal of factors leading to compression (e.g., carpal tunnel release surgery) 1b) Decompression with nerve transposition (e.g., ulnar nerve decompression) 1c) Neurectomy (nerve resection) (e.g., lateral femoral cutaneous nerve and interdigital nerve of the foot) 2) Neural tumors: tumors of neural sheath (schwannomas and neurofibromas). Procedures for each type of tumor vary, so it is important to distinguish when possible. Preoperative and postoperative imagins aspects 3) Traumatic nerve injury: 3a) Neurolysis: removal of adhesions surrounding the nerve 3b) Reconstruction of nerve continuity: excision of neuromas; neurorrhaphy or interposition of autologous nerve graft; other techniques including fibrin glue and nerve tubes 3c) Nerve transfer surgeryINTERACTIVE CASE-BASED DIDATICS a) Sample cases to illustrate and solidify the concepts, including pre and postoperative imaging b) Correlation with current literature dataCONCLUSION AND TAKE HOME MESSAGES Due to the advances in peripheral nerve surgery and increasing number of cases it has become essential for radiologists to be familiar with the main surgical techniques and postoperative imaging aspects

## MKEE-22 EXPLORING NON-TUMOROUS VASCULAR ABNORMALITIES IN MUSCULOSKELETAL IMAGING

**Awards**
**Certificate of Merit**

**TEACHING POINTS**

Non-tumorous vascular abnormalities in musculoskeletal present a diagnostic challenge, understanding these etiologies is crucial for an accurate diagnosis, especially because vascular abnormalities are often not the primary diagnostic consideration for clinicians, highlighting the role of radiologists in the diagnoses.Vascular abnormalities manifest through various symptoms such as pain, nodules, abnormal skin color and not rarely as incidental imaging findings, reflecting a wide array of pathologies.Multiple imaging methods can be used to provide precise localization and characterization of vascular abnormalities. Ultrasound offers real-time visualization and Doppler US exams provide valuable information about vascular flow. CT and MRI provide detailed anatomical information and the use of intravenous contrast in these methods improves the evaluation of vascular structures and the dynamics of blood flow. Conventional or minimally invasive angiography offers unparalleled visualization of vascular architecture.This presentation underscores the importance of a multidisciplinary approach in which radiologists collaborate to understand the complexities of non-tumorous vascular abnormalities in musculoskeletal imaging. By integrating clinical history, imaging findings, and radiological interpretation, we can optimize patient treatment and improve outcomes.

**TABLE OF CONTENTS/OUTLINE**

1. Overview epidemiology and clinical presentation2. The role of imaging2.1 Ultrasound2.2 MRI2.3 Angiography3. Non-tumor vascular pathologies:3.1 Traumatic and atraumatic thrombosis3.2 Ischemia3.3 Vasculitis3.4 Embolism3.5 Pseudoaneurysms3.6 Miscellaneous4. Flow chart

## MKEE-23 BEYOND THE MONITOR: EXPLORING 3D PRINTING IN RADIOLOGY

David R. Nascene, MD (*Abstract Co-Author*) Nothing to Disclose
Yu-Hui Huang, MD,MS (*Abstract Co-Author*) Nothing to Disclose
Ibrahim Abdalla, BS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Introduce the application of 3D printing in both clinical practice and educational contexts, highlighting its significance in enhancing understanding and treatment planning - Discuss commonly used techniques to create 3D models as well as their real life applications - Review a case involving a patient with recurrent left chest wall sarcoma, illustrating how 3D printing can be utilized to aid in understanding and managing complex clinical pathologies

**TABLE OF CONTENTS/OUTLINE**

- Introduction - 3D printing and use in clinical settings and education - Brief overview of relevant chest anatomy - Review the case of a patient with a recurrent left chest wall sarcoma- Methodology - Image selection and what to be mindful of - CT versus MRI, image thickness, and the use of contrast - Segmentation in Materialise Mimics and the best tools to get started - Region Grow, Split Mask, Multiple slice edit etc. - 3-Matic and the optimization of model characteristics - Sharing 3D Models using Sketchfab- Material Selection/Printing - Deciding between resin and filament prints - Overview of time and cost considerations- Conclusion

## MKEE-24 BONE LYMPHOMAS: A PICTORIAL ESSAY

Diogo G. Leao Edelmuth, MD (*Abstract Co-Author*) Nothing to Disclose
Henrique A. Lino, MD (*Abstract Co-Author*) Nothing to Disclose
Anderson Phelipe Dias Sabry Azar, MD (*Abstract Co-Author*) Nothing to Disclose
Paulo Ferreira, MD (*Abstract Co-Author*) Nothing to Disclose
Matheus Tonholo Ikedo, MD (*Abstract Co-Author*) Nothing to Disclose
Livia Vasconcelos, MD (*Abstract Co-Author*) Nothing to Disclose
Artemis D. Alves, MD (*Abstract Co-Author*) Nothing to Disclose
Renato Fujiki, MD (*Abstract Co-Author*) Nothing to Disclose
Lucas Nogueira, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Morphological Variability: We explore diverse bone lymphoma manifestations via radiographic imaging, emphasizing lytic lesions, periosteal reactions, and soft tissue involvement to recognize these patterns for accurate diagnosis and management.Imaging Modalities: We discuss radiography, CT, MRI, PET and image-guided procedures for bone lymphoma assessment, providing an overview of their strengthsDifferential Diagnosis: There are diagnostic challenges due to overlapping features with other bone lesions. We review key differentiating factors aiding an accurate differentiation.

**TABLE OF CONTENTS/OUTLINE**

Introduction: Bone lymphomas pose diagnostic challenges due to diverse radiographic presentations. This essay aims to elucidate their morphology, imaging modalities, diagnosis, and clinical implications.Methods: Review imaging studies depicting bone lymphomas, analyzing radiography, CT, MRI, PET and image-guided procedures for morphological features and differential diagnosis.Objectives: elucidate the radiographic manifestations of the disease and facilitate accurate diagnosis. This includes enhancing understanding of various imaging modalities and their roles in assessment.Discussion: Bone lymphomas exhibit varied radiographic patterns. CT offers detailed anatomy assessment, MRI enhances soft tissue delineation, and PET aids staging. Differential diagnosis involves careful consideration of imaging findings and clinical context.Conclusion: Accurate diagnosis of bone lymphomas requires recognizing diverse radiographic presentations and leveraging multiple imaging modalities. Awareness of imaging pitfalls is crucial for optimal management.

## MKEE-25 BRACHIAL (COM)PLEXUS: AN EASY-GOING REVIEW OF ANATOMY AND PATHOLOGIES

Paulo Eduardo Daruge Grando, MD (*Abstract Co-Author*) Nothing to Disclose
Miguel J. Neto (*Abstract Co-Author*) Nothing to Disclose
Aureliano T. Brandao SR, DC, PhD (*Abstract Co-Author*) Nothing to Disclose
Laercio A. Rosemberg, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Eduardo Baptista, MD (*Abstract Co-Author*) Nothing to Disclose
Izabel d. Karam, MD (*Abstract Co-Author*) Nothing to Disclose
Adham A. Castro, MD (*Abstract Co-Author*) Nothing to Disclose
Patricia C. Zuffo (*Abstract Co-Author*) Nothing to Disclose
Durval D. Santos, MD (*Abstract Co-Author*) Nothing to Disclose
Murilo Campos Silva, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

A) Identifying and understanding critical anatomical landmarks within MRI scans, such as the interscalene triangle, subclavian artery, and nerve roots from C5 to T1.B) Emphasize the importance of recognizing the normal appearances and variations of nerve paths to enhance diagnostic accuracy.C) Highlight the advantages of using high-resolution 3D imaging, DTI, and nerve-specific MRI sequences. Explain how these advanced techniques can reveal detailed nerve fiber integrity, crucial for diagnosing subtle neuropathies and planning surgical interventions.D) Discuss the key imaging signs of traumatic plexopathy, such as nerve discontinuity, hematoma, and pseudomeningocele formation. Train on differentiating between pre- and post-ganglionic injuries based on these imaging findings, and how they guide the prognosis and treatment strategies.E) How to identify nerve sheath tumors and differentiate them from other masses using MRI. Cover the imaging characteristics of benign versus malignant nerve tumors, and discuss how the localization, size, and effect on surrounding tissues can impact treatment options.F) The Role of Ultrasound in Real-time Diagnosis and Management.

**TABLE OF CONTENTS/OUTLINE**

A) Brachial plexus anatomy; B) MRI and ultrasound images; C) Pathologies; D) Future perspectives.

## MKEE-26 THE GREAT WALLS: ABDOMINAL, THORACIC, AND PARAVERTEBRAL - ANATOMY AND PATHOLOGICAL CONDITIONS

Marcos Felippe D. Correa, MD (*Abstract Co-Author*) Nothing to Disclose
Viviane S. Yamachira (*Abstract Co-Author*) Nothing to Disclose

Maria Vitoria Ludwig, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Our educational exhibit aims to review the anatomy and pathological conditions of the abdominal wall, thoracic wall, and paravertebral region through the following points: Reviewing the normal anatomy and anatomical variants of these three regions; Discussing the differential diagnosis for lesions encountered at these sites; Proposing an algorithmic approach to identifying lesions and diffuse processes based on their imaging characteristics; Highlighting the role of imaging techniques in the diagnosis and management of lesions affecting the abdominal wall, chest wall, and paravertebral region.

**TABLE OF CONTENTS/OUTLINE**

1) Anatomy of abdominal and thoracic walls. 2) Pathologies of abdominal and thoracic walls and proposed algorithmic approach based on imaging characteristics: Hernias (primary, incisional); Mechanical friction (elastofibroma dorsi, snapping scapula syndrome), Muscle injurie; Anatomical variants (Poland syndrome); Mass-like lesions - Fat containing (lipoma, liposarcoma, lipohypertrophy, arteriovascular malformations), Fluid (haematoma, Morel-Lavallee, abscess, seroma, lymphatic malformation), Solid / soft tissue (endometriosis, desmoid tumor, sarcoma, metastasis, fibromatosis, foreign body granuloma). 3) Illustrative cases with multimodality imaging. 4) Paravertebral anatomy. 5) Pathologies of paravertebral region and proposed algorithmic approach based on imaging characteristics and anatomical location (epaxial and hypaxial). 6) Illustrative cases with multimodality imaging.

## MKEE-27 LIFE AND DEATH IN MUSCULOSKELETAL RADIOLOGY: ATYPICAL FACETS OF BONE INFARCTION AND NECROSIS

**Awards**
**Certificate of Merit**

Pedro H. Arruda, MD (*Abstract Co-Author*) Nothing to Disclose
Marco Gonzalez (*Abstract Co-Author*) Nothing to Disclose
Francisco Rocha (*Abstract Co-Author*) Nothing to Disclose
Marcelo A. Nico, MD (*Abstract Co-Author*) Nothing to Disclose

Julio B. Guimaraes, MD (*Abstract Co-Author*) Nothing to Disclose
Alipio Ormond Filho, MD (*Abstract Co-Author*) Nothing to Disclose
Lucas N. Silva, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Osteonecrosis refers to a broad concept of the consequences of blood supply impairment on bone tissues, widely debated and described through classic radiological features. However, the diagnosis challenge relays mainly on its atypical manifestations or associated complications, which include subtle initial imaging changes, unusual skeletal locations, paraneoplasic manifestations or post-procedure complications, such as radiotherapy, diathermy and bone marrow transplant. Additionally, overlapping imaging findings also pose further difficulties, such as osteomyelitis, bone tumors and metabolic bone disease. Traditional imaging protocols, as well as some emerging techniques, can provide detailed and qualitative information about the bone microstructure, perfusion and metabolic behavior. Those techniques include diffusion-weighted MR imaging (DWI) , dynamic contrast-enhanced MRI (DCE-MRI), Time-Resolved Imaging of Contrast Kinetics (TRICKS), dual-energy CT (DECT) and positron emission tomography (PET) imaging. Bone necrosis may present typical or atypical manifestations, due to its complex origins and multiple underlying mechanisms. Besides, other many other bone abnormalities might mimic atypical bone infarction conditions. Through the assistance of multimodality imaging protocols, the radiologist role relies on knowing when to suspect an atypical bone necrosis presentation, and which imaging technique should guide towards a correct diagnosis.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction2. Etiology and Pathophysiology3. Imaging Patterns and Evolution4. Atypical Presentations 5. Bone Infarction-Like Diseases 6. Complications 7. Emerging techniques8. Conclusion

## MKEE-28 HOW TO CLASSIFY MUSCLE INJURIES: COMPARISON BETWEEN CLASSIFICATIONS BASED ON CASES

Adham A. Castro, MD (*Abstract Co-Author*) Nothing to Disclose
Eduardo Baptista, MD (*Abstract Co-Author*) Nothing to Disclose
Patricia C. Zuffo (*Abstract Co-Author*) Nothing to Disclose
Durval D. Santos, MD (*Abstract Co-Author*) Nothing to Disclose
Laercio A. Rosemberg, MD, PhD (*Abstract Co-Author*) Nothing to Disclose

Paulo Eduardo Daruge Grando, MD (*Abstract Co-Author*) Nothing to Disclose
Camila De Paula Silva, MD (*Abstract Co-Author*) Nothing to Disclose
Murilo Campos Silva, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

A) Overview of Muscle Injury Classifications provide a comprehensive review of the various muscle injury classification systems discussed in the paper. Highlight the criteria used by each system to classify muscle injuries, including anatomical location, extent of tissue damage, and functional impairment.B) Comparing Classification Systems discuss the strengths and weaknesses of each classification system based on clinical cases. Analyze how each system performs in terms of diagnostic clarity, prognostic value, and treatment guidance. Encourage critical thinking about which system might be best suited for different types of injuries or clinical settings.C) Imaging Techniques for Muscle Injury Evaluation: detail the role of various imaging modalities like MRI, ultrasound, and CT in the assessment of muscle injuries. Explain how these techniques complement the classification systems by providing detailed visual evidence of muscle fiber disruption, hematoma formation, and other pathological changes within the injured muscle.D) Future Directions and Research Opportunities discuss the gaps in current muscle injury classification systems and areas for future research. Encourage exploration of how new imaging technologies or biomarkers could be integrated into existing frameworks to enhance diagnostic accuracy and predictive power.

**TABLE OF CONTENTS/OUTLINE**

A) Muscle injury classifications;B) MRI cases images;C) Comparison of the most commonly used classifications;D) Principles of treatment for muscle injuries according to classifications and discussions on return to sport;E) Future perspectives.

## MKEE-29 EXPLORING BONE METAPHYSEAL LESIONS: INSIGHTS ON IMAGING AND INTERPRETATION

Pedro H. Arruda, MD (*Abstract Co-Author*) Nothing to Disclose
Isabela A. Da Cruz, MD (*Abstract Co-Author*) Nothing to Disclose
Flavia F. Araujo, MD (*Abstract Co-Author*) Nothing to Disclose
Marilia Da Cruz Fagundes, MD (*Abstract Co-Author*) Nothing to Disclose

Alipio Ormond Filho, MD (*Abstract Co-Author*) Nothing to Disclose
Gabriela Bailao, MD (*Abstract Co-Author*) Nothing to Disclose
Julio B. Guimaraes, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The metaphysis is a crucial region of the bone that has a specific anatomy, cellularity, and vascularization, and for this reason, some lesions develop preferentially in this location. This region is also important as growth and development occur during childhood and adolescence. The metaphysis, being the most metabolically active portion of bone, hosts a wide variety of tumors, both benign and malignant that require early detection to prevent adverse effects. It is also prone to infectious conditions like osteomyelitis and metabolic disorders disrupting bone mineral metabolism, potentially leading to deformities. Common fractures in this region, resulting from trauma or mechanical stress, vary in severity and may affect the growth plate, posing risks to bone development. Understanding the diverse imaging patterns in injuries involving the metaphysis is crucial for accurate diagnosis and early recognition of potential complications. Radiography is typically the initial imaging method used, and when combined with magnetic resonance imaging or computed tomography, it enhances sensitivity and specificity in diagnosing and characterizing lesions. This work aims to outline various metaphyseal lesions of different origins, highlighting their distinctive anatomical, histological, and vascular features. Early and precise diagnosis is crucial for promptly initiating appropriate treatment, thereby maximizing patient outcomes.

**TABLE OF CONTENTS/OUTLINE**

1. Background 2. Anatomy and histology 3. Development bone 4. Metaphyseal lesions 4.1 Tumoral 4.2 Inflammatory and infectious 4.3 Mechanic/traumatic 4.4 Dysplasias/congenital changes 4.5 Metabolic 5. Imaging findings 6. Diagnostic approach

## MKEE-3 MR NEUROGRAPHY OF FINE-CALIBER NERVES: A CASE-BASED REVIEW

**Awards**
**Magna Cum Laude**

**TEACHING POINTS**

The analysis of fine-caliber peripheral nerves using imaging methods is a challenging task. However, recent advances enabled higher resolution, thinner sequences with multiplanar reformatting, making it feasible to evaluate these very thin nerves using MR neurography (MRN). Therefore, MRN has been used to: (1) exclude the diagnosis of peripheral neuropathy by displaying normal nerves and regional muscles; (2) confirm suspicion of peripheral neuropathy by directly showing the nerve abnormality or regional muscle denervation changes by depicting the lesions causing nerve entrapment or impingement; (3) assess the extent of the abnormality or the disease load; (4) detect incidental lesions in the region of interest that mimic neuropathy symptoms; (5) provide imaging guidance treatments.We aim to demonstrate through cases collect in our institution the evaluation of multiple neuropathies, reinforcing its role as an important tool to access the small caliber peripheral nerves.

**TABLE OF CONTENTS/OUTLINE**

(1) Peripheral nerves: concepts and anatomy, focusing on fine-caliber nerves; (2) Neuropathy: imaging findings and diagnostic challenges- Role of MRN; (3) Review through cases from our service, with literature review, including, but not limited to: (3.1) Intercostal neuropathy; (3.2) Long thoracic nerve; (3.3) Accessory nerve; (3.4) Suprascapular nerve; (3.5) Palmar cutaneous branch of the median nerve; (3.6) Medial cutaneous nerve of the forearm; (3.7) Digital nerve; (3.8) Genitofemoral nerve; (3.9) Superior gluteal nerve; (3.10) Obturator nerve; (3.11) Ilioinguinal nerve; (3.12) Medial plantar nerve...

## MKEE-30 PHOTON-COUNTING CT IN MSK - HOW I DO IT

Henner Huflage, MD (*Abstract Co-Author*) Nothing to Disclose
Jan P. Grunz, MD (*Abstract Co-Author*) Research Consultant, Siemens AG
Andreas Kunz, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Since the clinical emergence of the first photon-counting CT (PCCT) system in late 2021, investigations have shown advantages in all fields of radiology. Compared with standard energy-integrating detector CT, PCCT allows for superior dose efficiency in every examination. While this aspect by itself is groundbreaking, the advantages do not stop there: PCCT facilitates an unprecedented combination of ultra-high resolution imaging without dose penalty or field of view restrictions, elimination of electronic noise, and ubiquitous spectral information. Considering the high demands of orthopedic imaging for visualization of minuscule details while simultaneously covering large portions of skeletal and soft tissue anatomy, no subspecialty may benefit more from this novel detector technology than musculoskeletal radiology. This educational aims to provide a personal introduction to the cosmos of PCCT, explain its technical basics, and highlight the most promising applications for patient care, while also mentioning current limitations that need to be overcome in the future.

### TABLE OF CONTENTS/OUTLINE

1. Technical background 2. Radiation dose reduction 3. Spatial resolution improvement 4. Metal artifact reduction 5. Multi-energy and spectral imaging 6. Current technical limitations and outlook 7. Discussion

## MKEE-31 SCULPTING SUCCESS: VALUABLE INSIGHTS INTO BONE TUMOR SURGERY WITH 3D RECONSTRUCTION TECHNIQUES

Micaela Sturnigh, MD (*Abstract Co-Author*) Nothing to Disclose
Jonathan Rosenvasser, MD (*Abstract Co-Author*) Nothing to Disclose
Javier M. Martinez Martinez, MD (*Abstract Co-Author*) Nothing to Disclose
Ignacio Ferrer, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. 3D Printing Process: To explore key stages, from image acquisition to bedside application.2. Selection of 3D Printing Technologies: To analyze the advantages and disadvantages of different 3D printing techniques and their specific applications in generating models for bone tumor resection.3. Preoperative Planning: to demonstrate how 3D printed models are used in preoperative planning to enhance surgical accuracy and efficiency. 4. Clinical Applications: Review clinical cases illustrating the use of 3D printed models in bone tumor resection and personalized implants.5. Visualization and Communication: To discuss how 3D printed models enhance communication among the surgical team and patients, to improve their understanding of the procedure.

### TABLE OF CONTENTS/OUTLINE

1. Introduction to the 3D printing process in bone tumor resection.2. Key techniques and technologies used in 3D printing of models for orthopedic surgery.3. Highlighted clinical cases: examples of 3D printed model applications in preoperative planning and bone tumor resection.4. Practical considerations and challenges in implementing 3D printing in orthopedic clinical practice.5. Additional applications of 3D-printed models in orthopedics: patient education, interdisciplinary communication and surgical training.6. Conclusion: advancing excellence in bone tumor surgery.

## MKEE-32 ARE YOU READING IN A VACUUM OR COOKING WITH GAS? DIAGNOSTIC PITFALLS IN INTERPRETATION OF NONINFECTIOUS CAUSES OF GAS IN MUSCULOSKELETAL IMAGING

Tetyana A. Gorbachova, MD (*Abstract Co-Author*) Nothing to Disclose
Osama Syed, DO (*Abstract Co-Author*) Nothing to Disclose
Jacob T. Ramsey, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Describe physiologic conditions and noninfectious disorders of musculoskeletal system associated with presence of gas.2. Review differential diagnosis of intraarticular, juxta articular and intraosseous gas and associated common interpretational pitfalls in setting of trauma.3. Review common and uncommon etiologies of gas after joint replacement.

### TABLE OF CONTENTS/OUTLINE

1. Intra-articular gasa. Transient positional vacuum phenomenon: etiologyb. Trauma:i. Traumatic arthrotomyii. Closed injury: intraarticular vacuum phenomenon (VP) as an indicator of transient dislocation (adult hip)c. Iatrogenic: joint aspiration/injectiond. Degenerative: asymptomatic VP and symptomatic pneumatocyste. VP as a mimicker of internal derangement on MRI (knee, shoulder)2. Intra-osseous and juxta articular gasa. Acute fracturesi. Open fracturesii. Closed fractures in high energy traumaiii. Iatrogenic (local anesthesia during reduction)b. Insufficiency fractures (pelvis, spine)c. Chronic fracture with nonunion/ pseudoarthrosisd. Degenerative: periarticular pneumatocyst, soft tissue extension mimicking abscess3. Arthroplasty associated gasa. Intramedullary pneumatosis in early post operative period as a lesion mimickerb. Aseptic hydrogen pneumarthrosis as a sign of crevice corrosion

## MKEE-33 GENOMIC LANDSCAPE OF LEIOMYOSARCOMA: INSIGHT AND UPDATES FOR RADIOLOGISTS

Mohammad Saleh, MD,MBBS (*Abstract Co-Author*) Nothing to Disclose
Francesco Alessandrino, MD (*Abstract Co-Author*) Nothing to Disclose
Ty K. Subhawong, MD (*Abstract Co-Author*) Research Consultant, Arog Pharmaceuticals, Inc;Stockholder, AbbVie Inc;Stockholder, AstraZeneca PLC;Stockholder, Johnson & Johnson;Stockholder, Pfizer Inc ;Stockholder, F. Hoffmann-La Roche Ltd;Stockholder, Teva Pharmaceutical Industries Ltd
Brandon Rose (*Abstract Co-Author*) Nothing to Disclose
Rosa P. Castillo, MD (*Abstract Co-Author*) Nothing to Disclose
Yu-Cherng C. Chang, MD (*Abstract Co-Author*) Nothing to Disclose
Emily Jonczak (*Abstract Co-Author*) Nothing to Disclose
Winston Pearce (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Provide an overview of the genomic landscape of leiomyosarcoma (LMS) with focus on the mutations with imaging and therapeutic correlates.- Describe the different imaging techniques and the imaging features of different subtypes of LMS.- Identify the limitations of imaging and provide strategies for accurate imaging diagnosis of LMS

**TABLE OF CONTENTS/OUTLINE**

Overview of the LMS- Genomic landscape, incidence, epidemiology of LMS- Novelties of molecular and histopathologic classification of LMS- Principles of therapy and stagingImaging of LMS - Role of imaging in management of LMS and limitations of current imaging- Imaging features of early stage and advanced uterine and extrauterine (soft tissue) LMS, with imaging examples for each subtype, including examples of vascular, retroperitoneal, cutaneous, extremity LMS.- Strategies for accurate imaging diagnosis for every step of the natural history of LMS: at diagnosis, before and after treatment- Pitfalls of LMS imaging (Liposarcomas, uterine leiomyomas, vascular leiomyomas, other peripheral soft tissue sarcomas)Future directions- Radiomics and machine learning approaches to imaging of LMS- Advanced imaging techniques for diagnosis of LMS- Applications of circulating tumor DNA

## MKEE-34 CHECKMATE TO CHEST WALL TUMORS: A STRATEGIC APPROACH TO DIAGNOSIS

Eduardo Baptista, MD (*Abstract Co-Author*) Nothing to Disclose
Margrit Muller, MD (*Abstract Co-Author*) Nothing to Disclose
Pedro Mecate Prada, MD (*Abstract Co-Author*) Nothing to Disclose

Lucas Daniel Pereira Lopes (*Abstract Co-Author*) Nothing to Disclose
Lucas Da Silva Costa, MD (*Abstract Co-Author*) Nothing to Disclose
Guilherme Swerts Pereira (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Chest wall tumors and tumor-like lesions are relatively rare, but understanding their diagnostic features is crucial. There exists a significant overlap in the presentation of different etiologies, with many non-specific features shared between benign and malignant tumors. Recognizing key imaging and clinical-epidemiological characteristics of the most common lesions is essential. Additionally, identifying findings that raise suspicion for malignancy is critical. This presentation will focus on multimodality essential features for differentiating benign and malignant lesions and, when possible, specific imaging features for determinante diagnosis. Relevant clinical and epidemiologic data will be highlighted. A brief review of a pertinent MRI protocol will also be included.

**TABLE OF CONTENTS/OUTLINE**

Introduction - Specific MRI protocol for chest wall lesionsCollection of cases, with a multimodality approach of the following lesions: Osteochondroma / Hemangioma / Elastofibroma Dorsi / Desmoid Tumor / Fibrous hamartoma of Infancy / Lipoma / Schwannoma / Ewing's Sarcoma / Chondrosarcoma / Myeloma / Metastasis / Brown Tumor / Leri Disease.

## MKEE-35 HIGH-RESOLUTION ULTRASOUND OF THE NAIL: CLINICAL AND PATHOLOGICAL CORRELATION

Tatiana Arroyave, MEd (*Abstract Co-Author*) Nothing to Disclose
Brian D. Norena Rengifo, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Diseases in the nail may be an incidental finding or may manifest as a palpable or visible abnormality. Knowledge of the anatomy of the nail is crucial in the evaluation of tumor, inflammatory or traumatic lesions. High-resolution ultrasound is the image of choice for the characterization of superficial lesions in the nail. A meticulous technique is necessary to determine the type, composition and location of the lesion. Establishing a differential diagnosis is essential to offer adequate treatment.

**TABLE OF CONTENTS/OUTLINE**

This educational e-exhibit will review nail anatomy, ultrasound imaging findings, and differential diagnosis of nail unit lesions. An overview of the ultrasound technique for evaluating nail lesions will be provided and correlation with clinical and pathological images will be performed.

## MKEE-36 IMAGING INSIGHTS INTO EXERTIONAL COMPARTMENT SYNDROME AND ATHLETIC PERFORMANCE

**Awards**
**Certificate of Merit**

Julio B. Guimaraes, MD (*Abstract Co-Author*) Nothing to Disclose
Isabela A. Da Cruz, MD (*Abstract Co-Author*) Nothing to Disclose
Marcelo A. Nico, MD (*Abstract Co-Author*) Nothing to Disclose
Pedro H. Arruda, MD (*Abstract Co-Author*) Nothing to Disclose
Alipio Ormond Filho, MD (*Abstract Co-Author*) Nothing to Disclose
Fernando O. Zorzenoni, MD (*Abstract Co-Author*) Nothing to Disclose
Thiago A. Rizzetto, MD (*Abstract Co-Author*) Nothing to Disclose
Marco Aurelio Soato Ratti, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Chronic Exertional Compartment Syndrome (CECS) is a prevalent yet frequently underdiagnosed condition, particularly among physically active individuals, posing substantial challenges and hindrances to performance. This review explores the multifaceted nature of CECS diagnosis and management, emphasizing the critical role of imaging techniques, notably MRI, in enhancing our understanding and approach to this condition. CECS diagnosis traditionally relied on invasive techniques like needle manometry, with its limitations and varying acceptance. However, advancements in imaging, especially MRI, offer non-invasive alternatives that present promising avenues for accurate diagnosis and improved patient outcomes. By examining the pathophysiology and anatomical considerations underlying CECS, clinicians gain valuable insights into its presentation and differential diagnosis. This study elucidates the diagnostic utility of imaging in CECS assessment, practical considerations and pitfalls associated with MRI interpretation, highlighting the importance of protocol standardization and clinician expertise. This article underscores the transformative impact of imaging, particularly MRI, in navigating the complexities of CECS diagnosis and management, aiming to empower healthcare professionals in optimizing patient care and facilitating a return to pain-free performance.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction; 2. Pathophysiology and Anatomy; 3. Symptoms and Clinical Scenario; 4. Classic Diagnostic Assessment 5. Non-Invasive Diagnostic Methods 6. MRI Expected Findings; 7. MRI Pitfalls; 8. Differential Diagnosis; 9. Treatment; 10. Conclusion

## MKEE-37 UNDERSTANDING EXTENSOR MECHANISM PATHOLOGIES AND THEIR POSTOPERATIVE APPEARANCES

Tony T. Wong, MD (*Abstract Co-Author*) Nothing to Disclose
Tina Roa, MD (*Abstract Co-Author*) Nothing to Disclose
Saheeb Ahmed, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Teaching Points 1. Understand the basic musculoskeletal anatomy of the knee through multiple imaging modalities (radiographs, CT, MRI), with a focus on the extensor mechanism. 2. Explore different pathologies of the extensor mechanism, their presentation, and their appearance under different imaging modalities. 3. Understand surgical variants used to treat extensor mechanism pathologies and the rationale behind their use. 4. Understand the expected postoperative appearance of extensor mechanism surgeries. 5. Recognize common postoperative complications.

**TABLE OF CONTENTS/OUTLINE**

Table of Contents/Outline 1. Normal Anatomy a. Radiographic features of the knee b. Cross sectional anatomy of the knee (CT and MRI), with a focus on the extensor mechanism (tendons, insertions, joints)2. Extensor mechanism pathology and related surgeriesa. Patellar instability i. MPFL reconstruction ii. Physeal sparing MPFL reconstruction iii. Lateral retinacular release iv. Tibial tuberosity transfer v. Roux-Goldthwait procedureb. Patellar abnormalities i. Patellofemoral cartilage repair ii. Bipartite patella resection iii. Patellar fracture repairc. Extensor mechanism tears i. Primary patellar and quadriceps tendon repair ii. Repair with augmentation: Achilles allograft reconstruction iii. Repair with augmentation: semitendinosus autograft reconstruction iv. Allograft patella extensor mechanism reconstruction3. Common postoperative complications

## MKEE-38 ULTRASOUND-GUIDED PERINEURAL INJECTIONS OF THE UPPER EXTREMITY FROM THE ARM TO THE WRIST

**Awards**
**Cum Laude**

Joseph C. Giaconi, MD (*Abstract Co-Author*) Nothing to Disclose
Nathaniel Mizraki, MD (*Abstract Co-Author*) Nothing to Disclose
George R. Matcuk JR, MD (*Abstract Co-Author*) Research Consultant, Canon Medical Systems Corporation
Tanya L. Tivorsak, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Perineural injections in the upper extremity can be performed under ultrasound real-time guidance for therapeutic and diagnostic purposes. This exhibit will review the sonoanatomy of certain nerves in the upper extremity and topographic anatomy correlation with MRI. We will provide a guide for techniques and approaches for injecting specific nerves.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction and indications for perineural injections- diagnose and confirm specific neuropathy prior to nerve surgery, relieve nerve pain2. Procedure preparation- ultrasound transducers, needle size, amount of anesthetic or steroid/anesthetic mixture3. Anatomy and injection techniques of certain nerves including musculocutaneous nerve, radial nerve, medial dorsal cutaneous nerve, ulnar nerve, and median nerve4. Risks and side effects

## MKEE-39 DEEP UNDERSTANDING OF THE TIBIOFIBULAR SYNDESMOSIS: ANATOMY, BIOMECHANICS, IMAGING APPROACH AND POSTOPERATIVE EVALUATION

**Awards**
**Certificate of Merit**

Julio B. Guimaraes, MD (*Abstract Co-Author*) Nothing to Disclose
Marcelo A. Nico, MD (*Abstract Co-Author*) Nothing to Disclose

Gustavo O. Watanabe, MD (*Abstract Co-Author*) Nothing to Disclose
Lucas N. Silva, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Tibiofibular syndesmotic injuries are challenging and often underestimated, especially mild or moderate cases. Proper diagnosis and treatment are essential to avoid long-term complication such as rotational instability and ankle osteoarthritis. The syndesmotic ligament injury and associated instability determine whether operative or non-operative treatment is needed. Imaging, like x-rays for initial assessment and weightbearing studies for dynamic insights, is crucial. MRI provides direct ligament visualization and detects associated injuries, despite limitations in evaluating ankle dynamics. In this context, knowledge of anatomy, biomechanics and injury mechanisms are essential in both diagnostic and therapeutic management. Emerging imaging techniques improves sensitivity, but they remain underutilized. Recognizing subtle imaging signs and comparing the affected side with the contralateral unaffected side can increase diagnostic accuracy. Postoperative imaging analysis is imperative when there is failure to achieve anatomical reduction, residual instability, or development of concomitant injuries. The radiologist should identify the surgical techniques, normal findings and abnormalities that may suggest complications, thus avoiding unnecessary procedures.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction 2. Tibiofibular syndesmosis anatomy 3. Biomechanics and trauma mechanism 4. Imaging diagnosis of tibiofibular syndesmosis injury a) Radiograph and Stress X-ray b) CT Scan c) Stress and weightbearing CT Scan d) MRI e) What to report in the preoperative exam? 5. Treatment and imaging evaluation a) Surgical techniques b) Complications c) What to report? 6.? ?Conclusion

## MKEE-4 VASCULAR VOYAGE: CHARTING VARIANT PATHWAYS IN MUSCULOSKELETAL IMAGING WITH CLINICAL AND SURGICAL IMPLICATIONS

**Awards**
**Certificate of Merit**

Sara Silberstein, MD, MS (*Abstract Co-Author*) Nothing to Disclose
Tetyana A. Gorbachova, MD (*Abstract Co-Author*) Nothing to Disclose
Andrei Tuluca (*Abstract Co-Author*) Nothing to Disclose
Maya Patel, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- To highlight different vascular variants encountered in common musculoskeletal studies- To review embryologic origin, prevalence, pertinent regional anatomy, and imaging of these vascular variants.- To describe the clinical significance and surgical implications of variant vascular anatomy with emphasis on risk of iatrogenic injury

### TABLE OF CONTENTS/OUTLINE

1. Persistent median artery: embryology/imaging/reported associations and complications - Bifid median nerve- Pronator syndrome - Carpal tunnel syndrome - Embolic digital ischemia 2. Corona mortis: embryology/classification/complications - Traumatic injury with superior pubic rami fractures - Iatrogenic injuries3. Persistent sciatic artery: embryology/classification/complications - Stenosis- Aneurysm- Imaging pitfalls - Surgical planning implications in revascularization procedures and renal transplant4. Aberrant anterior tibial artery: embryology/imaging/surgical significance - Total knee arthroplasty - High tibial osteotomy - PCL reconstruction- Posterior horn lateral meniscus repair 5. Dorsalis pedis artery: high take-off, oblique course - Aneurysm and pseudoaneurysm- Iatrogenic injury in fracture fixation and ankle arthroscopy - Fasciocutaneous flap reconstructions6. Summary table: key points

## MKEE-40 PEDIATRIC SACROILIAC JOINT: A PRATICAL GUIDEBOOK

Daisy T. Kase (*Abstract Co-Author*) Nothing to Disclose
Andre Y. Aihara, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Paola C. Kuenzer Goes, MD (*Abstract Co-Author*) Nothing to Disclose
Livia Monteiro, MD (*Abstract Co-Author*) Nothing to Disclose
Andre Rosenfeld, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The purpose of this study is:• Review of sacroiliac joint development and anatomy through didactics illustrations.• Highlight and discuss specific findings of normal anatomy and variations in the sacroiliac joint in pediatric population.• Discuss and demonstrate the imaging findings of the wide range diseases that may affect children sacroiliac joint in a multimodality approach (CR, CT, MRI)• Enhancing understanding and diagnostic accuracy of the most common sacroiliac pathologies, as well as presenting other causes of low back pain in childhood

### TABLE OF CONTENTS/OUTLINE

• Introduction and overview of the normal development and anatomy of the sacroiliac joint• Demonstrate with didactic illustrations and cases the anatomical variations that the radiologist should be aware of.• Illustrate didactically the radiographic, CT and MRI findings of each sacroiliac joint disease in children, including:• Inflammatory arthropathies and Reactive Arthritis• Trauma and sports related injuries• Pyogenic, Tuberculous and Other Infections• Tumors that may involve the sacroiliac joint• Present differential diagnosis for low back pain in children, and propose a diagnostic algorithm, including which exams to be requested and according to the findings and clinical-laboratory correlation, narrow down the differential diagnosis• Summary

## MKEE-41 IMAGING EVALUATION OF SHOULDER ARTHROPLASTY: A COMPREHENSIVE EDUCATIONAL OVERVIEW

Lucas K. Miyahara, MD (*Abstract Co-Author*) Nothing to Disclose
Victor C. Mello (*Abstract Co-Author*) Nothing to Disclose
Paola C. Kuenzer Goes, MD (*Abstract Co-Author*) Nothing to Disclose
Andre Y. Aihara, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The purpose of this study is to: • Review the imaging and discuss the different types of shoulder arthroplasty with didactic and illustrative cases to consolidate the acquired knowledge. • Identify the typical visual outcome of various arthroplasty and pinpoint the primary issues and complications that may arise post-surgery, shared to all types and particularly those specific to each type of replacement procedure. • Suggest a report template that highlights the key relevant information for the orthopedic surgeon.

### TABLE OF CONTENTS/OUTLINE

Advancements in shoulder arthroplasty, along with varied surgical techniques and detailed anatomical studies, have significantly improved outcomes. Common motivations for shoulder arthroplasty include osteoarthritis, inflammatory arthritis, fractures, rotator cuff issues, and avascular necrosis. Recognizing key imaging indicators is essential for accurate diagnosis and determining the most suitable arthroplasty approach. Radiologists must not only understand the indications for each procedure but also be knowledgeable about potential complications. The presentation will include the following contents: - Introduction - Hemiarthroplasty - Anatomic total shoulder arthroplasty - Reverse total shoulder arthroplasty - Complications - Report template suggestion - Bibliographical references

## MKEE-42 REVIEWING BENIGN AND MALIGNANT PRIMARY BONE TUMORS: A RADIOLOGY-PATHOLOGY CORRELATION

Richard L. Barger JR, MD (*Abstract Co-Author*) Nothing to Disclose
Lesley Summerville, MD (*Abstract Co-Author*) Nothing to Disclose
Shaun H. Johnson, MD (*Abstract Co-Author*) Nothing to Disclose
Vijaya K. Kosaraju, MD (*Abstract Co-Author*) Nothing to Disclose
Navid Faraji, MD (*Abstract Co-Author*) Nothing to Disclose
Nathan M. Amann, BS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Review the most common benign and malignant primary bone tumors including their risk factors and genetic markers- Understand imaging characteristics that can distinguish benign and malignant bone lesions- Understand the management of lesions discovered on imaging- Appreciate the histopathologic findings and how viewing the tumor at cellular level is reflected in radiologic imaging

**TABLE OF CONTENTS/OUTLINE**

Introduction to benign and malignant bone tumorsDefining benign vs. malignant primary bone lesionsSymptomatologyRelative incidenceHakim et al. 2015Incidence, risk factors and symptomatology of benign bone lesions including osteochondroma, giant cell tumor, osteoblastoma, and osteomaXu et al. 2023Incidence and risk factors stratified by age and gender for malignant bone tumors including osteosarcoma, chondrosarcoma, Ewing sarcoma, and chordomaImaging characteristics of bone tumors in generalBenign bone tumor characteristics Malignant bone tumor characteristicsManagement of discovered bone tumors Case review from our institutionPatient background and pertinent historyAnnotated imaging findingsAnnotated histopathologic findingsDiagnosis and reviewRisk factorsDiscussion of age distribution for specific tumorsGenetic markersProvided by the WHO 2020 Classification of Tumors of Bone (Choi et al. 2021)Typical imaging and histopathologic findingsConclusionSummarize imaging findings of benign and malignant lesionsSummarize histopathologic findings and how it is reflected in the imaging

## MKEE-43 CRACKS AND BREAKS: A RADIOLOGIST'S GUIDE TO FRACTURES

Andre Y. Aihara, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Paola C. Kuenzer Goes, MD (*Abstract Co-Author*) Nothing to Disclose
Ana Carolina D. Augusto, MD, MSc (*Abstract Co-Author*) Nothing to Disclose
Gustavo Junzi Konno, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

In this educational exhibit, our aim is to offer a thorough review of fractures, encompassing their terminology, classifications, complications, and specific characteristics related to various locations and skeletal maturation stages. A clear understanding and accurate reporting of these features are essential for enhancing clinical outcomes and minimizing complications.

**TABLE OF CONTENTS/OUTLINE**

Fractures are common events in the musculoskeletal radiology spectrum, demanding attention due to their clinical and functional implications. Understanding their complications is crucial for effective management and prevention of sequelae. Pediatric fractures possess unique characteristics, such as a greater potential for bone remodeling and anatomical peculiarities, necessitating a specific approach. Fracture classifications, such as Salter-Harris for epiphyseal fractures, and systems like AO/OTA, assist in standardizing assessment and selecting the most appropriate therapeutic approach, contributing to improved clinical outcomes. New technologies, like synthetic CT and dual-energy CT in conjunction with Deep Learning software, are revolutionizing musculoskeletal radiology, accelerating the identification of subtle fractures and underscoring the importance of continuous updating for musculoskeletal radiologists.

## MKEE-44 FROM BONES TO JOINTS: IMAGING INSIGHTS INTO MUSCULOSKELETAL SARCOIDOSIS

Lucas K. Miyahara, MD (*Abstract Co-Author*) Nothing to Disclose
Andre Y. Aihara, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Paola C. Kuenzer Goes, MD (*Abstract Co-Author*) Nothing to Disclose
Daisy T. Kase (*Abstract Co-Author*) Nothing to Disclose
Adham A. Castro, MD (*Abstract Co-Author*) Nothing to Disclose
Lucas R. Medeiros (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Sarcoidosis is a multisystemic granulomatous disorder of unknown etiology, characterized by the accumulation of T lymphocytes and macrophages in affected organs. While it most commonly involves the lungs, lymph nodes, skin, and eyes, it may affect any organ, including the musculoskeletal system, with both symptomatic and asymptomatic manifestations. The purpose of this exhibit is: 1. To review sarcoidosis etiopathogenesis 2. To discuss how modern imaging techniques such as PET/CT help detect asymptomatic musculoskeletal sarcoidosis and are changing its relative prevalence 3. To analyze multimodality imaging findings of musculoskeletal sarcoidosis 4. To assess the differential diagnosis of musculoskeletal sarcoidosis

**TABLE OF CONTENTS/OUTLINE**

1. Acute sarcoid arthritis 2. Chronic sarcoid arthritis 3. Small bones sarcoidosis 4. Classic “lace-like” osteolysis pattern of small bones sarcoidosis 5. Large bones sarcoidosis 6. Spine sarcoidosis 7. Nodular muscular sarcoidosis 8. Nodular “dark star” pattern muscular sarcoidosis 9. Chronic muscular sarcoidosis 10. Subcutaneous sarcoidosis 11. Differential diagnosis of musculoskeletal sarcoidosis, such as metastasis, enchondroma, bone cyst, osteomyelitis 12. Multimodality evaluation of musculoskeletal sarcoidosis, including ultrasound, radiograph, computed tomography, magnetic resonance, and PET/CT

## MKEE-45 SYSTEMATIC APPROACH FOR DIFFERENTIATING LOCAL RECURRENCE OF MUSCULOSKELETAL (MSK) SARCOMA FROM POST-TREATMENT CHANGES WITH ADVANCED MRI TECHNIQUES - PICTOR ASSAY

Pedro Daltro, MD (*Abstract Co-Author*) Nothing to Disclose
Flavia M. Costa, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Flavia P. Lopes, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Heron Werner JR, MD (*Abstract Co-Author*) Nothing to Disclose
Carolina A. Almeida, MD (*Abstract Co-Author*) Nothing to Disclose
Clarissa C. Moraes Do Carmo, MD (*Abstract Co-Author*) Nothing to Disclose
Alexandre C. Valim, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Radiological surveillance assessments following musculoskeletal sarcoma surgery play a critical role in early detection of local recurrence. However, interpreting imaging can pose challenges, necessitating a systematic approach to accurately evaluate silent local recurrence. It is essential to understand the patient's clinical and surgical history and pretreatment images for differentiating recurrence from time-dependent posttreatment changes When conducting an examination, radiologists must determine which advanced MRI techniques (such as DIXON T1, STIR, DWI, DCE perfusion, and TIC curve analysis) should be employed to analyze both bone marrow and soft tissue. It is imperative to differentiate local recurrence from other time-dependent post-treatment changes, such as seroma, scarring, pseudotumor, radiation-induced marrow and soft tissue alterations, infection, neuropathy, and muscle atrophy, among others. For a more precise diagnosis, correlation of histopathological features with the radiological appearance of the tumor is essential. An understanding of the applicability and limitations of these techniques is necessary to ensure accurate diagnosis and potentially guide appropriate treatment for our patients.

**TABLE OF CONTENTS/OUTLINE**

Advanced MRI techniques and applicability in the early diagnosis of silent recurrence of MSK sarcoma and surveillance of these patients. Case discussion to illustrate false positive and false negative cases. Common pittfallsDifferential diagnosis. Utilization of 3D printing, virtual reality, and augmented reality

in diagnostic and therapeutic decision-making.

### MKEE-46 ZERO TE (OZTEO) MR BONE IMAGING: EXPECTED AND SURPRISING BENEFITS IN MUSCULOSKELETAL IMAGING

Andrew B. Ross, MD, MPH (*Abstract Co-Author*) Nothing to Disclose
Kenneth S. Lee, MD, MBA (*Abstract Co-Author*) Grant, NFL;Research support, Hologic, Inc;Royalties, RELX
Humberto G. Rosas, MD (*Abstract Co-Author*) Co-founder, AyrFlo;Stockholder, AyrFlo
Michael J. Tuite, MD (*Abstract Co-Author*) Nothing to Disclose
Nicholas C. Laucis, MD (*Abstract Co-Author*) Nothing to Disclose
Nicholas Tan, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

Zero TE (oZTEo) is a new MR sequence designed for imaging cortical bone to create 'CT-like' images during MR exams. This 3-4 minute sequence can be easily added onto existing MR protocols. The oZTEo sequence enables visualization and characterization of structures and material that typically have extremely low signal on conventional MR sequences, including bone cortex, soft tissue calcification and ossification, and crystal deposition. During our institution's two years of using oZTEo in clinical practice, a surprising benefit of the sequence is its 3D isotropic acquisition which enables MPR reformatting and better assessment of anatomy, coalitions, and characterization of fractures on MR.

#### TABLE OF CONTENTS/OUTLINE

1. Brief overview of the physics of the Zero TE (oZTEo) sequence 2. Example cases of oZTEo enabling better characterization of osseous lesions, abnormalities, and pathologic fractures 3. Example cases of oZTEo enabling characterization of soft tissue calcification/ossification/crystal deposition 4. Example cases of oZTEo enabling better visualization of osseous anatomy including symptomatic coalitions 5. Overview of our institution's implementation of oZTEo with our MSK MR protocols by indication to most efficiently utilize the sequence

### MKEE-47 SACRAL MASSES: DISTINGUISHING CHORDOMAS FROM BENIGN NOTOCHORDAL TUMORS AND OTHER SACRAL TUMORS

Andrew E. Rosenberg, MD (*Abstract Co-Author*) Nothing to Disclose

Fabiano N. Cardoso, MD (*Abstract Co-Author*) Nothing to Disclose
Brooke L. Sarna, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

The purpose of this exhibit is to highlight the importance of distinguishing benign from malignant sacral masses to enhance patient care and avoid unnecessary procedures. Particular focus is paid to chordomas and benign notochordal tumors (BNCTs), with an additional example of an intraosseous hemangioma (IH) which falls under the differential diagnosis of sacral masses. Upon completing this exhibit, the learner will be able to:1. Properly recognize and describe the typical MRI and CT features of chordomas and BNCTs, including features that distinguish the two.2. Properly recognize the typical histopathologic findings of chordomas and BNCTs and to synthesize them with what is seen macroscopically on MRI.3. Properly recognize intraosseous hemangiomas and their confounding imaging features in relation to chordomas and BNCTs as a differential diagnosis.

#### TABLE OF CONTENTS/OUTLINE

1. Introduction presenting sacral masses and their prevalence and morbidity. A differential diagnosis including both benign and malignant lesions will be provided.2. In particular, the distinguishing imaging features, pathologic correlates, and when available gross specimen and intra-operative photographs of chordomas, benign notochordal tumors, intraosseous hemangiomas, chondrosarcomas, giant cell tumors, and other less common sacral tumors will be provided.3. Objective information with subsequent discussion will be provided to help the general radiologist distinguish between these lesions and form a differential diagnosis.4. Conclusion.5. Bibliography.

### MKEE-48 STEPS TO RECOVERY: GUIDING THROUGH IMAGING OF THE POST-OPERATIVE KNEE

Diogo G. Leao Edelmuth, MD (*Abstract Co-Author*) Nothing to Disclose

**TEACHING POINTS**

Knee replacements are devices used to replace damaged parts of the knee, usually in patients with severe arthritis or serious injuries. This summary focuses on the main angles, measurements and changes related to prostheses to guide radiologists in their reports. These are the main angles and measurements: The alfa angle, the gamma angle e femoral component alignment in the axial plane evaluate the relationship between the femur and the femoral component. On the other hand, the beta angle, the sigma angle and tibial component alignment in the axial plane evaluate the relationship between the tibia and the tibial component. As relevant changes we can highlight loosening: Indicated by changes in angles or increase in joint space. Radiolucent lines suggest this problem; polyethylene wear: evidenced by decreased joint space; infection: suspected by the presence of edema, increase in soft tissue or bone erosion.

**TABLE OF CONTENTS/OUTLINE**

Components of knee prostheses and their zones: it is essential to know what is being evaluated and how to describe the topography of the knee replacements. Main angles, measurements and variations of implant techniques: as important as knowing what to look for, is knowing where and how to look. Main complications: among them are osteolysis, loosening, cortical notching, periprosthetic fractures, infections and wear of the polyethylene component.

## MKEE-51 HALLUX VALGUS DEFORMITY: A COMPREHENSIVE AND ILLUSTRATED GUIDE FOR ITS RADIOGRAPHIC EVALUATION, SURGICAL TREATMENT OPTIONS, AND POTENTIAL COMPLICATIONS

**Awards**
**Certificate of Merit**

Ty K. Subhawong, MD (*Abstract Co-Author*) Research Consultant, Arog Pharmaceuticals, Inc;Stockholder, AbbVie Inc;Stockholder, AstraZeneca PLC;Stockholder, Johnson & Johnson;Stockholder, Pfizer Inc ;Stockholder, F. Hoffmann-La Roche Ltd;Stockholder, Teva Pharmaceutical Industries Ltd
Fabiano N. Cardoso, MD (*Abstract Co-Author*) Nothing to Disclose
Bryan Nixon, MD (*Abstract Co-Author*) Nothing to Disclose
Brooke L. Sarna, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The purpose of this exhibit is to provide learners with a radiographic definition of hallux valgus. Illustrations of various possible measurements are included to aid learners in improving the accuracy of their reports. An explanation and illustration of various surgical corrective techniques is also provided to better aid learners in interpreting post-operative films. Upon completing this exhibit, the learner will be able to:1. Diagnose hallux valgus on radiographs.2. Provide various associated measurements to the orthopedic surgeon to better aid in management and operative planning.3. Properly recognize various common surgical corrective techniques in the post-operative imaging setting.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction presenting hallux valgus and its prevalence and morbidity. The radiographic definition and associated measurements on foot radiographs will be provided with corresponding illustrations.2. In-depth discussion outlining various common corrective surgical techniques, including Chevron osteotomy, Akin osteotomy, Scarf osteotomy, Weil osteotomy, and joint arthodeses (ex. Lapidus procedure) with accompanying illustrations and radiographic examples. Particular attention will be paid to post-operative imaging and evaluation of complications. When available, intra-operative photographic correlation will be provided.3. Examples of surgical complications and their radiographic and, when available, intra-operative correlation. Emphasis will be placed on how the general radiologist can recognize early and late complications.4. Conclusion.5. Bibliography.

## MKEE-52 DON'T FALL BEHIND: A REVIEW OF SACRAL FRACTURES AND LUMBOSACRAL DISSOCIATION INJURY PATTERNS

Jacob C. Mandell, MD (*Abstract Co-Author*) Author with royalties, Cambridge University Press
Bharti Khurana, MD, MBA (*Abstract Co-Author*) Consultant, General Electric Company;Editor, Wolters Kluwer nv;Author, Cambridge University Press;Consultant, ROKIT Healthcare, Inc
Yan Epelboym, MPH (*Abstract Co-Author*) Association of University Radiologists GE Radiology Research Academic Fellowship Boston Imaging Core Laboratory: Consultant
Phat Tan Nguyen, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Sacral fracture classifications and how the radiologist's interpretation impacts orthopedic management.2. Lumbosacral dissociation injury patterns and their pathophysiologic mechanism of action.3. Vascular injuries commonly associated with sacral fractures and lumbosacral dissociations.

**TABLE OF CONTENTS/OUTLINE**

• Bony and Ligamentous Pelvic Anatomy• Imaging Evaluation• Classification of Sacral Fractures• Lumbosacral Dissociation Injury Patterns• Associated Vascular Injuries• Conclusion / Teaching SummaryPrompt identification of sacral fractures and lumbosacral dissociation is critical to facilitate optimal evaluation and management of trauma patients. Sacral fractures may be associated with low-energy impact in demineralized individuals or with high-energy impact in the general population. Radiologists should be familiar with the classification of common and rare types of sacral fractures to facilitate optimal communication with the orthopedist. The most commonly used is the Denis classification system which categorizes fractures into three zones (Zones 1, 2, and 3) and four morphological subtypes (H, U, T, and ?). Anatomic separation of the pelvis from the spinal column, otherwise known as lumbosacral dissociation is a highly morbid and rare subtype of sacral fracture. Knowledge and identification of lumbosacral dissociation injury patterns and subtle associated injuries will facilitate appropriate orthopedic intervention. A review of commonly associated pelvic vascular injury is also critical to facilitate appropriate interventional and surgical management.

## MKEE-53 ARTICULAR AND PERIARTICULAR PATHOLOGY OF THE ADULT HIP: WHAT ARE THE STRENGTHS AND WEAKNESSES OF ULTRASOUND?

**Awards**
**Cum Laude**

Andrew J. Grainger, MD (*Abstract Co-Author*) Speakers Bureau, General Electric Company
Robert S. Campbell, MBChB, FRCR (*Abstract Co-Author*) Nothing to Disclose
Lisa Billone, BSc (*Abstract Co-Author*) Nothing to Disclose
Sarah Allred, BSc (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Utilized correctly, the resolution and dynamic abilities of ultrasound provide a useful diagnostic tool to assess the hip joint and adjacent structures.2. The strengths and limitations of ultrasound diagnosis will be highlighted, providing the participant with the knowledge of when ultrasound is best suited for assessment in the adult hip.3. Anatomy, technical considerations, optimal scanning techniques and pathologic examples will be reviewed for the structures indicated in the outline. Correlation with other modalities where appropriate.4. Pitfalls will be reviewed with the goal of minimizing diagnostic error.

**TABLE OF CONTENTS/OUTLINE**

> ANTERIOR HIP: anatomy, sonographic technique, pathologic exampleso Hip joint capsule joint distention; highlighting the importance of aspiration, demonstration of alternative windows o Acetabular Labrum Limited visualization with ultrasound - use secondary signs, include alternate imaging windowso Femoroacetabular Impingement (FAI): highlight causes dynamic U/S to assess for FAIo Iliopsoas Complex outline components, highlight dynamic U/S, tendinopathy, impingement, bursal distention effectso The Prosthetic Hip joint infection, ALVAL, impingement> POSTERIOR HIP: including anatomy, sonographic technique, pathologic exampleso Posterior joint capsuleo Ischiofemoral impingement highlight causes dynamic ultrasound to assess for IFI, impact on Sciatic Nerveo Short external rotators: tips to identify structures overlying the posterior joint, highlighting limitations of assessment due to depth> Summary of strengths and weaknesses

## MKEE-54 MUSCLE EDEMA: A REVIEW OF APPROACHES TO THE DIFFERENTIAL DIAGNOSES

Julia E. Castro Anaya, MD (*Abstract Co-Author*) Nothing to Disclose
Andre Y. Aihara, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Raimundo Gomes Do Rego Neto (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The purpose of this study is:• Review the typical imaging findings of muscular edema on magnetic resonance imaging (MRI).• Characterize some of the main pathologies associated with muscular edema, understanding in this context their different physiopathologies.• Didactically propose a practical way to systematically approach various differential diagnoses in a didactic manner, considering the mechanism of edema, its distribution pattern, and enhancement after contrast administration.

**TABLE OF CONTENTS/OUTLINE**

• Characterizing muscular edema: normal appearance of musculature on magnetic resonance imaging and how to recognize characteristic findings of edema.Schematic drawing and sample cases• Physiopathology and mechanisms leading to muscular edema.Sample cases• Pattern of distribution of muscular edema according to the involvement of muscle groups.Sample cases• Characteristics after intravenous contrast administration.Sample cases• Flowchart with a targeted approach to the main differential diagnoses.Schematic drawing and table

## MKEE-55 ADD TO YOUR KNOWLEDGE: REVIEW OF THE NORMAL APPEARANCE AND TRAUMATIC INJURIES TO THE HIP ADDUCTOR MUSCULATURE

Chad Klochko, MD (*Abstract Co-Author*) Nothing to Disclose
Lisa Doan (*Abstract Co-Author*) Nothing to Disclose
Joseph G. Craig, MBChB (*Abstract Co-Author*) Nothing to Disclose
Brendan M. Franz, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1.) Overview of the normal adductor musculature of the hip on multiplanar MRI and ultrasound. 2.) Review of traumatic pathology involving the hip adductor musculature. 3.) Select additional pathologies of the medial hip musculature.

**TABLE OF CONTENTS/OUTLINE**

1.) Overview normal appearance of the adductor musculature of the hip on multiplanar MRI and ultrasound with review of associated muscle function. Including obturator Internus/Externus, Pectineus, Adductor Longus/Brevis, Adductor Magnus, Gracilis, Sartorius, Tensor fascia Lata, Iliopsoas, Vastus lateralis/medialis, and Gluteus Maximus. 2.) Review of traumatic pathology of the hip adductor musculature using both multiplanar MRI and ultrasound. Examples of muscle strain, partial thickness and full thickness tears involving the TFL, pectineus, obturator interns/externus, and adductor brevis. Avulsion injuries involving hamstring origins, adductor longus, and iliopsoas insertion. Isolated muscle atrophy. 3.) Example of additional pathologies affecting the adductor musculature including hematoma, abscess, and masses/neurofibromas. 4.) Conclusion

## MKEE-56 WELCOME TO THE JUNGLE: ANIMAL INSPIRED MUSCULOSKELETAL AND SPINE RADIOLOGY SIGNS

Jeremiah R. Long, MD (*Abstract Co-Author*) Nothing to Disclose
Andrew P. Sill, MD (*Abstract Co-Author*) Nothing to Disclose
Logan Haug, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Radiological signs are important for radiologists and trainees to be familiar with because they can enhance recall of associated pathology and improve diagnostic accuracy. This exhibit will demonstrate the common and recognizable animal inspired musculoskeletal and spine imaging signs via a quiz-style, case-based approach and, when not pathognomonic, provide a differential highlighting the key imaging features supporting the correct diagnosis. For example, in the case of the gull-wing sign which is commonly associated with erosive osteoarthritis, we will highlight the clinical and radiologic features (distribution, joint space narrowing, and soft tissue changes) of other erosive arthritides in the differential such as psoriatic and rheumatoid arthritis.

**TABLE OF CONTENTS/OUTLINE**

A "sign" represents a recognizable and recurring radiological pattern suggestive of a certain disease or condition. Our presentation will highlight the key features of the musculoskeletal and spine radiological signs listed below: Extra-axial skeleton signs: 1. Pooping duck sign (triquetral fracture) 2. Anteater sign (calcaneonavicular coalition) 3. Gull wing sign (erosive osteoarthritis) 4. Rat bite erosion (gout) 5. Zebra stripe sign (transverse sclerotic lines in the long bones) 6. Swan neck deformity (autoimmune/inflammatory arthropathies) 7. Talar beak sign (tarsal coalition) 8. Fishtail deformity (elbow). Axial skeleton signs: 1. Winking owl sign (unilateral absent pedicle) 2. Scotty dog (normal anatomy) 3. Claw sign (degenerative disc disease) 4. Shark's fin sign (unilateral facet joint dislocation) 5. Fish vertebrae sign (osteoporosis).

## MKEE-57 REPORTING AND DATA SYSTEMS (RADS) IN MUSCULOSKELETAL (MSK) RADIOLOGY: EXPLAINED IN A SIMPLIFIED MANNER FOR PRACTICAL USAGE

Atul K. Taneja, MD,PhD (*Abstract Co-Author*) Nothing to Disclose
Avneesh Chhabra, MD, MBA (*Abstract Co-Author*) Consultant, ICON plc;Consultant, Treace Medical Concepts, Inc;Author with royalties, Wolters Kluwer nv;Author with royalties, Jaypee Brothers Medical Publishers Ltd;Speaker, Siemens AG;Medical Advisor, ImageBiopsy Lab;Research Grant, ImageBiopsy Lab
Flavio Duarte Silva (*Abstract Co-Author*) Nothing to Disclose
Angela He, BS, BA (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Learn the value of Reporting and Data Systems in radiology for patient care and multidisciplinary communications-management. 2. Gain knowledge of different RADS systems in musculoskeletal radiology with respect to tumors, infections, and neuropathy scoring. 3. Improve understanding of key points of each of the RADS systems with illustrative imaging examples.

**TABLE OF CONTENTS/OUTLINE**

1. Review of American College of Radiology (ACR) statements for RADS systems and their value in radiology with relevance to improving interdisciplinary communications and patient care. 2. Discussion of key points of different RADS systems while highlighting key advantages and pitfalls for each scoring system a. Musculoskeletal infection-RADS (MSKI-RADS) b. Bone-RADS c. Soft Tissue-RADS (ST-RADS) d. Osseous Tumor-RADS (OT-RADS) e. Neuropathy Score-RADS (NS-RADS) 3. Case-based illustration of imaging examples in quiz format to aid reader learning and understanding in different RADS systems.

## MKEE-58 MR IMAGING OF ACUTE COMPARTMENT SYNDROME THROUGHOUT THE BODY

Atul K. Taneja, MD,PhD (*Abstract Co-Author*) Nothing to Disclose
Alipio Ormond Filho, MD (*Abstract Co-Author*) Nothing to Disclose

Flavio Duarte Silva (*Abstract Co-Author*) Nothing to Disclose
Angela He, BS, BA (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Learn about acute compartment syndrome and its presentation in various muscle groups of the body.2. Improve understanding of compartment syndrome imaging findings on MR imaging across various affected muscle groups with case-based illustrative imaging examples and gain knowledge of the consequences and complications of delayed or missed acute compartment syndrome diagnoses, especially in atypical cases

**TABLE OF CONTENTS/OUTLINE**

1. Review of acute compartment syndrome, its common clinical manifestations, and possible complications2. Discuss the current standards of diagnosing acute compartment syndrome, potential pitfalls of such methods, and the current role of imaging in diagnosing acute compartment syndrome3. Case-based illustration of imaging examples of acute compartment syndrome in various muscle groups to aid reader learning and prompt recognition of pertinent imaging findings; muscle groups to be covered: a. Legs b. Foot c. Thigh d. Paravertebral e. Forearm4. Case-based illustrations of chronic complications: a. Muscular atrophy b. Muscular fibrosis c. Tendinopathy d. Neuropathy

## MKEE-59 SCAPHOLUNATE INSTABILITY: A CLINICAL AND RADIOLOGICAL SYNOPSIS

Harikrishnan Nandakumar, MD (*Abstract Co-Author*) Nothing to Disclose
Harlan M. Stock, MD (*Abstract Co-Author*) Nothing to Disclose
Sukrita Menon, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Understanding the normal scapho-luno-capitate alignment, scapholunate and capitolunate angles and normal carpal arcs. 2. Review the structure of scapholunate ligament (SLL). 3. Understanding the mechanism of SLL disruption, its clinical importance, and arthroscopic classification (Geissler). 4. Review the mechanism of scapholunate dissociation, perilunate, lunate and midcarpal dislocations (Mayfield classification) using multimodality imaging. 5. Understanding the sequelae of carpal injuries including Dorsal and Volar intercalated segment instabilities (DISI and VISI). 6. Scapholunate Advanced Collapse (SLAC) and Scaphoid Nonunion Advanced Collapse (SNAC) - Review the etiology, stages, and multimodality imaging findings. 7. Prognosis, staging and brief overview of treatment for SLL injuries (each stage)

**TABLE OF CONTENTS/OUTLINE**

1. Introduction: Normal Scapholunate alignment, Normal intercarpal angles and carpal arcs. 2. Anatomy and function of SLL. 3. SLL injury: Etiology and arthroscopic classification. 4. Case based discussion - Mechanism, Ligament(s) affected, radiological features: a. Scapholunate dissociation. b. Perilunate dislocation. c. Midcarpal dislocation. d. Lunate dislocation. 5. SLAC: Etiology, mechanism, Watson staging system, radiological features. 6. SNAC: Etiology, mechanism, stages of osteoarthritis, radiological features. 7. DISI and VISI: Etiology, mechanism, and radiological features. 8. Prognostic factors and staging of SLL injuries (Garcia-Elias) and management

## MKEE-6 BIOMECHANICS, IMAGING AND DIFFERENTIAL DIAGNOSIS OF AVULSION FRACTURES: A PICTORIAL REVIEW

Elisabetta Ponte, MD (*Abstract Co-Author*) Nothing to Disclose
Andrei Daniel Onuta, MD (*Abstract Co-Author*) Nothing to Disclose
Monica Bernabeu Rodriguez, MD (*Abstract Co-Author*) Nothing to Disclose
Manuel Sebastian Paez Alvarez, MD (*Abstract Co-Author*) Nothing to Disclose
Victoria Esteban Izquierdo, MD (*Abstract Co-Author*) Nothing to Disclose
Pablo Garces Marin, MD (*Abstract Co-Author*) Nothing to Disclose
Yolanda Herrero Gomez, MD (*Abstract Co-Author*) Nothing to Disclose
Jaime Lopez Martin, MD (*Abstract Co-Author*) Nothing to Disclose
Javier Tejedor Toquero, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The aim of this report is to review the various ways in which avulsion fractures manifest in adult and pediatric population.To describe how avulsion fractures affect adjacent structures, and the best way to recognize them with their imaging characteristics at plain radiograph, computed tomography and resonance magnetic studies.To illustrate the main imaging features and to highlight associated injuries with-own experienced images.

**TABLE OF CONTENTS/OUTLINE**

Introduction, biomechanics, location and differential diagnosis.Avulsion fractures manifest when the tendon, ligament or joint capsule, becomes dislodged from the bone, typically resulting in the detachment of a cortical bone fragment.-Acute injuries demonstrate the presence of avulsed bone fragments.-Subacute/Chronic injuries exhibit more aggressive radiographic presentation due to repetitive trauma.The mechanism is determined when a structure that originates or is inserted into the bone exerts tension in the opposite direction to the bone, and this tension significantly exceeds the tensile strength of the bone.These fractures can occur in various anatomical locations and it is crucial to know their presentation well since complex injuries such as those that involve intra-articular extension or those that associate the presence of intra-articular loose bodies, delay in diagnosis can modify the prognosis and in case of subacute/chronic diseases, knowledge of them will help us not to confuse them with other pathologies.

## MKEE-60 ATHLETE'S HIP DISORDERS: BEYOND PUBALGIA

Irline Cordeiro de Macedo Pontes, MD (*Abstract Co-Author*) Nothing to Disclose
Matheus Tonholo Ikedo, MD (*Abstract Co-Author*) Nothing to Disclose

Gustavo Coutinho, MD (*Abstract Co-Author*) Nothing to Disclose
Gabrielle Nakamura, MD (*Abstract Co-Author*) Nothing to Disclose
Renato Fujiki, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Hip is one of the most complex articulations of the human body due its sophisticated biomechanics. Athletes test its capacity to the limit and some lesions are expected. However, hip disorders in athletes should not be misdiagnosed because most of them, if not treated correctly, can lead to movement limitation, decrease in quality of life and harm to professional athletes' career.The purpose of this exhibit is:
- Demonstrate a comprehensive understanding of the normal anatomy of the hip joint
- Explore the universe of hip pathologies beyond athlete's pubalgia, understanding its specific conditions and the difficulty to get the correct diagnosis
- Show how misdiagnosis and late treatment change prognosis, especially in professional athletes' career, even with small pathologies

**TABLE OF CONTENTS/OUTLINE**

1. Introduction: a. Hip anatomy, biomechanics and its association with sports b. Epidemiology, clinical aspects and prognosis of athletes' hip disorders, especially in career lifetime and return to practice 2. Case-by-case review, discussion and interpretation of the main pathologies of athlete's hip in different imaging methods (x-ray, ultrasound, computed tomography and magnetic resonance imaging) and compartmentalization a. bone and joints b. cartilage c. myotendinous 3. Conclusion and "take-home messages"

## MKEE-61 GETTING IT RIGHT WHEN TAKING A STANCE: HOW TO DIFFERENTIATE INFECTIONS FROM SPINAL TUMORS

Matheus Tonholo Ikedo, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Examine the main differential diagnoses of infectious and tumorous lesions in the spine and paravertebral structures, and the benefits of MRI in studying them; Identify key MRI findings for infections vs. tumors in the spine; Develop a systematic MRI interpretation for accurate diagnosis of spine tumor vs. infectious lesions.

**TABLE OF CONTENTS/OUTLINE**

The variety of causes in spinal lesions poses a diagnostic challenge. Radiologists must distinguish between manifestations of infections and tumors in spine imaging. This study provides an overview of these conditions, presents relevant images, and outlines MRI evaluation strategies to differentiate between infectious and tumor-related findings.Patients with spinal lesions commonly exhibit nonspecific symptoms like back pain and neurological deficits. In these cases, careful radiological interpretation is crucial to differentiate between spine infections and tumors, with MRI being the preferred modality.In most infection cases, MRI typically reveals vertebral endplate destruction, disc and bone marrow signal abnormalities, and epidural or paravertebral abscesses. Among infectious causes, spondylodiscitis and tuberculosis are common. Neoplastic causes include primary tumors like osteosarcoma and Ewing's sarcoma, and metastatic diseases. Overall, radiologists need to understand the main tumor and infectious spine diagnoses, and employ a systematic MRI interpretation for accurate diagnosis.

## MKEE-62 TODAY'S PRACTICE, TOMORROW'S PATIENTS: GENETIC MUSCULOSKELETAL DISEASES WORTH OUR ATTENTION

Majid Chalian, MD (*Abstract Co-Author*) Grant, The Boeing Company

**TEACHING POINTS**

Review the pathophysiology and clinical findings of genetic musculoskeletal disorders Describe the typical musculoskeletal imaging findings of each genetic disorder Discuss the differential diagnosis and associated systemic imaging findings of each genetic disorder

**TABLE OF CONTENTS/OUTLINE**

Many genetic disorders involve the musculoskeletal (MSK) system and have typical imaging features, but radiologists have difficulty interpreting them due to their rarity. Therefore, it is important that radiologists be familiar with these genetic disorders and their typical imaging appearances to accurately aid in diagnosis and proper management. We will discuss different genetic disorders affecting the MSK system with their imaging appearances. We will explore imaging findings of each disorder and discuss how imaging aids in correct diagnosis. In this exhibit, weIn this exhibit, we will also review the clinical manifestations and associated systemic imaging findings. The focus of our work is the typical imaging appearance of: A to Z Achondroplasia Blount's disease Caudal regression syndrome Cleidocranial dysplasia Congenital insensitivity to pain and anhidrosis Congenital Tibial Hemimelia Diaphyseal dysplasia (Camurati-Engelmann disease) Fibrodysplasia ossificans progressiva Gaucher's disease Hereditary multiple osteochondromas Limb-girdle muscular dystrophy Madelung's deformities Mucolipidosis Mucopolysaccharidosis: Hurler syndrome (I), Hunter's syndrome (II), Morquio's syndrome (IV) Multiple epiphyseal dysplasias Nail patella syndrome Osteogenesis imperfecta Osteopetrosis Lipid granulomatosis Primary hypertrophic osteoarthropathy Proteus syndrome Syndactyly and polydactyly

## MKEE-63 HEREDITARY MULTIPLE EXOSTOSES: REVISITING AN OLD FRIEND

Sara Gomez Pena, MD (*Abstract Co-Author*) Nothing to Disclose
Sonia Lon, MD (*Abstract Co-Author*) Nothing to Disclose
Manuel Lopez Herrero, MD (*Abstract Co-Author*) Nothing to Disclose
Ana M. Crespo, MD, PhD (*Abstract Co-Author*) Nothing to Disclose

Maria J. Moreno Casado (*Abstract Co-Author*) Nothing to Disclose
Alvaro Rueda-de-Eusebio, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To review the clinical presentation and pathogenesis of Hereditary Multiple Exostoses (HME). - To describe the classic imaging findings of HME, specially conventional radiography and skeletal surveys for its diagnosis and follow-up. -To highlight the role of CT and MRI for the better characterization of lesions and complications. - To learn about the main complications and deformities associated with HME, with special focus on malignant transformation. It is important that radiologists know this disease and its follow-up protocol in order to identify cases with a high risk of malignant transformation.

**TABLE OF CONTENTS/OUTLINE**

Background: HME presents as multiple osteochondromas (OC) arising from metaphyses of long and flat bones. Clinical presentation: lesions may be asymptomatic, but they may also cause pain or other symptoms. Deformities and chondrosarcomatous transformation can also occur. Pathogenesis and histopathology Imaging Features: OC may vary in shape and distribution. Cases are usually studied and followed up with skeletal surveys. In some patients, MRI and CT are necessary to further characterize suspicious lesions. US is important in pediatric cases. Complications: --Osseous deformities In recent years, new classifications have been published, such as the Masada and Jo classification for forearm deformities or the Ahn classification for ankle deformities. Synostosis of kissing OC, fracture of an OC, other deformities, vascular and neural complcations and formation of bursas can also occur. --Malignant transformation is less frequent but is the most dangerous complication. Ų We will use representative images from the series of our Sarcoma Reference Center, with more than 35 cases.

## MKEE-64 PICTORIAL REVIEW OF CORRELATION BETWEEN MRI AND ARTHROSCOPIC FINDINGS OF KNEE JOINT

Han-Ying Lin, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. There exists a robust correlation between MRI and arthroscopic evaluations in diagnosing cruciate ligament pathology.2. There is suboptimal correlation observed for meniscal pathology, particularly for ramp lesion, which may present very subtle abnormalities on MRI.3. For cartilaginous pathology, a strong correlation exists between pre-operative MR and arthroscopy. However, the post-operative appearance of cartilage on MRI varies depending on the type of procedure performed and the duration of follow-up.4. For acute traumatic injuries involving the lateral collateral ligament and posterolateral corner, there exists a strong correlation. However, in cases of chronic injury, MRI findings may present subtle manifestations, posing challenges for accurate diagnosis, and reliance on physical examination and intraoperative observations becomes pivotal for accurate assessment and management. 5. There is strong correlation between MRI and arthroscopy for inflammatory process such as gout and pigmented villonodular synovitis (PVNS).

**TABLE OF CONTENTS/OUTLINE**

1. Correlation for ACL, cyclops lesion, and meniscal tear2. Correlation for PCL, LCL, posterolateral corner injury3. Cartilage pathology undergoing various types of procedures, with follow-up images4. Inflammatory condition: gouty arthritis, PVNS.

## MKEE-65 TUBERCULOSIS IN MOTION: A RADIOLOGICAL VIEW OF THE MUSCULOSKELETAL TISSUES

Matheus Tonholo Ikedo, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Tuberculosis (TB) is a widespread public health problem. Musculoskeletal TB accounts for 25% of extrapulmonary cases and has a wide variety of imaging manifestations. Therefore, the aim of this exhibit is to:Present the main forms of musculoskeletal tuberculosis involvement.Review the main imaging findings from the different types of musculoskeletal TB, including both axial and extra-axial involvement.Demonstrate the main differential diagnoses of each type of musculoskeletal TB and ways to differentiate both conditions.

**TABLE OF CONTENTS/OUTLINE**

Introduction: the importance of identifying the main imaging findings from musculoskeletal TB.Main imaging findings from different types of musculoskeletal TB: Axial involvement: spondylodiscitis; tuberculous spinal meningitis; sacroiliac joints; the chest wall; Extra-axial involvement: peripheral arthritis; osteomyelitis; tenosynovitis and bursitis; myositis; Disseminated tuberculosis.Main differential diagnoses and their radiographic features: Infectious diseases ; Rheumatologic conditions ; Malignancy. Conclusion and take-home messages.

## MKEE-66 IMAGING OF MUSCULOSKELETAL INFECTIONS: KEY IMAGING FINDINGS AND DIFFERENTIAL DIAGNOSIS

Andre Y. Aihara, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Paola C. Kuenzer Goes, MD (*Abstract Co-Author*) Nothing to Disclose
Lauren L. Pinto, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Imaging is crucial in identifying key findings of musculoskeletal infections, assessing their extension, complications, and facilitating differential diagnoses. The purpose of this exhibit is to: elucidate the role of imaging modalities in diagnosing musculoskeletal infections, highlight key imaging findings that distinguish various types and stages of infection and facilitate differential diagnosis by illustrating and comparing infectious processes with other non-infectious conditions.

**TABLE OF CONTENTS/OUTLINE**

Epidemiology and Classification of Infections: overview and categorization of musculoskeletal infections.Imaging Modalities: Advantages and Disadvantages. Comparative analysis of X-ray, ultrasound, CT, and MRI.Key Imaging Findings: features such as increased soft tissue, fluid collections, gas formation, periostitis, bone edema, intramedullary fat globules, bone destruction, sequestra, cloaca, and involucrum.Complications: issues including deep infection extension, collections, thrombophlebitis, delayed or nonunion in fractures, joint ankylosis, subchondral fractures, and osteonecrosis.Differential Diagnosis: differentiating musculoskeletal infections from inflammatory, microcrystalline diseases, traumatic, and neoplastic disorders.

### TEACHING POINTS

This exhibit aims to: review intervention musculoskeletal procedures for low back pain relief in acute and outpatient settings, with emphasis on epidural injections; show a guide for patient interview; highlight the crucial aspects of pre-procedural planning; offer a step-by-step guide for performing both interlaminar and transforaminal lumbar spine infiltrations, discussing technique and possible challenges and complications; provide practical tips, tricks and self-assessment tools; discuss patient outcome and follow-up post procedure; briefly discuss other pain relief procedures in the lumbar spine, as well as future directions.

### TABLE OF CONTENTS/OUTLINE

Introduction to lumbar spine procedures in low back painBrief review of anatomy and physiopathology related to low back pain/Evidence-based discussion on indications and contraindication, emphasizing epidural infiltrations/Patient interview best practicesPre procedural planningPatient workup and expectations/Required imaging studies, procedure decision and planning/Preparation of materials, medications, contrast media, radiation dose discussionStep-by-step lumbar spine infiltration guide: interlaminar and transforaminal techniquesProcedure day preparation/Safety measures and sterile technique/Needle placement and localization, contrast and medication injectionPost procedure care/Case discussion and practical insights: cases of success, challenging cases, complications, tips and tricks and continuous medical education/Take-home points

## MKEE-69 DON'T FORGET POSTERIOR SHOULDER INSTABILITY, LEARN MORE ABOUT IT: MRI FINDINGS

Karly Cristhelly Garrido Estrella, MD (*Abstract Co-Author*) Nothing to Disclose
Juan Eugenio Cosme, MD (*Abstract Co-Author*) Nothing to Disclose
Sofia Arizaga, MD (*Abstract Co-Author*) Nothing to Disclose
Pamela L. Mendieta Rodriguez, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• To illustrate the relevant anatomy of the shoulder• To describe the biomechanism by which posterior shoulder instability occurs• To list the main etiologies of posterior shoulder instability• To review the role and importance of Magnetic Resonance Imaging (MRI) in the diagnosis of posterior instability• To explain step by step each of the associated lesions and their characteristics in the MRI showing images of the pathology.

### TABLE OF CONTENTS/OUTLINE

1. Introduction2. Relevant shoulder anatomy3. Biomechanics of posterior shoulder instability4. Etiological factors5. MRI (Magnetic Resonance Imaging) diagnosis and importance of Magnetic Resonance Arthrography6. Associated lesions: Reverse Hill-Sachs injury (McLaughlin injury), reverse Bankart lesion, reverse Perthes lesion, POLPSA (posterior labrocapsular periosteal sleeve avulsion injury), posterior GLAD injury (glenolabral articular disruption), reverse HAGL lesion (reverse humeral avulsion of the glenohumeral ligament) or RHAGL injuries, Kim lesion, Bennett lesion.7. Conclusions8. References.

## MKEE-7 UNVEILING ASYMMETRY: DYNAMIC INTERSECTIONS AND FIBER ORIENTATION SHIFTS IN THE RADIOULNAR LIGAMENTS OF THE TRIANGULAR FIBROCARTILAGE COMPLEX

**Awards**
**Cum Laude**

Hiroshi Yoshioka, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Keiichi Akita, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Yasuyuki Kurihara, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Taiki Nozaki, MD (*Abstract Co-Author*) Nothing to Disclose
Akimoto Nimura (*Abstract Co-Author*) Nothing to Disclose
Saya Horiuchi, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Explore the nuanced anatomy of the radioulnar ligaments in the Triangular Fibrocartilage Complex (TFCC) through our study, which includes cadaver dissections, histology, and MRI findings. We will question the conventional notion of ligament symmetry, presenting variations in fiber orientation from their origin to insertion. Additionally, we'll examine how these ligaments cross, their importance for joint stability and motion, and present our new concept, supported by comprehensive evidence, potentially influencing clinical and radiological perspectives on the TFCC.

**TABLE OF CONTENTS/OUTLINE**

1) Reevaluating the conventional view of the radioulnar ligaments' symmetry in the TFCC. 2) Mapping the gradations in fiber orientation from the proximal ends to the distal attachments in the ligament's pathway. 3) Highlighting the complex interweaving of the radioulnar ligaments, potentially influencing joint stability and dexterity. 4) Considering the practical implications of these anatomical insights for improving clinical approaches and radiological evaluations of the TFCC.

## MKEE-70 HOLDING YOUR BACK: PARAVERTEBRAL LESIONS

Andre Y. Aihara, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Paola C. Kuenzer Goes, MD (*Abstract Co-Author*) Nothing to Disclose
Daisy T. Kase (*Abstract Co-Author*) Nothing to Disclose
Lucas K. Miyahara, MD (*Abstract Co-Author*) Nothing to Disclose
Leonardo Kazunori Tsuji, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The paravertebral region is a complex anatomical structure located adjacent to the spine, providing it with stability, range of movement, vascular supply, containing the proximal portion of the nerves and the sympathetic chain/paravertebral ganglia. Paravertebral lesions can be tumoral or not, and may be primary, arising from any of the paravertebral components, or secondary, by invasion from adjacent structures or hematogenic/lymphatic dissemination. The purpose of this exhibit is to: 1. Review the paravertebral region, its anatomy, components, from the cervical to the sacral spine, and the relations between them. 2. Identify and classify the paravertebral lesions, illustrating the patterns of paravertebral lesions and the related etiology. 3. Highlight the main information that radiologists should include when reporting paravertebral lesions.

**TABLE OF CONTENTS/OUTLINE**

Introduction: General review of the normal paravertebral region and particularities from each segment (cervical, thoracic, lumbar and sacral). Differential diagnostic of paravertebral lesions and their general characteristics. Assessment of each imaging modality suitability in evaluating the paravertebral region. Tumoral lesions: Classifying the main groups of tumors, primary and secondary. Illustrating the tumoral lesions and their main imaging findings, and when adequate specific patterns of a tumor or a group. Non-tumoral lesions: Classifying the non-tumoral lesions by etiology. Illustrating their main imaging findings. Summary Table with the main lesions and their imaging aspects. Main information that should be included in the radiological report. Bibliographical references.

Agustin M. Marrero SR, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To know the anatomy, function, and biodynamic aspects of the adductor muscle complex. To recognize the spectrum of tearing of adductor muscles and tendons during sports practice analyzing their mechanism of injury. To evaluate the imaging methods in the different adductor lesions and to describe the precise location and characteristics. To describe ultrasound and magnetic resonance signs of these tears, emphasizing the prognostic criteria for recovery, return to play, and re-injury.

**TABLE OF CONTENTS/OUTLINE**

The adductor complex muscles consist of adductor longus, adductor brevis, adductor magnus, gracilis and pectineus muscles. Its main function is to bring the leg towards the midline of the body, and they also influence during high-speed directional changes. This muscle group is the second group most likely to be injured in sports with eccentric loads, particularly soccer. Adductor longus is the most superficial and originates from the anterior sector of the pubis and it inserts distally into the medial lip of the femur.The injuries of adductor muscle group were included in the category that causes of groin pain, being the adductor longus the most affected at the level of proximal insertion or at the myotendinous junction.Adductor longus proximal and central myotendinous junction injuries and proximal tendon injuries result in a large amount of time away from sports and a high risk of re-injury. Depending on its extent and location, we can estimate the evolution of injuries and the return to play.Adductor brevis and adductor magnus muscle injuries are less common than those of adductor longus. Adductor magnus, gracilis and pectineus muscle injuries are rare and uncommon.

## MKEE-73 *"BAD TO THE BONE"*: A GUIDE FOR THE CHALLENGING DIAGNOSIS OF CHRONIC NONBACTERIAL OSTEOMYELITIS

Adham A. Castro, MD (*Abstract Co-Author*) Nothing to Disclose
Mariana Barros Mendonca Figueiredo (*Abstract Co-Author*) Nothing to Disclose
CINTIA LEAL (*Abstract Co-Author*) Nothing to Disclose
Artur Da Rocha Correa Fernandes, MD, PhD (*Abstract Co-Author*) Nothing to Disclose

Stefanie Basilio Medeiros, MD (*Abstract Co-Author*) Nothing to Disclose
Leticia dos Reis Morimoto, MD (*Abstract Co-Author*) Nothing to Disclose
Leticia E. Lobato, MD, MD (*Abstract Co-Author*) Nothing to Disclose
Karina Hayama, MD (*Abstract Co-Author*) Nothing to Disclose
Thayssa Leite, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The purpose of this exhibit is:1. To review pathophysiology, epidemiology and natural history of Chronic Nonbacterial Osteomyelitis (CNO), emphasizing the key factors important for the radiologist to understand. 2. To correlate its natural history with imaging findings using a multimodal approach (including CR, CT, MRI and whole body exams). 3. To illustrate the presentations and specific findings of CNO and its differential diagnosis through didactic cases.

**TABLE OF CONTENTS/OUTLINE**

Table of Contents/Outline:1. Introduction and overview of Chronic Nonbacterial Osteomyelitis (CNO), including clinical assessment. 2. Didactic demonstration of radiograph, CT and MRI findings of the disease, along with the imaging protocol and the role of whole-body MRI in a multidisciplinary approach among imaging methods.3. Proposal of a guidebook for the main imaging findings and how to report them, aiding the pediatricians in determining the correct diagnosis and narrowing down the list of differential diagnosis. 4. Differential diagnosis, including bacterial osteomyelitis, juvenile idiopathic arthritis (JIA), Erdheim-Chester disease, bone tumors, hematologic malignancies, Paget's disease and Sweet syndrome. 5. Treatment and Prognosis. 6. Summary.

## MKEE-74 SAGITTAL SPINOPELVIC BALANCE: A COMPREHENSIVE REVIEW FOR PREOPERATIVE RADIOGRAPHIC ASSESSMENT

Michael Tay, MD (*Abstract Co-Author*) Nothing to Disclose
Ricardo D. Garza-Gongora, MD (*Abstract Co-Author*) Nothing to Disclose
Samuel Roberts, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Alignment of the spine and pelvis in the sagittal plane has a significant impact on patient morbidity. Problems in alignment and balance lead to compensatory maneuvers, such as knee bending and cervical hyperlordosis, which have been shown to reduce quality of life. In the evaluation of an adult panoramic lateral radiograph of the spine, specific sagittal parameters should be reported, as these have clinical implications and direct surgical management. Examples of important parameters to report include: global lumbar lordosis (LL), pelvic incidence (PI), pelvic tilt (PT), PI-LL mismatch, and sagittal vertical axis (SVA).

**TABLE OF CONTENTS/OUTLINE**

Intro Upright poster maintenance. Regional shapes Segmental: Pelvic (Rigid), Lumbar (Flexible intercalary), Thoracic (Semirigid), Cervical (Flexible intercalary). Balancing: Spinopelvic haromony, suprajacent balancing, intersegmental balancing, global balancing. Surgical management and case review.

## MKEE-75 GET YOUR KICKS ON LUMBOSACRAL PLEXUS ROUTE 66: THE MAIN NERVE PATHS ON MRI

Renato Fujiki, MD (*Abstract Co-Author*) Nothing to Disclose
Guilherme Morato Silva, MD (*Abstract Co-Author*) Nothing to Disclose
Gabrielle Nakamura, MD (*Abstract Co-Author*) Nothing to Disclose
Artemis D. Alves, MD (*Abstract Co-Author*) Nothing to Disclose
Renan D. Lederer, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- To demonstrate the normal MRI anatomy and the main pathologies involving the lumbosacral plexus;- To review and demonstrate the MRI protocols for better assessment of the lumbosacral plexus;- To understand the main function of each trunk and nerve, as well the clinical features of its involvement, correlating it to the image findings.

**TABLE OF CONTENTS/OUTLINE**

- Understanding the lumbosacral plexus anatomy and function is necessary to a precise diagnosis. Common causes of plexopathy are tumors, post-operative related pathologies, compressive syndromes, trauma, inflammatory and infectious diseases.- Review and demonstrate normal anatomy, anatomic variants and MRI protocols to assess the lumbosacral plexus; to describe the main pathologies involving the lumbosacral plexus. - Perform a literature review and pictorial essay.

## MKEE-76 DECODING THE ENIGMA: UNRAVELING MULTIMODALITY IMAGING ARTIFACTS IN MUSCOLOSKELETAL RADIOLOGY

Laercio A. Rosemberg, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Adham A. Castro, MD (*Abstract Co-Author*) Nothing to Disclose
Paulo Eduardo Daruge Grando, MD (*Abstract Co-Author*) Nothing to Disclose
Durval D. Santos, MD (*Abstract Co-Author*) Nothing to Disclose
Matheus Freitas, MD (*Abstract Co-Author*) Nothing to Disclose
Eduardo Baptista, MD (*Abstract Co-Author*) Nothing to Disclose
Ana Carolina Villela, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The purpose of this exhibit is: 1) To recognize the most common artifacts in different image modalities (MRI, CT, ultrasonography and radiography). 2) To discuss the mechanisms for the formations of artifacts and how to reduce their occurrence. 3) To understand the consequences of misinterpreting artifacts as pathologies using real cases and how to overcome them.

**TABLE OF CONTENTS/OUTLINE**

1) Most common artifacts in musculoskeletal radiology: A) MRI: Magnetic susceptibility; Dielectric effect; Motion; Flow; Aliasing; Gibbs ringing effect; Zipper; Reconstruction; Signal loss; Lipid suppression; Dark shading; Cross-talk; Signal-to-noise ratio; Moiré fringes; Inhomogeneity. B) CT: Motion; Beam hardening; Photon starvation; Truncation; Metallic Materials; Tube arcing; Windmill; Cone beam effect. C) Ultrasonography: Focal Zone; Posterior Enhancement; Acoustic Shadowing; Reverberation; Mirror Image; Anisotropy; Refractile shadowing; Range Ambiguity. D) Radiography: Motion; Black lightning marks; Clear spots; Ghosting; Stitching; Dead pixels; Radiopaque external objects; Image compositing; Grid cut-off; Parallax effect; Midgray clipping; Backscatter.2) Mechanisms of artifacts formation on MRI, CT, ultrasonography and radiography.3) How to reduce the occurrence of artifacts in each modality.4) Consequences of misinterpreting artifacts as pathologies and how they were overcome using real cases.

## MKEE-77 OVERUSE INJURIES IN PEDIATRIC SPORTS MEDICINE: FROM COMMON TO RARE CASES

Roddie Moraes Neto, MD (*Abstract Co-Author*) Nothing to Disclose

Viviane S. Yamachira (*Abstract Co-Author*) Nothing to Disclose
Vitor D. Bichuette, MD (*Abstract Co-Author*) Nothing to Disclose
Thiago Jose Pinheiro Lopes, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The participation of children and adolescents in sporting activities brings a series of physical and psychosocial benefits. Imbalances between training load and recovery, however, can make this interaction harmful, leading to cumulative microtrauma in bones, muscles, tendons and growth plates. With the popularity of youth sports programs, overuse injuries are increasingly common. The types and mechanisms of these lesions, as well as the peculiarities of the musculoskeletal system in the pediatric age group, are important information for the radiologist who works with young athletes. In this work, we propose to carry out a detailed review of overuse injuries, paying special attention to atypical presentations that have appeared in our service.

**TABLE OF CONTENTS/OUTLINE**

1) Introduction. 2) Particularities of the musculoskeletal system in children, with focus on apophysis. 3) Imaging characteristics of overuse injuries, mechanisms of occurrence and associated sports. 4) Atypical presentations of overuse injuries and when to raise suspicion. 5) Challenges, pearls and pitfalls: normal anatomical variants and other mimics of lesions. 6) Take home messages.

## MKEE-78 CHORDOMAS: A COMPREHENSIVE OVERVIEW OF IMAGING FEATURES AND DIFFERENTIAL DIAGNOSIS

MAURICIO PEDREIRA (*Abstract Co-Author*) Nothing to Disclose
Marcio A. Ishida, MD (*Abstract Co-Author*) Nothing to Disclose
Bruno B. Cardoso, MD (*Abstract Co-Author*) Nothing to Disclose
Adriano Silveira Moreira Novaes, MD (*Abstract Co-Author*) Nothing to Disclose
Luiz T. Nehme, MD (*Abstract Co-Author*) Nothing to Disclose
Andre Mannato, MD (*Abstract Co-Author*) Nothing to Disclose
Manoel Barbosa, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Review the imaging features of the chordoma and its epidemiology trough their respective topographies- Review the main differential diagnosis of chordomas

**TABLE OF CONTENTS/OUTLINE**

- Introduction:Main characteristics Imaging features- Specific Chordomas: Sacral chordoma Clival chordoma Vertebral chordoma- Differential diagnosis: Chodrosarcoma Metastasis Plasmacytoma Giant cell tumor Lymphoma Craniopharyngioma Invasive macroadenoma Spondylodiscitis- Conclusion

## MKEE-79 PRIMARY OSSEOUS TUMORS OF THE SPINE: TIPS FOR DIAGNOSIS

Oscar M. Navarro, MD (*Abstract Co-Author*) Nothing to Disclose
Ricardo Restrepo, MD (*Abstract Co-Author*) Nothing to Disclose
Maria Navallas, MD (*Abstract Co-Author*) Nothing to Disclose
Emilio Inarejos Clemente, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Describe the use of conventional techniques and multiparametric MRI for diagnosis and follow-up in primary spinal tumors.Describe the most common benign and malignant primary osseous spinal tumors.Discuss the most common imaging findings of primary osseous spinal tumors with corresponding surgical and gross pathology findings. Interpret multiparametric MR imaging in patients with malignant unresectable tumors.

**TABLE OF CONTENTS/OUTLINE**

1. Clinical findings and demographics of benign and malignant primary spinal tumors.2. Benign tumors: Hemangioma, osteochondroma, osteoblastoma, osteoid osteoma, unicameral and aneurysmal bone cyst. Malignant tumors: Ewing sarcoma, osteosarcoma, chondrosarcoma, hemangioendothelioma, Langerhans cell histiocytosis.3. Imaging techniques in the study of spinal tumors, emphasizing on the role of multiparametric MRI and PET-MR for diagnosis and follow-up (DWI, perfusion, dynamic contrast studies, 3D volume reconstruction, 3D printing models).4. Imaging findings of spinal tumors, with illustrative examples with clinical, surgical and histopathological correlation.5. Use of functional MRI and nuclear medicine in treatment response assessment with illustrative examples.6. Imaging follow-up after tumor resection. Appropriate MR sequences for the evaluation of prostheses and metal artifacts.

## MKEE-8 ADVANCED MR IMAGING TECHNIQUES FOR THE ASSESSMENT OF METASTATIC BONE MARROW LESIONS: WHAT DOES THE RADIOLOGIST NEED TO KNOW?

Anwar R. Padhani, MBBS, FRCR (*Abstract Co-Author*) Advisory Board, Siemens AG;Speakers Bureau, Siemens AG;Advisory Board, Lucida Medical Ltd;Stockholder, Lucida Medical Ltd
Khaoula Bessame, MD, MSc (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Multiparametric Whole body MRI (WB-MRI) provides both morphological and functional (disease activity) information, with higher specificity and sensitivity for assessment of metastatic bone marrow disease (MBMD) compared with CT.- CT only provides morphological information (lytic, sclerotic or mixed MBMD).- Functional WB-MRI includes marrow fat fraction (F%) calculated using the Dixon sequence, high b-value DWI, and ADC images.- High specificity criteria for active MBMD using functional WB-MRI include (all must be present): morphological criteria (>5mm in size measured on F% image), high signal intensity on DWI (tumour: background SI ratio >4), ADC value 650-1300, and low F% (<20%).- False positives on high b-value DW images include fractures, infection, and treated tumor due to T2 shine-through.- Background dense sclerosis falsely elevates lesion F%.-Always correlate focal high b-value signal intensity bone marrow lesions with morphology, ADC and Dixon images.- WB-MRI protocol also incorporates STAR-VIBE, an artificial intelligence-generated adjunctive sequence providing CT-like images.-STAR-VIBE matches mineralization on CT, enabling assessment of bone integrity and fracture detection. Additionally, it can delineate fibrous tissue, such as joint capsules.

**TABLE OF CONTENTS/OUTLINE**

- Schematic approach for bone marrow assessment using functional WB-MRI.- Seven MBMD patterns and likely morphological and functional WB-MRI findings.- Algorithmic approach for MBMD.- Application of the algorithmic approach on 10 cases from our institution using a question and answer approach, with learning points from both clinical and radiological perspectives.- Disease mimics.- Take home messages.

## MKEE-80 OSTEOMALACIA: IMAGING FINDINGS AND DIFFERENTIAL DIAGNOSIS

Karina Hayama, MD (*Abstract Co-Author*) Nothing to Disclose
Gabriel Franchi De Santi, MD (*Abstract Co-Author*) Nothing to Disclose
Andre Y. Aihara, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Daisy T. Kase (*Abstract Co-Author*) Nothing to Disclose
Thayssa Leite, MD (*Abstract Co-Author*) Nothing to Disclose
Adham A. Castro, MD (*Abstract Co-Author*) Nothing to Disclose
Mariana Barros Mendonca Figueiredo (*Abstract Co-Author*) Nothing to Disclose
CINTIA LEAL (*Abstract Co-Author*) Nothing to Disclose
Leticia E. Lobato, MD, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. To Review the pathophysiology of osteomalacia.2. To Discuss the causes of osteomalacia and its differential diagnosis.3. To explore risk factors, epidemiology, clinical manifestations, and diagnostic methods.4. To discuss the most common imaging findings of osteomalacia, including Looser zones/pseudofractures, using a multimodal imaging approach.

**TABLE OF CONTENTS/OUTLINE**

1 - Osteomalacia: pathophysiology, causes , risk factors and epidemiology, clinical manifestations and diagnosis.2 - Looser zones/ pseudofractures3- Principle imaging findings of osteomalacia. 4- Differential diagnosis with other conditions involving the spine and pelvic, such as neoplasms, inflammatory arthropathies, degenerative changes, enteropathic arthropathies, among others.

## MKEE-81 IMAGING OF SPORTS-RELATED SOFT-TISSUE INJURIES IN THE HAND

Carmelo Messina, MD (*Abstract Co-Author*) Nothing to Disclose
Domenico Albano (*Abstract Co-Author*) Nothing to Disclose
Stefano Fusco, MD (*Abstract Co-Author*) Nothing to Disclose

Luca Maria Sconfienza, MD, PhD (*Abstract Co-Author*) Travel support, Bracco Group;Travel support, Esaote SpA;Speakers Bureau, Esaote SpA;Travel support, ABIOGEN PHARMA SpA;Speakers Bureau, P&R Holding;Speakers Bureau, Pfizer Inc ;Speaker, Novartis AG;Speaker, Merck KGaA;Speaker, MSDF
Francesca Serpi, MD (*Abstract Co-Author*) Nothing to Disclose
Salvatore Gitto, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Soft-tissue injuries of the thumb and fingers are frequently encountered in athletes and result from several mechanisms of trauma, which are often sports-specific. They include collateral ligament and palmar plate injuries, closed tendon tears, and tendon instability conditions resulting from pulley or sagittal band rupture.- The severity of hand soft-tissue injuries varies widely, requiring from conservative to surgical treatment. Timely diagnosis is crucial to offer optimal clinical management and avoid long-term complications and loss of function.- The role of imaging is to guide treatment by accurately identifying the type of lesion, its location and severity. Radiologists should be able to recognize a wide variety of sports-related hand injury patterns on radiographs, ultrasound, and MRI. All essential information should be reported to the orthopedic surgeon, including proper injury classification and associated findings, such as fractures and joint dislocation.

**TABLE OF CONTENTS/OUTLINE**

1. Collateral ligament and palmar plate injuries1.1. Ulnar collateral ligament of the thumb metacarpophalangeal joint1.2. Other collateral ligaments1.3. Palmar plate2. Closed tendon tears2.1. Lateral slips of the extensor tendon (Mallet finger)2.2. Central slip of the extensor tendon (Boutonniere deformity)2.3. Flexor digitorum profundus tendon (Jersey finger)3. Tendon instability3.1. Annular pulley rupture (Climber’s finger)3.2. Sagittal band rupture (Boxer’s knuckle)4. Implications for clinical management4.1. Essential information needed by the orthopedic surgeon4.2. Focus on injuries requiring surgery with surgical correlation

## MKEE-82 HOW TO BE A BLOODHOUND: A RADIOLOGIST'S GUIDE TO HEMATOLOGIC MALIGNANCIES

Da Eul Lee, MD (*Abstract Co-Author*) Nothing to Disclose
Gong Yong Jin, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Byeong-Kwon Shin, MD, BS (*Abstract Co-Author*) Nothing to Disclose
Jae Sung Yun (*Abstract Co-Author*) Nothing to Disclose
Eun Hae Park, MD (*Abstract Co-Author*) Nothing to Disclose
Min Jee Kim, MD (*Abstract Co-Author*) Nothing to Disclose
Yeeun Lee, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

By this presentation, radiologists will explore key strategies for identifying and interpreting imaging findings associated with various hematologic malignancies. From recognizing subtle abnormalities to understanding the importance of specific imaging modalities, this presentation helps radiologists with the knowledge needed to effectively contribute to the diagnosis and management of these complex diseases.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction to Hematologic Malignancies 2. Role of Radiologist in Hematologic Disease Diagnosis 3. Imaging Modalities for Hematologic Malignancies 4. Strategies for Bone Marrow Imaging 5. Recognizing Bone Marrow Abnormalities 6. Image findings : Pearl and Pitfalls 7. Advanced Imaging Techniques 8. Future Directions in Radiology for Hematologic Malignancies

## MKEE-83 HOW TO BONE UP ON POST-TREATMENT: IMAGING ASPECTS OF BONE TUMORS FOLLOWING TREATMENT

Daisy T. Kase (*Abstract Co-Author*) Nothing to Disclose
Leticia dos Reis Morimoto, MD (*Abstract Co-Author*) Nothing to Disclose
Henrique M. Lederman, MD (*Abstract Co-Author*) Nothing to Disclose

Marcelo d. Petrilli (*Abstract Co-Author*) Nothing to Disclose
CINTIA LEAL (*Abstract Co-Author*) Nothing to Disclose
Thayssa Leite, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The purpose of this exhibit is:1.To review indications and treatment options for benign and malignant bone tumors, considering patients’ clinical data and prognosis. 2.To illustrate, using didactic cases, the post-treatment imaging characteristics of a variety of bone tumors, including expected post-operative findings, post-chemotherapy and radiotherapy effects, as well as immediate and late complications seen in multimodality images (radiographs, CT scans and MRI). 3.To propose a structured reporting format containing essential information required by physicians for the follow-up care of these patients.

**TABLE OF CONTENTS/OUTLINE**

1.Introduction and contextualization of the multidisciplinary approach to post-treatment management of benign and malignant bone tumors. 2.Overview of treatment options for benign and locally aggressive tumors, as well as malignant lesions, such as aneurysmal bone cyst, giant cell tumor, Langerhans cell histiocytosis, Ewing sarcoma, osteosarcoma, chondroblastoma, bone metastasis and others. 3.Discussion and demonstration of expected imaging findings post-surgery and with other treatment modalities, using a multimodal approach (CR, US, CT and MRI). 4.Presentation of didactic cases illustrating the main possible complications of bone tumor treatment, including prosthesis-related complications, infection, tumor recurrence and adverse effects of chemotherapy and radiotherapy. 5.Proposal of a checklist for post-treatment tumor evaluation, outlining key findings that radiologists need to actively seach for during the follow-up of these oncologic patients. 6.Addressing potential prognosis. 7.Summary.

## MKEE-84 READING BETWEEN THE SIGNALS: WHO'S THE RED FLAG AND WHO'S THE GREEN FLAG IN SPINAL MARROW SIGNAL CHANGES

Gong Yong Jin, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Yeeun Lee, MD (*Abstract Co-Author*) Nothing to Disclose
Eun Hae Park, MD (*Abstract Co-Author*) Nothing to Disclose
Da Eul Lee, MD (*Abstract Co-Author*) Nothing to Disclose
Jae Sung Yun (*Abstract Co-Author*) Nothing to Disclose
Min Jee Kim, MD (*Abstract Co-Author*) Nothing to Disclose
Byeong-Kwon Shin, MD, BS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Bone Marrow signal change can be very tricky. This discussion illuminates the nuanced interpretation of spinal marrow signal changes, discerning between red flags indicating potential pathology and green flags representing benign findings. To facilitate interactive learning, the presentation includes carefully selected questions derived from images of diseases that often pose challenges in clinical practice. By comprehending the spectrum of signal alterations and their clinical implications, radiologists can significantly enhance their ability to contribute to precise diagnosis and effective patient management in spinal imaging

**TABLE OF CONTENTS/OUTLINE**

1. Introduction of spinal marrow signal 2. Understading MR sequence setting for spinal imaging(T1WI T2WI, T2 fat suppressed image, T1 contrast enhanced image, Coronal image)3. Green flags - Benign signal change(Hemangioma, Schmorl's node, Modic change (type 1 and type 2))4. Red flags - Pathologic marrow signal changes(Trauma, Infectious spondylitis, Malignancy (multiple myeloma and bone metastasis))

## MKEE-85 IMAGING ASSESSMENT OF RESPONSE IN SOFT TISSUE SARCOMA AFTER NEOADJUVANT RADIOTHERAPY

**TEACHING POINTS**

• Effective management of Soft Tissue Sarcoma (STS) relies on a robust multidisciplinary collaborative effort where state-of-the-art imaging plays a pivotal role in both the initial evaluation of the disease and in the estimation of preoperative tumor response.• Neoadjuvant radiotherapy (nRT) has emerged as an effective pre-surgical therapy, reducing local recurrence rates. It has a dual action: potential tumor shrinkage and reduction in viable tumor cells, both of which facilitate surgical intervention and enhance the local tumor control.• STS demonstrate varying responses to nRT, largely dependent on their histological subtypes. For example, myxoid liposarcomas typically exhibit significant shrinkage following nRT, whereas other subtypes like undifferentiated pleomorphic sarcomas often show a notable increase in tumor size due to treatment-related phenomena.

**TABLE OF CONTENTS/OUTLINE**

Introduction: Significance of Imaging in Preoperative Management of STS.Neoadjuvant Radiotherapy (nRT): Growing Role of nRT as Preoperative Treatment of STS.Pictorial Review of STS Response after nRT: -Impact of Histological Subtype on Response-Examples of Response:• Shrinkage (e.g., Myxoid Liposarcoma, Round Cell STS)• Increase in Size (e.g., Undifferentiated Pleomorphic Sarcoma) - Possible Causes (Necrosis, Hemorrhage)

## MKEE-86 PERIPHERAL INVOLVEMENT IN SPONDYLOARTHRITIS: A CASE-BASED REVIEW

Marco de Andrade Bianchi (*Abstract Co-Author*) Nothing to Disclose
Pedro Henrique R. Silva, MD (*Abstract Co-Author*) Nothing to Disclose

Breno Trindade (*Abstract Co-Author*) Nothing to Disclose
Jose Claudio N. Junqueira, MD (*Abstract Co-Author*) Nothing to Disclose
Roberto Freitas (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Spondyloarthritis are characterized mainly by inflammatory involvement of the spine and sacroiliac joints. However, peripheral musculoskeletal structures are also commonly affected in this group of diseases, either in conjunction with axial skeleton changes or independently, particularly in the early stages. Diagnosing spondyloarthropathies can be challenging and often occurs several years after symptom onset. Understanding the imaging aspects of peripheral musculoskeletal involvement in this disease group is crucial for accurate and early diagnosis, as well as for patient management, reducing the likelihood of potential complications. The purpose of this exhibit is: 1- To discuss relevant aspects of spondyloarthritis, focusing on magnetic resonance imaging findings. 2- To review the pathophysiology of spondyloarthritis and their correlation with musculoskeletal changes in imaging exams. 3- To demonstrate, through magnetic resonance imaging exams and illustrations, the main musculoskeletal alterations in the peripheral involvement of spondyloarthritis. 4- To discuss practical challenges and pitfalls in imaging assessment of spondyloarthritis.

**TABLE OF CONTENTS/OUTLINE**

1- General aspects of spondyloarthritis a. Epidemiology b. Pathophysiology c. Diagnostic criteria 2- Imaging findings in spondyloarthritis: a case-based review a. Axial skeleton b. Peripheral involvement 3- Practical challenges and pitfalls in imaging evaluation of spondyloarthritis 4- Final considerations 5- References

## MKEE-87 ADVANCES IN NAIL EVALUATION: USING ULTRASOUND AND MRI

**Awards**
**Certificate of Merit**

Natally Horvat, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Giovanni G. Cerri, PhD (*Abstract Co-Author*) Nothing to Disclose

Renata V. Leao, MD (*Abstract Co-Author*) Nothing to Disclose
Jose De Arimateia Batista Araujo Filho (*Abstract Co-Author*) Nothing to Disclose
Luciana C. Zattar, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The evaluation of nail disorders has traditionally relied on clinical examination and imaging techniques like X-ray. However, recent advances in medical technology have introduced the use of ultrasound (HFUS) and MRI for a more comprehensive assessment of nail conditions. This educational exhibit aims to explore the benefits and applications of these methods, providing valuable insights for radiologists and clinicians. And also to provide attendees with a comprehensive understanding of the role of HFUS and MRI in nail evaluation, equipping them with the knowledge and skills to effectively utilize these advanced imaging techniques in clinical practice, with:1.Overview of nail anatomy and common nail disorders2.Principles of HFUS and MRI in nail evaluation3.Comparative analysis of HFUS, MRI, and traditional imaging techniques4.Case studies demonstrating the diagnostic utility of HFUS and MRI5.Practical tips for optimizing imaging protocols and interpreting findings6.Future directions and emerging technologies

**TABLE OF CONTENTS/OUTLINE**

1.Introduction: Overview of nail anatomy2.Traditional Imaging Techniques: Role and Limitations of conventional imaging modalities3.Principles of HFUS and MRI in Nail Evaluation: Advantages4.Clinical Case Studies: Illustrative cases showcasing the diagnostic capabilities of HFUS and MRI5.Practical ConsiderationsImaging protocols and tips for accurate interpretation Pitfalls and challenges6.Future Perspectives- Emerging technologies/Potential advancements

## MKEE-88 OSTEOSARCOMA RECURRENCE: WHAT THE RADIOLOGIST NEEDS TO KNOW

Marco Bianchi (*Abstract Co-Author*) Nothing to Disclose
Carlos Henrique Pierro Carvalhinho (*Abstract Co-Author*) Nothing to Disclose
Pedro Henrique R. Silva, MD (*Abstract Co-Author*) Nothing to Disclose
Breno Trindade (*Abstract Co-Author*) Nothing to Disclose
Mauricio Ricardo Moreira da Silva Filho, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- To promote early detection of osteosarcoma recurrence for an effective treatment. ? - To discuss the role of various imaging techniques (plain radiography, CT, MRI) in identifying recurrent osteosarcoma. ? - To identify key radiological signs of recurrence, such as new bone formation, soft tissue mass, and changes in the size or appearance of the original tumor. ? - To differentiate recurrent osteosarcoma from post-treatment changes and other conditions.- To discuss the role of biopsy and optimal biopsy techniques in ambiguous cases.- To emphasize the importance of an effective communication and a multidisciplinary approach involving radiologists, oncologists, and surgeons, for optimal patient management.

**TABLE OF CONTENTS/OUTLINE**

1. INTRODUCTION: A. A brief overview of osteosarcoma B. A brief overview of the imaging techniques and optimal imaging acquisition and post-processing parameters to detect recurrence. 2. RECOGNIZING SIGNS OF RECURRENCE: Overview of key radiological signs, including new bone formation, an enlarging soft tissue mass, and changes in the size or appearance of the original tumor.3. IDENTIFYING KEY FINDINGS AND DIFERENCIAL DIAGNOSIS: case studies and examples, with emphasis on what to report and what to recommend next to the clinician/ surgeon.4. CONCLUSION: Summary of key points. Future Directions.

## MKEE-89 SYSTEMATIC APPROACH IN THE DIAGNOSIS OF DESMOID-FIBROMATOSIS TUMOR OF EXTREMITIES WITH CONVENTIONAL AND ADVANCED MRI TECHNIQUES: TIPS AND TRICKS

**TEACHING POINTS**

Desmoid fibromatosis (DF) is a locally aggressive rare neoplasm, exhibiting a notable proclivity for recurrence, typically localized in the extremities. Classified as an "intermediate, locally aggressive" tumor, DF often presents diagnostic challenges and is prone to misidentification. It serves as a source of chronic pain, disability, and disfigurement. Given the rarity of this disease, arriving at a diagnosis necessitates a considerable diagnostic acumen. MRI stands as the preferred modality for imaging, thus mandating a systematic approach to effectively differentiate these tumors from malignant soft-tissue counterparts. The DF predisposes it to various complications, including compression and invasion of adjacent structures. Therefore, radiologists must remain cognizant of these potential complications to furnish accurate reports and promptly inform attending physicians for timely management. The propensity for false positive and false negative outcomes underscores the necessity for vigilance among those interpreting DF examinations, attributed to the tumor's high cellular density, as well as mucoid or cystic degeneration. An appreciation of both the capabilities and constraints of MRI techniques is imperative for achieving precise diagnoses and, subsequently, optimal treatment strategies for our patients.

**TABLE OF CONTENTS/OUTLINE**

The value of conventional and advanced MRI techniques (DIXON T1, T2*, SWI, DCEperfusion and TIC, DWI) in diagnosis and follow-up of DF. Case discussion to demonstrate the utility of distinguishing these tumors from: Lymphoma, Synoviosarcoma, Ewing sarcoma, High grade pleomorphic sarcoma, Fibrosarcoma, Giant cel Tumor. Common pittfalls.

## MKEE-9 WATER DENSITY VALUE EVALUATION METHOD BY MATERIAL DECOMPOSITION ANALYSIS USING DUAL ENERGY CT FOR VERTEBRAL COMPRESSION FRACTURES

Masanobu Nishi (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1.Virtual non-calcium (VNCa) images are water density value images created by two-material decomposition process based on dual energy acquisition using a fast kV switching method.2.We devised a quantitative evaluation method for vertebral compression fractures using the characteristics of water density values of water and calcium or water and hydroxyapatite as the two materials.3.We verified the concordance rate between our quantitative

evaluation results and clinical results for 201 cases in which both DECT and MRI examinations were performed for suspected vertebral compression fractures.4.Given the high degree of agreement with clinical findings, we believe that this method can serve as a valuable diagnostic aid

**TABLE OF CONTENTS/OUTLINE**

Vertebral compression fractures affect the quality of daily life. Virtual non-Calcium images (VNCa) are derived from dual-energy CT and show water density values by separating water and bone components. In these images reveal edematous changes related to compression fracture. Previous studies have highlighted its diagnostic value. However, the subjective nature of visual evaluations poses challenges in accurate interpretation. To address this, we established a standard water density value and devised a quantitative method to measure deviations in water density for each vertebral body. In this exhibition, we detail the standard and evaluation values for quantitative assessment, along with the evaluation methodology. We then compared these quantitative evaluations with clinical findings, observing a high level of agreement. Our results suggest that this method can effectively aid in distinguishing such findings, enhancing clinical diagnostic accuracy.

## MKEE-90 NONTRAUMATIC SPINAL CORD COMPRESSION: ESSENTIAL INQUIRY QUESTIONS IN THE EMERGENCY SETTING

Jose A. Narvaez, MD (*Abstract Co-Author*) Nothing to Disclose
Javier Hernandez Ganan (*Abstract Co-Author*) Nothing to Disclose
Juan Carlos Sardinas (*Abstract Co-Author*) Nothing to Disclose
Ricardo Jose Ponce Silva (*Abstract Co-Author*) Nothing to Disclose
German G. Ratto, MD (*Abstract Co-Author*) Nothing to Disclose
Karina Janeth Gordillo Zabaleta, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- In a non-traumatic setting, acute myelopathy can be caused by compressive or non-compressive factors. These include extramedullary and intramedullary causes. Extramedullary causes can be degenerative (herniated disc), infectious (epidural abscess), vascular (malformations or epidural haematoma), and metastatic. - We would like to draw your attention to metastatic spinal cord compression (MSCC), which is defined as compression of the spinal cord and cauda equina by an extradural tumour mass. It is therefore important to understand and know the anatomy, pathophysiology and updated radiological protocols used to make an accurate diagnosis. The minimum radiological evidence of spinal cord compression is indentation of the theca at the level of the clinical features and displacement or encapsulation of the thecal sac surrounding the spinal cord or cauda equina by spinal epidural metastases (SEM) or locally advanced cancer. - These features are important in determining spinal instability. The Spine Instability Neoplastic Score (SINS) and the Epidural Spinal Cord Compression Scale, also known as the Bilsky Scale, are useful tools for predicting the need for urgent surgery. We will present many clinical cases using these scales.

**TABLE OF CONTENTS/OUTLINE**

- Definition of non-traumatic spinal cord compression (SCC) - Radiological anatomy of the spinal cord - Updated protocols for the emergency department - Imaging features on MR and CT - Causes of non-traumatic cord compression (Emphasis on extramedullary metastatic causes): Degenerative, infectious, and metastatic. - SINS and Bilsky classifications and their therapeutic implications: What should theradiologist know?

## MKEE-91 GRIP YOUR LEASH WELL: MUSCULOSKELETAL INJURIES TO THE DOG WALKERS

Bharat Aggarwal, MD (*Abstract Co-Author*) Nothing to Disclose
Akram Jawed (*Abstract Co-Author*) Nothing to Disclose
Vikas Gupta (*Abstract Co-Author*) Nothing to Disclose
Amit K. Sahu, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Biswajit Borborah, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Dog walkers usually undergo multiple musculoskeletal injuries in the upper and lower limbs including the tendon, ligament other soft tissue injuries as well as bony injuries. Many of these injuries go un noticed as they may be trivial at the time of occurrence. However they present with greater disability in later stages. Early detection by clinical examination and proper imaging will lead to prevention of disabilities. Most of the dog walkers being elderly population, suffer from multiple injuries even with lesser trauma. Common injuries of the joints of the upper limb can be seen in a dog walker due to dog pulling behaviour. The mode of injury can be trips, falls or repetitive strain. Soft tissue sprains, strains and fractures of bones are commonly encountered with most commonly injured parts being fingers and rotator cuff.

**TABLE OF CONTENTS/OUTLINE**

Getting familiar with the common mechanisms of injury in dog walkers, both in upper and lower limbs. The hard yank of the leash can cause injuries of the hand that includes ulnar collateral ligament tear, injury to pulley mechanism, tendon tears and bony avulsions of small bones. The pull along the leash and rotation of the arm can lead to rotator cuff tear, medial and lateral epicondylitis.Pulling mechanism by heavy dogs can lead to imbalance in dog walkers and can lead to lower limb injuries including the internal derangement of knee joint and tear of medial and lateral supporting ligaments of the ankle.

## MKEE-92 SKIN CANVAS: PORTRAITS OF DIVERSITY

**Awards**
**Certificate of Merit**

Geovana Ribeiro, MD (*Abstract Co-Author*) Nothing to Disclose
Eduardo D. Chiovatto, MD (*Abstract Co-Author*) Nothing to Disclose
Vivian Marques (*Abstract Co-Author*) Nothing to Disclose
Maria Cristina Chammas, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Julia D. Zavariz, MD (*Abstract Co-Author*) Nothing to Disclose
Matheus Brunetto, MD (*Abstract Co-Author*) Nothing to Disclose
Rafael Moreli Antonine (*Abstract Co-Author*) Nothing to Disclose
Carolina Carotenuto Ramos, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

This study aims to characterize the anatomy of the skin and differentiate the main skin types, emphasizing their characteristics in relation to individual lifestyle habits. To achieve this, we analyze variations across different age groups and locations within the same individual, as well as contrasting the characteristics of skin more exposed to the sun with those less exposed, taking into account the use of sunscreen. Moreover, we explore the key findings on prevalent benign and malignant skin lesions, underscoring the critical role of high-frequency ultrasound and its features as vital tools for characterizing these lesions and identifying at-risk populations.This research contributes to a more comprehensive understanding of skin diversity in the population and

its relationship with environmental and behavioral factors, as well as helping to better understand the characteristic patterns of skin lesions, facilitating their ultrasound diagnosis.

**TABLE OF CONTENTS/OUTLINE**

1. Method, significance, and attributes of high-frequency ultrasound in assessing skin anatomy and its lesions. 2. Comparison between histological skin anatomy and the ultrasound features. 3. Various skin types present within a single individual. 4. Sonographic disparities between young skin and with high levels of elastosis due to age/sun exposure. 5. Discrimination of patterns of ultrasound findings between benign and malignant skin lesions 6. Application of Doppler while characterizing dermatological lesions.7. New technologies for dermatological diagnostics: elastography, Contrast-Enhanced Ultrasound (CEUS) and Artificial Intelligence.

## MKEE-93 IMAGING FINDINGS IN POSTOPERATIVE PATELLOFEMORAL INSTABILITY: USUAL FINDINGS AND COMPLICATIONS

Luiz T. Nehme, MD (*Abstract Co-Author*) Nothing to Disclose
Giovana G. Mesquita, MD (*Abstract Co-Author*) Nothing to Disclose
Marilia Da Cruz Fagundes, MD (*Abstract Co-Author*) Nothing to Disclose
Adriano Silveira Moreira Novaes, MD (*Abstract Co-Author*) Nothing to Disclose
Bruno C. Carneiro (*Abstract Co-Author*) Nothing to Disclose
Eduardo J. Bronzatto (*Abstract Co-Author*) Nothing to Disclose
Bruno B. Cardoso, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Patellofemoral instability is a multifactorial condition that is related to the presence of clinical and anatomical risk factors. The number of risk factors and the number of dislocation episodes, whether associated with osteochondral injuries or not, determine whether the treatment will be surgical or clinical. In case of surgical treatment, medial patellofemoral ligament reconstruction is the most frequently performed approach, either alone or in combination with other procedures. Malposition of the femoral tunnel, severe trochlear dysplasia, and patella fracture are the main causes of the need for surgical revision in medial patellofemoral ligament reconstruction. Tibial tuberosity osteotomy is frequently performed in conjunction with medial patellofemoral ligament reconstruction to correct an increased TTGT and/or patella alta. As this is a surgery with greater morbidity, it requires a longer return to weight-bearing and physical activity. Complications related to this procedure include fractures, deep vein thrombosis, and overcorrection. In addition, some particularities related to the treatment of pediatric patients should be considered in the surgical approach, such as the placement of the femoral tunnel below the growth plate in medial patellofemoral ligament reconstruction. Tibial tuberosity osteotomy is proscribed in children due to the high risk of growth arrest and/or recurvatum genu. Knowledge of the main surgical procedures and their most frequent complications is essential for correct imaging interpretation.

**TABLE OF CONTENTS/OUTLINE**

- Introduction
- Risk Factors and Treatments
- Surgical Procedures and Complications
- Conclusion

## MKEE-94 EXCAVATING BONY DISCOVERIES: A REVIEW OF INCIDENTAL OSSEOUS FINDINGS

Erwin Ho (*Abstract Co-Author*) Nothing to Disclose
Lawrence Wang, DO (*Abstract Co-Author*) Nothing to Disclose
Jasmine Zhao, MD (*Abstract Co-Author*) Nothing to Disclose
Kasha Chen (*Abstract Co-Author*) Nothing to Disclose
Roozbeh Houshyar, MD (*Abstract Co-Author*) Nothing to Disclose
Christopher Sahagian (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Review clinical presentation, epidemiology, distribution, imaging appearance, and management of incidental benign osseous findings.

**TABLE OF CONTENTS/OUTLINE**

Incidental benign osseous findings are often discovered on non-musculoskeletal (MSK) examinations for non-musculoskeletal pathology. However, despite their benign nature, some osseous findings may change the entire clinical course and warrant additional imaging workup and sometimes even surgical intervention. This exhibit seeks to elucidate a broad range of incidental osseous findings in various imaging modalities, while clinicians work up other non-MSK issues, in a case-based fashion. This exhibit will present cases of incidental benign but clinically significant osseous findings and include avascular necrosis, insufficiency fracture, osteochondroma, fibrous dysplasia, enchondroma, brown tumors, and giant cell tumors. These diseases will be displayed with annotated images across multiple imaging modalities.

## MKEE-95 IMAGING THE BRACHIAL PLEXUS

Amit K. Sahu, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Akram Jawed (*Abstract Co-Author*) Nothing to Disclose
Bharat Aggarwal, MD (*Abstract Co-Author*) Nothing to Disclose
Vikas Gupta (*Abstract Co-Author*) Nothing to Disclose
Arshpreet Kaur, MBBS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

• Brachial plexus is a complex network of nerves originating from the lower cervical and upper thoracic spinal cord segments. It consists of roots, trunks, divisions, cords, and terminal branches. Familiarize yourself with the spatial relationships and typical branching patterns. • MRI is the preferred modality due to its excellent soft tissue contrast and multiplanar capabilities. • Recognize normal anatomical variants like the presence of an accessory phrenic nerve, anomalous innervation patterns, or variable branching. Differentiate these from pathological findings like traumatic injuries (stretch, compression, laceration), neoplastic involvement (tumors like schwannomas, neurofibromas), inflammatory processes (brachial plexitis, e.g., Parsonage-Turner syndrome), and vascular abnormalities (e.g., thoracic outlet syndrome). • Determine the precise location and extent of pathology within the brachial plexus, whether it involves the roots, trunks, divisions, cords, or terminal branches. This localization is crucial for treatment planning. • Assess vascular structures adjacent to the brachial plexus, such as the subclavian artery and vein, for potential compression or displacement contributing to neurovascular conditions like thoracic outlet syndrome. • Utilize advanced imaging techniques such as MPR) and 3D

**TABLE OF CONTENTS/OUTLINE**

• Anatomy of brachial plexus • Appropriate MRI protocol • Normal variants of plexus which may mimic pathology • Traumatic, infective, inflammatory and neoplastic pathologies • Follow-up imaging post treatment

## MKEE-96 CHALLENGES AND IMPORTANCE OF DIAGNOSING FOREIGN BODIES IN MUSCULOSKELETAL RADIOLOGY

Laercio A. Rosemberg, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Eduardo Baptista, MD (*Abstract Co-Author*) Nothing to Disclose
Adham A. Castro, MD (*Abstract Co-Author*) Nothing to Disclose

**TEACHING POINTS**

1- Types of Foreign Bodies and Their Insertion Contexts for each material.2- Imaging Methods for Detecting Foreign Bodies.3- Importance of Foreign Bodies Diagnosis.4- Radiological findings characteristic of each material.5 - What is the best imaging test to detect each exposed material.

**TABLE OF CONTENTS/OUTLINE**

1- Types of Foreign Bodies and their characteristics in imaging exams.2- Comparison of the different methods for detecting each type of foreign body, with their advantages, disadvantages and indications.3 - Illustrated teaching cases from our institution, showing different types of foreign bodies, using different diagnostic methods, in different contexts.3- Exhibition of simulated cases in phantoms with tissue density similar to human tissue, emphasizing surgical materials.4 - Exposure of the main risk factors for forgetting surgical material.

## MKEE-97 EXPLORING SOLID-CYSTIC BONE LESIONS: IMAGING ASPECTS

Luiz T. Nehme, MD (*Abstract Co-Author*) Nothing to Disclose
Bruno C. Carneiro (*Abstract Co-Author*) Nothing to Disclose
Adriano Silveira Moreira Novaes, MD (*Abstract Co-Author*) Nothing to Disclose
Bruno B. Cardoso, MD (*Abstract Co-Author*) Nothing to Disclose
Eduardo J. Bronzatto (*Abstract Co-Author*) Nothing to Disclose
Giovana G. Mesquita, MD (*Abstract Co-Author*) Nothing to Disclose
Marilia Da Cruz Fagundes, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Solid-cystic bone lesions comprise a heterogeneous group of pathologies that can be neoplastic or non-neoplastic, benign or malignant, primary or metastatic, and may exhibit aggressive or non-aggressive behavior.These lesions may pose diagnostic challenges due to their varied imaging appearances and clinical presentations. A radiological approach is established based on age, clinical presentation, location, and imaging characteristics to differentiate them.A common feature of many of these lesions is the presence of fluid-fluid levels, such as in aneurysmal bone cysts (ABC) and ABC-like changes, simple bone cysts, telangiectatic osteosarcoma, metastases, brown tumors, sacrococcygeal teratoma, and adamantinoma.ABC-like changes are associated with other neoplasia, especially giant cell tumor, chondroblastoma, osteoblastoma, non-ossifying fibroma, fibrous dysplasia, chondromyxoid fibroma and Langerhans cell histiocytosis.Other bone tumors may have a solid-cystic appearance on imaging, for instance lipomas and fibrous dysplasia with cystic degeneration, and aggressive neoplasia with extensive necrosis.Moreover, non-neoplastic disease may mimic a solid-cystic bone tumor, for example inflammatory arthropathy, infection, subperiosteal hematoma and hemophilic pseudotumor.Understanding the imaging aspects of solid-cystic bone lesions is crucial for accurate diagnosis and appropriate management.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction2. ABC3. ABC-like changes4. Simple bone cyst5. Telangiectatic osteosarcoma6. Metastases7. Sacrococcygeal teratoma8. Non-neoplastic pitfalls9. Conclusion

## MKEE-99 DON'T GET HUNG UP ON THE DISTAL BICEPS TENDON: A REVIEW DISTAL BICEP TENDON TEARS, NORMAL ANATOMY, US SCANNING TECHNIQUE, AND PATHOLOGY ON US AND MRI

Chad Klochko, MD (*Abstract Co-Author*) Nothing to Disclose
Zaid Mahdi, MD (*Abstract Co-Author*) Nothing to Disclose
Laurie A. Geiger, BS (*Abstract Co-Author*) Nothing to Disclose
Danishi Bedi (*Abstract Co-Author*) Nothing to Disclose
Prateek Chintalapati, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Review of normal anatomy of the distal biceps tendon on US and MRI. 2. Technique for localizing and evaluating the tendon on ultrasound. 3. Post traumatic biceps imaging on US and MRI. 4. Pearls and pitfalls of distal bicep's imaging. Brief review of surgical treatment and post operative appearance on MRI and radiographs.

**TABLE OF CONTENTS/OUTLINE**

Brief review of normal anatomy of the distal biceps tendon - Technique for identifying the tendon on ultrasound. Normal appearance of the tendon on static and dynamic imaging. - Different US imaging approaches including the anterior, lateral, dorsal and medial approaches. - Brief review of normal anatomy on MRI involving the distal biceps tendon. Posttraumatic distal biceps imaging on ultrasound and MRI. - Review of common mechanisms of injury. - Static and dynamic US images of normal, partial thickness and full thickness hears of the distal biceps tendon. Correlative multiplanar MRI images of the distal biceps tendon. - Identification of the lacertus fibrosus in applicable cases Pearls and pitfalls of distal bicep's imaging. Brief review of surgical treatment and post operative appearance on MRI and radiographs. - Landmarks helpful in identifying the correct tendon and not adjacent structures - Useful physical findings - Common operative treatment - Post operative radiographic imaging appearance - MR example of post-operative retear of the distal biceps tendon. Conclusion/Summary

Alipio Ormond Filho, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The demographic shift towards an aging population presents novel healthcare challenges, notably in diagnosing and managing musculoskeletal conditions. Advanced age heightens susceptibility to various inflammatory musculoskeletal disorders, due to a chronic pro-inflammatory status and immune system dysregulation. Additionally, the elderly population are susceptible to adverse effects from polypharmacy, immunosuppressive responses, and drug-induced myopathies. Furthermore, tumors can predispose individuals to musculoskeletal inflammatory responses via the secretion of inflammatory cytokines and modulation of the immune system (paraneoplastic syndromes).The initial presentation of inflammatory conditions in elderly often presents lacking conventional radiological markers or prominent laboratory abnormalities. Discriminating between the insidious onset of inflammatory musculoskeletal disorders and degenerative changes poses a radiological challenge. Radiologists play a pivotal role in this scenario, serving as key contributors to the recognition of such conditions, thereby preventing irreversible disability and preserving the quality of life in the elderly population.

### TABLE OF CONTENTS/OUTLINE

1. Introduction2. The immune system of the elderly3. Multimodality imaging and approach4. Rheumatological Diseasesa) Rheumatoid Arthritisb) Enthesopathiesc) Rheumatica Polymyalgia5. Crystal Arthropathies a) Goutb) Calcium Pyrophosphate Deposition Disease 6. Inflammatory Myopathies a) Polymyositis and Dermatomyositis b) Inclusion Body Myositis 7. ## IMAGING OF KNEE ARTHROPLASTY: WHAT THE RADIOLOGIST NEEDS TO KNOW

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Avneesh Chhabra, MD, MBA (*Abstract Co-Author*) Consultant, ICON plc;Consultant, Treace Medical Concepts, Inc;Author with royalties, Wolters Kluwer nv;Author with royalties, Jaypee Brothers Medical Publishers Ltd;Speaker, Siemens AG;Medical Advisor, ImageBiopsy Lab;Research Grant, ImageBiopsy Lab
Flavio Duarte Silva (*Abstract Co-Author*) Nothing to Disclose
Dhilip Andrew, MBBS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Learn about different types of knee arthroplasties and arthroplasty implants used in routine practice.
- Gain knowledge of the pre-operative planning and measurements for knee arthroplasty including AI-generated automated limb angular and linear measurements.
- Improve knowledge and understanding about knee arthroplasty-related complications and their various imaging appearances.

### TABLE OF CONTENTS/OUTLINE

- Review relevant clinical anatomy, indications, surgical details of different types of arthroplasties.
- Discuss the role of multimodality imaging and role of validated AI-generated measurements for preoperative planning of knee arthroplasty and follow-up imaging for monitoring of complications.
- Case-based illustration of normal and abnormal findings on knee radiographs and cross-sectional images for monitoring such patients post-operatively.
- Normal appearances
- Common complications
- Implant specific complications.

## THE ISSUE IS THE TISSUE: CT FINDINGS OVERLOOKED ON SOFT TISSUE WINDOWS IN LOWER EXTREMITY IMAGING

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Cornelia B. Wenokor, MD (*Abstract Co-Author*) Nothing to Disclose
Douglas Ardekani, DO (*Abstract Co-Author*) Nothing to Disclose
Justin Newman, DO (*Abstract Co-Author*) Nothing to Disclose
Garrett Yoon, MD, MS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Reviewing commonly overlooked soft tissue pathology that can be clearly demonstrated with soft tissue window settings, particularly in cases of traumatic musculoskeletal injuries. 2. Illustrating and discussing the clinical significance of these findings; for instance, reporting tendon entrapment to aid in surgical planning. 3. Advocating for the use of CT imaging in making early time-sensitive findings on soft tissue windows, potentially avoiding the use of costly additional imaging modalities including MRI.

### TABLE OF CONTENTS/OUTLINE

1. Bone Marrow Pathology (Fracture, Marrow Infiltrative Disease). 2. Subcutaneous and Muscle Pathology (Compartment Syndrome, Morel-Lavallée Lesion, Muscle Tear, Hematoma, Thoracolumbar Fascia Tear, Accessory Soleus Muscle). 3. Ligament Pathology (Ligament Tears, Avulsion Injuries). 4. Meniscal and Knee Capsular Pathology. 5. Tendon Pathology (Entrapment, Rupture, Dislocation). 6. Nerve Pathology (Baxter's Neuropathy, Nerve Transection, Fibrolipomatous Hamartoma).

## SCAPHOID FRACTURE: CLASSIFICATION, IMAGING, COMPLICATIONS AND TREATMENT

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Kawanpreet S. Rakhra, MD, FRCPC (*Abstract Co-Author*) Nothing to Disclose
Juvel Lee, MD (*Abstract Co-Author*) Nothing to Disclose
Dyan V. Flores, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The scaphoid is the most commonly fractured carpal bone, typically following a fall on an outstretched hand in a young or middle-aged adult. Majority (65%) of scaphoid fractures involve the waist, with the next most common location (15%) being the proximal pole. The unique distal-to-proximal flow of the scaphoid’s blood supply predisposes the larger proximal pole to complications to avascular necrosis. Other complications like delayed union or non-union can also occur. The radiologists plays an instrumental role in scaphoid fractures from diagnosis, detection of complications, to preoperative and postoperative assessment. The objectives of this educational exhibit are:1. To review scaphoid anatomy, particularly those unique to the bone (i.e., dual blood supply, lack of periosteum)2. To illustrate scaphoid fracture complications and their imaging appearances 3. To discuss treatment options and indications

### TABLE OF CONTENTS/OUTLINE

SCAPHOID ANATOMY • Blood supply SCAPHOID FRACTURE • Mayo classification • Herbert and Fisher classification • ACR criteria for imaging of a scaphoid fracture • Complication: Malunion (delayed union and non-union) • Complication: Avascular necrosis • Complication: Scaphoid non-union advanced collapse • Imaging of complications TREATMENT • Management considerations for proximal versus distal scaphoid fracture • Casting versus internal fixation • Bone grafts: nonvascularized versus vascularized • Post-operative imaging evaluation OTHER TRAUMATIC CONDITIONS • Scapholunate instability • Other forms of carpal instability involving the scaphoid

### TEACHING POINTS

Demonstrate the named fractures and fracture-dislocation injuries of the upper and lower extremities. Differentiate similar fracture or fracture-dislocation patterns (Essex-Lopresti, Monteggia, and Galeazzi and Rolando, Bennett, and Pseudo-Bennett) and fractures occurring in close anatomic proximity such as at the 5th metatarsal base: stress fractures, Jones, and pseudo-Jones injuries. Emphasize injuries that can occur concurrently with eponymous fractures such as ACL and meniscal injury with Segond fractures. Highlight imaging findings (degree of displacement, articular surface involvement, articular step off, comminution, and degree of dislocation) relevant to clinical or orthopedic management and decision-making. Briefly note the historical individuals credited with the original descriptions of these fractures.

### TABLE OF CONTENTS/OUTLINE

Upper Extremity: Thumb Base: Rolando, Bennett, Pseudo-Bennett Wrist: Barton, Colles, Hutchinson, and Smith Forearm: Essex-Lopresti, Galleazi, and Monteggia Shoulder: Hill-Sachs and Bankart. Lower Extremity: 5th Metatarsal Base: Stress, Jones, Pseudo-Jones (avulsion) Midfoot: Chopart, Lisfranc Talus: Cedell and Shepherd Ankle: Cotton, Dupuytren, Gosselin, Pilon, Tillaux, Maissoneuve Knee: Pelligrini-Stieda, Segond, Reverse Segond, Maissoneuve.

## IMAGING PATTERNS OF SPONDYLODISCITIS: A PICTORIAL REVIEW

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Trang T. Dam, MD,PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Spondylodiscitis is an infection involved disc-endplate complex, vertebral body, paravertebral tissue and epidural space. Diagnosis and treatment of spondylodiscitis can be delayed due to nonspecific signs and symptoms. 2. Magnetic resonance imaging (MRI), due to its high sensitivity and specificity, can help in early-phase detection, and differentiate between infectious spondylodiscitis versus inflammatory or degenerative spinal changes. 3. Computed tomography (CT) aids in evaluating bone erosions, calcifications, bone quality and CT-guided biopsy help to obtain causative organisms. 4. This exhibit describes the role of MRI and CT on the assessment of spondylodiscitis and other mimicking disorders in clinical practice

### TABLE OF CONTENTS/OUTLINE

Spondylodiscitis: introduction.Pyogenic spondylodiscitis: typical and atypical imaging patterns. Tuberculosis spondylodiscitis: typical and atypical imaging patterns. Postoperative spondylodiscitis.Non-infectious spinal disorders mimicking infections: how MRI can help? Diagnostic work-up in suspicious spondylodiscitis.

## DECIPHERING ORTHOPEDIC HIP HARDWARE IMAGING: HOW TO RECOGNIZE AND WHAT SURGEONS NEED TO KNOW

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Danielle B. Rumi, MD (*Abstract Co-Author*) Nothing to Disclose
Ingrid D. Caridade, MD (*Abstract Co-Author*) Nothing to Disclose
Erica D. Cruz, MD (*Abstract Co-Author*) Nothing to Disclose
Bruna Maria Lobato Vaughan, MD (*Abstract Co-Author*) Nothing to Disclose
Diego A. Garcia, MD (*Abstract Co-Author*) Nothing to Disclose
Gabriela Lauar, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Interpreting hip orthopedic materials through imaging methods can be challenging for the radiologist, as it is crucial knowledge due to its essential role in postoperative evaluation and diagnosing complications related to these devices. Plain radiographs are often the initial method of choice due to their availability, low cost, and ability to provide an overview of implant position, bone integrity, and joint alignment. However, other imaging methods such as computed tomography (CT) and magnetic resonance imaging (MRI) may be necessary for a more detailed assessment of the prosthesis-bone interface, surrounding soft tissues, and complications such as loosening, osteolysis, periprosthetic fractures, and infection. Ultrasonography also plays an important role in detecting peri-implant fluid collections and assessing adjacent soft tissues. The combination of these imaging methods allows for a comprehensive and accurate approach in interpreting hip orthopedic materials, assisting the medical team in making appropriate treatment decisions and improving patient outcomes post-surgery.

### TABLE OF CONTENTS/OUTLINE

Through a pictorial essay, we will review the normal anatomy of the hip, indications for orthopedic materials, how to assess them through imaging methods, and what their main complications are.

## MRI FINDINGS OF THE IDIOPATHIC INFLAMMATORY MYOPATHIES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Emad S. Allam, MD (*Abstract Co-Author*) Nothing to Disclose
Hongmin Xu, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Describe MRI findings of major subtypes of idiopathic inflammatory myopathies (IIM) and associated comorbidities.Clarify differentiating features among key IIM variants to enhance diagnosis confidence among radiologists.Highlight the connection between IIM and cancer, advocating for prompt cancer screening in IIM cases.

### TABLE OF CONTENTS/OUTLINE

Exhibit major IIM cases including dermatomyositis, polymyositis, paraneoplastic fasciitis/myositis, and anti-synthetase syndrome myositis.Imaging features including the extent and pattern of muscle involvement and disease activity on MRI are described.Summary of differential diagnosis of the major subtypes of IIM. Highlights the importance of a comprehensive approach involving medical history, physical examination, laboratory testing, and advanced imaging techniques like MRI in differentiating between subtypes of myositis and guiding muscle biopsy.

Jose Maria Martinez Gomiz (*Abstract Co-Author*) Nothing to Disclose
Carlos Oliva Fonte (*Abstract Co-Author*) Nothing to Disclose
Javier Azpeitia Arman, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To know the different types of shoulder replacement. To review the role of imaging techniques (plain radiograph, CT, MRI, US, scintigraphy) in the evaluation of shoulder prostheses. To understand the usefulness and limitations of plain radiographs and CT in the evaluation of shoulder replacements, emphasizing useful parameters and illustrating image analysis and interpretation. To become familiar with normal and abnormal postoperative imaging findings and signs of complications

### TABLE OF CONTENTS/OUTLINE

We review imaging of shoulder replacement, highlighting key concepts perceived as important variables by the surgeon and correlating images with clinical considerations and functional outcomes. We present: A review of types of replacement. Surgery aims. Imaging. Plain radiographs -Technique and views. Standard image acquisition: beam and anatomical landmarks -Parameters that should be evaluated: description of the components and alignment relative to normal anatomic alignment. Imaging. CT -Technique. -Parameters that should be evaluated. -Imaging of complications Early complications include instability or dislocation, hematoma, ulnar nerve dysfunction, deep infection, heterotopic ossification, and scapular spine fracture. Late complications include humeral and glenoid fractures, metaglene loosening, and scapular notching. Role of MRI, US and scintigraphy.

### TEACHING POINTS

- Understanding the anatomy of digital nerves in the upper limb;
- Navigating the anatomy of digital nerves in the lower limb;
- Correlating imaging findings with pathological changes in digital nerves;
- Analyzing ultrasonographic and magnetic resonance imaging findings across digital nerve pathologies.

### TABLE OF CONTENTS/OUTLINE

Introduction:
- Anatomy of digital nerves
- Upper limb
- Lower limb
- Structure of the digital nerve
- Clinical presentationOverview of Magnetic Resonance Imaging (MRI) and Ultrasonography (US) in nerve evaluation:
- Normal imaging characteristics on MRI and US
- Techniques and protocols for digital nerves MRI
- US imaging techniques and considerations for digital nerve evaluationCase-based review:
- Traumatic lesions
- Inflammatory conditions
- Tumors
- Extrinsic compressionSummaryTake home messages

## ELBOW IMAGING - HOW TO MASTER ITS COMPLEXITIES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Jan P. Grunz, MD (*Abstract Co-Author*) Research Consultant, Siemens AG
Andreas Kunz, MD (*Abstract Co-Author*) Nothing to Disclose
Theresa Sophie Patzer, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Dislocations and fractures of the elbow joint are a common finding following trauma. At the same time, osseous lesions are often associated with injuries of the ligaments and tendons, in particular concerning the lateral and medial collateral ligament complex, as well as the distal insertion of the biceps tendon. Diagnostic work-up requires a profound understanding of anatomy, biomechanics and typical injury patterns. While conventional radiography oftentimes represents the primary imaging modality, additional cross-sectional examinations with high spatial resolution are often required in order to address the fracture pattern and associated soft tissue pathologies in detail.

### TABLE OF CONTENTS/OUTLINE

1. Elbow joint anatomy a. Biomechanical properties b. Medial and lateral collateral ligament complex c. Muscles i. Extensors originating from lateral humeral epicondyle ii. Flexors originating from medial humeral epicondyle iii. Biceps tendon inserting at radial tuberosity d. Chiasma antebrachia 2. Imaging a. MRI with and without intravenous contrast enhancement b. Advantages of cone-beam CT over multidetector CT c. Postoperative Imaging 3. Pathologies a. Rupture of lateral collateral ligament complex b. Rupture of medial collateral ligament complex c. Lateral epicondylitis (tennis elbow) d. Medial epicondylitis (golfer’s elbow) e. Rupture of the biceps tendon f. Osborne-Cotterill lesion 4. Discussion

## BEFORE AND AFTER: EVALUATING RESPONSE TO TREATMENT IN MULTIPLE MYELOMA - WHOLE BODY MR IMAGING AND PET/CT

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Jesus D. Aquerreta, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Maria J. Garcia-Velloso, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Alberto Paternain, MD (*Abstract Co-Author*) Nothing to Disclose
Pablo Del Nido Recio (*Abstract Co-Author*) Nothing to Disclose
Marcos Jimenez Vazquez, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• Whole-body MR Imaging (WB-MRI) and FDG-PET/CT have a crucial role in the follow-up of Multiple Myeloma.• It is important to correlate the morphology of the lesions with diffusion-weighted imaging values (MRI) and with up-take values (FDG-PET/CT).• FDG-PET/CT is the gold standard for studying extramedullary disease, whereas WB-MRI has more sensitivity in depicting diffuse disease and non-secretor myeloma.

### TABLE OF CONTENTS/OUTLINE

The Myeloma Response Assessment and Diagnosis System (MY-RADS) characterizes the disease state on MRI, at diagnosis and during follow-up. It is aimed to standardize reports and minimize variations. 5 Response Assessment Categories (RAC) have been described:• RAC 1 (Highly likely to be responding): previously evident lesion shows increase in ADC values from = 1400 to >1400 μm2/sec or = 40% increase in ADC from baseline.• RAC 2 (Likely to be responding): an increase in ADC from = 1000 to <1400, or >25% but <40% increase in ADC from baseline.• RAC 3: No observable change.• RAC 4 (Likely to be progressing): no change in size but increasing signal intensity with ADC values <1400.• RAC 5 (Highly likely to be progressing): new regions of hyperintensity with ADC values between 600-1000.On the other hand, the Italian myeloma criteria for PET use (IMPetUs) has standardized PET interpretation. FDG uptake is graded by the five-point scale of Deauville score (DS):1) No up-take is observed.2) Uptake = mediastinum.3) Uptake > mediastinum but = liver.4) Uptake moderately increased compared to the liver.5) Uptake markedly increased compared to the liver.Bone marrow non-focal uptake, focal bone lesions (site, number and uptake), paramedullary and extramedullary lesions are also studied.

Darryl B. Sneag, MD (*Abstract Co-Author*) Researcher, General Electric Company;Researcher, Siemens AG;Research support, AMAG Pharmaceuticals, Inc
Yen Po Lin, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• Occipital neuralgia is a common pain syndrome that often occurs in combination with other headache disorders, such as migraines and tension headaches. An overlap in symptoms presents a diagnostic challenge for clinicians. Additionally, the small size and neighboring dermatomal territories of the occipital nerves often limit conventional MRI from accurately localizing pathology.• MR neurography (MRN) has not traditionally been used for occipital nerve evaluation. New technical advancements, including deep learning reconstruction techniques that enable higher spatial resolution, particularly for 3D isotropic sequences, now enable MRN as a modality to visualize these small nerves. • When performing MRN, it is crucial for the radiologist to be familiar with occipital nerve anatomy and technical considerations to optimize image quality.

### TABLE OF CONTENTS/OUTLINE

• Background• Anatomy Overview o Greater, lesser and third occipital nerves• Technical Considerations o Magnet: high field strengtho RF Coils: conventional head and neck coil or newly-developed conformable neck coil o Protocol/Sequences & 7; Anatomical 2D sequences: proton density sequences& 7; MR neurography 2D sequences: T2 Dixon and T2 fat-saturated sequences& 7; MR neurography 3D sequences: double echo steady state& 7; Fat and vascular suppression techniques & 7; Deep learning reconstruction& 7; Zero-to-echo time (ZTE) sequences: for anatomical reference and rendering • Case exampleso Normal anatomy demonstration o Unilateral occipital neuropathy/ entrapmento Traumatic injuryo Iatrogenic injury/neuromao Treatment: decompression surgery, nerve block/injection, radiofrequency ablation

## LEVEL UP BONE TUMOR DIAGNOSIS FOR RADIOLOGISTS: MALIGNANT TRANSFORMATION OF BONE WITH IMAGING-PATHOLOGY CORRELATION

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Hyang-Sook Jeong (*Abstract Co-Author*) Nothing to Disclose
Jee-Young Kim, MD (*Abstract Co-Author*) Nothing to Disclose
Seul Ki Lee, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Common bone lesions, initially benign or low-grade malignant, have the potential to transform into higher-grade of malignancies. 2. Although typical imaging features of common bone lesions are well-established, malignant transformation is rare and can be easily missed. Additionally, sampling errors during biopsies can lead to inaccurate diagnoses. 3. Benign bone tumors that can transform into malignancies include osteochondroma, enchondroma, fibrous dysplasia, and giant cell tumor of bone. Non-tumorous conditions that may undergo malignant transformation include Paget's disease of bone, bone infarction, chronic osteomyelitis, and bone that has received radiation therapy. 4. Low-grade malignancies that can progress to higher grades include low-grade central osteosarcoma, and atypical cartilaginous tumor/low-grade chondrosarcoma. 5. Early recognition of malignant transformation in bone lesions is crucial. Combining clinical presentation, imaging findings, and accurate pathology is essential for planning appropriate management strategies.

### TABLE OF CONTENTS/OUTLINE

1. Typical Imaging Features of Common Bone Tumors 1-1. Bone Matrix: Osseous, Chondroid, and Fibrous 1-2. Benign vs. Malignant 2. Atypical Imaging Features and Diagnostic Challenges: Pearls and Pitfalls 2-1. Benign Bone Lesions Showing Malignant Transformation (Tumorous and Non-Tumorous Conditions) 2-2. Low-Grade Malignancies Progressing to Higher-Grades 3. The Importance of Precise Biopsy for Accurate Pathologic Diagnosis 4. Patients at Risk for Malignant Transformation of Bone Lesions 4-1. Impact of Prior treatment (Denosumab, Surgery, or Radiation) 4-2. Treatment Options: Timely Surgery vs. Watchful Follow-Up

Fumiko Yagi, MD (*Abstract Co-Author*) Nothing to Disclose
Yoshitake Yamada, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The purposes of our exhibit are as follows: (1) To explain the development, background, and performance of 320-detector-row upright computed tomography (CT) for whole-body scans, (2) To describe the anatomical changes in each musculoskeletal structure due to differences in body position, that is, the direction of gravity, and (3) To illustrate the clinical applications and usefulness of upright CT in various orthopedic diseases with clinical case presentations.

### TABLE OF CONTENTS/OUTLINE

(1) Development and advantages of upright CT with an area detector for whole-body scans (2) Performance of 320-detector-row upright CT: Physical characteristics, workflow improvement, safety, and remote operation during the infectious disease pandemic (3) Effects of gravity on the shoulder girdle, upper extremities, thorax, vertebrae, hip, knee, foot, and muscles in various parts of the body (4) Clinical applications of upright CT for various orthopedic diseases such as knee osteoarthritis, hip osteoarthritis, scoliosis/spinal deformity, lumbar spondylolisthesis, orbital wall fracture, and pectus excavatum (5) Upright 4D-CT (6) More accurate evaluation of seatbelt safety for autopilot driving with upright CT (7) Limitation (8) Conclusion

Sarah Hickman, MBBS (*Presenter*) Research collaboration, Vara;Research collaboration, ScreenPoint Medical BV;Research collaboration, Lunit Inc;Research collaboration, Kheiron Medical Technologies Ltd;Research collaboration, Alphabet Inc;Research collaboration, Volpara Health Technologies Limited

### TEACHING POINTS

- MSK TB is rare (1-3% of cases of TB) and most commonly affects the spine (50%), followed by TB arthritis, and tenosynovitis is very rare. Concurrent intrathoracic TB occurs in ~ < 50% of cases. [Yukie Rodriguez-Takeuchi et al 2019, Pattamapaspong et al 2024, Burrill 2007]. -Symptom onset is insidious over weeks to months with progressive pain, night sweats, fatigue, weight loss and low grade fever. This leads to a significant delay in diagnosis (reportedly 3 -24 months).-Spinal involvement occurs via haematogenous spread usually infecting the anterior and central vertebral body. Infection can spread over multiple levels with sparing of the disc through subligamentous spread. With time, vertebral destruction and cold abscess formation may occur. -Disc involvement is usually late. Spread to paraspinal tissues may be in the form of a psoas abscess with calcification highly suggestive of TB. Epidural phlegmon can also extend to compress the spinal cord / cauda equina. -TB osteomyelitis is often misdiagnosed as multiple bone metastases. -TB Arthritis occurs from osteomyelitis or hematogenous spread and is typically a chronic granulomatous monoarthritis affecting weight bearing joints and typically demonstrates Phemister triad (juxta-articular osteoporosis, peripheral osseous erosion and gradual narrowing of the joint space).-TB Tenosynovitis occurs from hematogenous spread or extension from TB arthritis and most commonly occurs in the wrist and hand, usually involving the flexor tendon sheath.

### TABLE OF CONTENTS/OUTLINE

1) Introduction to MSK TB2) Spondylodiscitis 3) Psoas Abscess 4) Osteomyelitis 5) Septic arthritis 6) Synovitis 7) Tenosynovitis 8) Bursitis 9) Intramuscular / subcutaneous10) Conclusion

### TEACHING POINTS

Upon reviewing this exhibit, the reader should:• Be familiar with the pathologies that can present with radial wrist pain. A brief overview will be provided detailing each pathology, including epidemiology and clinical presentation, essential for the differential diagnosis.• Be able to select the appropriate imaging modality in each case (plain film, ultrasound, CT, MRI) based on the patient's history, clinical context and symptoms, taking into account the utility and limitations of each modality.• Accurately describe the findings in studies performed on patients affected by the mentioned pathologies.• Recognize the complications associated with each disease and their representation in imaging.• Understand the available therapeutic options, including interventions involving radiologists.

### TABLE OF CONTENTS/OUTLINE

• Wrist anatomy• Differential diagnosis o Due to overuse:? De Quervain's stenosing tenosynovitis.? Proximal and distal intersection syndromes.o Acute traumatic origin:? Fracture of the distal end of the radius.? Carpal fractures: scaphoid, trapezius.? Fractures of the base of the first metacarpal: Bennett, Rolando and pseudo-Bennett.o Degenerative arthropathy:? Trapeziometacarpal osteoarthritis.? Trapezio-scapho-trapezoid osteoarthritis.? Radiocarpal osteoarthritis.o Nerve entrapment and injury:? Cheiralgia paresthetica - Wartenberg syndrome.? Post-traumatic neuroma.• Conclusions

## PORTABLE LOW-FIELD MRI FOR IMPROVED MUSCULOSKELETAL DISORDERS DIAGNOSTICS - METHODS, CHALLENGES AND FUTURE POTENTIAL

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Shira Nemirovsky-Rotman (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Medical imaging is a key component for diagnostics of musculoskeletal (MSK) conditions, currently considered a significant national public health issue - due to ageing population as well as prevalence of sport injuries. The growing need for accurate and fast examinations has resulted in a bottleneck in medical diagnostics and treatment. MRI exhibits superior soft-tissue contrast and resolution compared to other modalities; specifically, it is considered the gold-standard for diagnostics of a range of MSK injuries and disorders. Recently, research has focused on portable and low-field MRI scanners, which may be applied for various applications, including MSK. Low-field MRI provides invaluable opportunities for lower maintenance costs, as well as portable and accessible imaging; however, it produces images that suffer from reduced resolution and signal-to-noise ratios compared to their high-field counterparts. To address this issue, recent deep-learning-based methods have been applied to translate images acquired with low-field scanners to images with perceived high-field quality. Such methods show proof-of-concept in translating from low to high resolution; however, further research is needed to determine the diagnostic integrity of the obtained images for specific clinical applications.

### TABLE OF CONTENTS/OUTLINE

1. Principles of AI-based algorithms for image translation from low- to high-field MRI scanners;2. The challenge of image registration and domain adaptation when training AI-based low-to-high-field translation algorithms;3. Clinical/diagnostic evaluation criteria vs. computer vision measures for assessment of reconstructed high-field images (as obtained from low-field).

## GIANT CELL-RICH LESIONS OF BONE: BEYOND GIANT CELL TUMOR OF BONE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Xavier Sanjuan (*Abstract Co-Author*) Nothing to Disclose
Jose A. Narvaez, MD (*Abstract Co-Author*) Nothing to Disclose
Karen Perez Alfonso, MD (*Abstract Co-Author*) Nothing to Disclose
Juan Carlos Sardinas (*Abstract Co-Author*) Nothing to Disclose
German G. Ratto, MD (*Abstract Co-Author*) Nothing to Disclose
Javier Hernandez Ganan (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Giant cell-rich bone lesions comprize heterogeneous neoplastic and non-neoplastic disorders with diverse clinical, radiological and pathological presentations. They are characterized by the presence of conspicuous osteoclast-type giant cells as a component of the presenting entity. Giant cell tumor of bone is probably the best known of this group of lesions. The objectives of this review are: - To explain the molecular background in the formation of osteoclast-type giant cells (role of RANK ligand). - To analyze the radiological features of giant cell tumor of bone and post-treatment changes with denosumab. - To review the different tumors that can present giant cells, analyzing the relevant radiological features. - To review the molecular alterations that help to differentiate these entities, especially the H3.3 mutations.

### TABLE OF CONTENTS/OUTLINE

- Cell biology in the formation of osteoclast-like giant cells. - Giant cell tumor of bone: imaging features, microscopic and molecular pathology features. - Imaging and pathologic features of GCTB after denosumab treatment. - Variants of GCTB: malignant GCTB, multicentric GCTB, metastatic GCTB. - Imaging and patholiogic features of other giant cell-rich lesions: o Aneurymal bone cyst (ABC) o Giant cell granuloma of the jaws (GCG). o Giant cell-rich osteosarcoma. o Giant Cell Reparative Granuloma (Solid ABC) o Benign fibrous histiocytoma of the bone (GCTB with regressive changes). o Non-ossifying fibroma of bone (NOF). o Chondroblastoma. o Chondromyxoid fibroma. o Brown tumor of hyperparathyroidism.

## REVEALING RADIOGRAPHS: KEY REPORTS FOR THE ORTHOPEDIST IN FRACTURE MANAGEMENT

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Sonia Carolina Hernandez Sanchez (*Abstract Co-Author*) Nothing to Disclose
Gustavo Rozo (*Abstract Co-Author*) Nothing to Disclose
Guillermo A. Granados Gonzalez, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Recognize the different stages of bone healing, understand primary and secondary orthopedic management options.Identify complications such as non-union, pseudoarthrosis, and malunion.Accurate diagnosis and early intervention prevent long-term complications.Understand the process of bone transport and its clinical applications in correcting bone defects.Know what findings to include in radiological reports for effective decision-making.Recognize the importance of clear and concise communication in reports to ensure optimal patient care.

### TABLE OF CONTENTS/OUTLINE

Table of Contents1. The Natural History of Fracture and Its Management - Orthopedic and Surgical Management of Fractures2. Alterations and Complications in Consolidation - Is pseudoarthrosis the same as non-union? - Types of non-union3. Functional Basis of External Fixation and Bone Transport4. Useful Reports for the Orthopedist5. Cases6. Teaching Points

## ANALYSIS OF MUSCLE VIABILITY USING MAGNETIC RESONANCE IMAGING IN COMPARTMENT SYNDROME

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Ana Belen Barba Arce, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Describe the study protocol using magnetic resonance imaging (MRI) in the assessment of compartment syndrome. 2. Determine the structural changes in the muscles affected by compartment syndrome, both acute and chronic. 3. Obtain objective and precise data on muscle viability that can help in treatment planning and patient follow-up. 4. Analyze the acute and chronic complications of this syndrome. 5. Perform a differential diagnosis with other entities.

### TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Acute compartment syndrome. 2.1. Etiology. 2.2. Pathophysiology. 2.3. Clinical manifestations. 2.4. Diagnostic tests. 2.5. Treatment. 2.6. MRI study protocol. 2.6.1. Findings. 2.6.2. Muscle viability analysis. 3. Chronic compartment syndrome. 3.1. Chronic exertional compartment syndrome. 3.2. MRI study protocol. 3.2.1. Findings. 3.2.2. Muscle viability analysis. 4. Complications of compartment syndrome. 4.1. Infection. 4.2. Myonecrosis. 4.3. Calcifying myonecrosis. 4.4. Fibrous contractures. 4.5. Rhabdomyolysis. 5. Differential diagnosis. 6. Conclusions.

## SQUEEZE THE DAY: AN IMAGING-BASED REVIEW OF DENERVATION SYNDROMES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Alejandra Cardona Del Valle, MD (*Abstract Co-Author*) Nothing to Disclose
Gabriel Camareno-Soto, BSc (*Abstract Co-Author*) Nothing to Disclose
Carol Sanchez Santana (*Abstract Co-Author*) Nothing to Disclose
Kevin Hornedo, BS (*Abstract Co-Author*) Nothing to Disclose
Elizabeth Trullenque, MD (*Abstract Co-Author*) Nothing to Disclose
Santiago A. Saldana Mendez, MD, BS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

A. Review relevant anatomy, pathophysiology, and clinical presentation of Denervation Syndromes. B. Showcase the most common denervation syndromes and epidemiology. C. Discuss key imaging findings on Ultrasound (US) and Magnetic Resonance Images (MRI) for diagnosis. D. Examine the role of imaging in treatment planning.Denervation syndromes, resulting from diverse causes such as trauma, infection, tumors, or autoimmune disorders, frequently manifest as pain and weakness. While traditional diagnosis relied on clinical assessment and electromyography, MRI and ultrasound now play pivotal roles. These imaging modalities aid in identifying injury sites, duration of denervation, and underlying causes. This exhibit comprehensively reviews common denervation syndromes, showcasing MRI and ultrasound images to elucidate diagnosis and develop optimal treatment strategies.

### TABLE OF CONTENTS/OUTLINE

I. Introduction Objectives II. Anatomy and Pathophysiology III. Clinical Presentation IV. Showcase Common Denervation Syndromes A. Upper extremity 1. Subcapsular N. 2. Axillary N. 3. Radial N. 4. Median N. 5. Ulnar N. B. Lower extremity 1. Femoral N. 2. Obturator N. 3. Sciatic N. 4. Tibial 5. N. V. Diagnosis Key imaging findings on US and MRI evaluations VI. Treatment VII. Conclusion

## DISCOID LATERAL MENISUCUS: HELPFUL FINDINGS IN X-RAY AND MAGNETIC RESONANCE IMAGING, AND NEW INSIGHTS ON SHAPE FEATURES OF BONE AND CARTILAGE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Keita Nagawa (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The major radiographical findings of discoid lateral meniscus (DLM) have been reported to be widening of the lateral joint line, cupping of the lateral tibial plateau, squaring of the lateral femoral condyle, widening of the tibial eminence, elevation of the fibular head, and condylar cutoff sign. To diagnose DLM on magnetic resonance imaging (MRI), several findings are important; the meniscal width is over 15 mm on the coronal slice. Continuity of the meniscus between the anterior and posterior horns on three or more 5-mm thick consecutive sagittal slices. In the recent studies, new insights for DLM concerning bone and cartilage morphology have been reported, including hypoplasia of the posterior lateral femoral condyle, and thin lateral tibial cartilage. In our analysis for DLM concerning the volume of subchondral bone and cartilage, the volume of lateral femoral epiphyseal bone and the cartilage volume of lateral tibial plateau were significantly smaller in the DLM group compared to the control group.

### TABLE OF CONTENTS/OUTLINE

1. Basics of DLM2. Important X-ray findings for DLM3. To diagnose DLM with MRI4. New insights for DLM: bone and cartilage morphology5. Our findings for DLM: volume of subchondral bone and cartilage

## VIRTUAL NON CALCIUM IMAGING IN CONTRAST ENHANCED DUAL-ENERGY CT IMPROVES DETECTION OF BONE METASTASES AND MAY ALSO REFLECT ACTIVITY OF BONE METASTASES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Shunsuke Itaya, RT (*Abstract Co-Author*) Nothing to Disclose
Yasuo Sakurai, MD (*Abstract Co-Author*) Nothing to Disclose
Yoshihisa Kodama, MD,PhD (*Abstract Co-Author*) Nothing to Disclose
Hirotaka Nakashima, MSc, RT (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Deep learning imaging reconstruction (DLIR) based virtual non-calcium (VNCa) images were created using a two-material decomposition process based on dual-energy CT acquisition with fast kV switching.2. The diagnostic performance of contrast-enhanced CT imaging and VNCa imaging was compared in 53 patients with clinically confirmed bone metastases.3. Three substance pairs were used for VNCa images in contrast-enhanced dual-energy CT: Iodine (Hydroxyapatite), Water (Hydroxyapatite), and Water (Calcium).4. Evaluation of metastatic bone tumors using VNCa imaging on contrast-enhanced dual-energy CT demonstrated superior diagnostic performance compared to conventional CT imaging.

### TABLE OF CONTENTS/OUTLINE

Bone metastasis is a possible complication of all cancers and reduces the quality of life of patients. CT is difficult to diagnose osteoblastic bone metastases without destruction and is often missed. Virtual non calcium (VNCa) images are material-dense images obtained with dual-energy CT, which enhances the water component and removes the bone component. Using VNCa images in contrast-enhanced dual-energy CT may improve the identification of bone metastases and evaluate the activity of bone metastases by assessing the presence of contrast uptake. In this exhibition, we compared the diagnostic performance of bone metastases in contrast-enhanced dual-energy CT when evaluated with VNCa images plus bone and soft tissue conditions and when evaluated with bone and soft tissue conditions images only. The results showed that VNCa imaging had a higher discriminative ability for metastatic bone tumors. Furthermore, it was suggested that evaluating the activity of bone metastases is also feasible.

### TEACHING POINTS

Chronic Recurrent Multifocal Osteomyelitis (CRMO) is an idiopathic inflammatory disorder of the bones, typically seen in children and adolescents. Whole-body magnetic resonance imaging (WB - MRI) is a very useful imaging tool in the detection and follow-up of such alterations. Therefore, the aim of this exhibit is to:Describe the main points related to the protocol of WB - MRI in children, including the particularities of the age group and the techniques used.Expose the main concepts of CRMO, including its pathophysiology and its main radiographic features.Demonstrate the main imaging findings of CRMO in WB-MRI and ways to identify such alterations in all sequences.Identify pitfalls and potential confounding imaging findings in WB-MRI.

### TABLE OF CONTENTS/OUTLINE

Introduction: the importance of WB-MRI in the diagnosis and follow-up of CRMO.WB-MRI in childrenProtocolParticularities in childrenCRMODefinition and epidemiologyPathophysiologyMain radiographic featuresPitfalls in WB-MRINormal versus pathologic signal alterations.

## DYNAMIC SPINE FLEXIBILITY EVALUATION WITH DYNAMIC DIGITAL RADIOGRAPHY FOR ADOLESCENT IDIOPATHIC SCOLIOSIS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Zhiwei Wang, MD (*Abstract Co-Author*) Nothing to Disclose
Man Wang (*Abstract Co-Author*) Nothing to Disclose
Wu Liu (*Abstract Co-Author*) Nothing to Disclose
Shuo Ma (*Abstract Co-Author*) Nothing to Disclose
Zhe Zhao (*Abstract Co-Author*) Nothing to Disclose
Ruiyao Qin (*Abstract Co-Author*) Nothing to Disclose
Yun Wang (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To demonstrate a new way to evaluate spine flexibility with dynamic digital radiography.To design motion for supine bending, fulcrum bending and suspension, the general principle, and special points for each position. To suggest the exposure parameters and effect dose follow the ALARA principle. To show the case of each position movement, the trajectory and dynamic Cobb’s angle changes and stretch distance changes.

### TABLE OF CONTENTS/OUTLINE

1. Background: -limits of static spine flexible evaluation - new technique of dynamic digital radiography (DDR) 2. Key aspects of DDR position acquisition: - Posture designing - Movement training 3. Exposure conditions for DDR: - Exposure parameters - Effective radiation dose 4. The dynamic changes of Cobb’s angle, spinal flexibility, and subject's stability during different DDR positions: - Cobb’s angle variations during different bending motion - Stretch distance changes during suspension motion

## THE NEGLECTED HORNS: VARIANTS, PITFALLS AND PATHOLOGIES OF THE ANTERIOR HORNS OF THE MENISCI

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Michael Brown, MD (*Abstract Co-Author*) Nothing to Disclose
Thomas S. Truong, MD (*Abstract Co-Author*) Nothing to Disclose
Pamela J. Walsh, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The anterior horns of the menisci are less frequently considered than the body and posterior horns when assessing and studying meniscal appearance and pathology. The anterior horns of the medial and lateral menisci possess variant anatomy and at times may mimic pathologies. True tears and pathologic processes do occur in the anterior horn, and at times are subtle and may be overlooked. This educational exhibit is designed to demonstrate the traditional and variant anatomy of the medial and lateral menisci's anterior horns with examples of how to discern variant anatomy from pathology. The exhibit will also show examples of true pathology of the anterior horn, highlighting subtleties not to be overlooked.

### TABLE OF CONTENTS/OUTLINE

Background Medial Meniscus Anatomy Variant Anatomy/Pathology mimics Far anterior insertion of the anterior horn Anterior meniscofemoral ligament of the medial meniscus Oblique meniscomeniscal ligament Lateral Meniscus Anatomy Variant Anatomy/Pathology mimics Striated/speckled appearance of the root attachment Mucoid degeneration of the anterior root/relationship to the ACL insertion Transverse ligament mimicking tear Pathology Meniscal contusions Tears Radial tears (more commonly seen at the lateral meniscus) Flap tears Complex tears Parameniscal cysts

## SPRINT TO DIAGNOSIS: UNRAVELING LOWER LIMB MUSCULOSKELETAL INJURIES IN RUNNERS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Danielle B. Rumi, MD (*Abstract Co-Author*) Nothing to Disclose
Diego A. Garcia, MD (*Abstract Co-Author*) Nothing to Disclose
Felipe C. Ferreira Dionisio, MD (*Abstract Co-Author*) Nothing to Disclose
Jose F. Neto, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Anatomy Understanding: Reviewing the anatomy of the structures of the lower limb to get a precise diagnosis.Early Recognition: Highlight the importance of prompt identification of lower limb musculoskeletal injuries in runners to prevent chronicity and optimize outcomes.Multimodal Imaging: Discuss the role of advanced imaging modalities such as MRI, CT, and ultrasound in providing detailed anatomical assessment and accurate diagnosis of soft tissue and bone injuries.Clinical Correlation: Emphasize the integration of imaging findings with clinical history and physical examination to enhance diagnostic precision.Injury Patterns: Explore common patterns of lower limb injuries encountered in runners, including stress fractures, muscle strains, tendinopathies, and ligamentous injuries, to aid radiologists in targeted evaluation.Conclusion: After this education exhibit you should be able to correctly diagnose the most prevalent injuries in runners.

## FIRM GRASP OF ANKLE INSTABILITY: UNDERSTANDING MRI FEATURES OF FAILURE MODES OF THE LATERAL ANKLE LIGAMENTS WITH SURGICAL AND FLUOROSCOPIC CORRELATION

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Dhiren Shah, MBBS, FRCR (*Abstract Co-Author*) Nothing to Disclose
Andrew Goldberg (*Abstract Co-Author*) Nothing to Disclose
Dimitri Amiras, MBBS, FRCR (*Abstract Co-Author*) Clinical Advisory Board, Medical iSight
Rikin Hargunani, FRCR, MBBS (*Abstract Co-Author*) Nothing to Disclose
Jedrzej Krawczyk, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. How to image and identify the CFL, superior and inferior ATFL bundles on imaging2. Why these are important for management in suspected ankle instability.3. Injury to the lateral ligament complex involving the fibula / inferior ATFL can lead to subtalar joint instability4. This can be detected both during on-able fluoroscopy and intra-operatively and most importantly - correlated with MR appearances.

### TABLE OF CONTENTS/OUTLINE

Lateral fibulotalocalcaneal ligament complex (LFTCL) is formed by the inferior fascicle of the anterior talofibular ligament (ATFL), connected with the calcaneofibular ligament (CFL) by arciform fibres ; it plays an important role in inversion injury prevention. This ligament complex is distinct from the superior fascicle of the ATFL - an intra-articular ligament unlikely to heal. An isolated repair of ATFL results in great outcomes if the complex is intact.In our exhibit, we outline:1. The anatomy and biomechanics of the lateral ligaments of the ankle.2. Injury mechanisms and related failure modes of the ligaments.3. MRI sequences used in our practice.4. Subsequent MRI appearances related to different failure models.5. Dynamic instability demonstrated by dynamic fluoroscopy.6. Correlation of example MRI cases with intra-operative videos.

## OPERATIONALIZING CLINICAL KNEE MRI AT 7T: THE GOOD, THE BAD, AND THE UGLY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Aaron J. Wyse, MD (*Abstract Co-Author*) Nothing to Disclose
Michael G. Fox, MD (*Abstract Co-Author*) Royalties, RELX
Jeremiah R. Long, MD (*Abstract Co-Author*) Nothing to Disclose
David M. Melville, MD (*Abstract Co-Author*) Nothing to Disclose
Jonathan A. Flug, MD, MBA (*Abstract Co-Author*) Nothing to Disclose
ANTHONY HANNON (*Abstract Co-Author*) Nothing to Disclose
Jason Tilque (*Abstract Co-Author*) Nothing to Disclose
Samuel J. Fahrenholtz, PhD (*Presenter*) Stockholder, Nano X Imaging

### TEACHING POINTS

1) Though 7T represents a new technology with incredible capabilities, the current hardware and software requires intense optimization to reach an operational level of clinical abilities comparable with current 3T and 1.5T imaging. 7T clearance by the Food and Drug Administration is limited to knee and brain. 2) The primary advantage of 7T knee magnetic resonance imaging (MRI) is increased signal-to-noise ratio (SNR) which can be used for better resolution, less noise appearance, and/or faster imaging. 3) The primary disadvantages are heating and inhomogeneities in B0 and B1+. The inhomogeneities most significantly make chemical shift selective fat saturation fail, sometimes in the same anatomical regions across the acquisition planes. 4) Key technologies, e.g., deep learning reconstruction algorithms, are being deployed at 7T. MRI transmit and receive coil design is important. 5) The logistics of 7T are difficult. It is an expensive system with increased MR safety efforts and the possibility to induce bioeffects in patients.

### TABLE OF CONTENTS/OUTLINE

1) Patient eligibility and safety at 7T; 2) Balancing SNR, acquisition time, and resolution; 3) Effects of B0 and B1+ inhomogeneities; 4) 3D MRI; 5) Deep learning reconstruction

### TEACHING POINTS

; Soft tissue tumors of fibrous origin are one of the most common tumors found in clinical practice.; They may have different biological behavior and imaging appearance, depending on the type. Some of these lesions may be reactive to a primary process, such as elastofibroma dorsi and myositis ossificans.; Tumors with high cellularity show higher signal on T2-weighted imaging (WI) and more enhancement, whereas tumors with dense internal collagen content show low signal intensity and less enhancement.

### TABLE OF CONTENTS/OUTLINE

Fibroblastic and myofibroblastic tumors can be classified according to their biological behavior:
• **Benign lesions**:
○ Elastofibroma dorsi: it is located between the scapula and the posterior chest wall and it has heterogeneous appearance (fibrous and fatty tissue).
○ Myositis Ossificans: it shows a heterogeneous appearance on imaging and has calcified areas.
○ Fibromatosis Colli: it is found on the sternocleidomastoid muscle and it is secondary to trauma during childbirth.
○ Other lesions are: Nodular Fasciitis and Fibroma of the Tendon Sheath.
• **Intermediate lesions**: Palmar (Dupuytren) and Plantar (Ledderhose) Fibromatosis, Dermatofibrosarcoma, Solitary Fibrous Tumor.
• **Malignant lesions**:
○ Fibrosarcoma (not otherwise specified): it is hypointense on T1 WI and iso- to hyperintense on T2 WI, with peripheral enhancement.
○ Myxofibrosarcoma: it has a heterogeneous appearance with hyperintense foci on T2. Osseous involvement is frequent.
○ Sclerosing Epitheloid Fibrosarcoma: it produces cortical destruction and it shows variable signal intensity on T1 WI, with variable enhancement.
○ Other tumors are: Undifferentiated Pleomorphic Sarcoma or Low-grade Fibromyxoid Sarcoma.

## ONCOLOGIC AND NON-ONCOLOGIC SKELETAL MUSCLE UPTAKE PATTERNS ON 18F FDG PET-CT: A CASE BASED MULTI-MODALITY PICTORIAL REVIEW WITH TEACHING PEARLS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Pokhraj P. Suthar, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Nicholas Magill (*Abstract Co-Author*) Nothing to Disclose
Iryna Kostirko (*Abstract Co-Author*) Nothing to Disclose
Sumeet Virmani, MD, MS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

F18 FDG PET-CT is a well-established imaging modality with applications in cancer staging, cardiology and neurology. Skeletal muscle FDG uptake seen on whole-body PET-CT may be physiologic or pathologic. Physiologic/normal FDG uptake in skeletal muscles is usually mild and homogeneous. This case-based pictorial review highlights the spectrum of physiologic and pathologic skeletal muscle uptake patterns on F-18 FDG PET-CT, some of which are very specific and virtually diagnostic. Our case-based pictorial review aims to review:1) Expected physiologic distribution and intensity of FDG uptake in skeletal muscles.2) Various physiologic variants (FDG injection in a postprandial state, use of insulin before FDG injection, vigorous muscle exercise, stress-induced muscle tension, spastic paresis, talking, chewing, clenching of fist, use of accessory muscles of respiration, use of crutches, altered biomechanics, etc.)3. Various non-oncologic pathologic patterns of skeletal muscle uptake (elastofibroma dorsi, post-vaccination, Baastrup's disease, hot spot sign in acetabular fossa etc.)4. Various focal and diffuse oncologic patterns of skeletal muscle uptake (leiomyosarcoma, rhabdomyosarcoma, lymphoma, metastasis)

### TABLE OF CONTENTS/OUTLINE

Our case-based pictorial review of 20 interesting cases, highlights the spectrum of physiologic and pathologic skeletal muscle uptake patterns on F-18 FDG PET-CT, some of which are very specific and virtually diagnostic. Increased awareness of such patterns helps in avoiding misdiagnosis and unnecessary further interventions minimizing morbidity and mortality.

## SPECTRUM OF UNDIFFERENTIATED SMALL ROUND CELL SARCOMAS— A RADIOLOGIC-PATHOLOGIC CORRELATION IN THE ERA OF WHO CLASSIFICATION 5TH EDITION (2020)

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Ryo Kurokawa, MD,PhD (*Abstract Co-Author*) Nothing to Disclose
Mariko Kurokawa, MD (*Abstract Co-Author*) Nothing to Disclose
Yasunobu Takaki (*Abstract Co-Author*) Nothing to Disclose
Koichiro Mori (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• Familiarize yourself with the new category, "undifferentiated small round cell sarcoma of bone and soft tissue," introduced in the WHO Classification of Tumors 5th edition (2020). • Recognize that these tumors primarily affect young individuals, exhibit high malignancy, and have a poor prognosis, emphasizing the importance of early and accurate diagnosis. • Understand the role of molecular genetic analysis in the accurate differential diagnosis of these tumors, as they often present with overlapping clinical and imaging features. • Learn to identify the characteristic imaging features of Ewing sarcoma and its related entities, which can help narrow down the differential diagnosi. • Keep in mind other small round cell tumors that should be considered in the differential diagnosis.

### TABLE OF CONTENTS/OUTLINE

- Introduction
- Overview of the WHO Classification of Tumors 5th edition (2020) and the new category of "undifferentiated small round cell sarcoma of bone and soft tissue"
- Ewing sarcoma
- Clinical features, imaging findings, and pathological findings
- Treatment and imaging assessment after therapy
- New histological types such as Ewing like sarcoma
- Clinical features, imaging findings, and pathological findings
- Differentiation from Ewing sarcoma on imaging
- Differential diagnosis of small round cell tumors
- Malignant lymphoma, embryonal rhabdomyosarcoma, alveolar rhabdomyosarcoma, neuroblastoma, and desmoplastic small round cell tumor (DSRCT)
- Conclusion
- Significance of understanding the spectrum of undifferentiated small round cell sarcomas in the era of the WHO Classification 5th edition (2020)

## UNLOCKING THE MYSTERIES OF PELVIC FLOOR DISORDERS: A UNIQUE PERSPECTIVE THROUGH MUSCULOSKELETAL ULTRASOUND

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Pritika Panchal (*Abstract Co-Author*) Nothing to Disclose
Santosh Patil (*Abstract Co-Author*) Nothing to Disclose
S. Sindhura, MBBS (*Abstract Co-Author*) Nothing to Disclose
Shah S Sameerkumar (*Abstract Co-Author*) Nothing to Disclose
Vijay Halagappanavar Vamadevappa (*Abstract Co-Author*) Nothing to Disclose
Y C. Manjunatha, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The purposes of this exhibit are:- Highlight the role of musculoskeletal ultrasound, provide comprehensive overview of pelvic floor anatomy, common disorders, and the utility of musculoskeletal ultrasound in their evaluation. Demonstrate imaging techniques, discuss clinical applications and illustrate ultrasound findings in diagnosing and managing pelvic floor disorders. Highlight the advantages of musculoskeletal ultrasound over traditional imaging modalities. Emphasis on elastography and USG guided interventions.

### TABLE OF CONTENTS/OUTLINE

Exhibit will be organized under the following headings: Introduction.
- Anatomy of pelvic floor.
- Indications of pelvic floor ultrasound.
- Equipment and technique.
- Common pelvic floor disorders
- Anterior compartment
- Stress urinary incompetence.
- Post sling surgery.
- Fowler syndrome- external urethral sphincter thickening.
- Pelvic organ prolapse.
- Cystocele.
- Central compartment
- Tricompartmental disease.
- Pneumovagina.
- Varicose veins.
- Angioneurotic edema.
- Barthrolin cyst.
- Sebaceous cyst
- Epidermoid.
- Posterior compartment
- Rectocele.
- Enterocele.
- Rectal intussusception.
- Rectoanal intussusception.

### TEACHING POINTS

1. Radiographic Evaluation of the Pediatric ElbowThe pediatric elbow presents unique challenges in radiographic assessment due to the ongoing development of ossification centers and growth plates. Key considerations include:Assessment of Growth Plates;Alignment and Joint Spaces;Ossification Centers (CRITOE);2. Trauma and Sports Related PainRecognize the main types of fractures that occur in the pediatric elbow, their most prevalent mechanism of injury, classification (when necessary), pitfalls in interpretation in different imaging methods, and the main complications.3. Non-Traumatic ConditionsAcquire understanding regarding the variances between the musculoskeletal systems of pediatric and adult patients. Explore the clinical and radiological manifestations of musculoskeletal disorders in children. To discuss the optimal imaging strategies for specific disease entities.

### TABLE OF CONTENTS/OUTLINE

1) RADIOGRAPHIC EVALUATION OF THE PEDIATRIC ELBOW2) TRAUMA AND SPORTS RELATED PAINACUTE TRAUMA:Fracture of the distal humeral epiphysis; Radial head dislocation; Supracondylar fracture; Lateral condyle fracture; Monteggia fracture-dislocation;Medial epicondyle fracture; Posterolateral elbow dislocation.OVERUSE INJURIESPanner's disease / Osteochondrosis of the capitellum; Osteochondral lesion (osteochondritis dissecans) in the capitellum; Osteochondral lesion (osteochondritis dissecans) in the trochlea; Traction apophysitis (medial epicondyle; olecranon)3) NON-TRAUMATIC CONDITIONS: Infection; Inflammatory (JIA); Tumors; Hemophilia

## FIRE IN THE HOLE: REVIEW OF BLAST-RELATED HAND INJURIES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Roozbeh Houshyar, MD (*Abstract Co-Author*) Nothing to Disclose
Kasha Chen (*Abstract Co-Author*) Nothing to Disclose
Christopher Sahagian (*Abstract Co-Author*) Nothing to Disclose
Cassidy Tung (*Abstract Co-Author*) Nothing to Disclose
Kenneth N. Huynh, DO (*Abstract Co-Author*) Nothing to Disclose
Lawrence Wang, DO (*Abstract Co-Author*) Nothing to Disclose
Erwin Ho (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. To review the epidemiology of varying hand-blast injuries. 2. To discuss typical injury patterns of firework-related hand-blast injuries and highlight the key imaging findings with consideration of the hand anatomy and mechanism of injury. 3. To discuss corresponding injury complications and treatment options.

### TABLE OF CONTENTS/OUTLINE

Each year, roughly 3,000 hand-blast injuries occur in the United States and the incidence continues to rise. Such a trend is concerning because those affected are often young, with blast injuries causing soft tissue, neurovascular, bone, and joint damage that result in significant hand impairment and amputation. Only a few studies have specifically investigated firework-related injuries and have proposed injury mechanisms and severity classifications. The extensive nature of blast injuries combined with the increasing incidence underscores the urgent need for a better understanding of the mechanism of injury, pertinent radiologic findings, and treatment options. This exhibit will aim to (1) describe the growing public health issue of hand blast injuries, (2) review relevant anatomy of the hand, (3) discuss firework-related injury patterns with respect to the injury mechanism and anatomic considerations, and (4) illustrate our institution’s cases of hand blast injuries along a spectrum of severity with annotated radiographic images. An understanding of the typical injury pattern can help radiologists discern the often-complex radiographic appearance of blast injuries.

## THUMBS UP FOR ULTRASOUND OF THE RADIAL WRIST

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Cum Laude**

Andrew J. Grainger, MD (*Abstract Co-Author*) Speakers Bureau, General Electric Company
Lisa Billone, BSc (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. High resolution ultrasound can be used as a first line imaging modality for patients presenting with radial wrist pain, whether traumatic or non-traumatic in nature.2. The sonoanatomy of the radial wrist, including joints, ligaments, tendons, and nerves will be illustrated and described allowing participants to evaluate these structures in a protocol driven manner.3. The dynamic capabilities, superior spatial resolution, and direct patient interaction of ultrasound which provide unique advantages over MRI will be highlighted.4. Real case examples of pathologies causing radial wrist symptoms will be considered, including:a. Bone and joint disorders, such as synovitis, osteoarthritis, ligament injury, scaphoid fracturesb. Tendon pathologies, such as DeQuervain’s disease, intersection syndromes, tenosynovitis, partial and complete tears, post-operative complicationsc. Nerve disorders, such as Wartenberg's syndrome, impingement, venipuncture injury, transectiond. Miscellaneous disorders, such as ganglion cysts, pseudoaneurysms, cystic adventitial disease

### TABLE OF CONTENTS/OUTLINE

A. IntroductionB. Anatomy, ultrasound technique, pathology with case examples for thea. Bone and Joint i. Radiocarpal and midcarpal jointsii. Scapho-trapezium-trapezoid and 1st carpometacarpal jointsiii. Scapholunate ligamentiv. Scaphoid boneb. Tendon i. Abductor pollicis longus and extensor pollicis brevisii. Extensor carpi radialis longus and extensor carpi radialis brevisiii. Extensor pollicis longusiv. Flexor carpi radialisv. Flexor pollicis longusc. Nerve i. Superficial radial nerved. Miscellaneous i. Ganglion cystsii. Radial artery disordersiii. Accessory musclesC. Take home points

## LUMBAR SPINE PARASPINAL MUSCLES ON MRI: ANATOMY, DERANGEMENTS, CONSENSUS RECOMMENDATIONS AND NEW HORIZONS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Robert D. Boutin, MD (*Abstract Co-Author*) Nothing to Disclose
Eddy Zandee van Rilland, MD (*Abstract Co-Author*) Nothing to Disclose
John Kleimeyer (*Abstract Co-Author*) Nothing to Disclose
Akshay Chaudhari, PhD (*Abstract Co-Author*) Research support, General Electric Company;Research support, Koninklijke Philips NV;Research Consultant, Subtle Medical, Inc
Jennifer A. Padwal, MD, MS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1) Imaging evaluation of paraspinal muscles, particularly the multifidus which has been most thoroughly studied, requires an understanding of muscle anatomy and innervation that can help inform patterns of pathologic muscle changes. 2) Paraspinal muscle derangements have important implications for muscle function and low back pain in nonoperative, preoperative, and postoperative settings. 3) Current grading systems/methodologies for lumbar spine muscle measurements of cross-sectional area (CSA) and fatty infiltration (FI) are variable and generally qualitative. Automated AI techniques can be used for accurate, quantitative measurements of CSA and FI, facilitating longitudinal evaluation over time.

### TABLE OF CONTENTS/OUTLINE

I. Paraspinal muscle anatomy: muscle composition, innervation, vascularity, attachments, and function. II. Review MRI findings of paraspinal muscle derangements based on physiological mechanism, including single or multilevel involvement, distribution, and time course. Discussion of the contribution of paraspinal muscle derangements to low back pain and decreased function. III. Current MRI methodologies of evaluating paraspinal muscle, including MRI-derived measurements of CSA and FI using chemical-shift MRI. Challenges of translating research into clinical practice and future directions, including potential added value of AI tools in the clinical setting and opportunistic implementation of International Society for the Study of the Lumbar Spine (ISSLS) consensus recommendations.

## MUSCLING IN ON THE ACTION - ACCESSORY MUSCLES OF THE UPPER EXTREMITY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Kathryn J. Stevens, MBBS, FRCR (*Abstract Co-Author*) Nothing to Disclose
Jennifer A. Padwal, MD, MS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1) Multiple accessory muscles exist within the upper extremity, and have a widely varying prevalence 2) Accessory muscles are often overlooked but can have a significant clinical impact and present intraoperative challenges if not identified on preoperative imaging 3) Accessory muscles are best identified on MRI, particularly on T1 or PD-weighted images without fat suppression, where they can be confidently separated from the adjacent fat 4) Detailed knowledge of upper extremity muscle anatomy and awareness of these normal variants will help the practicing radiologist correctly identify these accessory muscles and become familiar with their contribution to upper extremity pathology

### TABLE OF CONTENTS/OUTLINE

I) Accessory muscles of the shoulder/upper arm: case-based anatomic review and clinical impact II) Accessory muscles of the elbow/forearm: case-based anatomic review and clinical impact III) Accessory muscles of the wrist/hand: case-based anatomic review and clinical impact

### TEACHING POINTS

Anatomy and BiomechanicsInjury mechanisms and patternsSpecific ConditionsInjury Grading

### TABLE OF CONTENTS/OUTLINE

Muscles can be classified based on fiber orientation. In parallel muscles, fibers run parallel to the tendons, allowing larger ranges of excursion. Injuries typically affect the tendons and cause retraction. Pennate muscles, where fibers are oriented at an angle, generate greater force and are more susceptible to strains.Acute muscle injuries result from strain, contusion, laceration or compartment syndrome. The lower extremities are more frequently affected, especially the hamstring muscles, rectus femoris, and calf muscles. In the upper extremities, the most commonly injured are the rotator cuff and biceps brachii. Typically, the myotendinous junction is the most vulnerable. In older patients, the tendinous regions become the primary weak points. In skeletally immature patients, the apophysis is often affected, leading to apophysitis and avulsive fractures.DOMS is delayed muscular response to unaccustomed exertion, characterized, in MRI, by reversible enlargement and increased signal intensity in one or more muscles. Myositis ossificans is an abdormal response to trauma, resulting in nodular swelling, edema and peripheric calcifications.Various grading systems for muscle injury exist, primarily based on the type and size of lesion, the percentage of the cross-sectional area affected, and the presence of an intramuscular hematoma.

## IF THE SHOE FITS, CALL IT: A LUMPY BUMPY CASE REVIEW OF BENIGN FOOT AND ANKLE SOFT TISSUE TUMORS AND MIMICS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Cornelia B. Wenokor, MD (*Abstract Co-Author*) Nothing to Disclose
Garrett Yoon, MD, MS (*Abstract Co-Author*) Nothing to Disclose
Christopher Azzam, MD (*Abstract Co-Author*) Nothing to Disclose
Justin Newman, DO (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Soft tissue tumors of the foot and ankle are rare, making diagnosis often difficult and delayed. Adding to this challenge is the multitude of tumor mimics, placing us in a diagnostic dilemma. Fortunately, the vast majority of these pathologies are benign. However, our ability to distinguish between them and generate a differential diagnosis is imperative for optimal management, directing treatment, and avoiding unnecessary interventions. We present common, as well as rare and interesting cases of benign foot and ankle soft tissue tumors and tumor mimics on imaging, including radiographs, CT, and MRI. We highlight demographics, etiology, salient characteristics, and important differential considerations. The selected cases encompass a wide range of tissue types, including fibrous, pericytic, vascular, adipocytic, fibrohistiocytic, and neural. This exhibit aims to facilitate accurate diagnosis of foot and ankle soft tissue tumors and tumor mimics, as well as raise awareness of several rare lumps and bumps.

### TABLE OF CONTENTS/OUTLINE

IntroductionDesmoplastic fibroblastomaPlantar fibromatosis/Ledderhose diseaseGlomangiomatosisHemangiomaAngiofibrolipomaFibrolipomatous hamartomaTenosynovial giant cell tumorSchwannomaNeurofibromaTumor Mimics (calcific myonecrosis, tumoral calcinosis, posterior tibial neuritis, Morton’s neuroma, Haglund’s syndrome, saphenous vein thrombophlebitis, foreign body and pyogenic granuloma, ganglion cyst, heterotopic bone, keloid, Dupuytren’s)Conclusion

## STREAMLINING DUAL ENERGY CT MUSCULOSKELETAL PROTOCOLS IN A LARGE ACADEMIC CENTER: TIPS FROM THE GROUND UP

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Lawrence Wang, DO (*Abstract Co-Author*) Nothing to Disclose
Peter H. Pham, MD (*Abstract Co-Author*) Nothing to Disclose
Arash Anavim, MD, MBA (*Abstract Co-Author*) Nothing to Disclose
Anderanik Tomasian, MD (*Abstract Co-Author*) Nothing to Disclose
Maryam Golshan Momeni, MD (*Abstract Co-Author*) Nothing to Disclose
Jasmine Zhao, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Utilizing data from two energy spectra, dual energy CT (DECT) enables the detection and quantification of materials, which helps identify crystal arthropathy, bone marrow edema, tendon/ligament injuries, while also reducing metal artifacts in musculoskeletal imaging. 2. DECT findings often lead to significant changes in management, bolster diagnostic confidence, enhance incidental lesion characterization, and minimize the need for invasive interventions. 3. Despite its advantages, DECT adoption faces hurdles such as cost implications, data overload, and the need for additional education among clinicians and radiologists. 4. Stepwise implementation methods and education initiatives to increase familiarity with DECT are necessary to streamline its integration into routine practice.

### TABLE OF CONTENTS/OUTLINE

1. Learning Objectives 2. Basic overview of DECT: Acquisition, Post-processing, and Interpretation 3. Applications of DECT in Musculoskeletal Imaging 4. Clinical Benefits of DECT Utilization 5. Impact of DECT on Clinical Management: Illustrated Though Emergency Department Cases 6. Barriers to DECT: Cost and Data Overload 7. Solutions and Steps to DECT implementation (3 Prong Approach) 8. Summary and Key Takeaways

Peter H. Pham, MD (*Abstract Co-Author*) Nothing to Disclose
Lawrence Wang, DO (*Abstract Co-Author*) Nothing to Disclose
Jasmine Zhao, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Despite its prevalence, diagnosing gout can be challenging due to its resemblance to other acute medical conditions. 2. Dual energy CT (DECT) utilizes attenuation data at two energy spectra to detect monosodium urate crystals, facilitating accurate gout diagnosis. 3. DECT offers practicality for emergency room settings, boasts high sensitivity and specificity, and expedites diagnosis, particularly in atypical cases or when traditional methods are inconclusive. 4. False positives, attributed to beam hardening and motion artifacts, are potential drawbacks. Additionally, false negatives may occur in the early stages of gout (<6 weeks). 5. DECT should be integrated into routine emergency imaging protocols to aid in diagnosing acute and challenging gout presentations, thereby guiding appropriate management.

### TABLE OF CONTENTS/OUTLINE

1. Learning Objectives 2. Background: Clinical Presentation of Acute Gout 3. DECT Applications in Musculoskeletal Imaging 4. Utility of DECT for Gout in the Emergency Department: Advantages and Pitfalls 5. Ten Case-Based Examples of Atypical Gout Presentations 6. Summary and Key Takeaways

## EXPLORATION OF BONE EDEMA: SPECTRAL ANALYSIS VIA DUAL-ENERGY COMPUTED TOMOGRAPHY FOR URGENT EVALUATION

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Yeni Fernandez de Lara Barrera, MD (*Abstract Co-Author*) Nothing to Disclose
Estefania Murrieta Peralta, MD (*Abstract Co-Author*) Nothing to Disclose
Maria M. Salazar Osorio, MD (*Abstract Co-Author*) Nothing to Disclose
Karina I. Holguin Andrade, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Enhanced Characterization: Explore how the use of a bone edema map with dual-energy computed tomography (DECT) can improve fracture characterization, providing a more detailed and accurate assessment. 2. Identification of Hidden Fractures: 3. Reduced Diagnostic Time: Explain how DECT's ability to characterize fractures can decrease the time needed for diagnosing injuries, especially in emergency situations. 4. Differentiation between Acute and Chronic Fractures. 5. Utility of Bone Edema in DECT: Showcase the advantages of using bone edema as an indicator in DECT, such as its ability to detect fractures in early stages, precision in fracture localization, and its usefulness in treatment monitoring and surgical planning.

### TABLE OF CONTENTS/OUTLINE

Background: Dual-energy computed tomography (DECT) is a sophisticated imaging technique that utilizes two distinct kilovoltages to assess X-ray absorption in tissues.Bone Marrow Edema: Bone marrow edema is a common feature in traumatic injuries and pathological conditions.Main Applications: Identification and diagnosis of fractures in the carpal and wrist bones.Compression vertebral fractures, distinguishing between acute and chronic fractures. Oncological evaluation.Hidden hip fractures and identification of periprosthetic fractures.Limitations and Pitfalls: Metallic Artifacts and Soft Tissue Limitations.Conclusion: Dual-energy computed tomography represents a significant advancement in the evaluation of bone marrow edema.

## UPPER EXTREMITY NERVES AND THEIR BRANCHES - A MAGNETIC RESONANCE IMAGING AND SONOGRAPHIC ATLAS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Gregory S. Stacy, MD (*Abstract Co-Author*) Nothing to Disclose
Katie L. Nguyen, MD,BS (*Abstract Co-Author*) Nothing to Disclose
Braden Anderson, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

We have received growing numbers of requests to evaluate nerves of the upper extremity (e.g., in the setting of penetrating trauma) in order to assess the degree of nerve damage and potential for repair. These requests have included the major nerves as well as various cutaneous branches, which might not be as familiar to the radiologist. Dedicated ultrasound imaging has been particularly useful in the setting of ballistic fragments and orthopedic hardware. The purpose of this exhibit is to provide an atlas of upper extremity nerves using magnetic resonance images alongside corresponding sonographic images. Supplementary sonographic videos will be provided to aid in anatomic localization. We will review the origin of the major nerves (median, radial, ulnar, and musculocutaneous) at the distal brachial plexus, discuss their separate paths in the arm, and highlight several key and lesser-known branches along their respective courses. Discussion will feature key osseous, muscular, and vascular landmarks.

### TABLE OF CONTENTS/OUTLINE

Introduction Ultrasound Technique Proximal Anatomy: Brachial Plexus Cords Median Nerve: Arm, Elbow, Forearm, and Wrist Anterior Interosseous Nerve Palmar Cutaneous Branch Ulnar Nerve: Arm, Elbow, Forearm, and Wrist Dorsal Cutaneous Branch Radial Nerve: Arm, Elbow, and Forearm Posterior Antebrachial Cutaneous Nerve Superficial Branch Deep Branch/Posterior Interosseous Nerve Musculocutaneous Nerve Lateral Antebrachial Cutaneous Nerve Medial Cutaneous Nerves Conclusion

Reda Britel, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Advancements in musculoskeletal oncology, incorporating 3D segmentation, radiomics, and printing, notably enhance surgical planning. 1-Segmentation in 3D involves the division of medical images into regions of interest, enabling precise manipulation and visualization of anatomical structures. 2-Radiomics, a rapidly evolving field, involves the extraction and analysis of quantitative features from medical images, offering valuable insights into tumor characteristics and behavior. 3-Additionally, 3D printing allows for the creation of physical models from medical imaging data, facilitating preoperative visualization and planning. Integration of these technologies improves surgical precision, reduces operative times, and enhances postoperative outcomes.However, challenges like specialized training persist. Future advancements promise further enhancements in musculoskeletal oncology surgical planning.

Leonor Savarese, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Bone biopsies are a critical element in the diagnostic pathway for various bone diseases, including primary bone tumors, metastatic conditions, infections, and other non-neoplastic disorders. In numerous instances, image-guided percutaneous biopsy is the preferred procedure due to its minimally invasive nature, high diagnostic yield, cost-effectiveness, and lower morbidity compared to surgical biopsy. Among image-guided techniques, computed tomography (CT) provides the benefit of superior spatial resolution and precise needle placement, thereby enhancing the success rate of the biopsy. Nevertheless, some skeletal sites can pose particular challenges, even with CT guidance, owing to anatomically intricate lesions, closeness to vital structures, lesions that are not visible on CT, or sclerotic lesions. Understanding the complexity of bone biopsies can represent an important resource for managing such cases effectively and safely.

### TABLE OF CONTENTS/OUTLINE

Case-based review of various unusual and challenging cases of CT-guided bone biopsies, illustrating technical challenges, potential complications and practical strategies to increase the safety and diagnostic yield of the procedure.

## GLENOHUMERAL ARTHROSIS: DOES YOUR REPORT TRULY ADDRESS THE SURGEON'S QUERIES?

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Diego A. Garcia, MD (*Abstract Co-Author*) Nothing to Disclose
Ezir Lima Neto, MD (*Abstract Co-Author*) Nothing to Disclose
Danielle B. Rumi, MD (*Abstract Co-Author*) Nothing to Disclose
Fernanda Yukari H. Takahashi, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Shoulder osteoarthritis is an extremely important condition, especially in aging adults, which justifies its high and increasing prevalence. Furthermore, it has a strong correlation with chondral injuries, and it is the most frequent cause of disability in the USA as a consequence of decreased motion and pain. Secondary causes are more common, such as trauma or repeated microtrauma in throwing athletes, chondrolysis, avascular necrosis, inflammatory arthropathy, and joint instability. Management depends on various aspects, including symptoms, radiological findings, and staging. This study’s goal is to review the key points that the radiological report must address for surgical planning using examples from our service.

## BROKEN BONES IN LITTLE ONES: THE PLAYFUL PATH TO EVALUATING CHILDREN'S FRACTURES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Erica D. Cruz, MD (*Abstract Co-Author*) Nothing to Disclose
Diego A. Garcia, MD (*Abstract Co-Author*) Nothing to Disclose
Felipe C. Ferreira Dionisio, MD (*Abstract Co-Author*) Nothing to Disclose
Danielle B. Rumi, MD (*Abstract Co-Author*) Nothing to Disclose
Fernanda Yukari H. Takahashi, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Fractures in children constitute a common entity in medical practice, especially for radiologists. However, this age group presents particularities compared to the adult population, such as in epidemiology, presentation, and classification. Therefore, understanding the development and maturation of the skeleton is necessary to comprehend the different types of pediatric fractures. Although the prognosis for most fractures is excellent, knowledge about children’s fractures and their accurate description is of utmost importance for therapeutic success. This study aims to provide a didactic review of the most prevalent pediatric fractures, correlate them with different imaging methods, and describe their main radiological findings and classifications.

### TABLE OF CONTENTS/OUTLINE

- Introduction
- Objective
- Review of normal pediatric skeleton development
- Cases of pediatric fractures in different joints and different imaging methods, detailing common radiological findings and classifications
- Conclusion
- References

## STRUCTURED REPORTING FOR GLENOID-TRACK: ASSESSING SHOULDER STABILITY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Danielle B. Rumi, MD (*Abstract Co-Author*) Nothing to Disclose
Bianca Bianco, MD (*Abstract Co-Author*) Nothing to Disclose
Diego A. Garcia, MD (*Abstract Co-Author*) Nothing to Disclose
Yuree M. Herenio SR, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The shoulder is the most frequently dislocated joint in the body, largely due to its extensive range of motion, which is unmatched in humans. Between 1% and 2% of people will endure a glenohumeral dislocation in their lifetime, with anterior dislocations comprising over 95% of these cases. Such dislocations often result from falls onto an extended arm or shoulder. A significant portion of those who suffer an initial anterior shoulder dislocation, specifically 20% to 48%, will face recurrences. This risk is especially high among younger individuals, where recurrence rates soar to 66% to 94% in those under 20 years old.

### TABLE OF CONTENTS/OUTLINE

Introduction; Objective; Glenoid-Track: Assessing Shoulder Stability; Measurement Parameters; Discussion; Radiological Cases; Conclusion; References.

## DECODING PATELLOFEMORAL INSTABILITY: A STRUCTURED REPORT APPROACH

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Roberto Froeder Oliveira, MD (*Abstract Co-Author*) Nothing to Disclose
Danielle B. Rumi, MD (*Abstract Co-Author*) Nothing to Disclose
Diego A. Garcia, MD (*Abstract Co-Author*) Nothing to Disclose
Bianca Bianco, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Patellofemoral instability represents a significant clinical challenge, directly influencing knee functionality and patient well-being. This study addresses the four main etiological determinants of patellofemoral instability: the Caton-Deschamps index for the quantification of high patella, Dejour's classification of trochlear dysplasia, the measurement of the tibial tubercle-trochlear groove (TT-TG) length, and the analysis of patellar tilt. We employed advanced imaging methods to draw direct correlations between these anatomical variables and episodes of patellar instability, demonstrating the interrelationship of these factors in the pathogenesis of femoropatellar instability, as well as providing insights for the development of more effective interventions. This study highlights the importance of an in-depth assessment of anatomical factors in the clinical management of patellofemoral instability, proposing an integrative model for risk prediction and treatment personalization. The clinical relevance lies in improving therapeutic outcomes and reducing the recurrence of pathologies, reinforcing the need for precise and individualized surgical planning.

### TABLE OF CONTENTS/OUTLINE

Introduction; Objective; Determinants of patellofemoral instability: the Caton-Deschamps index, Dejour's classification, measurement of the tibial tubercle-trochlear groove length and patellar tilt; Discussion; Radiological Cases; Conclusion; References.

### TEACHING POINTS

Review the pathophysiology of rheumatoid arthritis.Explain the different articular and extra-articular radiological manifestations using illustrative cases.Review the usefulness of the different imaging techniques in this pathology: plain radiography, ultrasound, CT and MRI.Differential diagnoses of peripheral arthropathies.

### TABLE OF CONTENTS/OUTLINE

Rheumatoid arthritis is a chronic autoimmune disease that mainly affects the musculoskeletal system and can become highly disabling during its evolution. Early diagnosis is essential to establish treatment in the initial stages of the disease, which can delay its progression and improve the life quality of these patients. For this, it is essential to know the articular and extra-articular radiological findings of this pathology and the utilities of the different imaging techniques for its diagnosis. In this exhibit we review the typical signs of rheumatoid arthritis with plain radiography, ultrasound, CT, and MRI and show the diagnostic imaging tips. Typically, this disease affects small joints with characteristic signs that allow to differentiate it from other peripheral arthropathies.

Bianca Bianco, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

A medical report on soft tissue tumors must be clear, detailed, and comprehensive, ensuring a deep understanding of the case and enabling the medical community to assess and compare different therapeutic approaches. It is crucial to provide precise information about location, size, involvement of critical structures, and the presence of necrosis, as these characteristics are essential for determining prognosis and guiding clinical decisions. A well-crafted report significantly contributes to the advancement of medicine and the improvement of patient outcomes.

### TABLE OF CONTENTS/OUTLINE

Introduction to Soft Tissue Tumor; Objectives; Location and Depth; Size of the Tumor; Involvement of Critical Structures; Presence of Necrosis; Diagnostic Methods; Radiological Cases; Conclusion; References.

## BONE MARROW IMAGING: UNRAVELING VARIATIONS AND IDENTIFYING PATHOLOGIES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Andre Y. Aihara, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Ana Carolina D. Augusto, MD, MSc (*Abstract Co-Author*) Nothing to Disclose
Beatriz Benetti, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The purpose of this study is to improve understanding of the different normal patterns of bone marrow conversion and reconversion, as well as pathological changes, using systematic analysis of the T1 signal to guide differentiation between the pathologies. Additionally, advanced MR techniques, including chemical shift imaging, diffusion-weighted imaging, dynamic contrast-enhanced MRI, and whole-body MRI, may be utilized in cases warranting further investigation, and will also be explored.

### TABLE OF CONTENTS/OUTLINE

The most common MRI signal variations observed in adult patients' bone marrow encompass a spectrum ranging from normal variants to benign pathologies and malignancies. Understanding the normal appearance and the physiological (re)conversion pattern is crucial for identifying and categorizing these entities effectively. Typically, in benign variations, the signal intensity of the lumbar vertebral bodies on T1-weighted SE images should be higher than that of adjacent intervertebral discs. Similarly, the signal intensity of appendicular red marrow areas on T1-weighted SE images should be higher than that of adjacent muscles. A systematic approach to analyzing T1 signal intensity aids in classifying the most common alterations. However, attention should also be paid to additional signs, such as contralateral involvement, periosteal reaction, cortical extension, and post-contrast enhancement.

Priyanka Jha, MBBS (*Abstract Co-Author*) Nothing to Disclose
Wendaline M. VanBuren, MD (*Abstract Co-Author*) Nothing to Disclose
Ceylan Colak, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Endometriosis is a common condition, affecting one in 10 premenopausal women, impacting approximately 200 million women globally. 2. Early diagnosis remains a challenge. The most common clinical presentation is pelvic pain, but patients may be asymptomatic or present with infertility. The average delay in diagnosis ranges from 4 to 11 years, and 65% of patients are initially misdiagnosed. 3. Contributing to the delay in diagnosis, patients may undergo multiple studies related to the musculoskeletal (MSK) system including lumbar, sacroiliac, pelvic and hip MRI studies. While endometriosis may involve nerves and soft tissues, MSK MRI protocols are not typically optimized for adequate mapping of disease in the pelvis, which may involve the bowel, bladder, ureters, and the diagnosis itself may not be established without a dedicated protocol. 4. Imaging studies, especially MRI, have a critical role in the noninvasive diagnosis of endometriosis. Endometriosis specific MRI protocols are important for the identification of disease as recommended by evidence-based consensus guidelines by the European Society of Urogenital Radiology and the Society of Abdominal Radiology Endometriosis disease-focused panel. In daily practice, it is important to recognize common MRI findings of endometriosis on MSK studies and to identify when to recommend a dedicated endometriosis imaging and gynecological evaluation.

### TABLE OF CONTENTS/OUTLINE

1. Title 2. Disclosures 3. What is endometriosis? 4. Learning objectives 5. Common MR imaging findings of endometriosis 6. MRI protocol considerations 7. Treatment options 8. Case examples with imaging findings 9. Conclusion 10. References

## KOOSH IT: USING GOLDEN-ANGLE RADIAL KOOSHBALL SAMPLING FOR 4D DYNAMIC MRI OF JOINTS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Joshua Auger (*Abstract Co-Author*) Nothing to Disclose
Sarah D. Bixby, MD, MBA (*Abstract Co-Author*) Nothing to Disclose
Simon K. Warfield, PhD (*Abstract Co-Author*) Nothing to Disclose
Jade Iwasaka-Neder, MD, MPH (*Abstract Co-Author*) Nothing to Disclose
Fatih Calakli (*Abstract Co-Author*) Nothing to Disclose
Musa Tunc Arslan (*Abstract Co-Author*) Nothing to Disclose
Giovani Schulte Farina, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Joints are moving structures by nature and motion abnormalities should be evaluated by assessing the full anatomy dynamically. Biomechanical parameters from static or quasi-static MRI scans are different from moving motion. - Most of the dynamic imaging techniques are 2D over time. - There is still a need for improved dynamic imaging with 4D (3D+time), submillimeter isotropic (<1mm3), relatively artifact-free, and contrast changeable to the different MSK tissues of interest to better characterize motion joint motion abnormalities. - Golden-angle radial kooshball sampling in combination with sliding window reconstruction can provide dynamic and motion-robust images of the joints during real-time motion in 4D using high-field 3T scanners. - The 4D dynamic radial kooshball technique can be implemented for different joints, such as ankles and knees. - Full anatomy of the joints can be visualized dynamically in the 3 planes throughout the maximum range of motion.

### TABLE OF CONTENTS/OUTLINE

- Dynamic MRI Imaging in MSK: current techniques- K-space sampling - 3D golden-angle radial kooshball - Basis and concepts - Applications in dynamic imaging - Cartesian sampling- Reconstruction algorithms for dynamic imaging - Sliding window reconstruction- Patient preparation - Movement training and patient positioning- 4D dynamic imaging of joints - Knee - Ankle- Challenges and limitations - Potential clinical applications - Impingement phenomenon - Patellofemoral tracking - Hindfoot motion in tarsal coalition - Microinstability

## A RADIOLOGICAL GUIDE TO HAND INFLAMMATION: HANDY TIPS TO UNRAVEL DIAGNOSIS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Firat Atak, MD (*Abstract Co-Author*) Nothing to Disclose
Ustun Aydingoz, MD (*Abstract Co-Author*) Nothing to Disclose
Sevtap Arslan (*Abstract Co-Author*) Nothing to Disclose
Adalet E. Yildiz, MD (*Abstract Co-Author*) Nothing to Disclose
Yasin Yarasir, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Inflammatory diseases of the hand are a diagnostic challenge both clinically and radiological. 2. Although many conditions do not have specific imaging findings, some clinical and radiological clues can help narrow down the differential considerations and reach the correct diagnosis. 3. Accurate diagnosis is critical to initiating appropriate treatment before inflammation causes long-term harm to the hand.

### TABLE OF CONTENTS/OUTLINE

A. An overview of inflammatory hand conditions. B. Imaging modalities and protocols. C. The spectrum of hand inflammation - a. Autoimmune (rheumatoid arthritis, seronegative spondyloarthritis, systemic lupus erythematosus, scleroderma, polyarteritis nodosa); b. Depositional (gout, CPPD, ochronosis); c. Infectious (Whipple disease, Mycobacterial, septic arthritis, osteomyelitis, necrotizing fasciitis, paronychia, cellulitis); d. Traumatic/degenerative (De Quervain tenosynovitis, post-traumatic inflammation, erosive osteoarthritis); e. Miscellaneous (sarcoidosis, foreign body-related inflammation, complex regional pain syndrome) D. Summary chart. E. Conclusion.

Raquel Acosta Hernandez, MD (*Abstract Co-Author*) Nothing to Disclose
Santiago Resano Pardo SR (*Abstract Co-Author*) Nothing to Disclose
Maria D. Lopez Parra, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

In the evaluation of soft tissue lesions the goal of imaging ,is to confidently identify lesions that exhibit typical diagnostic imaging features and do not need further studies.When a solid soft tissue tumor is encountered and malignancy cannot be excluded, a histology study is mandatory.Although the imaging characteristics of several of the lesions discussed are non-specific,combining them with clinical features and lesion location allows the radiologist to suggest a specific type of tumor

### TABLE OF CONTENTS/OUTLINE

Soft tissue tumors are frequently encountered in clinical practice.They include benign and malignant neoplasms, as well as pseudotumoural lesions.The differential diagnosis of soft tissue lesions can be narrowed significantly with the aid of imaging .Radiographs are critical in determining the presence or absence of mineralization and setting whether soft tissue mineralization are chondral or ossific in nature and to evaluate cortical involvement versus isolated soft tissue lesion in order to narrow the differential diagnosis.The US seems well suited for screening soft tissue masses, allowing us to differentiate cystic from solid nature of soft-tissue lesions.The cystic nature can be confirmed with sonography or MR imaging avoiding further studies.In non cystic lesion, the location and signal characteristics can suggest the diagnosis of some specific pathologies.Equally, and based on the presence or absence of mineralization, lesion density/signal intensity,and enhancement pattern synovial based lesions can be suggested. Finally,knowledge of the incidence of specific neoplasms of the foot and hand based on patient age aids radiologists in providing a limited differential diagnosis.

### TEACHING POINTS

The aim of this exhibition is to: a) Review the main surgical procedures in peripheral nerves and postoperative imaging b) Highlight the most important topics for the surgeon c) Show illustrative and didactic cases from our service

### TABLE OF CONTENTS/OUTLINE

INTRODUCTION a) Advances in peripheral nerve surgery b) Imaging modalities c) Surgical techniques and their indicationsIMAGING INTERPRETATION Main types of nerve injury and surgery, expected imaging findings and potential complications: 1) Neural compressive syndromes: 1a) Decompression: removal of factors leading to compression (e.g., carpal tunnel release surgery) 1b) Decompression with nerve transposition (e.g., ulnar nerve decompression) 1c) Neurectomy (nerve resection) (e.g., lateral femoral cutaneous nerve and interdigital nerve of the foot) 2) Neural tumors: tumors of neural sheath (schwannomas and neurofibromas). Procedures for each type of tumor vary, so it is important to distinguish when possible. Preoperative and postoperative imagins aspects 3) Traumatic nerve injury: 3a) Neurolysis: removal of adhesions surrounding the nerve 3b) Reconstruction of nerve continuity: excision of neuromas; neurorrhaphy or interposition of autologous nerve graft; other techniques including fibrin glue and nerve tubes 3c) Nerve transfer surgeryINTERACTIVE CASE-BASED DIDATICS a) Sample cases to illustrate and solidify the concepts, including pre and postoperative imaging b) Correlation with current literature dataCONCLUSION AND TAKE HOME MESSAGES Due to the advances in peripheral nerve surgery and increasing number of cases it has become essential for radiologists to be familiar with the main surgical techniques and postoperative imaging aspects

### TEACHING POINTS

Non-tumorous vascular abnormalities in musculoskeletal present a diagnostic challenge, understanding these etiologies is crucial for an accurate diagnosis, especially because vascular abnormalities are often not the primary diagnostic consideration for clinicians, highlighting the role of radiologists in the diagnoses.Vascular abnormalities manifest through various symptoms such as pain, nodules, abnormal skin color and not rarely as incidental imaging findings, reflecting a wide array of pathologies.Multiple imaging methods can be used to provide precise localization and characterization of vascular abnormalities. Ultrasound offers real-time visualization and Doppler US exams provide valuable information about vascular flow. CT and MRI provide detailed anatomical information and the use of intravenous contrast in these methods improves the evaluation of vascular structures and the dynamics of blood flow. Conventional or minimally invasive angiography offers unparalleled visualization of vascular architecture.This presentation underscores the importance of a multidisciplinary approach in which radiologists collaborate to understand the complexities of non-tumorous vascular abnormalities in musculoskeletal imaging. By integrating clinical history, imaging findings, and radiological interpretation, we can optimize patient treatment and improve outcomes.

### TEACHING POINTS

Morphological Variability: We explore diverse bone lymphoma manifestations via radiographic imaging, emphasizing lytic lesions, periosteal reactions, and soft tissue involvement to recognize these patterns for accurate diagnosis and management.Imaging Modalities: We discuss radiography, CT, MRI, PET and image-guided procedures for bone lymphoma assessment, providing an overview of their strengthsDifferential Diagnosis: There are diagnostic challenges due to overlapping features with other bone lesions. We review key differentiating factors aiding an accurate differentiation.

### TABLE OF CONTENTS/OUTLINE

Introduction: Bone lymphomas pose diagnostic challenges due to diverse radiographic presentations. This essay aims to elucidate their morphology, imaging modalities, diagnosis, and clinical implications.Methods: Review imaging studies depicting bone lymphomas, analyzing radiography, CT, MRI, PET and image-guided procedures for morphological features and differential diagnosis.Objectives: elucidate the radiographic manifestations of the disease and facilitate accurate diagnosis. This includes enhancing understanding of various imaging modalities and their roles in assessment.Discussion: Bone lymphomas exhibit varied radiographic patterns. CT offers detailed anatomy assessment, MRI enhances soft tissue delineation, and PET aids staging. Differential diagnosis involves careful consideration of imaging findings and clinical context.Conclusion: Accurate diagnosis of bone lymphomas requires recognizing diverse radiographic presentations and leveraging multiple imaging modalities. Awareness of imaging pitfalls is crucial for optimal management.

Murilo Campos Silva, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

A) Identifying and understanding critical anatomical landmarks within MRI scans, such as the interscalene triangle, subclavian artery, and nerve roots from C5 to T1.B) Emphasize the importance of recognizing the normal appearances and variations of nerve paths to enhance diagnostic accuracy.C) Highlight the advantages of using high-resolution 3D imaging, DTI, and nerve-specific MRI sequences. Explain how these advanced techniques can reveal detailed nerve fiber integrity, crucial for diagnosing subtle neuropathies and planning surgical interventions.D) Discuss the key imaging signs of traumatic plexopathy, such as nerve discontinuity, hematoma, and pseudomeningocele formation. Train on differentiating between pre- and post-ganglionic injuries based on these imaging findings, and how they guide the prognosis and treatment strategies.E) How to identify nerve sheath tumors and differentiate them from other masses using MRI. Cover the imaging characteristics of benign versus malignant nerve tumors, and discuss how the localization, size, and effect on surrounding tissues can impact treatment options.F) The Role of Ultrasound in Real-time Diagnosis and Management.

### TABLE OF CONTENTS/OUTLINE

A) Brachial plexus anatomy; B) MRI and ultrasound images; C) Pathologies; D) Future perspectives.

### TEACHING POINTS

Our educational exhibit aims to review the anatomy and pathological conditions of the abdominal wall, thoracic wall, and paravertebral region through the following points: Reviewing the normal anatomy and anatomical variants of these three regions; Discussing the differential diagnosis for lesions encountered at these sites; Proposing an algorithmic approach to identifying lesions and diffuse processes based on their imaging characteristics; Highlighting the role of imaging techniques in the diagnosis and management of lesions affecting the abdominal wall, chest wall, and paravertebral region.

### TABLE OF CONTENTS/OUTLINE

1) Anatomy of abdominal and thoracic walls. 2) Pathologies of abdominal and thoracic walls and proposed algorithmic approach based on imaging characteristics: Hernias (primary, incisional); Mechanical friction (elastofibroma dorsi, snapping scapula syndrome), Muscle injurie; Anatomical variants (Poland syndrome); Mass-like lesions - Fat containing (lipoma, liposarcoma, lipohypertrophy, arteriovascular malformations), Fluid (haematoma, Morel-Lavallee, abscess, seroma, lymphatic malformation), Solid / soft tissue (endometriosis, desmoid tumor, sarcoma, metastasis, fibromatosis, foreign body granuloma). 3) Illustrative cases with multimodality imaging. 4) Paravertebral anatomy. 5) Pathologies of paravertebral region and proposed algorithmic approach based on imaging characteristics and anatomical location (epaxial and hypaxial). 6) Illustrative cases with multimodality imaging.

### TEACHING POINTS

Osteonecrosis refers to a broad concept of the consequences of blood supply impairment on bone tissues, widely debated and described through classic radiological features. However, the diagnosis challenge relays mainly on its atypical manifestations or associated complications, which include subtle initial imaging changes, unusual skeletal locations, paraneoplasic manifestations or post-procedure complications, such as radiotherapy, diathermy and bone marrow transplant. Additionally, overlapping imaging findings also pose further difficulties, such as osteomyelitis, bone tumors and metabolic bone disease. Traditional imaging protocols, as well as some emerging techniques, can provide detailed and qualitative information about the bone microstructure, perfusion and metabolic behavior. Those techniques include diffusion-weighted MR imaging (DWI) , dynamic contrast-enhanced MRI (DCE-MRI), Time-Resolved Imaging of Contrast Kinetics (TRICKS), dual-energy CT (DECT) and positron emission tomography (PET) imaging. Bone necrosis may present typical or atypical manifestations, due to its complex origins and multiple underlying mechanisms. Besides, other many other bone abnormalities might mimic atypical bone infarction conditions. Through the assistance of multimodality imaging protocols, the radiologist role relies on knowing when to suspect an atypical bone necrosis presentation, and which imaging technique should guide towards a correct diagnosis.

## HOW TO CLASSIFY MUSCLE INJURIES: COMPARISON BETWEEN CLASSIFICATIONS BASED ON CASES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Adham A. Castro, MD (*Abstract Co-Author*) Nothing to Disclose
Eduardo Baptista, MD (*Abstract Co-Author*) Nothing to Disclose
Patricia C. Zuffo (*Abstract Co-Author*) Nothing to Disclose
Durval D. Santos, MD (*Abstract Co-Author*) Nothing to Disclose
Laercio A. Rosemberg, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Paulo Eduardo Daruge Grando, MD (*Abstract Co-Author*) Nothing to Disclose
Camila De Paula Silva, MD (*Abstract Co-Author*) Nothing to Disclose
Murilo Campos Silva, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

A) Overview of Muscle Injury Classifications provide a comprehensive review of the various muscle injury classification systems discussed in the paper. Highlight the criteria used by each system to classify muscle injuries, including anatomical location, extent of tissue damage, and functional impairment.B) Comparing Classification Systems discuss the strengths and weaknesses of each classification system based on clinical cases. Analyze how each system performs in terms of diagnostic clarity, prognostic value, and treatment guidance. Encourage critical thinking about which system might be best suited for different types of injuries or clinical settings.C) Imaging Techniques for Muscle Injury Evaluation: detail the role of various imaging modalities like MRI, ultrasound, and CT in the assessment of muscle injuries. Explain how these techniques complement the classification systems by providing detailed visual evidence of muscle fiber disruption, hematoma formation, and other pathological changes within the injured muscle.D) Future Directions and Research Opportunities discuss the gaps in current muscle injury classification systems and areas for future research. Encourage exploration of how new imaging technologies or biomarkers could be integrated into existing frameworks to enhance diagnostic accuracy and predictive power.

### TABLE OF CONTENTS/OUTLINE

A) Muscle injury classifications;B) MRI cases images;C) Comparison of the most commonly used classifications;D) Principles of treatment for muscle injuries according to classifications and discussions on return to sport;E) Future perspectives.

### TEACHING POINTS

The metaphysis is a crucial region of the bone that has a specific anatomy, cellularity, and vascularization, and for this reason, some lesions develop preferentially in this location. This region is also important as growth and development occur during childhood and adolescence. The metaphysis, being the most metabolically active portion of bone, hosts a wide variety of tumors, both benign and malignant that require early detection to prevent adverse effects. It is also prone to infectious conditions like osteomyelitis and metabolic disorders disrupting bone mineral metabolism, potentially leading to deformities. Common fractures in this region, resulting from trauma or mechanical stress, vary in severity and may affect the growth plate, posing risks to bone development. Understanding the diverse imaging patterns in injuries involving the metaphysis is crucial for accurate diagnosis and early recognition of potential complications. Radiography is typically the initial imaging method used, and when combined with magnetic resonance imaging or computed tomography, it enhances sensitivity and specificity in diagnosing and characterizing lesions. This work aims to outline various metaphyseal lesions of different origins, highlighting their distinctive anatomical, histological, and vascular features. Early and precise diagnosis is crucial for promptly initiating appropriate treatment, thereby maximizing patient outcomes.

### TABLE OF CONTENTS/OUTLINE

1. Background 2. Anatomy and histology 3. Development bone 4. Metaphyseal lesions 4.1 Tumoral 4.2 Inflammatory and infectious 4.3 Mechanic/traumatic 4.4 Dysplasias/congenital changes 4.5 Metabolic 5. Imaging findings 6. Diagnostic approach

### TEACHING POINTS

The analysis of fine-caliber peripheral nerves using imaging methods is a challenging task. However, recent advances enabled higher resolution, thinner sequences with multiplanar reformatting, making it feasible to evaluate these very thin nerves using MR neurography (MRN). Therefore, MRN has been used to: (1) exclude the diagnosis of peripheral neuropathy by displaying normal nerves and regional muscles; (2) confirm suspicion of peripheral neuropathy by directly showing the nerve abnormality or regional muscle denervation changes by depicting the lesions causing nerve entrapment or impingement; (3) assess the extent of the abnormality or the disease load; (4) detect incidental lesions in the region of interest that mimic neuropathy symptoms; (5) provide imaging guidance treatments.We aim to demonstrate through cases collect in our institution the evaluation of multiple neuropathies, reinforcing its role as an important tool to access the small caliber peripheral nerves.

### TABLE OF CONTENTS/OUTLINE

(1) Peripheral nerves: concepts and anatomy, focusing on fine-caliber nerves; (2) Neuropathy: imaging findings and diagnostic challenges- Role of MRN; (3) Review through cases from our service, with literature review, including, but not limited to: (3.1) Intercostal neuropathy; (3.2) Long thoracic nerve; (3.3) Accessory nerve; (3.4) Suprascapular nerve; (3.5) Palmar cutaneous branch of the median nerve; (3.6) Medial cutaneous nerve of the forearm; (3.7) Digital nerve; (3.8) Genitofemoral nerve; (3.9) Superior gluteal nerve; (3.10) Obturator nerve; (3.11) Ilioinguinal nerve; (3.12) Medial plantar nerve...

## PHOTON-COUNTING CT IN MSK - HOW I DO IT

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Henner Huflage, MD (*Abstract Co-Author*) Nothing to Disclose
Jan P. Grunz, MD (*Abstract Co-Author*) Research Consultant, Siemens AG
Andreas Kunz, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Since the clinical emergence of the first photon-counting CT (PCCT) system in late 2021, investigations have shown advantages in all fields of radiology. Compared with standard energy-integrating detector CT, PCCT allows for superior dose efficiency in every examination. While this aspect by itself is groundbreaking, the advantages do not stop there: PCCT facilitates an unprecedented combination of ultra-high resolution imaging without dose penalty or field of view restrictions, elimination of electronic noise, and ubiquitous spectral information. Considering the high demands of orthopedic imaging for visualization of minuscule details while simultaneously covering large portions of skeletal and soft tissue anatomy, no subspecialty may benefit more from this novel detector technology than musculoskeletal radiology. This educational aims to provide a personal introduction to the cosmos of PCCT, explain its technical basics, and highlight the most promising applications for patient care, while also mentioning current limitations that need to be overcome in the future.

### TABLE OF CONTENTS/OUTLINE

1. Technical background 2. Radiation dose reduction 3. Spatial resolution improvement 4. Metal artifact reduction 5. Multi-energy and spectral imaging 6. Current technical limitations and outlook 7. Discussion

## SCULPTING SUCCESS: VALUABLE INSIGHTS INTO BONE TUMOR SURGERY WITH 3D RECONSTRUCTION TECHNIQUES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Micaela Sturnigh, MD (*Abstract Co-Author*) Nothing to Disclose
Jonathan Rosenvasser, MD (*Abstract Co-Author*) Nothing to Disclose
Javier M. Martinez Martinez, MD (*Abstract Co-Author*) Nothing to Disclose
Ignacio Ferrer, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. 3D Printing Process: To explore key stages, from image acquisition to bedside application.2. Selection of 3D Printing Technologies: To analyze the advantages and disadvantages of different 3D printing techniques and their specific applications in generating models for bone tumor resection.3. Preoperative Planning: to demonstrate how 3D printed models are used in preoperative planning to enhance surgical accuracy and efficiency. 4. Clinical Applications: Review clinical cases illustrating the use of 3D printed models in bone tumor resection and personalized implants.5. Visualization and Communication: To discuss how 3D printed models enhance communication among the surgical team and patients, to improve their understanding of the procedure.

### TABLE OF CONTENTS/OUTLINE

1. Introduction to the 3D printing process in bone tumor resection.2. Key techniques and technologies used in 3D printing of models for orthopedic surgery.3. Highlighted clinical cases: examples of 3D printed model applications in preoperative planning and bone tumor resection.4. Practical considerations and challenges in implementing 3D printing in orthopedic clinical practice.5. Additional applications of 3D-printed models in orthopedics: patient education, interdisciplinary communication and surgical training.6. Conclusion: advancing excellence in bone tumor surgery.

## ARE YOU READING IN A VACUUM OR COOKING WITH GAS? DIAGNOSTIC PITFALLS IN INTERPRETATION OF NONINFECTIOUS CAUSES OF GAS IN MUSCULOSKELETAL IMAGING

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Tetyana A. Gorbachova, MD (*Abstract Co-Author*) Nothing to Disclose
Osama Syed, DO (*Abstract Co-Author*) Nothing to Disclose
Jacob T. Ramsey, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Describe physiologic conditions and noninfectious disorders of musculoskeletal system associated with presence of gas.2. Review differential diagnosis of intraarticular, juxta articular and intraosseous gas and associated common interpretational pitfalls in setting of trauma.3. Review common and uncommon etiologies of gas after joint replacement.

### TABLE OF CONTENTS/OUTLINE

1. Intra-articular gasa. Transient positional vacuum phenomenon: etiologyb. Trauma:i. Traumatic arthrotomyii. Closed injury: intraarticular vacuum phenomenon (VP) as an indicator of transient dislocation (adult hip)c. Iatrogenic: joint aspiration/injectiond. Degenerative: asymptomatic VP and symptomatic pneumatocyste. VP as a mimicker of internal derangement on MRI (knee, shoulder)2. Intra-osseous and juxta articular gasa. Acute fracturesi. Open fracturesii. Closed fractures in high energy traumaiii. Iatrogenic (local anesthesia during reduction)b. Insufficiency fractures (pelvis, spine)c. Chronic fracture with nonunion/ pseudoarthrosisd. Degenerative: periarticular pneumatocyst, soft tissue extension mimicking abscess3. Arthroplasty associated gasa. Intramedullary pneumatosis in early post operative period as a lesion mimickerb. Aseptic hydrogen pneumarthrosis as a sign of crevice corrosion

### TEACHING POINTS

Chest wall tumors and tumor-like lesions are relatively rare, but understanding their diagnostic features is crucial. There exists a significant overlap in the presentation of different etiologies, with many non-specific features shared between benign and malignant tumors. Recognizing key imaging and clinical-epidemiological characteristics of the most common lesions is essential. Additionally, identifying findings that raise suspicion for malignancy is critical. This presentation will focus on multimodality essential features for differentiating benign and malignant lesions and, when possible, specific imaging features for determinante diagnosis. Relevant clinical and epidemiologic data will be highlighted. A brief review of a pertinent MRI protocol will also be included.

### TABLE OF CONTENTS/OUTLINE

Introduction - Specific MRI protocol for chest wall lesionsCollection of cases, with a multimodality approach of the following lesions: Osteochondroma / Hemangioma / Elastofibroma Dorsi / Desmoid Tumor / Fibrous hamartoma of Infancy / Lipoma / Schwannoma / Ewing's Sarcoma / Chondrosarcoma / Myeloma / Metastasis / Brown Tumor / Leri Disease.

## HIGH-RESOLUTION ULTRASOUND OF THE NAIL: CLINICAL AND PATHOLOGICAL CORRELATION

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Tatiana Arroyave, MEd (*Abstract Co-Author*) Nothing to Disclose
Brian D. Norena Rengifo, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Diseases in the nail may be an incidental finding or may manifest as a palpable or visible abnormality. Knowledge of the anatomy of the nail is crucial in the evaluation of tumor, inflammatory or traumatic lesions. High-resolution ultrasound is the image of choice for the characterization of superficial lesions in the nail. A meticulous technique is necessary to determine the type, composition and location of the lesion. Establishing a differential diagnosis is essential to offer adequate treatment.

### TABLE OF CONTENTS/OUTLINE

This educational e-exhibit will review nail anatomy, ultrasound imaging findings, and differential diagnosis of nail unit lesions. An overview of the ultrasound technique for evaluating nail lesions will be provided and correlation with clinical and pathological images will be performed.

### TEACHING POINTS

Chronic Exertional Compartment Syndrome (CECS) is a prevalent yet frequently underdiagnosed condition, particularly among physically active individuals, posing substantial challenges and hindrances to performance. This review explores the multifaceted nature of CECS diagnosis and management, emphasizing the critical role of imaging techniques, notably MRI, in enhancing our understanding and approach to this condition. CECS diagnosis traditionally relied on invasive techniques like needle manometry, with its limitations and varying acceptance. However, advancements in imaging, especially MRI, offer non-invasive alternatives that present promising avenues for accurate diagnosis and improved patient outcomes. By examining the pathophysiology and anatomical considerations underlying CECS, clinicians gain valuable insights into its presentation and differential diagnosis. This study elucidates the diagnostic utility of imaging in CECS assessment, practical considerations and pitfalls associated with MRI interpretation, highlighting the importance of protocol standardization and clinician expertise. This article underscores the transformative impact of imaging, particularly MRI, in navigating the complexities of CECS diagnosis and management, aiming to empower healthcare professionals in optimizing patient care and facilitating a return to pain-free performance.

## UNDERSTANDING EXTENSOR MECHANISM PATHOLOGIES AND THEIR POSTOPERATIVE APPEARANCES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Tony T. Wong, MD (*Abstract Co-Author*) Nothing to Disclose
Tina Roa, MD (*Abstract Co-Author*) Nothing to Disclose
Saheeb Ahmed, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Teaching Points 1. Understand the basic musculoskeletal anatomy of the knee through multiple imaging modalities (radiographs, CT, MRI), with a focus on the extensor mechanism. 2. Explore different pathologies of the extensor mechanism, their presentation, and their appearance under different imaging modalities. 3. Understand surgical variants used to treat extensor mechanism pathologies and the rationale behind their use. 4. Understand the expected postoperative appearance of extensor mechanism surgeries. 5. Recognize common postoperative complications.

### TABLE OF CONTENTS/OUTLINE

Table of Contents/Outline 1. Normal Anatomy a. Radiographic features of the knee b. Cross sectional anatomy of the knee (CT and MRI), with a focus on the extensor mechanism (tendons, insertions, joints)2. Extensor mechanism pathology and related surgeriesa. Patellar instability i. MPFL reconstruction ii. Physeal sparing MPFL reconstruction iii. Lateral retinacular release iv. Tibial tuberosity transfer v. Roux-Goldthwait procedureb. Patellar abnormalities i. Patellofemoral cartilage repair ii. Bipartite patella resection iii. Patellar fracture repairc. Extensor mechanism tears i. Primary patellar and quadriceps tendon repair ii. Repair with augmentation: Achilles allograft reconstruction iii. Repair with augmentation: semitendinosus autograft reconstruction iv. Allograft patella extensor mechanism reconstruction3. Common postoperative complications

Gustavo O. Watanabe, MD (*Abstract Co-Author*) Nothing to Disclose
Lucas N. Silva, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Tibiofibular syndesmotic injuries are challenging and often underestimated, especially mild or moderate cases. Proper diagnosis and treatment are essential to avoid long-term complication such as rotational instability and ankle osteoarthritis. The syndesmotic ligament injury and associated instability determine whether operative or non-operative treatment is needed. Imaging, like x-rays for initial assessment and weightbearing studies for dynamic insights, is crucial. MRI provides direct ligament visualization and detects associated injuries, despite limitations in evaluating ankle dynamics. In this context, knowledge of anatomy, biomechanics and injury mechanisms are essential in both diagnostic and therapeutic management. Emerging imaging techniques improves sensitivity, but they remain underutilized. Recognizing subtle imaging signs and comparing the affected side with the contralateral unaffected side can increase diagnostic accuracy. Postoperative imaging analysis is imperative when there is failure to achieve anatomical reduction, residual instability, or development of concomitant injuries. The radiologist should identify the surgical techniques, normal findings and abnormalities that may suggest complications, thus avoiding unnecessary procedures.

### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Tibiofibular syndesmosis anatomy 3. Biomechanics and trauma mechanism 4. Imaging diagnosis of tibiofibular syndesmosis injury a) Radiograph and Stress X-ray b) CT Scan c) Stress and weightbearing CT Scan d) MRI e) What to report in the preoperative exam? 5. Treatment and imaging evaluation a) Surgical techniques b) Complications c) What to report? 6.? ?Conclusion

## IMAGING EVALUATION OF SHOULDER ARTHROPLASTY: A COMPREHENSIVE EDUCATIONAL OVERVIEW

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Lucas K. Miyahara, MD (*Abstract Co-Author*) Nothing to Disclose
Victor C. Mello (*Abstract Co-Author*) Nothing to Disclose
Paola C. Kuenzer Goes, MD (*Abstract Co-Author*) Nothing to Disclose
Andre Y. Aihara, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The purpose of this study is to: • Review the imaging and discuss the different types of shoulder arthroplasty with didactic and illustrative cases to consolidate the acquired knowledge. • Identify the typical visual outcome of various arthroplasty and pinpoint the primary issues and complications that may arise post-surgery, shared to all types and particularly those specific to each type of replacement procedure. • Suggest a report template that highlights the key relevant information for the orthopedic surgeon.

### TABLE OF CONTENTS/OUTLINE

Advancements in shoulder arthroplasty, along with varied surgical techniques and detailed anatomical studies, have significantly improved outcomes. Common motivations for shoulder arthroplasty include osteoarthritis, inflammatory arthritis, fractures, rotator cuff issues, and avascular necrosis. Recognizing key imaging indicators is essential for accurate diagnosis and determining the most suitable arthroplasty approach. Radiologists must not only understand the indications for each procedure but also be knowledgeable about potential complications. The presentation will include the following contents: - Introduction - Hemiarthroplasty - Anatomic total shoulder arthroplasty - Reverse total shoulder arthroplasty - Complications - Report template suggestion - Bibliographical references

## CRACKS AND BREAKS: A RADIOLOGIST'S GUIDE TO FRACTURES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Andre Y. Aihara, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Paola C. Kuenzer Goes, MD (*Abstract Co-Author*) Nothing to Disclose
Ana Carolina D. Augusto, MD, MSc (*Abstract Co-Author*) Nothing to Disclose
Gustavo Junzi Konno, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

In this educational exhibit, our aim is to offer a thorough review of fractures, encompassing their terminology, classifications, complications, and specific characteristics related to various locations and skeletal maturation stages. A clear understanding and accurate reporting of these features are essential for enhancing clinical outcomes and minimizing complications.

### TABLE OF CONTENTS/OUTLINE

Fractures are common events in the musculoskeletal radiology spectrum, demanding attention due to their clinical and functional implications. Understanding their complications is crucial for effective management and prevention of sequelae. Pediatric fractures possess unique characteristics, such as a greater potential for bone remodeling and anatomical peculiarities, necessitating a specific approach. Fracture classifications, such as Salter-Harris for epiphyseal fractures, and systems like AO/OTA, assist in standardizing assessment and selecting the most appropriate therapeutic approach, contributing to improved clinical outcomes. New technologies, like synthetic CT and dual-energy CT in conjunction with Deep Learning software, are revolutionizing musculoskeletal radiology, accelerating the identification of subtle fractures and underscoring the importance of continuous updating for musculoskeletal radiologists.

### TEACHING POINTS

Sarcoidosis is a multisystemic granulomatous disorder of unknown etiology, characterized by the accumulation of T lymphocytes and macrophages in affected organs. While it most commonly involves the lungs, lymph nodes, skin, and eyes, it may affect any organ, including the musculoskeletal system, with both symptomatic and asymptomatic manifestations. The purpose of this exhibit is: 1. To review sarcoidosis etiopathogenesis 2. To discuss how modern imaging techniques such as PET/CT help detect asymptomatic musculoskeletal sarcoidosis and are changing its relative prevalence 3. To analyze multimodality imaging findings of musculoskeletal sarcoidosis 4. To assess the differential diagnosis of musculoskeletal sarcoidosis

### TABLE OF CONTENTS/OUTLINE

1. Acute sarcoid arthritis 2. Chronic sarcoid arthritis 3. Small bones sarcoidosis 4. Classic “lace-like” osteolysis pattern of small bones sarcoidosis 5. Large bones sarcoidosis 6. Spine sarcoidosis 7. Nodular muscular sarcoidosis 8. Nodular “dark star” pattern muscular sarcoidosis 9. Chronic muscular sarcoidosis 10. Subcutaneous sarcoidosis 11. Differential diagnosis of musculoskeletal sarcoidosis, such as metastasis, enchondroma, bone cyst, osteomyelitis 12. Multimodality evaluation of musculoskeletal sarcoidosis, including ultrasound, radiograph, computed tomography, magnetic resonance, and PET/CT

Carolina A. Almeida, MD (*Abstract Co-Author*) Nothing to Disclose
Clarissa C. Moraes Do Carmo, MD (*Abstract Co-Author*) Nothing to Disclose
Alexandre C. Valim, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Radiological surveillance assessments following musculoskeletal sarcoma surgery play a critical role in early detection of local recurrence. However, interpreting imaging can pose challenges, necessitating a systematic approach to accurately evaluate silent local recurrence. It is essential to understand the patient's clinical and surgical history and pretreatment images for differentiating recurrence from time-dependent posttreatment changes When conducting an examination, radiologists must determine which advanced MRI techniques (such as DIXON T1, STIR, DWI, DCE perfusion, and TIC curve analysis) should be employed to analyze both bone marrow and soft tissue. It is imperative to differentiate local recurrence from other time-dependent post-treatment changes, such as seroma, scarring, pseudotumor, radiation-induced marrow and soft tissue alterations, infection, neuropathy, and muscle atrophy, among others. For a more precise diagnosis, correlation of histopathological features with the radiological appearance of the tumor is essential. An understanding of the applicability and limitations of these techniques is necessary to ensure accurate diagnosis and potentially guide appropriate treatment for our patients.

### TABLE OF CONTENTS/OUTLINE

Advanced MRI techniques and applicability in the early diagnosis of silent recurrence of MSK sarcoma and surveillance of these patients. Case discussion to illustrate false positive and false negative cases. Common pittfallsDifferential diagnosis. Utilization of 3D printing, virtual reality, and augmented reality in diagnostic and therapeutic decision-making.

## ZERO TE (OZTEO) MR BONE IMAGING: EXPECTED AND SURPRISING BENEFITS IN MUSCULOSKELETAL IMAGING

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Andrew B. Ross, MD, MPH (*Abstract Co-Author*) Nothing to Disclose
Kenneth S. Lee, MD, MBA (*Abstract Co-Author*) Grant, NFL;Research support, Hologic, Inc;Royalties, RELX
Humberto G. Rosas, MD (*Abstract Co-Author*) Co-founder, AyrFlo;Stockholder, AyrFlo
Michael J. Tuite, MD (*Abstract Co-Author*) Nothing to Disclose
Nicholas C. Laucis, MD (*Abstract Co-Author*) Nothing to Disclose
Nicholas Tan, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Zero TE (oZTEo) is a new MR sequence designed for imaging cortical bone to create 'CT-like' images during MR exams. This 3-4 minute sequence can be easily added onto existing MR protocols. The oZTEo sequence enables visualization and characterization of structures and material that typically have extremely low signal on conventional MR sequences, including bone cortex, soft tissue calcification and ossification, and crystal deposition. During our institution's two years of using oZTEo in clinical practice, a surprising benefit of the sequence is its 3D isotropic acquisition which enables MPR reformatting and better assessment of anatomy, coalitions, and characterization of fractures on MR.

### TABLE OF CONTENTS/OUTLINE

1. Brief overview of the physics of the Zero TE (oZTEo) sequence 2. Example cases of oZTEo enabling better characterization of osseous lesions, abnormalities, and pathologic fractures 3. Example cases of oZTEo enabling characterization of soft tissue calcification/ossification/crystal deposition 4. Example cases of oZTEo enabling better visualization of osseous anatomy including symptomatic coalitions 5. Overview of our institution's implementation of oZTEo with our MSK MR protocols by indication to most efficiently utilize the sequence

Fabiano N. Cardoso, MD (*Abstract Co-Author*) Nothing to Disclose
Brooke L. Sarna, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The purpose of this exhibit is to highlight the importance of distinguishing benign from malignant sacral masses to enhance patient care and avoid unnecessary procedures. Particular focus is paid to chordomas and benign notochordal tumors (BNCTs), with an additional example of an intraosseous hemangioma (IH) which falls under the differential diagnosis of sacral masses. Upon completing this exhibit, the learner will be able to:1. Properly recognize and describe the typical MRI and CT features of chordomas and BNCTs, including features that distinguish the two.2. Properly recognize the typical histopathologic findings of chordomas and BNCTs and to synthesize them with what is seen macroscopically on MRI.3. Properly recognize intraosseous hemangiomas and their confounding imaging features in relation to chordomas and BNCTs as a differential diagnosis.

### TABLE OF CONTENTS/OUTLINE

1. Introduction presenting sacral masses and their prevalence and morbidity. A differential diagnosis including both benign and malignant lesions will be provided.2. In particular, the distinguishing imaging features, pathologic correlates, and when available gross specimen and intra-operative photographs of chordomas, benign notochordal tumors, intraosseous hemangiomas, chondrosarcomas, giant cell tumors, and other less common sacral tumors will be provided.3. Objective information with subsequent discussion will be provided to help the general radiologist distinguish between these lesions and form a differential diagnosis.4. Conclusion.5. Bibliography.

### TEACHING POINTS

Knee replacements are devices used to replace damaged parts of the knee, usually in patients with severe arthritis or serious injuries. This summary focuses on the main angles, measurements and changes related to prostheses to guide radiologists in their reports. These are the main angles and measurements: The alfa angle, the gamma angle e femoral component alignment in the axial plane evaluate the relationship between the femur and the femoral component. On the other hand, the beta angle, the sigma angle and tibial component alignment in the axial plane evaluate the relationship between the tibia and the tibial component. As relevant changes we can highlight loosening: Indicated by changes in angles or increase in joint space. Radiolucent lines suggest this problem; polyethylene wear: evidenced by decreased joint space; infection: suspected by the presence of edema, increase in soft tissue or bone erosion.

### TABLE OF CONTENTS/OUTLINE

Components of knee prostheses and their zones: it is essential to know what is being evaluated and how to describe the topography of the knee replacements. Main angles, measurements and variations of implant techniques: as important as knowing what to look for, is knowing where and how to look. Main complications: among them are osteolysis, loosening, cortical notching, periprosthetic fractures, infections and wear of the polyethylene component.

## HALLUX VALGUS DEFORMITY: A COMPREHENSIVE AND ILLUSTRATED GUIDE FOR ITS RADIOGRAPHIC EVALUATION, SURGICAL TREATMENT OPTIONS, AND POTENTIAL COMPLICATIONS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Ty K. Subhawong, MD (*Abstract Co-Author*) Research Consultant, Arog Pharmaceuticals, Inc;Stockholder, AbbVie Inc;Stockholder, AstraZeneca PLC;Stockholder, Johnson & Johnson;Stockholder, Pfizer Inc ;Stockholder, F. Hoffmann-La Roche Ltd;Stockholder, Teva Pharmaceutical Industries Ltd
Fabiano N. Cardoso, MD (*Abstract Co-Author*) Nothing to Disclose
Bryan Nixon, MD (*Abstract Co-Author*) Nothing to Disclose
Brooke L. Sarna, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The purpose of this exhibit is to provide learners with a radiographic definition of hallux valgus. Illustrations of various possible measurements are included to aid learners in improving the accuracy of their reports. An explanation and illustration of various surgical corrective techniques is also provided to better aid learners in interpreting post-operative films. Upon completing this exhibit, the learner will be able to:1. Diagnose hallux valgus on radiographs.2. Provide various associated measurements to the orthopedic surgeon to better aid in management and operative planning.3. Properly recognize various common surgical corrective techniques in the post-operative imaging setting.

### TABLE OF CONTENTS/OUTLINE

1. Introduction presenting hallux valgus and its prevalence and morbidity. The radiographic definition and associated measurements on foot radiographs will be provided with corresponding illustrations.2. In-depth discussion outlining various common corrective surgical techniques, including Chevron osteotomy, Akin osteotomy, Scarf osteotomy, Weil osteotomy, and joint arthodeses (ex. Lapidus procedure) with accompanying illustrations and radiographic examples. Particular attention will be paid to post-operative imaging and evaluation of complications. When available, intra-operative photographic correlation will be provided.3. Examples of surgical complications and their radiographic and, when available, intra-operative correlation. Emphasis will be placed on how the general radiologist can recognize early and late complications.4. Conclusion.5. Bibliography.

## DON’T FALL BEHIND: A REVIEW OF SACRAL FRACTURES AND LUMBOSACRAL DISSOCIATION INJURY PATTERNS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Jacob C. Mandell, MD (*Abstract Co-Author*) Author with royalties, Cambridge University Press
Bharti Khurana, MD, MBA (*Abstract Co-Author*) Consultant, General Electric Company;Editor, Wolters Kluwer nv;Author, Cambridge University Press;Consultant, ROKIT Healthcare, Inc
Yan Epelboym, MPH (*Abstract Co-Author*) Association of University Radiologists GE Radiology Research Academic Fellowship Boston Imaging Core Laboratory: Consultant
Phat Tan Nguyen, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Sacral fracture classifications and how the radiologist’s interpretation impacts orthopedic management.2. Lumbosacral dissociation injury patterns and their pathophysiologic mechanism of action.3. Vascular injuries commonly associated with sacral fractures and lumbosacral dissociations.

### TABLE OF CONTENTS/OUTLINE

• Bony and Ligamentous Pelvic Anatomy• Imaging Evaluation• Classification of Sacral Fractures• Lumbosacral Dissociation Injury Patterns• Associated Vascular Injuries• Conclusion / Teaching SummaryPrompt identification of sacral fractures and lumbosacral dissociation is critical to facilitate optimal evaluation and management of trauma patients. Sacral fractures may be associated with low-energy impact in demineralized individuals or with high-energy impact in the general population. Radiologists should be familiar with the classification of common and rare types of sacral fractures to facilitate optimal communication with the orthopedist. The most commonly used is the Denis classification system which categorizes fractures into three zones (Zones 1, 2, and 3) and four morphological subtypes (H, U, T, and ?). Anatomic separation of the pelvis from the spinal column, otherwise known as lumbosacral dissociation is a highly morbid and rare subtype of sacral fracture. Knowledge and identification of lumbosacral dissociation injury patterns and subtle associated injuries will facilitate appropriate orthopedic intervention. A review of commonly associated pelvic vascular injury is also critical to facilitate appropriate interventional and surgical management.

## WELCOME TO THE JUNGLE: ANIMAL INSPIRED MUSCULOSKELETAL AND SPINE RADIOLOGY SIGNS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Jeremiah R. Long, MD (*Abstract Co-Author*) Nothing to Disclose
Andrew P. Sill, MD (*Abstract Co-Author*) Nothing to Disclose
Logan Haug, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Radiological signs are important for radiologists and trainees to be familiar with because they can enhance recall of associated pathology and improve diagnostic accuracy. This exhibit will demonstrate the common and recognizable animal inspired musculoskeletal and spine imaging signs via a quiz-style, case-based approach and, when not pathognomonic, provide a differential highlighting the key imaging features supporting the correct diagnosis. For example, in the case of the gull-wing sign which is commonly associated with erosive osteoarthritis, we will highlight the clinical and radiologic features (distribution, joint space narrowing, and soft tissue changes) of other erosive arthritides in the differential such as psoriatic and rheumatoid arthritis.

### TABLE OF CONTENTS/OUTLINE

A “sign” represents a recognizable and recurring radiological pattern suggestive of a certain disease or condition. Our presentation will highlight the key features of the musculoskeletal and spine radiological signs listed below: Extra-axial skeleton signs: 1. Pooping duck sign (triquetral fracture) 2. Anteater sign (calcaneonavicular coalition) 3. Gull wing sign (erosive osteoarthritis) 4. Rat bite erosion (gout) 5. Zebra stripe sign (transverse sclerotic lines in the long bones) 6. Swan neck deformity (autoimmune/inflammatory arthropathies) 7. Talar beak sign (tarsal coalition) 8. Fishtail deformity (elbow). Axial skeleton signs: 1. Winking owl sign (unilateral absent pedicle) 2. Scotty dog (normal anatomy) 3. Claw sign (degenerative disc disease) 4. Shark’s fin sign (unilateral facet joint dislocation) 5. Fish vertebrae sign (osteoporosis).

## REPORTING AND DATA SYSTEMS (RADS) IN MUSCULOSKELETAL (MSK) RADIOLOGY: EXPLAINED IN A SIMPLIFIED MANNER FOR PRACTICAL USAGE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Atul K. Taneja, MD,PhD (*Abstract Co-Author*) Nothing to Disclose
Avneesh Chhabra, MD, MBA (*Abstract Co-Author*) Consultant, ICON plc;Consultant, Treace Medical Concepts, Inc;Author with royalties, Wolters Kluwer nv;Author with royalties, Jaypee Brothers Medical Publishers Ltd;Speaker, Siemens AG;Medical Advisor, ImageBiopsy Lab;Research Grant, ImageBiopsy Lab
Flavio Duarte Silva (*Abstract Co-Author*) Nothing to Disclose
Angela He, BS, BA (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Learn the value of Reporting and Data Systems in radiology for patient care and multidisciplinary communications-management. 2. Gain knowledge of different RADS systems in musculoskeletal radiology with respect to tumors, infections, and neuropathy scoring. 3. Improve understanding of key points of each of the RADS systems with illustrative imaging examples.

### TABLE OF CONTENTS/OUTLINE

1. Review of American College of Radiology (ACR) statements for RADS systems and their value in radiology with relevance to improving interdisciplinary communications and patient care. 2. Discussion of key points of different RADS systems while highlighting key advantages and pitfalls for each scoring system a. Musculoskeletal infection-RADS (MSKI-RADS) b. Bone-RADS c. Soft Tissue-RADS (ST-RADS) d. Osseous Tumor-RADS (OT-RADS) e. Neuropathy Score-RADS (NS-RADS) 3. Case-based illustration of imaging examples in quiz format to aid reader learning and understanding in different RADS systems.

## MR IMAGING OF ACUTE COMPARTMENT SYNDROME THROUGHOUT THE BODY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Atul K. Taneja, MD,PhD (*Abstract Co-Author*) Nothing to Disclose
Alipio Ormond Filho, MD (*Abstract Co-Author*) Nothing to Disclose
Flavio Duarte Silva (*Abstract Co-Author*) Nothing to Disclose
Angela He, BS, BA (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Learn about acute compartment syndrome and its presentation in various muscle groups of the body.2. Improve understanding of compartment syndrome imaging findings on MR imaging across various affected muscle groups with case-based illustrative imaging examples and gain knowledge of the consequences and complications of delayed or missed acute compartment syndrome diagnoses, especially in atypical cases

### TABLE OF CONTENTS/OUTLINE

1. Review of acute compartment syndrome, its common clinical manifestations, and possible complications2. Discuss the current standards of diagnosing acute compartment syndrome, potential pitfalls of such methods, and the current role of imaging in diagnosing acute compartment syndrome3. Case-based illustration of imaging examples of acute compartment syndrome in various muscle groups to aid reader learning and prompt recognition of pertinent imaging findings; muscle groups to be covered: a. Legs b. Foot c. Thigh d. Paravertebral e. Forearm4. Case-based illustrations of chronic complications: a. Muscular atrophy b. Muscular fibrosis c. Tendinopathy d. Neuropathy

## SCAPHOLUNATE INSTABILITY: A CLINICAL AND RADIOLOGICAL SYNOPSIS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Harikrishnan Nandakumar, MD (*Abstract Co-Author*) Nothing to Disclose
Harlan M. Stock, MD (*Abstract Co-Author*) Nothing to Disclose
Sukrita Menon, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Understanding the normal scapho-luno-capitate alignment, scapholunate and capitolunate angles and normal carpal arcs. 2. Review the structure of scapholunate ligament (SLL). 3. Understanding the mechanism of SLL disruption, its clinical importance, and arthroscopic classification (Geissler). 4. Review the mechanism of scapholunate dissociation, perilunate, lunate and midcarpal dislocations (Mayfield classification) using multimodality imaging. 5. Understanding the sequelae of carpal injuries including Dorsal and Volar intercalated segment instabilities (DISI and VISI). 6. Scapholunate Advanced Collapse (SLAC) and Scaphoid Nonunion Advanced Collapse (SNAC) - Review the etiology, stages, and multimodality imaging findings. 7. Prognosis, staging and brief overview of treatment for SLL injuries (each stage)

### TABLE OF CONTENTS/OUTLINE

1. Introduction: Normal Scapholunate alignment, Normal intercarpal angles and carpal arcs. 2. Anatomy and function of SLL. 3. SLL injury: Etiology and arthroscopic classification. 4. Case based discussion - Mechanism, Ligament(s) affected, radiological features: a. Scapholunate dissociation. b. Perilunate dislocation. c. Midcarpal dislocation. d. Lunate dislocation. 5. SLAC: Etiology, mechanism, Watson staging system, radiological features. 6. SNAC: Etiology, mechanism, stages of osteoarthritis, radiological features. 7. DISI and VISI: Etiology, mechanism, and radiological features. 8. Prognostic factors and staging of SLL injuries (Garcia-Elias) and management

## BIOMECHANICS, IMAGING AND DIFFERENTIAL DIAGNOSIS OF AVULSION FRACTURES: A PICTORIAL REVIEW

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Elisabetta Ponte, MD (*Abstract Co-Author*) Nothing to Disclose
Andrei Daniel Onuta, MD (*Abstract Co-Author*) Nothing to Disclose
Monica Bernabeu Rodriguez, MD (*Abstract Co-Author*) Nothing to Disclose
Manuel Sebastian Paez Alvarez, MD (*Abstract Co-Author*) Nothing to Disclose
Victoria Esteban Izquierdo, MD (*Abstract Co-Author*) Nothing to Disclose
Pablo Garces Marin, MD (*Abstract Co-Author*) Nothing to Disclose
Yolanda Herrero Gomez, MD (*Abstract Co-Author*) Nothing to Disclose
Jaime Lopez Martin, MD (*Abstract Co-Author*) Nothing to Disclose
Javier Tejedor Toquero, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The aim of this report is to review the various ways in which avulsion fractures manifest in adult and pediatric population.To describe how avulsion fractures affect adjacent structures, and the best way to recognize them with their imaging characteristics at plain radiograph, computed tomography and resonance magnetic studies.To illustrate the main imaging features and to highlight associated injuries with-own experienced images.

### TABLE OF CONTENTS/OUTLINE

Introduction, biomechanics, location and differential diagnosis.Avulsion fractures manifest when the tendon, ligament or joint capsule, becomes dislodged from the bone, typically resulting in the detachment of a cortical bone fragment.-Acute injuries demonstrate the presence of avulsed bone fragments.-Subacute/Chronic injuries exhibit more aggressive radiographic presentation due to repetitive trauma.The mechanism is determined when a structure that originates or is inserted into the bone exerts tension in the opposite direction to the bone, and this tension significantly exceeds the tensile strength of the bone.These fractures can occur in various anatomical locations and it is crucial to know their presentation well since complex injuries such as those that involve intra-articular extension or those that associate the presence of intra-articular loose bodies, delay in diagnosis can modify the prognosis and in case of subacute/chronic diseases, knowledge of them will help us not to confuse them with other pathologies.

### TEACHING POINTS

Hip is one of the most complex articulations of the human body due its sophisticated biomechanics. Athletes test its capacity to the limit and some lesions are expected. However, hip disorders in athletes should not be misdiagnosed because most of them, if not treated correctly, can lead to movement limitation, decrease in quality of life and harm to professional athletes' career.The purpose of this exhibit is:
- Demonstrate a comprehensive understanding of the normal anatomy of the hip joint
- Explore the universe of hip pathologies beyond athlete's pubalgia, understanding its specific conditions and the difficulty to get the correct diagnosis
- Show how misdiagnosis and late treatment change prognosis, especially in professional athletes' career, even with small pathologies

### TABLE OF CONTENTS/OUTLINE

1. Introduction: a. Hip anatomy, biomechanics and its association with sports b. Epidemiology, clinical aspects and prognosis of athletes' hip disorders, especially in career lifetime and return to practice 2. Case-by-case review, discussion and interpretation of the main pathologies of athlete's hip in different imaging methods (x-ray, ultrasound, computed tomography and magnetic resonance imaging) and compartmentalization a. bone and joints b. cartilage c. myotendinous 3. Conclusion and "take-home messages"

### TEACHING POINTS

Examine the main differential diagnoses of infectious and tumorous lesions in the spine and paravertebral structures, and the benefits of MRI in studying them; Identify key MRI findings for infections vs. tumors in the spine; Develop a systematic MRI interpretation for accurate diagnosis of spine tumor vs. infectious lesions.

### TABLE OF CONTENTS/OUTLINE

The variety of causes in spinal lesions poses a diagnostic challenge. Radiologists must distinguish between manifestations of infections and tumors in spine imaging. This study provides an overview of these conditions, presents relevant images, and outlines MRI evaluation strategies to differentiate between infectious and tumor-related findings.Patients with spinal lesions commonly exhibit nonspecific symptoms like back pain and neurological deficits. In these cases, careful radiological interpretation is crucial to differentiate between spine infections and tumors, with MRI being the preferred modality.In most infection cases, MRI typically reveals vertebral endplate destruction, disc and bone marrow signal abnormalities, and epidural or paravertebral abscesses. Among infectious causes, spondylodiscitis and tuberculosis are common. Neoplastic causes include primary tumors like osteosarcoma and Ewing's sarcoma, and metastatic diseases. Overall, radiologists need to understand the main tumor and infectious spine diagnoses, and employ a systematic MRI interpretation for accurate diagnosis.

### TEACHING POINTS

Review the pathophysiology and clinical findings of genetic musculoskeletal disorders Describe the typical musculoskeletal imaging findings of each genetic disorder Discuss the differential diagnosis and associated systemic imaging findings of each genetic disorder

### TABLE OF CONTENTS/OUTLINE

Many genetic disorders involve the musculoskeletal (MSK) system and have typical imaging features, but radiologists have difficulty interpreting them due to their rarity. Therefore, it is important that radiologists be familiar with these genetic disorders and their typical imaging appearances to accurately aid in diagnosis and proper management. We will discuss different genetic disorders affecting the MSK system with their imaging appearances. We will explore imaging findings of each disorder and discuss how imaging aids in correct diagnosis. In this exhibit, weIn this exhibit, we will also review the clinical manifestations and associated systemic imaging findings. The focus of our work is the typical imaging appearance of: A to Z Achondroplasia Blount’s disease Caudal regression syndrome Cleidocranial dysplasia Congenital insensitivity to pain and anhidrosis Congenital Tibial Hemimelia Diaphyseal dysplasia (Camurati-Engelmann disease) Fibrodysplasia ossificans progressiva Gaucher’s disease Hereditary multiple osteochondromas Limb-girdle muscular dystrophy Madelung's deformities Mucolipidosis Mucopolysaccharidosis: Hurler syndrome (I), Hunter’s syndrome (II), Morquio’s syndrome (IV) Multiple epiphyseal dysplasias Nail patella syndrome Osteogenesis imperfecta Osteopetrosis Lipid granulomatosis Primary hypertrophic osteoarthropathy Proteus syndrome Syndactyly and polydactyly

## HEREDITARY MULTIPLE EXOSTOSES: REVISITING AN OLD FRIEND

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Sara Gomez Pena, MD (*Abstract Co-Author*) Nothing to Disclose
Sonia Lon, MD (*Abstract Co-Author*) Nothing to Disclose
Manuel Lopez Herrero, MD (*Abstract Co-Author*) Nothing to Disclose
Ana M. Crespo, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Maria J. Moreno Casado (*Abstract Co-Author*) Nothing to Disclose
Alvaro Rueda-de-Eusebio, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To review the clinical presentation and pathogenesis of Hereditary Multiple Exostoses (HME). - To describe the classic imaging findings of HME, specially conventional radiography and skeletal surveys for its diagnosis and follow-up. -To highlight the role of CT and MRI for the better characterization of lesions and complications. - To learn about the main complications and deformities associated with HME, with special focus on malignant transformation. It is important that radiologists know this disease and its follow-up protocol in order to identify cases with a high risk of malignant transformation.

### TABLE OF CONTENTS/OUTLINE

Background: HME presents as multiple osteochondromas (OC) arising from metaphyses of long and flat bones. Clinical presentation: lesions may be asymptomatic, but they may also cause pain or other symptoms. Deformities and chondrosarcomatous transformation can also occur. Pathogenesis and histopathology Imaging Features: OC may vary in shape and distribution. Cases are usually studied and followed up with skeletal surveys. In some patients, MRI and CT are necessary to further characterize suspicious lesions. US is important in pediatric cases. Complications: --Osseous deformities In recent years, new classifications have been published, such as the Masada and Jo classification for forearm deformities or the Ahn classification for ankle deformities. Synostosis of kissing OC, fracture of an OC, other deformities, vascular and neural complcations and formation of bursas can also occur. --Malignant transformation is less frequent but is the most dangerous complication. Ų We will use representative images from the series of our Sarcoma Reference Center, with more than 35 cases.

## PICTORIAL REVIEW OF CORRELATION BETWEEN MRI AND ARTHROSCOPIC FINDINGS OF KNEE JOINT

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Han-Ying Lin, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. There exists a robust correlation between MRI and arthroscopic evaluations in diagnosing cruciate ligament pathology.2. There is suboptimal correlation observed for meniscal pathology, particularly for ramp lesion, which may present very subtle abnormalities on MRI.3. For cartilaginous pathology, a strong correlation exists between pre-operative MR and arthroscopy. However, the post-operative appearance of cartilage on MRI varies depending on the type of procedure performed and the duration of follow-up.4. For acute traumatic injuries involving the lateral collateral ligament and posterolateral corner, there exists a strong correlation. However, in cases of chronic injury, MRI findings may present subtle manifestations, posing challenges for accurate diagnosis, and reliance on physical examination and intraoperative observations becomes pivotal for accurate assessment and management. 5. There is strong correlation between MRI and arthroscopy for inflammatory process such as gout and pigmented villonodular synovitis (PVNS).

### TABLE OF CONTENTS/OUTLINE

1. Correlation for ACL, cyclops lesion, and meniscal tear2. Correlation for PCL, LCL, posterolateral corner injury3. Cartilage pathology undergoing various types of procedures, with follow-up images4. Inflammatory condition: gouty arthritis, PVNS.

### TEACHING POINTS

Tuberculosis (TB) is a widespread public health problem. Musculoskeletal TB accounts for 25% of extrapulmonary cases and has a wide variety of imaging manifestations. Therefore, the aim of this exhibit is to:Present the main forms of musculoskeletal tuberculosis involvement.Review the main imaging findings from the different types of musculoskeletal TB, including both axial and extra-axial involvement.Demonstrate the main differential diagnoses of each type of musculoskeletal TB and ways to differentiate both conditions.

### TABLE OF CONTENTS/OUTLINE

Introduction: the importance of identifying the main imaging findings from musculoskeletal TB.Main imaging findings from different types of musculoskeletal TB: Axial involvement: spondylodiscitis; tuberculous spinal meningitis; sacroiliac joints; the chest wall; Extra-axial involvement: peripheral arthritis; osteomyelitis; tenosynovitis and bursitis; myositis; Disseminated tuberculosis.Main differential diagnoses and their radiographic features: Infectious diseases ; Rheumatologic conditions ; Malignancy. Conclusion and take-home messages.

## IMAGING OF MUSCULOSKELETAL INFECTIONS: KEY IMAGING FINDINGS AND DIFFERENTIAL DIAGNOSIS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Andre Y. Aihara, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Paola C. Kuenzer Goes, MD (*Abstract Co-Author*) Nothing to Disclose
Lauren L. Pinto, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Imaging is crucial in identifying key findings of musculoskeletal infections, assessing their extension, complications, and facilitating differential diagnoses. The purpose of this exhibit is to: elucidate the role of imaging modalities in diagnosing musculoskeletal infections, highlight key imaging findings that distinguish various types and stages of infection and facilitate differential diagnosis by illustrating and comparing infectious processes with other non-infectious conditions.

### TABLE OF CONTENTS/OUTLINE

Epidemiology and Classification of Infections: overview and categorization of musculoskeletal infections.Imaging Modalities: Advantages and Disadvantages. Comparative analysis of X-ray, ultrasound, CT, and MRI.Key Imaging Findings: features such as increased soft tissue, fluid collections, gas formation, periostitis, bone edema, intramedullary fat globules, bone destruction, sequestra, cloaca, and involucrum.Complications: issues including deep infection extension, collections, thrombophlebitis, delayed or nonunion in fractures, joint ankylosis, subchondral fractures, and osteonecrosis.Differential Diagnosis: differentiating musculoskeletal infections from inflammatory, microcrystalline diseases, traumatic, and neoplastic disorders.

Taiki Nozaki, MD (*Abstract Co-Author*) Nothing to Disclose
Akimoto Nimura (*Abstract Co-Author*) Nothing to Disclose
Saya Horiuchi, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Explore the nuanced anatomy of the radioulnar ligaments in the Triangular Fibrocartilage Complex (TFCC) through our study, which includes cadaver dissections, histology, and MRI findings. We will question the conventional notion of ligament symmetry, presenting variations in fiber orientation from their origin to insertion. Additionally, we'll examine how these ligaments cross, their importance for joint stability and motion, and present our new concept, supported by comprehensive evidence, potentially influencing clinical and radiological perspectives on the TFCC.

### TABLE OF CONTENTS/OUTLINE

1) Reevaluating the conventional view of the radioulnar ligaments' symmetry in the TFCC. 2) Mapping the gradations in fiber orientation from the proximal ends to the distal attachments in the ligament's pathway. 3) Highlighting the complex interweaving of the radioulnar ligaments, potentially influencing joint stability and dexterity. 4) Considering the practical implications of these anatomical insights for improving clinical approaches and radiological evaluations of the TFCC.

## HOLDING YOUR BACK: PARAVERTEBRAL LESIONS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Andre Y. Aihara, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Paola C. Kuenzer Goes, MD (*Abstract Co-Author*) Nothing to Disclose
Daisy T. Kase (*Abstract Co-Author*) Nothing to Disclose
Lucas K. Miyahara, MD (*Abstract Co-Author*) Nothing to Disclose
Leonardo Kazunori Tsuji, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The paravertebral region is a complex anatomical structure located adjacent to the spine, providing it with stability, range of movement, vascular supply, containing the proximal portion of the nerves and the sympathetic chain/paravertebral ganglia. Paravertebral lesions can be tumoral or not, and may be primary, arising from any of the paravertebral components, or secondary, by invasion from adjacent structures or hematogenic/lymphatic dissemination. The purpose of this exhibit is to: 1. Review the paravertebral region, its anatomy, components, from the cervical to the sacral spine, and the relations between them. 2. Identify and classify the paravertebral lesions, illustrating the patterns of paravertebral lesions and the related etiology. 3. Highlight the main information that radiologists should include when reporting paravertebral lesions.

### TABLE OF CONTENTS/OUTLINE

Introduction: General review of the normal paravertebral region and particularities from each segment (cervical, thoracic, lumbar and sacral). Differential diagnostic of paravertebral lesions and their general characteristics. Assessment of each imaging modality suitability in evaluating the paravertebral region. Tumoral lesions: Classifying the main groups of tumors, primary and secondary. Illustrating the tumoral lesions and their main imaging findings, and when adequate specific patterns of a tumor or a group. Non-tumoral lesions: Classifying the non-tumoral lesions by etiology. Illustrating their main imaging findings. Summary Table with the main lesions and their imaging aspects. Main information that should be included in the radiological report. Bibliographical references.

### TEACHING POINTS

To know the anatomy, function, and biodynamic aspects of the adductor muscle complex. To recognize the spectrum of tearing of adductor muscles and tendons during sports practice analyzing their mechanism of injury. To evaluate the imaging methods in the different adductor lesions and to describe the precise location and characteristics. To describe ultrasound and magnetic resonance signs of these tears, emphasizing the prognostic criteria for recovery, return to play, and re-injury.

### TABLE OF CONTENTS/OUTLINE

The adductor complex muscles consist of adductor longus, adductor brevis, adductor magnus, gracilis and pectineus muscles. Its main function is to bring the leg towards the midline of the body, and they also influence during high-speed directional changes. This muscle group is the second group most likely to be injured in sports with eccentric loads, particularly soccer. Adductor longus is the most superficial and originates from the anterior sector of the pubis and it inserts distally into the medial lip of the femur.The injuries of adductor muscle group were included in the category that causes of groin pain, being the adductor longus the most affected at the level of proximal insertion or at the myotendinous junction.Adductor longus proximal and central myotendinous junction injuries and proximal tendon injuries result in a large amount of time away from sports and a high risk of re-injury. Depending on its extent and location, we can estimate the evolution of injuries and the return to play.Adductor brevis and adductor magnus muscle injuries are less common than those of adductor longus. Adductor magnus, gracilis and pectineus muscle injuries are rare and uncommon.

Thayssa Leite, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The purpose of this exhibit is:1. To review pathophysiology, epidemiology and natural history of Chronic Nonbacterial Osteomyelitis (CNO), emphasizing the key factors important for the radiologist to understand. 2. To correlate its natural history with imaging findings using a multimodal approach (including CR, CT, MRI and whole body exams). 3. To illustrate the presentations and specific findings of CNO and its differential diagnosis through didactic cases.

### TABLE OF CONTENTS/OUTLINE

Table of Contents/Outline:1. Introduction and overview of Chronic Nonbacterial Osteomyelitis (CNO), including clinical assessment. 2. Didactic demonstration of radiograph, CT and MRI findings of the disease, along with the imaging protocol and the role of whole-body MRI in a multidisciplinary approach among imaging methods.3. Proposal of a guidebook for the main imaging findings and how to report them, aiding the pediatricians in determining the correct diagnosis and narrowing down the list of differential diagnosis. 4. Differential diagnosis, including bacterial osteomyelitis, juvenile idiopathic arthritis (JIA), Erdheim-Chester disease, bone tumors, hematologic malignancies, Paget's disease and Sweet syndrome. 5. Treatment and Prognosis. 6. Summary.

## SAGITTAL SPINOPELVIC BALANCE: A COMPREHENSIVE REVIEW FOR PREOPERATIVE RADIOGRAPHIC ASSESSMENT

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Michael Tay, MD (*Abstract Co-Author*) Nothing to Disclose
Ricardo D. Garza-Gongora, MD (*Abstract Co-Author*) Nothing to Disclose
Samuel Roberts, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Alignment of the spine and pelvis in the sagittal plane has a significant impact on patient morbidity. Problems in alignment and balance lead to compensatory maneuvers, such as knee bending and cervical hyperlordosis, which have been shown to reduce quality of life. In the evaluation of an adult panoramic lateral radiograph of the spine, specific sagittal parameters should be reported, as these have clinical implications and direct surgical management. Examples of important parameters to report include: global lumbar lordosis (LL), pelvic incidence (PI), pelvic tilt (PT), PI-LL mismatch, and sagittal vertical axis (SVA).

### TABLE OF CONTENTS/OUTLINE

Intro Upright poster maintenance. Regional shapes Segmental: Pelvic (Rigid), Lumbar (Flexible intercalary), Thoracic (Semirigid), Cervical (Flexible intercalary). Balancing: Spinopelvic haromony, suprajacent balancing, intersegmental balancing, global balancing. Surgical management and case review.

Artemis D. Alves, MD (*Abstract Co-Author*) Nothing to Disclose
Renan D. Lederer, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- To demonstrate the normal MRI anatomy and the main pathologies involving the lumbosacral plexus;- To review and demonstrate the MRI protocols for better assessment of the lumbosacral plexus;- To understand the main function of each trunk and nerve, as well the clinical features of its involvement, correlating it to the image findings.

### TABLE OF CONTENTS/OUTLINE

- Understanding the lumbosacral plexus anatomy and function is necessary to a precise diagnosis. Common causes of plexopathy are tumors, post-operative related pathologies, compressive syndromes, trauma, inflammatory and infectious diseases.- Review and demonstrate normal anatomy, anatomic variants and MRI protocols to assess the lumbosacral plexus; to describe the main pathologies involving the lumbosacral plexus. - Perform a literature review and pictorial essay.

Eduardo Baptista, MD (*Abstract Co-Author*) Nothing to Disclose
Ana Carolina Villela, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The purpose of this exhibit is: 1) To recognize the most common artifacts in different image modalities (MRI, CT, ultrasonography and radiography). 2) To discuss the mechanisms for the formations of artifacts and how to reduce their occurrence. 3) To understand the consequences of misinterpreting artifacts as pathologies using real cases and how to overcome them.

### TABLE OF CONTENTS/OUTLINE

1) Most common artifacts in musculoskeletal radiology: A) MRI: Magnetic susceptibility; Dielectric effect; Motion; Flow; Aliasing; Gibbs ringing effect; Zipper; Reconstruction; Signal loss; Lipid suppression; Dark shading; Cross-talk; Signal-to-noise ratio; Moiré fringes; Inhomogeneity. B) CT: Motion; Beam hardening; Photon starvation; Truncation; Metallic Materials; Tube arcing; Windmill; Cone beam effect. C) Ultrasonography: Focal Zone; Posterior Enhancement; Acoustic Shadowing; Reverberation; Mirror Image; Anisotropy; Refractile shadowing; Range Ambiguity. D) Radiography: Motion; Black lightning marks; Clear spots; Ghosting; Stitching; Dead pixels; Radiopaque external objects; Image compositing; Grid cut-off; Parallax effect; Midgray clipping; Backscatter.2) Mechanisms of artifacts formation on MRI, CT, ultrasonography and radiography.3) How to reduce the occurrence of artifacts in each modality.4) Consequences of misinterpreting artifacts as pathologies and how they were overcome using real cases.

Thiago Jose Pinheiro Lopes, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The participation of children and adolescents in sporting activities brings a series of physical and psychosocial benefits. Imbalances between training load and recovery, however, can make this interaction harmful, leading to cumulative microtrauma in bones, muscles, tendons and growth plates. With the popularity of youth sports programs, overuse injuries are increasingly common. The types and mechanisms of these lesions, as well as the peculiarities of the musculoskeletal system in the pediatric age group, are important information for the radiologist who works with young athletes. In this work, we propose to carry out a detailed review of overuse injuries, paying special attention to atypical presentations that have appeared in our service.

### TABLE OF CONTENTS/OUTLINE

1) Introduction. 2) Particularities of the musculoskeletal system in children, with focus on apophysis. 3) Imaging characteristics of overuse injuries, mechanisms of occurrence and associated sports. 4) Atypical presentations of overuse injuries and when to raise suspicion. 5) Challenges, pearls and pitfalls: normal anatomical variants and other mimics of lesions. 6) Take home messages.

## PRIMARY OSSEOUS TUMORS OF THE SPINE: TIPS FOR DIAGNOSIS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Oscar M. Navarro, MD (*Abstract Co-Author*) Nothing to Disclose
Ricardo Restrepo, MD (*Abstract Co-Author*) Nothing to Disclose
Maria Navallas, MD (*Abstract Co-Author*) Nothing to Disclose
Emilio Inarejos Clemente, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Describe the use of conventional techniques and multiparametric MRI for diagnosis and follow-up in primary spinal tumors.Describe the most common benign and malignant primary osseous spinal tumors.Discuss the most common imaging findings of primary osseous spinal tumors with corresponding surgical and gross pathology findings. Interpret multiparametric MR imaging in patients with malignant unresectable tumors.

### TABLE OF CONTENTS/OUTLINE

1. Clinical findings and demographics of benign and malignant primary spinal tumors.2. Benign tumors: Hemangioma, osteochondroma, osteoblastoma, osteoid osteoma, unicameral and aneurysmal bone cyst. Malignant tumors: Ewing sarcoma, osteosarcoma, chondrosarcoma, hemangioendothelioma, Langerhans cell histiocytosis.3. Imaging techniques in the study of spinal tumors, emphasizing on the role of multiparametric MRI and PET-MR for diagnosis and follow-up (DWI, perfusion, dynamic contrast studies, 3D volume reconstruction, 3D printing models).4. Imaging findings of spinal tumors, with illustrative examples with clinical, surgical and histopathological correlation.5. Use of functional MRI and nuclear medicine in treatment response assessment with illustrative examples.6. Imaging follow-up after tumor resection. Appropriate MR sequences for the evaluation of prostheses and metal artifacts.

## ADVANCED MR IMAGING TECHNIQUES FOR THE ASSESSMENT OF METASTATIC BONE MARROW LESIONS: WHAT DOES THE RADIOLOGIST NEED TO KNOW?

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Anwar R. Padhani, MBBS, FRCR (*Abstract Co-Author*) Advisory Board, Siemens AG;Speakers Bureau, Siemens AG;Advisory Board, Lucida Medical Ltd;Stockholder, Lucida Medical Ltd
Khaoula Bessame, MD, MSc (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Multiparametric Whole body MRI (WB-MRI) provides both morphological and functional (disease activity) information, with higher specificity and sensitivity for assessment of metastatic bone marrow disease (MBMD) compared with CT.- CT only provides morphological information (lytic, sclerotic or mixed MBMD).- Functional WB-MRI includes marrow fat fraction (F%) calculated using the Dixon sequence, high b-value DWI, and ADC images.- High specificity criteria for active MBMD using functional WB-MRI include (all must be present): morphological criteria (>5mm in size measured on F% image), high signal intensity on DWI (tumour: background SI ratio >4), ADC value 650-1300, and low F% (<20%).- False positives on high b-value DW images include fractures, infection, and treated tumor due to T2 shine-through.- Background dense sclerosis falsely elevates lesion F%.-Always correlate focal high b-value signal intensity bone marrow lesions with morphology, ADC and Dixon images.- WB-MRI protocol also incorporates STAR-VIBE, an artificial intelligence-generated adjunctive sequence providing CT-like images.-STAR-VIBE matches mineralization on CT, enabling assessment of bone integrity and fracture detection. Additionally, it can delineate fibrous tissue, such as joint capsules.

### TABLE OF CONTENTS/OUTLINE

- Schematic approach for bone marrow assessment using functional WB-MRI.- Seven MBMD patterns and likely morphological and functional WB-MRI findings.- Algorithmic approach for MBMD.- Application of the algorithmic approach on 10 cases from our institution using a question and answer approach, with learning points from both clinical and radiological perspectives.- Disease mimics.- Take home messages.

Francesca Serpi, MD (*Abstract Co-Author*) Nothing to Disclose
Salvatore Gitto, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Soft-tissue injuries of the thumb and fingers are frequently encountered in athletes and result from several mechanisms of trauma, which are often sports-specific. They include collateral ligament and palmar plate injuries, closed tendon tears, and tendon instability conditions resulting from pulley or sagittal band rupture.- The severity of hand soft-tissue injuries varies widely, requiring from conservative to surgical treatment. Timely diagnosis is crucial to offer optimal clinical management and avoid long-term complications and loss of function.- The role of imaging is to guide treatment by accurately identifying the type of lesion, its location and severity. Radiologists should be able to recognize a wide variety of sports-related hand injury patterns on radiographs, ultrasound, and MRI. All essential information should be reported to the orthopedic surgeon, including proper injury classification and associated findings, such as fractures and joint dislocation.

### TABLE OF CONTENTS/OUTLINE

1. Collateral ligament and palmar plate injuries1.1. Ulnar collateral ligament of the thumb metacarpophalangeal joint1.2. Other collateral ligaments1.3. Palmar plate2. Closed tendon tears2.1. Lateral slips of the extensor tendon (Mallet finger)2.2. Central slip of the extensor tendon (Boutonniere deformity)2.3. Flexor digitorum profundus tendon (Jersey finger)3. Tendon instability3.1. Annular pulley rupture (Climber’s finger)3.2. Sagittal band rupture (Boxer’s knuckle)4. Implications for clinical management4.1. Essential information needed by the orthopedic surgeon4.2. Focus on injuries requiring surgery with surgical correlation

CINTIA LEAL (*Abstract Co-Author*) Nothing to Disclose
Thayssa Leite, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The purpose of this exhibit is:1.To review indications and treatment options for benign and malignant bone tumors, considering patients' clinical data and prognosis. 2.To illustrate, using didactic cases, the post-treatment imaging characteristics of a variety of bone tumors, including expected post-operative findings, post-chemotherapy and radiotherapy effects, as well as immediate and late complications seen in multimodality images (radiographs, CT scans and MRI). 3.To propose a structured reporting format containing essential information required by physicians for the follow-up care of these patients.

### TABLE OF CONTENTS/OUTLINE

1.Introduction and contextualization of the multidisciplinary approach to post-treatment management of benign and malignant bone tumors. 2.Overview of treatment options for benign and locally aggressive tumors, as well as malignant lesions, such as aneurysmal bone cyst, giant cell tumor, Langerhans cell histiocytosis, Ewing sarcoma, osteosarcoma, chondroblastoma, bone metastasis and others. 3.Discussion and demonstration of expected imaging findings post-surgery and with other treatment modalities, using a multimodal approach (CR, US, CT and MRI). 4.Presentation of didactic cases illustrating the main possible complications of bone tumor treatment, including prosthesis-related complications, infection, tumor recurrence and adverse effects of chemotherapy and radiotherapy. 5.Proposal of a checklist for post-treatment tumor evaluation, outlining key findings that radiologists need to actively seach for during the follow-up of these oncologic patients. 6.Addressing potential prognosis. 7.Summary.

Jae Sung Yun (*Abstract Co-Author*) Nothing to Disclose
Min Jee Kim, MD (*Abstract Co-Author*) Nothing to Disclose
Byeong-Kwon Shin, MD, BS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Bone Marrow signal change can be very tricky. This discussion illuminates the nuanced interpretation of spinal marrow signal changes, discerning between red flags indicating potential pathology and green flags representing benign findings. To facilitate interactive learning, the presentation includes carefully selected questions derived from images of diseases that often pose challenges in clinical practice. By comprehending the spectrum of signal alterations and their clinical implications, radiologists can significantly enhance their ability to contribute to precise diagnosis and effective patient management in spinal imaging

### TABLE OF CONTENTS/OUTLINE

1. Introduction of spinal marrow signal 2. Understading MR sequence setting for spinal imaging(T1WI T2WI, T2 fat suppressed image, T1 contrast enhanced image, Coronal image)3. Green flags - Benign signal change(Hemangioma, Schmorl's node, Modic change (type 1 and type 2))4. Red flags - Pathologic marrow signal changes(Trauma, Infectious spondylitis, Malignancy (multiple myeloma and bone metastasis))

### TEACHING POINTS

• Effective management of Soft Tissue Sarcoma (STS) relies on a robust multidisciplinary collaborative effort where state-of-the-art imaging plays a pivotal role in both the initial evaluation of the disease and in the estimation of preoperative tumor response.• Neoadjuvant radiotherapy (nRT) has emerged as an effective pre-surgical therapy, reducing local recurrence rates. It has a dual action: potential tumor shrinkage and reduction in viable tumor cells, both of which facilitate surgical intervention and enhance the local tumor control.• STS demonstrate varying responses to nRT, largely dependent on their histological subtypes. For example, myxoid liposarcomas typically exhibit significant shrinkage following nRT, whereas other subtypes like undifferentiated pleomorphic sarcomas often show a notable increase in tumor size due to treatment-related phenomena.

### TABLE OF CONTENTS/OUTLINE

Introduction: Significance of Imaging in Preoperative Management of STS.Neoadjuvant Radiotherapy (nRT): Growing Role of nRT as Preoperative Treatment of STS.Pictorial Review of STS Response after nRT: -Impact of Histological Subtype on Response-Examples of Response:• Shrinkage (e.g., Myxoid Liposarcoma, Round Cell STS)• Increase in Size (e.g., Undifferentiated Pleomorphic Sarcoma) - Possible Causes (Necrosis, Hemorrhage)

### TEACHING POINTS

Spondyloarthritis are characterized mainly by inflammatory involvement of the spine and sacroiliac joints. However, peripheral musculoskeletal structures are also commonly affected in this group of diseases, either in conjunction with axial skeleton changes or independently, particularly in the early stages. Diagnosing spondyloarthropathies can be challenging and often occurs several years after symptom onset. Understanding the imaging aspects of peripheral musculoskeletal involvement in this disease group is crucial for accurate and early diagnosis, as well as for patient management, reducing the likelihood of potential complications. The purpose of this exhibit is: 1- To discuss relevant aspects of spondyloarthritis, focusing on magnetic resonance imaging findings. 2- To review the pathophysiology of spondyloarthritis and their correlation with musculoskeletal changes in imaging exams. 3- To demonstrate, through magnetic resonance imaging exams and illustrations, the main musculoskeletal alterations in the peripheral involvement of spondyloarthritis. 4- To discuss practical challenges and pitfalls in imaging assessment of spondyloarthritis.

### TABLE OF CONTENTS/OUTLINE

1- General aspects of spondyloarthritis a. Epidemiology b. Pathophysiology c. Diagnostic criteria 2- Imaging findings in spondyloarthritis: a case-based review a. Axial skeleton b. Peripheral involvement 3- Practical challenges and pitfalls in imaging evaluation of spondyloarthritis 4- Final considerations 5- References

## ADVANCES IN NAIL EVALUATION: USING ULTRASOUND AND MRI

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Natally Horvat, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Giovanni G. Cerri, PhD (*Abstract Co-Author*) Nothing to Disclose
Marcos Felippe D. Correa, MD (*Abstract Co-Author*) Nothing to Disclose
Renata V. Leao, MD (*Abstract Co-Author*) Nothing to Disclose
Jose De Arimateia Batista Araujo Filho (*Abstract Co-Author*) Nothing to Disclose
Luciana C. Zattar, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The evaluation of nail disorders has traditionally relied on clinical examination and imaging techniques like X-ray. However, recent advances in medical technology have introduced the use of ultrasound (HFUS) and MRI for a more comprehensive assessment of nail conditions. This educational exhibit aims to explore the benefits and applications of these methods, providing valuable insights for radiologists and clinicians. And also to provide attendees with a comprehensive understanding of the role of HFUS and MRI in nail evaluation, equipping them with the knowledge and skills to effectively utilize these advanced imaging techniques in clinical practice, with:1.Overview of nail anatomy and common nail disorders2.Principles of HFUS and MRI in nail evaluation3.Comparative analysis of HFUS, MRI, and traditional imaging techniques4.Case studies demonstrating the diagnostic utility of HFUS and MRI5.Practical tips for optimizing imaging protocols and interpreting findings6.Future directions and emerging technologies

### TABLE OF CONTENTS/OUTLINE

1.Introduction: Overview of nail anatomy2.Traditional Imaging Techniques: Role and Limitations of conventional imaging modalities3.Principles of HFUS and MRI in Nail Evaluation: Advantages4.Clinical Case Studies: Illustrative cases showcasing the diagnostic capabilities of HFUS and MRI5.Practical ConsiderationsImaging protocols and tips for accurate interpretation Pitfalls and challenges6.Future Perspectives- Emerging technologies/Potential advancements

## OSTEOSARCOMA RECURRENCE: WHAT THE RADIOLOGIST NEEDS TO KNOW

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Marco Bianchi (*Abstract Co-Author*) Nothing to Disclose
Carlos Henrique Pierro Carvalhinho (*Abstract Co-Author*) Nothing to Disclose
Pedro Henrique R. Silva, MD (*Abstract Co-Author*) Nothing to Disclose
Breno Trindade (*Abstract Co-Author*) Nothing to Disclose
Mauricio Ricardo Moreira da Silva Filho, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- To promote early detection of osteosarcoma recurrence for an effective treatment. ? - To discuss the role of various imaging techniques (plain radiography, CT, MRI) in identifying recurrent osteosarcoma. ? - To identify key radiological signs of recurrence, such as new bone formation, soft tissue mass, and changes in the size or appearance of the original tumor. ? - To differentiate recurrent osteosarcoma from post-treatment changes and other conditions.- To discuss the role of biopsy and optimal biopsy techniques in ambiguous cases.- To emphasize the importance of an effective communication and a multidisciplinary approach involving radiologists, oncologists, and surgeons, for optimal patient management.

### TABLE OF CONTENTS/OUTLINE

1. INTRODUCTION: A. A brief overview of osteosarcoma B. A brief overview of the imaging techniques and optimal imaging acquisition and post-processing parameters to detect recurrence. 2. RECOGNIZING SIGNS OF RECURRENCE: Overview of key radiological signs, including new bone formation, an enlarging soft tissue mass, and changes in the size or appearance of the original tumor.3. IDENTIFYING KEY FINDINGS AND DIFERENCIAL DIAGNOSIS: case studies and examples, with emphasis on what to report and what to recommend next to the clinician/ surgeon.4. CONCLUSION: Summary of key points. Future Directions.

Flavia P. Lopes, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Carolina A. Almeida, MD (*Abstract Co-Author*) Nothing to Disclose
Flavia M. Costa, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Desmoid fibromatosis (DF) is a locally aggressive rare neoplasm, exhibiting a notable proclivity for recurrence, typically localized in the extremities. Classified as an "intermediate, locally aggressive" tumor, DF often presents diagnostic challenges and is prone to misidentification. It serves as a source of chronic pain, disability, and disfigurement. Given the rarity of this disease, arriving at a diagnosis necessitates a considerable diagnostic acumen. MRI stands as the preferred modality for imaging, thus mandating a systematic approach to effectively differentiate these tumors from malignant soft-tissue counterparts. The DF predisposes it to various complications, including compression and invasion of adjacent structures. Therefore, radiologists must remain cognizant of these potential complications to furnish accurate reports and promptly inform attending physicians for timely management. The propensity for false positive and false negative outcomes underscores the necessity for vigilance among those interpreting DF examinations, attributed to the tumor's high cellular density, as well as mucoid or cystic degeneration. An appreciation of both the capabilities and constraints of MRI techniques is imperative for achieving precise diagnoses and, subsequently, optimal treatment strategies for our patients.

### TABLE OF CONTENTS/OUTLINE

The value of conventional and advanced MRI techniques (DIXON T1, T2*, SWI, DCEperfusion and TIC, DWI) in diagnosis and follow-up of DF. Case discussion to demonstrate the utility of distinguishing these tumors from: Lymphoma, Synoviosarcoma, Ewing sarcoma, High grade pleomorphic sarcoma, Fibrosarcoma, Giant cel Tumor. Common pittfalls.

## WATER DENSITY VALUE EVALUATION METHOD BY MATERIAL DECOMPOSITION ANALYSIS USING DUAL ENERGY CT FOR VERTEBRAL COMPRESSION FRACTURES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Masanobu Nishi (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1.Virtual non-calcium (VNCa) images are water density value images created by two-material decomposition process based on dual energy acquisition using a fast kV switching method.2.We devised a quantitative evaluation method for vertebral compression fractures using the characteristics of water density values of water and calcium or water and hydroxyapatite as the two materials.3.We verified the concordance rate between our quantitative evaluation results and clinical results for 201 cases in which both DECT and MRI examinations were performed for suspected vertebral compression fractures.4.Given the high degree of agreement with clinical findings, we believe that this method can serve as a valuable diagnostic aid

### TABLE OF CONTENTS/OUTLINE

Vertebral compression fractures affect the quality of daily life. Virtual non-Calcium images (VNCa) are derived from dual-energy CT and show water density values by separating water and bone components. In these images reveal edematous changes related to compression fracture. Previous studies have highlighted its diagnostic value. However, the subjective nature of visual evaluations poses challenges in accurate interpretation. To address this, we established a standard water density value and devised a quantitative method to measure deviations in water density for each vertebral body. In this exhibition, we detail the standard and evaluation values for quantitative assessment, along with the evaluation methodology. We then compared these quantitative evaluations with clinical findings, observing a high level of agreement. Our results suggest that this method can effectively aid in distinguishing such findings, enhancing clinical diagnostic accuracy.

Karina Janeth Gordillo Zabaleta, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- In a non-traumatic setting, acute myelopathy can be caused by compressive or non-compressive factors. These include extramedullary and intramedullary causes. Extramedullary causes can be degenerative (herniated disc), infectious (epidural abscess), vascular (malformations or epidural haematoma), and metastatic. - We would like to draw your attention to metastatic spinal cord compression (MSCC), which is defined as compression of the spinal cord and cauda equina by an extradural tumour mass. It is therefore important to understand and know the anatomy, pathophysiology and updated radiological protocols used to make an accurate diagnosis. The minimum radiological evidence of spinal cord compression is indentation of the theca at the level of the clinical features and displacement or encapsulation of the thecal sac surrounding the spinal cord or cauda equina by spinal epidural metastases (SEM) or locally advanced cancer. - These features are important in determining spinal instability. The Spine Instability Neoplastic Score (SINS) and the Epidural Spinal Cord Compression Scale, also known as the Bilsky Scale, are useful tools for predicting the need for urgent surgery. We will present many clinical cases using these scales.

### TABLE OF CONTENTS/OUTLINE

- Definition of non-traumatic spinal cord compression (SCC) - Radiological anatomy of the spinal cord - Updated protocols for the emergency department - Imaging features on MR and CT - Causes of non-traumatic cord compression (Emphasis on extramedullary metastatic causes): Degenerative, infectious, and metastatic. - SINS and Bilsky classifications and their therapeutic implications: What should theradiologist know?

## GRIP YOUR LEASH WELL: MUSCULOSKELETAL INJURIES TO THE DOG WALKERS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Bharat Aggarwal, MD (*Abstract Co-Author*) Nothing to Disclose
Akram Jawed (*Abstract Co-Author*) Nothing to Disclose
Vikas Gupta (*Abstract Co-Author*) Nothing to Disclose
Amit K. Sahu, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Biswajit Borborah, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Dog walkers usually undergo multiple musculoskeletal injuries in the upper and lower limbs including the tendon, ligament other soft tissue injuries as well as bony injuries. Many of these injuries go un noticed as they may be trivial at the time of occurrence. However they present with greater disability in later stages. Early detection by clinical examination and proper imaging will lead to prevention of disabilities. Most of the dog walkers being elderly population, suffer from multiple injuries even with lesser trauma. Common injuries of the joints of the upper limb can be seen in a dog walker due to dog pulling behaviour. The mode of injury can be trips, falls or repetitive strain. Soft tissue sprains, strains and fractures of bones are commonly encountered with most commonly injured parts being fingers and rotator cuff.

### TABLE OF CONTENTS/OUTLINE

Getting familiar with the common mechanisms of injury in dog walkers, both in upper and lower limbs. The hard yank of the leash can cause injuries of the hand that includes ulnar collateral ligament tear, injury to pulley mechanism, tendon tears and bony avulsions of small bones. The pull along the leash and rotation of the arm can lead to rotator cuff tear, medial and lateral epicondylitis.Pulling mechanism by heavy dogs can lead to imbalance in dog walkers and can lead to lower limb injuries including the internal derangement of knee joint and tear of medial and lateral supporting ligaments of the ankle.

Rafael Moreli Antonine (*Abstract Co-Author*) Nothing to Disclose
Carolina Carotenuto Ramos, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

This study aims to characterize the anatomy of the skin and differentiate the main skin types, emphasizing their characteristics in relation to individual lifestyle habits. To achieve this, we analyze variations across different age groups and locations within the same individual, as well as contrasting the characteristics of skin more exposed to the sun with those less exposed, taking into account the use of sunscreen. Moreover, we explore the key findings on prevalent benign and malignant skin lesions, underscoring the critical role of high-frequency ultrasound and its features as vital tools for characterizing these lesions and identifying at-risk populations.This research contributes to a more comprehensive understanding of skin diversity in the population and its relationship with environmental and behavioral factors, as well as helping to better understand the characteristic patterns of skin lesions, facilitating their ultrasound diagnosis.

### TABLE OF CONTENTS/OUTLINE

1. Method, significance, and attributes of high-frequency ultrasound in assessing skin anatomy and its lesions. 2. Comparison between histological skin anatomy and the ultrasound features. 3. Various skin types present within a single individual. 4. Sonographic disparities between young skin and with high levels of elastosis due to age/sun exposure. 5. Discrimination of patterns of ultrasound findings between benign and malignant skin lesions 6. Application of Doppler while characterizing dermatological lesions.7. New technologies for dermatological diagnostics: elastography, Contrast-Enhanced Ultrasound (CEUS) and Artificial Intelligence.

### TEACHING POINTS

Patellofemoral instability is a multifactorial condition that is related to the presence of clinical and anatomical risk factors. The number of risk factors and the number of dislocation episodes, whether associated with osteochondral injuries or not, determine whether the treatment will be surgical or clinical. In case of surgical treatment, medial patellofemoral ligament reconstruction is the most frequently performed approach, either alone or in combination with other procedures. Malposition of the femoral tunnel, severe trochlear dysplasia, and patella fracture are the main causes of the need for surgical revision in medial patellofemoral ligament reconstruction. Tibial tuberosity osteotomy is frequently performed in conjunction with medial patellofemoral ligament reconstruction to correct an increased TTGT and/or patella alta. As this is a surgery with greater morbidity, it requires a longer return to weight-bearing and physical activity. Complications related to this procedure include fractures, deep vein thrombosis, and overcorrection. In addition, some particularities related to the treatment of pediatric patients should be considered in the surgical approach, such as the placement of the femoral tunnel below the growth plate in medial patellofemoral ligament reconstruction. Tibial tuberosity osteotomy is proscribed in children due to the high risk of growth arrest and/or recurvatum genu. Knowledge of the main surgical procedures and their most frequent complications is essential for correct imaging interpretation.

Roozbeh Houshyar, MD (*Abstract Co-Author*) Nothing to Disclose
Christopher Sahagian (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Review clinical presentation, epidemiology, distribution, imaging appearance, and management of incidental benign osseous findings.

### TABLE OF CONTENTS/OUTLINE

Incidental benign osseous findings are often discovered on non-musculoskeletal (MSK) examinations for non-musculoskeletal pathology. However, despite their benign nature, some osseous findings may change the entire clinical course and warrant additional imaging workup and sometimes even surgical intervention. This exhibit seeks to elucidate a broad range of incidental osseous findings in various imaging modalities, while clinicians work up other non-MSK issues, in a case-based fashion. This exhibit will present cases of incidental benign but clinically significant osseous findings and include avascular necrosis, insufficiency fracture, osteochondroma, fibrous dysplasia, enchondroma, brown tumors, and giant cell tumors. These diseases will be displayed with annotated images across multiple imaging modalities.

## IMAGING THE BRACHIAL PLEXUS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Amit K. Sahu, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Akram Jawed (*Abstract Co-Author*) Nothing to Disclose
Bharat Aggarwal, MD (*Abstract Co-Author*) Nothing to Disclose
Vikas Gupta (*Abstract Co-Author*) Nothing to Disclose
Arshpreet Kaur, MBBS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• Brachial plexus is a complex network of nerves originating from the lower cervical and upper thoracic spinal cord segments. It consists of roots, trunks, divisions, cords, and terminal branches. Familiarize yourself with the spatial relationships and typical branching patterns. • MRI is the preferred modality due to its excellent soft tissue contrast and multiplanar capabilities. • Recognize normal anatomical variants like the presence of an accessory phrenic nerve, anomalous innervation patterns, or variable branching. Differentiate these from pathological findings like traumatic injuries (stretch, compression, laceration), neoplastic involvement (tumors like schwannomas, neurofibromas), inflammatory processes (brachial plexitis, e.g., Parsonage-Turner syndrome), and vascular abnormalities (e.g., thoracic outlet syndrome). • Determine the precise location and extent of pathology within the brachial plexus, whether it involves the roots, trunks, divisions, cords, or terminal branches. This localization is crucial for treatment planning. • Assess vascular structures adjacent to the brachial plexus, such as the subclavian artery and vein, for potential compression or displacement contributing to neurovascular conditions like thoracic outlet syndrome. • Utilize advanced imaging techniques such as MPR) and 3D

### TABLE OF CONTENTS/OUTLINE

• Anatomy of brachial plexus • Appropriate MRI protocol • Normal variants of plexus which may mimic pathology • Traumatic, infective, inflammatory and neoplastic pathologies • Follow-up imaging post treatment

Eduardo J. Bronzatto (*Abstract Co-Author*) Nothing to Disclose
Giovana G. Mesquita, MD (*Abstract Co-Author*) Nothing to Disclose
Marilia Da Cruz Fagundes, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Solid-cystic bone lesions comprise a heterogeneous group of pathologies that can be neoplastic or non-neoplastic, benign or malignant, primary or metastatic, and may exhibit aggressive or non-aggressive behavior.These lesions may pose diagnostic challenges due to their varied imaging appearances and clinical presentations. A radiological approach is established based on age, clinical presentation, location, and imaging characteristics to differentiate them.A common feature of many of these lesions is the presence of fluid-fluid levels, such as in aneurysmal bone cysts (ABC) and ABC-like changes, simple bone cysts, telangiectatic osteosarcoma, metastases, brown tumors, sacrococcygeal teratoma, and adamantinoma.ABC-like changes are associated with other neoplasia, especially giant cell tumor, chondroblastoma, osteoblastoma, non-ossifying fibroma, fibrous dysplasia, chondromyxoid fibroma and Langerhans cell histiocytosis.Other bone tumors may have a solid-cystic appearance on imaging, for instance lipomas and fibrous dysplasia with cystic degeneration, and aggressive neoplasia with extensive necrosis.Moreover, non-neoplastic disease may mimic a solid-cystic bone tumor, for example inflammatory arthropathy, infection, subperiosteal hematoma and hemophilic pseudotumor.Understanding the imaging aspects of solid-cystic bone lesions is crucial for accurate diagnosis and appropriate management.

## DON’T GET HUNG UP ON THE DISTAL BICEPS TENDON: A REVIEW DISTAL BICEP TENDON TEARS, NORMAL ANATOMY, US SCANNING TECHNIQUE, AND PATHOLOGY ON US AND MRI

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Chad Klochko, MD (*Abstract Co-Author*) Nothing to Disclose
Zaid Mahdi, MD (*Abstract Co-Author*) Nothing to Disclose
Laurie A. Geiger, BS (*Abstract Co-Author*) Nothing to Disclose
Danishi Bedi (*Abstract Co-Author*) Nothing to Disclose
Prateek Chintalapati, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Review of normal anatomy of the distal biceps tendon on US and MRI. 2. Technique for localizing and evaluating the tendon on ultrasound. 3. Post traumatic biceps imaging on US and MRI. 4. Pearls and pitfalls of distal bicep’s imaging. Brief review of surgical treatment and post operative appearance on MRI and radiographs.

### TABLE OF CONTENTS/OUTLINE

Brief review of normal anatomy of the distal biceps tendon - Technique for identifying the tendon on ultrasound. Normal appearance of the tendon on static and dynamic imaging. - Different US imaging approaches including the anterior, lateral, dorsal and medial approaches. - Brief review of normal anatomy on MRI involving the distal biceps tendon. Posttraumatic distal biceps imaging on ultrasound and MRI. - Review of common mechanisms of injury. - Static and dynamic US images of normal, partial thickness and full thickness hears of the distal biceps tendon. Correlative multiplanar MRI images of the distal biceps tendon. - Identification of the lacertus fibrosus in applicable cases Pearls and pitfalls of distal bicep’s imaging. Brief review of surgical treatment and post operative appearance on MRI and radiographs. - Landmarks helpful in identifying the correct tendon and not adjacent structures - Useful physical findings - Common operative treatment - Post operative radiographic imaging appearance - MR example of post-operative retear of the distal biceps tendon. Conclusion/Summary

Harrison Lang, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. - Illustrate pathophysiology and mechanism of spread of Coccidioidomycosis. 2. -Provide multisystem case-based review of the imaging features of Coccidioidomycosis.

### TABLE OF CONTENTS/OUTLINE

• Coccidioidomycosis (aka “Valley Fever”) is a fungal infection found in dry desert soil. Symptomatic cases can range from mild pulmonary involvement to invasive multisystem infection particularly in the elderly and immunocompromised patients.• Intracranial findings: meningitis; hydrocephalus; vasculitis, arterial occlusion, cerebral infarction; focal parenchymal lesions, abscess, scattered T2 hyperintense white matter abnormalities.• Spinal findings: Discitis osteomyelitis +/- epidural abscess, spinal arachnoiditis, intramedullary edema/syrinx, intradural extramedullary lesions, syringomyelia/bulbia.• Chest: Acute: parenchymal ground glass or nodular consolidation +/- cavitation; intrathoracic adenopathy, pleural effusions, peribronchial thickening, miliary nodules; Chronic: residual nodule, chronic cavitation, and pneumonia, mycetoma, abscess, bronchopleural fistula• Abdomen and pelvis: Peritonitis (most common site in abdomen), hepatosplenic abscesses, lymphadenitis, pyelonephritis and renal mycetoma, prostatitis, epididymoorchitis, PID.• Musculoskeletal system Osteomyelitis, synovitis, soft tissue abscesses, cellulitis.Summary: Due to the potential multisystem involvement of Coccidioidomycosis, this exhibit is designed to help the radiologist identify spectrum of imaging features associated with each organ system, as well as provide examples where infection can mimic malignancy such as peritoneal carcinomatosis and osseous metastatic disease.

## MSEE-10 LADIES AND GENTLEMEN! WELCOME TO THE GREATEST SHOW ON EARTH - A GUIDE TO ENSURING THE CONTINUED HEALTH OF CIRCUS PERFORMERS

Cinthia D. Ortega, MD,PhD (*Abstract Co-Author*) Speaker, Johnson & Johnson
Douglas da Cunha Khalil, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Imagine you have just been hired as the primary radiologist for a traveling circus. To succeed in your new role, you must familiarize yourself with several conditions that may become occupational hazards for your patients.This presentation will highlight the following main points: Recall common and uncommon diseases that are related to circus activities; Review the imaging patterns of different health issues; Imagine the diseases to be aware of when joining a traveling carnival; Discuss when the performer should be referred for a US, CT, or MRI scan.

### TABLE OF CONTENTS/OUTLINE

What are the conditions that may affect circus performers? Imagine what an occupational medicine physician would have to recognize, evaluate, and manage when deciding to join a traveling carnival.Various diseases and injuries can lead to a loss of productive work time among circus performers. Efficient use of diagnostic imaging can lead to proper diagnosis, quicker recovery rates, and, therefore, reduced lost work time for the troupe.Prepare to be amazed and dive into the magic of the circus. Before the curtain drops, the audience must understand the potential hazards that could lie in waiting for the troupe. This study presents a series of cases involving lesions and diseases that could create a stressful night for the circus ringmaster. But as any performer knows all too well, "the show must go on!".

## MSEE-11 VALUE OF RADIOLOGIC-PATHOLOGIC CORRELATION

Maria A. Manning, MD (*Abstract Co-Author*) Nothing to Disclose
Jamie Marko, MD (*Abstract Co-Author*) Nothing to Disclose

### TEACHING POINTS

1. Introduce the genetic epidemiologic background of Peutz-Jeghers Syndrome (PJS). 2. Discuss the different common presentations diagnostic criteria of PJS. 3. Summarize the risk of different cancers in PJS patients, according to current literature. 4. Learn various imaging modalities for cancer screening in established PJS cases. 5. Illustrate cancers diagnosed by imaging in PJS. 6. Demonstrate the impact of imaging surveillance on patient outcomes.

### TABLE OF CONTENTS/OUTLINE

1) Introduction to PJS a) Incidence and etiology of PJS. b) Genetic error mode of inheritance. 2) Diagnosis of PJS a) Frequent presentations: i. Mucocutaneous pigmentation ii. Intussusception b) Diagnostic criteria: i. Indications of genetic testing ii. Indications suggested frequency of colonoscopy upper endoscopy 3) Prognosis cancer risk a) Overall cancer risk b) Strongly associated GIT pancreatic cancers c) Strongly associated Gynecologic cancers d) Lung cancer risk e) Other associated cancers 4) Imaging surveillance for cancers in PJS: a) Pancreatic CT / MRI examination b) Gastro-intestinal series. c) Pelvic / testicular Ultrasonography. d) Mammography and breast MRI 5) Examples of cancer cases diagnosed by imaging screening 6) Screening impact on patient outcome.

## MSEE-13 MASTOCYTOSIS: PATHOGENESIS, WHO CLASSIFICATION, IMAGING FEATURES WITH PATHOLOGIC CORRELATION

Mamie Gao, MD (*Abstract Co-Author*) Nothing to Disclose
Hagar S. Mahmoud, MBBCh (*Abstract Co-Author*) Nothing to Disclose
Khaled M. Elsayes, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Review the pathology and clinical entities of mastocytosis. 2. Highlight the imaging features of mastocytosis in multiple organ systems including the lungs, lymph nodes, gastrointestinal tract, liver, kidneys, skin and musculoskeletal system 3. Discuss the potential mimics and pitfalls that may simulate the imaging features of mastocytosis.

### TABLE OF CONTENTS/OUTLINE

1-Mastocytosis pathology and pathophysiology: cutaneous mastocytosis, systemic mastocytosis (with or without cutaneous manifestations), and mast cell sarcoma. 2. Subtypes of systemic mastocytosis • indolent systemic mastocytosis (most common) • Smoldering systemic mastocytosis • Systemic mastocytosis with an associated hematological neoplasm • Aggressive systemic mastocytosis • Mast cell leukemia 2. Multisystem review of mastocytosis is a systemic disease that may affect any organ (lung, liver, spleen, musculoskeletal, gastrointestinal tract, kidneys, lymph nodes, and skin) 3. Imaging findings of mastocytosis on the US, MR, and CT is a pattern of diseases characterized by abnormal proliferation and infiltration of mast cells in different organs with inflammatory mediator release.

## MSEE-14 IMAGING AND UPDATES IN ROSAI-DORFMAN DISEASE

Yashant Aswani, MD (*Abstract Co-Author*) Nothing to Disclose
Leonardo G. Marcelino, MD (*Abstract Co-Author*) Nothing to Disclose
Zubin Driver, MBBS (*Abstract Co-Author*) Nothing to Disclose
Amar Shah, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Discuss recent updates in the pathogenesis and classification of Rosai-Dorfman Disease (RDD). 2. Describe the role of imaging and clinical and radiologic findings of RDD. 3. Review new treatment options and therapeutic response evaluation.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction 2. Review epidemiology and pathophysiology of Rosai-Dorfman Disease (RDD) 3. Newer Classification systems (2016 Working Group of Histiocytic Society Classification and 2022 WHO classification of hemolymphoid neoplasms) 4. Mixed histiocytosis: an overlap syndrome 5. Association with IgG4-related disease, autoimmune diseases, and neoplasia 6. Diagnosis of RDD 7. Role of Imaging 8. Review common and uncommon imaging presentations of RDD a. Lymphadenopathy b. Cutaneous Involvement c. Central nervous system involvement i. Brain (parenchymal and dural) ii. Spine d. Skeletal system (axial and appendicular skeleton) e. Abdomen and Pelvis i. Retroperitoneum 1. Renal, perirenal, and primary retroperitoneal ii. Organs 1. Pancreas, liver, and bowel iii. Peritoneum f. Intrathoracic Involvement. i. Cardiac, trachea, mediastinum g. Breast h. Head and Neck i. Orbit, paranasal sinuses, and thyroid 9. Prognosis 10. Molecular targets for treatment 11. Review treatment options and recent advances

## MSEE-15 FUNDAMENTALS OF GASTROINTESTINAL AND GENITOURINARY FLUOROSCOPY: A PRACTICAL GUIDE FOR BEGINNERS

Dennis M. Balfe, MD (*Abstract Co-Author*) Nothing to Disclose
Cary L. Siegel, MD (*Abstract Co-Author*) Nothing to Disclose
Anup S. Shetty, MD (*Abstract Co-Author*) Nothing to Disclose
Grace G. Zhu, MD (*Abstract Co-Author*) Nothing to Disclose
Bradley Eichar (*Abstract Co-Author*) Nothing to Disclose
Mark J. Hoegger, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Fluoroscopic image acquisition and interpretation of conditions affecting the gastrointestinal and genitourinary systems remains a crucial skill set for the radiologist. However, advances in other technologies may make fluoroscopy less familiar to the practicing radiologist. The purpose of this exhibit is to: 1. Explain the principles of contrast agent mechanism and selection. 2. Describe the practical function of fluoroscopy cameras. 3. Display the basics of patient positioning and fluoroscopic image acquisition. 4. Provide principles and steps of the most common fluoroscopy studies.

**TABLE OF CONTENTS/OUTLINE**

1. Contrast agents: physics fundamentals, types of agents, specific indications, and contraindications. 2. Patient considerations: patient positioning, limited examinations, and fluoroscopic views. 3. Fluoroscopy camera standardized function: magnification, image acquisition, patient maneuvers, and collimation. 4. Principles of common fluoroscopy examinations: barium swallow/esophagram, upper GI, hysterosalpingogram, enemas, and cystography.

## MSEE-16 MULTIMODALITY IMAGING OF HEREDITARY CANCER SYNDROMES IN THE ABDOMEN

**Awards**
**Cum Laude**

Avinash Nehra, MD (*Abstract Co-Author*) Nothing to Disclose
Garima Suman, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Hereditary cancer syndromes account for 5-10% of all cancers. Imaging plays a vital role in diagnosis, screening, and surveillance of patients diagnosed or at risk for hereditary cancer syndromes. Radiologists may be able to suggest the diagnosis of underlying genetic disease, particularly in patients with multiple neoplasms at a young age. Basic knowledge of screening and surveillance guidelines and genetic mutations associated with cancer syndromes is essential for radiologists to provide optimal clinical care. In this exhibit, we will provide a comprehensive illustration of the abdominal manifestations of cancer syndromes relevant to day-to-day practice.

**TABLE OF CONTENTS/OUTLINE**

1. Overview of abdominal manifestations of various hereditary cancer syndromes.2. Review epidemiology, genetics, current screening and surveillance guidelines, and how imaging plays a role.3. Describe imaging features of the following syndromes:- Lynch Syndrome- Familial Adenomatous Polyposis- Peutz Jeghers Syndrome- Multiple Endocrine Neoplasia Types 1 and 2- Von-Hipple Lindau Disease- Birt Hogg Dube syndrome - Hereditary Diffuse Gastric Cancer- Hereditary Pancreatic Ductal Adenocarcinoma- BRCA1 and 2 associated cancer syndromes- Tuberous Sclerosis- Cowden syndrome- Hereditary pancreatic ductal adenocarcinoma- Li Fraumeni syndrome- Hereditary paraganglioma-pheochromocytoma syndrome

## MSEE-17 TWIST AND SHOUT: INSIGHTS INTO ORGAN TORSION - A MULTISYSTEMIC IMAGING REVIEW

Elaine Yanata, MD (*Abstract Co-Author*) Nothing to Disclose
Laura M. Coura, MD (*Abstract Co-Author*) Nothing to Disclose
Rafael Docema, MD (*Abstract Co-Author*) Nothing to Disclose

Lucas Daniel Pereira Lopes (*Abstract Co-Author*) Nothing to Disclose
Fernando M. Coelho, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Natalia K. Fujiwara, MD (*Abstract Co-Author*) Nothing to Disclose
Gabriel Angelo Vasconcelos Sterchile, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Upon visiting this presentation, the viewer is expected to:- Understand the importance of organic torsion as medical emergencies and how imaging helps in the diagnosis.- Recognize imaging signs of torsions through the body.- Learn unusual torsion sites and imaging findings in different imaging modalities.- Detect imaging red flags of organic suffering and loss of viability.

**TABLE OF CONTENTS/OUTLINE**

This presentation contains a pictorial review of the torsion sites that can occur through the body, using different imaging methods, such as x-ray, ultrasound, computed tomography and magnetic resonance imaging. The usual radiological sign, the “whirlpool sign” which may be found in different scenarios, will be highlighted.The torsions included in this study are as follows:- Lung- Heart/inferior vena cava (herniation after traumatic pericardial

rupture)- Gastric volvulus- Sigmoid volvulus- Cecal volvulus- Petersen's hernia- Ovarian torsion- Testicular torsion- Isolated fallopian tube torsion- Testicular appendix torsion- And more...

## MSEE-18 WHEN TB STRIKES BELOW: UNVEILING THE ABDOMINAL MANIFESTATIONS OF TUBERCULOSIS

Marcella R. Prado, MD (*Abstract Co-Author*) Nothing to Disclose
ALEXANDRE BEZERRA (*Abstract Co-Author*) Nothing to Disclose
Mayra V. Soares, MD (*Abstract Co-Author*) Nothing to Disclose
Tiago Bertoncini, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To recognize the pathophysiology and contamination forms of tuberculosis.To learn about most abdominal radiological manifestations of tuberculosis, improving diagnostic performance.To discuss differential imaging diagnosis of TB, especially in immunosuppressed patients.

### TABLE OF CONTENTS/OUTLINE

Tuberculosis (TB) is an infectious, transmissible, chronic disease caused by Mycobacterium tuberculosis and a worldwide public health problem. Infection is secondary to inhaling suspended particles after forced breathing maneuvers, such as coughing. For this reason, lung infection is its most prevalent and best-known manifestation. However, other forms of dissemination are observed, resulting in nervous, musculoskeletal, and abdominal system involvement.Abdominal and other extrapulmonary TB manifestations correspond to 15-25% of cases, usually associated with immunosuppression, especially in individuals with HIV-acquired immunodeficiency syndrome. Imaging investigation is crucial since abdominal manifestations can result in extensive differential diagnosis. While findings are not pathognomonic, clinical-radiological correlation allows for the correct diagnosis and eventual complications, contributing to adequate treatment.A favorable clinical scenario, associated with knowledge of pathophysiology and familiarity with the multiple abdominal radiological manifestations of tuberculosis, contributes to the diagnosis, reducing morbidity and mortality and the social impact of the disease.

## MSEE-19 DIVING BENEATH THE SURFACE: UNVEILING CUTANEOUS TUMORS WITH ULTRA-HIGH-FREQUENCY AND DOPPLER ULTRASOUND IN DERMATOLOGY

Ivana Gibbons (*Abstract Co-Author*) Nothing to Disclose
Laura S. Lima, MD (*Abstract Co-Author*) Nothing to Disclose
Mariana Galupo (*Abstract Co-Author*) Nothing to Disclose
Almir Bitencourt, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Soraia Damiao, MD (*Abstract Co-Author*) Nothing to Disclose
Rubens Chojniak, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Leticia Cavalcante (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- To illustrate the ultra-high-frequency (UHF) ultrasound characteristics of the most common benign and malignant cutaneous lesions in B-mode and Doppler.- To demonstrate the association between the UHF ultrasound findings with the dermatoscopy and anatomopatologic results.

### TABLE OF CONTENTS/OUTLINE

Ultrasound has been a staple medical diagnostic tool for over half a century. In dermatology, its utilization is more recent, particularly with the advent of UHF ultrasound (> 15 MHz), enabling meticulous scrutiny of the skin and its appendages. Classically, UHF ultrasound is used to study changes in the hypoderma, as nodules and inflammatory processes. In cutaneous oncology, it can be used to identify and delimit the lesions, as well as assess the depth and invasion of neighboring structures by the tumor. In surgical planning, determining margins is of great importance and can avoid incomplete resections and unnecessary reinterventions. Ultrasound can also help in the differential diagnosis between benign and malignant cutaneous tumors, however it is essential that the radiologist learn to correlate ultrasound features with clinical / dermatoscopic evaluation as well as histological results.

## MSEE-2 GETTING THE MOST OUT OF MULTIDISCIPLINARY CASE CONFERENCE (MDC): THE RADIOLOGIST'S PERSPECTIVE FOR BEST PATIENT CARE

Zeyad Elias (*Abstract Co-Author*) Nothing to Disclose
Hayley Panet (*Abstract Co-Author*) Nothing to Disclose
Ania Z. Kielar, MD, FRCPC (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Regardless of the type of MDC there are common themes that can help radiologists best prepare, in a time effective manner. This educational poster will address opportunities to improve efficiency, standardize MDC with an ultimate goal of improving patient management and outcomes.

### TABLE OF CONTENTS/OUTLINE

Considerations:1. Standardizing information presented to radiologists- Adequate history (AI may help to pull relevant information about diagnosis, prior patient therapies, and other intervention)- Knowing where to quickly find imaging if not on institutional PACS- Creating an environment of professionalism: encouraging physicians who submit patients for MDC to be present for their discussion or to send a delegate rather than delaying to another time- Use of standard template reporting by other radiologists to help those radiologists preparing MDC to find relevant information quickly 2. Ways to come to consensus at MDC on which guidelines to follow for each disease entity 3. Addressing volume of work for the radiologists a. What is a reasonable number of patients to review and discuss at MDC? i. Are all cases discussed relevant/necessary?b. Cost of increasing number of MDC if cannot accommodate patient volumes 4. Providing support to radiologists preparing MDC a. Options include time off the clinical schedule, or a lighter scheduleb. Including fellows in MDC preparation and presentationEquitably distributing MDC participation across the department

## MSEE-20 UNCOMMON FINDINGS INSICKLECELL ANEMIA: FROM HEAD TO TOE

**Awards**
**Certificate of Merit**

Lina M. Cadavid Alvarez, MD (*Abstract Co-Author*) Nothing to Disclose
Carolina Gutierrez Marquez, MD (*Abstract Co-Author*) Nothing to Disclose
Laura Agudelo, MD (*Abstract Co-Author*) Nothing to Disclose
Ricardo Uribe Gonzalez, MD (*Abstract Co-Author*) Nothing to Disclose
Laura Moreno Salinas, MD (*Abstract Co-Author*) Nothing to Disclose
Yeison Gomez (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Sickle cell anemia is an inherited disease caused by abnormal hemoglobin production that alters the shape of red blood cells and causes vascular occlusion, chronic hemolytic anemia, and infection. It can affect any part of the body with a variety of clinical and radiological manifestations. This scientific exposition will review the imaging manifestations of sickle cell anemia throughout the body in different imaging modalities, with emphasis on atypical presentations, including pediatric and adult patients. Recognizing the typical and atypical presentations of sickle cell anemia will allow a better approach to diagnosis and treatment of patients.

**TABLE OF CONTENTS/OUTLINE**

Review of the different radiological manifestations of sickle cell anemia throughout the body, highlighting rare findings. Examples based on cases (common and uncommon features) of sickle cell anemia throughout the body with different imaging modalities: Head and neck. Chest. Abdomen and pelvis. Musculoskeletal Multi-organic. Discussion with clinical cases and different imaging modalities used for diagnosis (US, CT, MRI), with their limitations and strengths.

## MSEE-21 BEYOND THE LUNG: RARE PRESENTATIONS OF EXTRAPULMONARY TUBERCULOSIS

Ricardo Uribe Gonzalez, MD (*Abstract Co-Author*) Nothing to Disclose
Carolina Gutierrez Marquez, MD (*Abstract Co-Author*) Nothing to Disclose
Jhonathan Reina Alzate, MD (*Abstract Co-Author*) Nothing to Disclose
Lina M. Cadavid Alvarez, MD (*Abstract Co-Author*) Nothing to Disclose
Andres F. Latorre Pinto, MD (*Abstract Co-Author*) Nothing to Disclose
Duban Aristizabal Gonzalez, MD (*Abstract Co-Author*) Nothing to Disclose
Yeison Gomez (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Tuberculosis (TB) manifests across a wide spectrum of presentations. While the pulmonary system is the most commonly affected, TB can extend its reach to involve every organ system in the body. This results in a diverse array of imaging appearances, often resembling radiologic features of other conditions. This scientific exhibit will review rare extrapulmonary manifestations of TB throughout the body on different imaging modalities, with emphasis in atypical presentations including children and adult patients. Recognizing atypical presentations of TB will allow a better diagnostic approach and further treatment of patients in daily radiological practice given the high prevalence of the disease.

**TABLE OF CONTENTS/OUTLINE**

1) Review the different systems involved by the disease, highlighting atypical forms.2) Cased based examples of extrapulmonary TB infections in different organ systems and imaging modalities:· Genitourinary· Abdomen and pelvis· Bone · Head3) Discuss the relevance of each diagnostic modalities used in the approach of TB infection through the different case scenarios.

## MSEE-22 WBMRI IN MGUS: UNDERSTANDING THE "HIDDEN ENEMY"

Pedro Daltro, MD (*Abstract Co-Author*) Nothing to Disclose
Clarissa C. Moraes Do Carmo, MD (*Abstract Co-Author*) Nothing to Disclose
Heron Werner JR, MD (*Abstract Co-Author*) Nothing to Disclose
Tatiana M. Fazecas, MD (*Abstract Co-Author*) Nothing to Disclose
Vitor M. Sardenberg, MD (*Abstract Co-Author*) Nothing to Disclose
Alexandre C. Valim, MD (*Abstract Co-Author*) Nothing to Disclose
Carolina A. Almeida, MD (*Abstract Co-Author*) Nothing to Disclose
Flavia M. Costa, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Flavia P. Lopes, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

MGUS, a premalignant hematological condition prevalent in the elderly, carries a yearly progression rate to multiple myeloma (MM) of approximately 1%. It's imperative to explore potential related diseases stemming from MGUS and conduct investigations to exclude the presence of a malignant form. Rheumatologic diseases (RDs) influence the biology of MGUS, elevating the risk of progression to multiple myeloma (MM) or associated lymphoproliferative malignancies. WBMRI is a sensitive imaging modality that provide comprehensive coverage with high soft tissue contrast and spatial resolution in a condensed timeframe. It proves instrumental in the assessment of various multisystemic diseases and to detect and characterize multifocal or systemic conditions, both oncological and non-oncological. Achieving accurate diagnosis and effective surveillance demands a multidisciplinary approach, integrating radiological expertise to mitigate the risk of end-organ damage. As a cost-effective diagnostic imaging tool, WBMRI streamlines the process of diagnosis, therapeutic monitoring, and treatment decision-making, thereby enhancing patient care and outcomes.

**TABLE OF CONTENTS/OUTLINE**

Monoclonal Gammopathy of Undetermined Significance (MGUS): Clinical and Epidemiological Insights Diagnosis of MGUS Imaging Diagnosis: Whole-Body Diffusion-Weighted Magnetic Resonance Imaging Technique Exploration of Different Diseases Associated with MGUS, including: • Smoldering Myeloma • Multiple Myeloma • Non-Hodgkin Lymphomas • Waldenstrom Macroglobulinemia • Amyloid Light-chain and Amyloidosis • POEMS Syndrome (Osteosclerotic Myeloma) • Chronic Inflammatory Rheumatic Diseases

## MSEE-23 CLINICAL APPLICABILITY OF THE MASEI PROTOCOL DIFFERENTIAL DIAGNOSIS OF SPONDYLOARTHRITIS AND FIBROMYALGIA THROUGH ULTRASONOGRAPHY

Deise Vargas (*Abstract Co-Author*) Nothing to Disclose
Marco de Andrade Bianchi (*Abstract Co-Author*) Nothing to Disclose
Ricardo Amaro Noleto Araujo (*Abstract Co-Author*) Nothing to Disclose
Amanda Martins E. Ribeiro Dos Santos, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Enthesitis, characterized as an essential pathogenic marker of spondyloarthritis, is often overlooked in clinical practice, resulting in missed opportunities for accurate diagnoses and effective disease activity assessments. This study examines the performance of the Madrid Sonography Enthesitis Index (MASEI) protocol in ultrasonographic evaluation of entheses, in which we will address:- Definition and clinical relevance of enthesitis in spondyloarthritis.- Importance of differential diagnosis between spondyloarthritis and fibromyalgia.- Demonstration of the use and interpretation of MASEI in clinical practice.

**TABLE OF CONTENTS/OUTLINE**

- Introduction: Contextualization of enthesitis and its underutilization.- Methodology: Study details and ultrasound techniques employed.- Data: Analysis- Comparison between patients with spondyloarthritis and fibromyalgia.- Conclusions and Clinical Implications- Discussion on the relevance of MASEI in improving diagnosis and clinical management.- Recommendations for Clinical Practice- How to effectively implement MASEI.This work emphasizes the need to incorporate MASEI into clinical practice to enhance the diagnosis and treatment of spondyloarthritis, avoiding misdiagnosis of fibromyalgia.

## MSEE-24 CONTRIBUTIONS TO ACCURATE DIAGNOSIS OF COMMON SKIN LESIONS IN DERMATOLOGICAL ULTRASOUND PRACTICE

Marco de Andrade Bianchi (*Abstract Co-Author*) Nothing to Disclose
Deise Vargas (*Abstract Co-Author*) Nothing to Disclose
Amanda Martins E. Ribeiro Dos Santos, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- The combination of high-frequency ultrasound imaging and color Doppler allows for precise identification and study of skin lesions, including neoplasms, and tumor microcirculation.- High-frequency ultrasound imaging provides real-time, non-invasive, and detailed visualization of skin lesions directly on the patient's body.- This study aims to contribute to more accurate diagnoses in dermatology through the creation of a panel containing images of skin lesions and high-frequency ultrasound examination findings.- The panel serves as a valuable resource for physicians performing high-frequency dermatological ultrasound, facilitating lesion recognition and study.The purpose is to present a panel, which serves as consultation material, with images of the clinical and ultrasound presentation of the main most common dermatological lesions found in daily practice.

**TABLE OF CONTENTS/OUTLINE**

- Highlighting the importance of high-frequency ultrasound in enhancing skin lesion diagnosis and providing detailed, non-invasive imaging for more accurate diagnoses.- Descriptive study detailing the creation of a consultation panel for routine dermatological ultrasound in a private hospital.- Compilation of examination images, descriptions, and lesion photos to aid physicians in high-frequency dermatological ultrasound.- Creation of a panel for physicians to consult and study common skin lesions using high-frequency dermatological ultrasound.

## MSEE-25 BULLETS 101: WHAT THE RADIOLOGIST NEEDS TO KNOW

Shima Aran, MD (*Abstract Co-Author*) Nothing to Disclose
Larry A. Kramer, MD (*Abstract Co-Author*) Nothing to Disclose
Claudia Cotes, MD (*Abstract Co-Author*) Nothing to Disclose
Tiffany A. Kumala (*Abstract Co-Author*) Nothing to Disclose
Vidhyulatha Sanata, MD, MBBS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Bullet injuries are prevalent in urban areas, particularly in regions with high rates of gun ownership, such as the United States. Imaging plays a crucial role in assessing the trajectory of the bullet and identifying internal organ injuries in the emergency setting. Generally, retained intact bullets or fragments are harmless unless they migrate, or their location causes internal damage. However, they pose a challenge for radiologists during MRI scans or when MRI clearance is required, especially if the bullet's history or composition hasn't been assessed previously. The goal of this presentation is to familiarize the radiologist with the most common types of guns and bullets, review different bullet compositions and how it affects our practice as radiologists in terms of artifacts and MRI clearance, and to describe the importance of a comprehensive assessment of bullet-related injuries, given the frequency of such incidents in communities with prevalent gun culture.

**TABLE OF CONTENTS/OUTLINE**

Table of Contents/Outline:
- Guns and Bullet types: Gun type: Handguns, Shotguns, Rifles. Bullet type: Round nose, ward cutter, semi-wad cutter, Full metal jacket, Hollow point. Composition of bullets: Lead, steel, copper, bullet core Jacket steel, nickel, or copper
- Bullet composition based on radiologic appearance: determining MRI clearance.
- Imaging Assessment: Acute and Chronic Injuries (Wound track, Internal injuries, Retained bullets, Anatomical Location)
- Imaging Artifacts and potential workarounds

## MSEE-26 CLINICAL ROLE OF PET/CT IN CAR T-CELL TREATMENT

**Awards**
**Certificate of Merit**

Carolina P. Abud, MD (*Abstract Co-Author*) Nothing to Disclose
Marina M. Costa (*Abstract Co-Author*) Nothing to Disclose
Leticia Rigo (*Abstract Co-Author*) Nothing to Disclose
Fabio Lewin, MD (*Abstract Co-Author*) Nothing to Disclose
Douglas J. Racy, MD (*Abstract Co-Author*) Nothing to Disclose
Kamila S. Albuquerque, MD (*Abstract Co-Author*) Nothing to Disclose
Ana C. Uski, MD (*Abstract Co-Author*) Nothing to Disclose
Glaucia Oki, MD, MSc (*Abstract Co-Author*) Nothing to Disclose
Graziela C. Bernardo, MD (*Abstract Co-Author*) Nothing to Disclose
Evandro J. Bonetti, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

CAR T-cell therapy was initially developed for the treatment of refractory hematological malignancies. Currently, its indications are being expanded to include some types of solid tumors. The responses to this therapy have some particularities and knowing the expected evolution and correlation with the treatment chronogram is essential. The aim of this presentation is emphasize the role of imaging in this scenario (pre- and post-treatment), demonstrate the radiological findings that define evolutionary behavior, with a focus on FDG PET-CT, for the purpose of making unskilled radiologists more familiar with the therapy, to help them to identify the critical points.

**TABLE OF CONTENTS/OUTLINE**

Case-based didactic review of CAR T-cell therapy literature, with FDG PET-CT findings and others imaging methods, including the severe complications, and correlating on our service´s digital archive.

## MSEE-27 ABDOMINAL INVOLVEMENT IN LYMPHOMA: IMAGING FINDINGS BEYOND THE LYMPH NODE

Polizio, MD (*Abstract Co-Author*) Nothing to Disclose
Matheus M. Gomes SR, MD (*Abstract Co-Author*) Nothing to Disclose
Maria Carolina De Moraes Sarmento (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

THE PURPOSE OF THIS EXHIBIT IS: 1. Review the most common sites of extranodal lymphoma, knowing that this entity has the potencial to affect any organ or tissue, in a variety of presentations that can mimic many other conditions.2. Recognize unusual and little-reported patterns of extranodal lymphoma through illustrative clinical cases (including CT, MRI and functional imaging methods).3. Highlight the role of the radiologist in decision-making in a multidisciplinary team.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction 1.a Definitions, clinical, pathophysiological aspects 1.b CT and MRI protocols (Hints at evaluation of images; Potential "blind spots; Pearls and Pitfalls).2. Illustrative clinical cases: 2.a The main CT and MRI findings assessment of disease 2.b Atypical sites, clinical and imaging features 2.c Liver and Spleen 2.d Gastrointestinal tract 2.e Geniturinary tract 2.f Biliary tract 2.g Adrenal gland 2.h Peritoneum and Peritoneal Reflections 2.i Abdominal Wall3. Take-home messages 3.a Extranodal lymphoma can simulate other neoplasms or inflammatory conditions. 3.b Raising suspicion for this condition, especially in atypical epidemiological groups and in unexpected contexts, can make a difference in patient management, decision to biopsy, staging, or in detection of reccurrence and complications.

## MSEE-28 EXPECTED FINDINGS AND COMMON COMPLICATIONS OF COSMETIC PLASTIC SURGERY PROCEDURES: WHAT THE RADIOLOGIST NEEDS TO KNOW

Omar Andres Pantoja Burbano, MD (*Abstract Co-Author*) Nothing to Disclose
Lucas Ortiz, MD (*Abstract Co-Author*) Nothing to Disclose
Camilo A. Caicedo Montano, MD (*Abstract Co-Author*) Nothing to Disclose
Nicole Erazo Morera, MD (*Abstract Co-Author*) Nothing to Disclose
Felipe Aluja, MD, MEd (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Review of the most common cosmetic plastic surgery procedures and their expected radiologic appearance. Identify abnormal findings and complications related to cosmetic plastic surgery procedures. Recognize the potential systemic complications and their radiologic features.

**TABLE OF CONTENTS/OUTLINE**

Introduction Common procedures: Facial (bichectomy, rhinoplasty, blepharoplasty, rhytidectomy, Dermal filler injections, Botox and hyaluronic acid), breast (augmentation, removal and mastopexy), abdominal (liposuction, belt lipectomy, abdominoplasty), Buttock augmentation, penile implants. Expected radiographic appearance and normal postoperative findings: what is normal and what is not. Complications: Acute: infection, collections, abscess, skin necrosis and fasciitis, lymphedema. Chronic: capsular contracture, breast or buttock prothesis rupture, iatrogenic allogenosis, gastrointestinal tract perforation, intra-abdominal injury, collections, fistula. Systemic complications: pulmonary embolism, pulmonary fat embolism, SDRA, deep vein thrombosis. Pitfalls Take home points.

## MSEE-29 BEYOND THE HORIZON: LANDSCAPE SIGNS IN RADIOLOGICAL IMAGING

Manolin Gomez Rivadeneira (*Abstract Co-Author*) Nothing to Disclose
Alejandra Cardona Del Valle, MD (*Abstract Co-Author*) Nothing to Disclose
Alejandro Gonzalez, BS (*Abstract Co-Author*) Nothing to Disclose
Jose A. Lara, MD (*Abstract Co-Author*) Nothing to Disclose
Claudia Muns, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

-Discuss the most common radiological signs inspired by landscapes. -Explain the background, etiology, and radiological uses of each of the discussed signs. -Describe the signs through example cases and illustrations using various imaging modalities.

**TABLE OF CONTENTS/OUTLINE**

-I. Educational Objectives and Introduction- II. Discuss signs in the following categories: Urban, Rural, Marine and Snow land- III. Imaging examples- IV. Review importance in recognition- V. Self-assessment with multiple cases in quiz format- IX. ConclusionIn this comprehensive pictorial review, we will showcase a series of classic radiological signs inspired by different landscapes, such as rural, urban, marine, and snowland environments. These signs, visible across various imaging modalities, will be illustrated with example cases from our institution. Each sign will be presented alongside a public domain image or diagram of the object that inspired its name, allowing for easier association and recognition. Additionally, a concise explanation of the underlying pathology and pertinent information will be provided.-Urban Signs: Include the inverted Mercedes-Benz, racing car, flat tire, spoke wheel, steeple, lead pipe, tram track, and crazy paving signs.-Rural Signs: Include Mount Fuji, apple core, cotton wool, tulip bulb, and tree in bud signs.-Marine Signs: Include the whirlpool, bone island, seashore, sail, double bubble, triple bubble, and atoll signs.-Snowland Signs: Include snowman and snowstorm signs. By exploring these different landscape-themed signs, the pictorial review aims to enhance the recognition and understanding of various pathologies.

## MSEE-30 RADIOLOGIST GUIDE TO THE EVOLVING WORLD OF ECMOS

Scott A. Grumley, MD (*Abstract Co-Author*) Nothing to Disclose
Naga Sai Rasagna Mareddy, MBBS (*Abstract Co-Author*) Nothing to Disclose
Nina L. Terry, MD, JD (*Abstract Co-Author*) Stockholder, Johnson & Johnson;Spouse, Stockholder, Johnson & Johnson;Stockholder, Kimberly-Clark Corporation;Spouse, Stockholder, Kimberly-Clark Corporation;Stockholder, Microsoft Corporation;Spouse, Stockholder, Microsoft Corporation;Spouse, Stockholder, Amge
Satinder P. Singh, MD (*Abstract Co-Author*) Nothing to Disclose
Mohamed Ibrahim, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

• Understanding different ECMO configuration setups and their clinical context. • Learn to interpret evolving ECMO cannula configurations and underlying pathologies. • Appreciate the vital role of radiologists through accurate imaging interpretation and multidisciplinary collaboration.

**TABLE OF CONTENTS/OUTLINE**

• Introduction and Understanding ECMO setup: - Brief overview of ECMO and its significance in critical care. - Illustrative review of ECMO configurations in different clinical scenarios, explanation of VV, VA, and hybrid ECMO setups and potential complications and solutions. • Role of Radiologists in ECMO Care:

- Highlight the importance of accurate imaging interpretation in assessing cannula placement and complications. - Steps in obtaining optimal CTA images - Discuss collaborative approach between radiologists and multidisciplinary teams in ECMO patient management.

## MSEE-31 IMAGING OF DIABETIC COMPLICATIONS: FROM HEAD TO TOE

**Awards**
**Certificate of Merit**

Yoshitake Yamada, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Masahiro Jinzaki, MD, PhD (*Abstract Co-Author*) Support, Canon Medical Systems Corporation;Support, General Electric Company
Hirotaka Akita (*Abstract Co-Author*) Nothing to Disclose
Fumiko Yagi, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

(1) Understanding pathophysiology of diabetes mellitus(2) Understanding useful imaging findings in diabetes-related complications

### TABLE OF CONTENTS/OUTLINE

I. IntroductionII. Pathophysiology of diabetes mellitusIII. Diabetes-related complicationsA. Head/neck- Hyperostosis Frontalis Interna- Stroke- Non-ketotic hyperglycemic hemichorea- Dementia- Malignant otitis externaB. Heart/vessel- Diabetic Cardiomyopathy- Coronary artery disease- Peripheral Artery DiseaseC. Breast - Diabetic mastopathyD. Gastrointestinal tract- Black esophagus (acute necrotizing esophagitis)- Fatty liver/subcapsular fatty infiltration- Emphysematous cholecystitis- Atrophic pancreas- Pancreatitis- Pneumatosis cystoides intestinalisE. Genitourinary system- Diabetic kidney disease- Renal abscess- Renal papillary necrosis- Medullary nephrocalcinosis- Xanthogranulomatous pyelonephritis- Emphysematous pyelonephritis/cystitisF. Reproductive organs- Calcification of the Vas Deferens- Vascular erectile dysfunction- Polycystic Ovary SyndromeG. Musculoskeletal system- Fournier's gangrene- Necrotizing fasciitis- Osteomyelitis- Spondylodiscitis- Diffuse idiopathic skeletal hyperostosis- Muscle Denervation- Insulin ball

## MSEE-32 MAXIMIZING THE POTENTIAL OF HIGH-FREQUENCY ULTRASOUND FOR SKIN FILLER IDENTIFICATION: FACTORS INFLUENCING PRODUCT EVALUATION AND DISTINCTION

Giovanni G. Cerri, PhD (*Abstract Co-Author*) Nothing to Disclose
Gabrielle A. Zattar (*Abstract Co-Author*) Nothing to Disclose
Gladstone Faria (*Abstract Co-Author*) Nothing to Disclose
Natally Horvat, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Ricardo Boggio (*Abstract Co-Author*) Nothing to Disclose
Natalia Venturelli (*Abstract Co-Author*) Nothing to Disclose
Jose de Arimateia B. Araujo Filho, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Luciana C. Zattar, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Aesthetic procedures are increasingly being performed using injectable materials. In this context, the radiologist has been requested to recognize their usual aspects. To achieve accurate and timely detection and an appropriate approach for each case, High-frequency ultrasound (HFUS) is the most effective method. It is well established in the literature that ultrasound can identify the type of filler material injected, however, few studies address the aspects that can influence this identification. Correct knowledge of these aspects as well as the limitations of the devices should be known to the radiologist. This study aims to discuss and illustrate the factors that influence product evaluation and distinction.The purpose of this exhibit is:- To show and describe the main image patterns of cosmetic fillers that allow its identification (morphology, echogenicity, matrix, posterior artifacts), and teach how to report it;- To list, classify, and describe the different injectables and procedural aspects (dilution, rheology, manufacturer/trades, application site, injection technique, purpose, time of injection, and integration) and their influence on imaging;- To highlight the importance of different HFUS devices, transducers, and image settings in the product distinction;- To show and describe a practical chart that may help reach the correct product's approach in daily practice;

### TABLE OF CONTENTS/OUTLINE

1. INTRODUCTION: why is it important?2. HOW TO IDENTIFICATE AND REPORT INJECTABLE MATERIALS3. WHICH FACTORS INFLUENCES?4. STEP-BY-STEP APPROACH5. WHAT SHOULD WE CARE ABOUT?5. CONCLUSION: new perspectives

## MSEE-33 ADENOID CYSTIC CARCINOMA: MULTIORGAN MANIFESTATIONS

**Awards**
**Certificate of Merit**

Komal B. Shah, MD (*Abstract Co-Author*) Nothing to Disclose
Ioannis Vlahos, MBBS, FRCR (*Abstract Co-Author*) Director, Grayscale Ltd;Co-owner, Grayscale Ltd;
Sireesha Yedururi, MBBS (*Abstract Co-Author*) Nothing to Disclose
Toma Omofoye, MD (*Abstract Co-Author*) Nothing to Disclose
Mylene T. Truong, MD (*Abstract Co-Author*) Nothing to Disclose
Girish S. Shroff, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Based on clinical/radiology experience at an international cancer referral center. Familiarize radiologists with: 1. Anatomic LocationsCommoner: salivary gland, nasal cavity, sinus, tongue, trachea/central bronchi Uncommon/Rare: breast, female reproductive tract, cervix, prostate, skin, etc 2. Varying use of multimodality imaging (CT, MRI, FDG PET/CT, ultrasound) according to location 3. Correlation of imaging with pathology, metastatic risk, clinical/surgical implications 4. Unique patterns of disease spread and of metastases

### TABLE OF CONTENTS/OUTLINE

Background/classification Epidemiologic Clinical Features Examples by anatomic site, diagnostic criteria, mimics and pitfalls Radpath correlations and site variable CT/MRI/PET correlation to histology subtypes/outcome Patterns of disease spread, perineural disease, metastases, growth rates Treatment surgical considerations

## MSEE-34 "TAKING A BITE OUT OF TEMPOROMANDIBULAR JOINT IMAGING" - ANATOMY, PATHOLOGY, AND INCIDENTAL FINDINGS

**Awards**
**Certificate of Merit**

Kathryn J. Stevens, MBBS, FRCR (*Abstract Co-Author*) Nothing to Disclose
Jennifer A. Padwal, MD, MS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1) Review the basic anatomy of the temporomandibular joint including the articular disc and capsular attachments, surrounding muscles of mastication, condyle and adjacent temporal bone 2) Review normal position of articular disc, retrodiscal layers, and condylar head on both closed and open mouth views 3) Demonstrate different TMJ pathology including articular disc degeneration/perforation, disc displacement, joint effusions, and TMJ degenerative changes 4) Highlight potential "don't miss" incidental findings on CT and MR imaging of the TMJ

### TABLE OF CONTENTS/OUTLINE

I. Basic anatomic review of the temporomandibular joint and associated structures, including normal positioning on open-mouth and closed-mouth views II. Pathology of the temporomandibular joint III. Incidental temporomandibular joint findings on CT and MRI

## MSEE-35 PATHWAYS OF PERIL: RADIOLOGICAL INSIGHTS INTO MALIGNANT SUBPERITONEAL AND RETROPERITONEAL TUMORAL INFILTRATION

Venkata S. Katabathina, MD (*Abstract Co-Author*) Nothing to Disclose
Navya Dasyam, MD (*Abstract Co-Author*) Nothing to Disclose
Gayathri Devi Jalluri, MD,MBBS (*Abstract Co-Author*) Nothing to Disclose
Anil K. Dasyam, MD (*Abstract Co-Author*) Nothing to Disclose
Renjie Chen, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Peritoneal ligaments and mesenteries are best identified by the vessels running through them - Constituents of the different compartments of retroperitoneal spaces dictate the common pathology in these compartments - Subperitoneal spaces and retroperitoneal spaces are interconnected providing uninterrupted pathways for tumor spread -Retropreitoneal tumoral infiltration is often associated with significant constrictive effect

### TABLE OF CONTENTS/OUTLINE

- Embryological development of peritoneal and retroperitoneal spaces - Anatomy of retroperitoneal spaces and their components - Anatomy of peritoneal ligaments and mesenteries - Pathways of subperitoneal tumor infiltration in abdomen o Peritoneal ligaments o Omentum and Mesenteries - Pathways of subperitoneal tumor infiltration in pelvis o Peritoneal Ligaments o Mesenteries - Constricting effect of retroperitoneal tumor infiltration - clinical consequences and imaging clues - Communications between subperitoneal and retroperitineal spaces - clinical implications and imaging clues - Imaging mimics of malignant subperitoneal and retroperitoneal tumor infiltration - Summary

## MSEE-36 VASCULAR COMPRESSION SYNDROMES: A PICTORIAL OVERVIEW

Gavin Low, FRCR (*Abstract Co-Author*) Nothing to Disclose
Rishi P. Mathew, DMRD,MBBS (*Abstract Co-Author*) Nothing to Disclose
Ryan K. Chee, MD (*Abstract Co-Author*) Nothing to Disclose
Mitchell Wilson, MD, FRCPC (*Abstract Co-Author*) Nothing to Disclose
Wendy Tu, MD, FRCPC (*Abstract Co-Author*) Nothing to Disclose
Ranjit Singh, MBBS, BMedSc (*Abstract Co-Author*) Nothing to Disclose
Reshma Mary Koshy, MBChB, FRCR (*Presenter*) Nothing to Disclose

### TEACHING POINTS

This pictorial review aims to concisely summarise notable features identified in seven main vascular syndromes within the abdomen and pelvis using examples from different imaging modalities including ultrasound, fluoroscopy, CT and MRI. These relatively rare syndromes are often poorly understood and can be easily overlooked. They can be asymptomatic and identified incidentally or may manifest symptomatically.

### TABLE OF CONTENTS/OUTLINE

Table of contents • Median Arcuate Ligament Syndrome • Superior Mesenteric Artery Syndrome • Nutcracker Syndrome • May-Thurner Syndrome • Ureteropelvic Junction Obstruction • Retrocaval Ureter • Ovarian Vein Syndrome • Portal BiliopathyOutline This educational exhibit will primarily focus on the imaging features commonly encountered with the above entities. Information will be highlighted by providing case examples using a range of different imaging modalities. A brief overview on each syndrome demographics as well as potential treatment options will be explored. A table summarising the main key findings will also be provided to summarise the main imaging teaching points.

## MSEE-37 UNDERSTANDING DUAL-ENERGY CT. GETTING STARTED: ESSENTIALS IN TECHNICAL PRINCIPLES AND CLINICAL SCENARIOS

Augstin Z. Guzman Mercado, MD (*Abstract Co-Author*) Nothing to Disclose
Monica Lucia Lopez Salazar, MD (*Abstract Co-Author*) Nothing to Disclose
Pedro Daniel Soto Vargas, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- To overview the technical and physical principles behind Dual-Energy CT. - To summarize the various acquisition methods of Dual-Energy CT and the advantages and limitations of each approach. - To overview basic principles of how material decomposition images are generated. - To review material decomposition images commonly used in clinical practice. - To identify clinical settings where spectral reconstruction can increase the diagnostic sensitivity - To exemplify potential artifacts and pitfalls on spectral reconstructions.

### TABLE OF CONTENTS/OUTLINE

- Technical principles of Dual-Energy CT - Dual-Energy CT acquisition approaches - Understating material decomposition - Material decomposition images commonly used in clinical practice - Applicability of dual-energy CT in various clinical scenarios - Artifacts and Pitfalls - Advantages and limitations

## MSEE-38 MICROVASCULAR FLOW IMAGING IN SOLID TUMORS: A PRACTICAL APPROACH

Ramon Borge Rizzi, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Doppler US is a non-invasive and cost-effective imaging method useful for assessing vascularization patterns of organs and structures, including solid tumors. The most common modalities commercially available include spectral Doppler, color Doppler, and power Doppler.Microvascular flow imaging (MVFI) is a novel technique based on different filters from Doppler imaging, which excels in characterizing slow flow in small vessels, a challenge for conventional Doppler methods.MVFI applications in oncologic imaging are still evolving, with great potential in the diagnosis and follow-up of hepatobiliary, genitourinary, vascular, gastrointestinal, skin, and muscular tumors.This pictorial review aims to provide a practical overview of MVFI's main applications and limitations in oncologic imaging. It emphasizes key points and potential challenges for integrating MVFI into clinical practice.

### TABLE OF CONTENTS/OUTLINE

Background: perfusion imaging US techniques (advantages and disadvantages)- Doppler imaging- Contrast-enhanced US- Microvascular flow imagingPrinciples of MVFI - Recognizing microvascular patterns: a practical approachApplications of MVFI in oncologic imaging: a case-based review with multimodality imaging correlations- Skin- Thyroid- Lymph nodes- Liver- Kidney- Colon- Other tumorsClinical use: pearls and pitfallsSummary and take home messages

## MSEE-39 IMAGING IN SYSTEMIC SCLEROSIS (SCLERODERMA)

**Awards**
**Certificate of Merit**

David J. DiSantis, MD (*Abstract Co-Author*) Nothing to Disclose
Margarita V. Revzin, MD, MS (*Abstract Co-Author*) Nothing to Disclose
Galib Mirza Nasirul Islam, MBBS (*Abstract Co-Author*) Nothing to Disclose
Yashant Aswani, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Systemic sclerosis (Scleroderma) is a clinically heterogeneous disorder with protean manifestations, a chronic and frequently progressive course, and significant disability, disfigurement and mortality. Virtually every organ can be affected. This exhibit discusses scleroderma in detail and at the conclusion of the module, the learner should be able to:
- Familiarize with the pathogenesis and clinical features of scleroderma
- Understand the role imaging in the diagnosis and evaluation of scleroderma
- Discuss radiological findings seen in scleroderma
- Describe current treatment strategies, newer techniques as well as common confounding drug-induced manifestations

### TABLE OF CONTENTS/OUTLINE

- Introduction
- Epidemiology
- Pathology and pathogenesis
- Disease classification
- Diagnosis and role of serum markers
- Mixed connective tissue disease (MCTD)
- Role of Imaging
- Manifestations of Scleroderma (reduced oral aperture, mucocutaneous telangiectasia, joint contractures, digital ischemic ulcers, cardiomyopathy, gastrointestinal hypomotility and bacterial overgrowth)
- Cutaneous Manifestations
- Respiratory involvement (interstitial lung disease and pulmonary arterial hypertension)
- Gastrointestinal Manifestations (upper tract, lower tract and anorectal)
- Renal involvement and scleroderma renal crisis
- Musculoskeletal Manifestations
- Cardiovascular involvement
- Urinary system Manifestations
- Nervous System Involvement
- Miscellaneous Features
- Cancer in Scleroderma
- Prognostic Factors
- Treatment Strategies
- Drug-induced manifestations

## MSEE-4 IMAGING FEATURES OF PERINEAL SUPPURATIONS

Marc Zins, MD (*Abstract Co-Author*) Nothing to Disclose
Alexandre Delpla (*Abstract Co-Author*) Nothing to Disclose
Boulay-Coletta Isabelle, MD (*Abstract Co-Author*) Nothing to Disclose
Caroline Touloupas (*Abstract Co-Author*) Nothing to Disclose
Sophie Beranger Gibert (*Abstract Co-Author*) Nothing to Disclose
EMNA YOUNSI (*Abstract Co-Author*) Nothing to Disclose
Arnaud Pouvelle (*Abstract Co-Author*) Nothing to Disclose
Mohamed A. Haouari I, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Perineal suppurations are pathological conditions with diverse clinical manifestations. They vary in severity and may be life-threatening. Regardless of the acute or chronic presentation, imaging plays a fundamental role in the initial assessment and post-treatment evaluation. CT scan is generally sufficient to establish the diagnosis of extensive perineal suppuration. MRI is necessary for assessment of fistula in-ano and for etiological assessment. Perineal suppurative lesions include abscesses, inflammatory masses, fistulous tracts, and fasciitis. Perineal suppuration may be of anorectal, cutaneous, genital, or urological origin. In the postoperative period of pelvic or perineal surgery, suppuration usually consists of infection of an implanted prosthetic material or anastomotic leakage. Imaging helps establishing the right diagnosis by showing specific or highly suggestive findings of some pathologies.

**TABLE OF CONTENTS/OUTLINE**

Overview of the male and female perineal anatomy. Discuss the indications and limitations of the different imaging modalities according to the acute or chronic nature of the clinical presentation and its severity. Discuss suppurative perineal conditions according to patient sex, clinical presentation, anatomical location and origin, and relation to the anal canal of the suppuration (communicating or not). Identify specific or highly suggestive imaging features of every etiology.

## MSEE-40 TIPS AND TRICKS IN ULTRASOUND EVALUATION OF ABDOMINAL HERNIAS

Margarita V. Revzin, MD, MS (*Abstract Co-Author*) Nothing to Disclose
Catalina A. Carvajal Perrejinoski, MD (*Abstract Co-Author*) Nothing to Disclose
Gonzalo Aragon, MD (*Abstract Co-Author*) Nothing to Disclose
Catalina Alarcon Del Campo, MD (*Abstract Co-Author*) Nothing to Disclose
Eugenio Zalaquett, MD, MS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1) Profound comprehension of anatomical intricacies is indispensable in diagnosing and assessing abdominal wall hernias through ultrasound. A nuanced grasp of topographic anatomy proves invaluable in pinpointing the regions predisposed to herniation.2) Ultrasound stands unparalleled as the foremost imaging modality for scrutinizing abdominal hernias. Its unparalleled capacity for dynamic assessment, coupled with its adaptability to various patient positions, renders it peerless in this regard.3) Surgeons demand precise insights into the location, dimensions, and contents of hernial sacs. All this questions can be answered with an adequate ultrasound evaluation.

**TABLE OF CONTENTS/OUTLINE**

Abdominal wall anatomyUltrasound evaluationTips and TricksAnterior Abdominal Wall HerniasMidline herniaUmbilical herniaSpigelian herniaRichter herniaInguinal herniaFemoral herniaAmyand herniaGarengeot hernia

## MSEE-41 PIQUING YOUR INTEREST IN THE PECOMA FAMILY

**Awards**
**Certificate of Merit**

Grace G. Zhu, MD (*Abstract Co-Author*) Nothing to Disclose
Cary L. Siegel, MD (*Abstract Co-Author*) Nothing to Disclose
Douglas M. Rogers, MD (*Presenter*) Royalties, RELX

**TEACHING POINTS**

Teaching Points1) Clarify the pathologic and genetic characteristics of the tumors within the perivascular epithelioid cell tumor (PEComa) family, and their relationship to tuberous sclerosis complex2) Provide a multi-modality case-based review of the wide array of PEComas, geared toward radiologists concerned about potential malignancy or risk for complications

**TABLE OF CONTENTS/OUTLINE**

Outline1) Introduction/Backgrounda) Histology/Pathologyb) Tuberous Sclerosis Complex2) Pulmonarya) Lymphangioleiomyomatosisb) Primary pulmonary PEComa (Clear cell "sugar" tumor)3) Renala) Angiomyolipomab) Epithelioid variant angiomyolipomac) Monophasic/lipid poor angiomyolipoma versus capsular leiomyoma4) Uterine PEComaa) Benignb) Malignant5) Miscellaneous Sporadic PEComasa) Liverb) Retroperitoneumc) Pancreasd) Bowele) Soft tissuesf) Clear cell myomelanocytic tumor of the falciform ligament/ligamentum teres (CCMMT)6) Treatment considerations and follow-up

## MSEE-42 DECODING THE IMMUNOTHERAPY-RELATED ADVERSE EVENTS WITH IMAGING

**Awards**
**Cum Laude**

Roberto Garcia Figueiras, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Joan C. Vilanova, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Antonio Luna, MD, PhD (*Abstract Co-Author*) Speaker, General Electric Company
Sandra Baleato Gonzalez, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Cancer immunotherapies have revolutionized the therapeutic management of a wide number of malignancies. However, local, or systemic adverse events, so called immune- related adverse events (irAEs) are major complications. Radiologists play a fundamental role in the identification irAEs, both essential to be able to deliver the best care possible for the patient. This exhibit aims to: • Review the pathophysiology of irAES. • List the most common adverse effects, the incidence, and the median time to onset. • Recognize these findings on imaging to stablish a specific treatment.

**TABLE OF CONTENTS/OUTLINE**

1. Pathophysiological mechanisms of irAES. 2. Clinical significance and risk factors. 3. Timeline and Incidence, 4. Subtypes of irAES- The Essentials: colitis and pneumonitis.- The Killers: cardiac toxicities. - The Forgotten ones: vasculitis, polyarthritis, pneumatosis.- The Misreaded: acute kidney injury.- The Mimickers: sarcoid-like reaction, adrenalitis, and others. 5. Take home points. 6. Conclusions

## MSEE-43 THE CURRENT ROLE OF DERMATOLOGICAL ULTRASOUND IN CUTANEOUS NEOPLASM

Luciana C. Zattar, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

High frequency ultrasound (HFUS) is increasingly gaining more space in the evaluation of skin tumors due to its high anatomical definition and diagnostic accuracy. It allows in vivo analysis of primary lesion as well as locoregional staging, essential for a better surgical planning and important in the postoperative follow-up of the patients.This study aims to discuss and illustrate the radiologist's role in the evaluation of skin tumors with HFUS. The knowledge of tumors characteristics and specific imaging findings is essential for correct diagnosis and management of patients.The purpose of this exhibit is:- To describe a practical step by step approach of the skin tumors;- To show the main image patterns of the most common skin tumors and its subtypes;- To list, illustrate and describe characteristic imaging findings of rare skin tumors: dermatofibrosarcoma protuberans, cutaneous lymphoma, Kaposi sarcoma- To highlight the importance of HFUS in tumors diagnosis, staging and therapeutic planning;- To illustrate the use of HFUS in evaluation of therapeutic success, recurrence and complication;- To keep in mind important teaching points in skin tumors evaluation

**TABLE OF CONTENTS/OUTLINE**

INTRODUCTION: ultrasound, technique, tumorsDIAGNOSISCompositionLocalizationTREATMENTPre-treatment evaluationDuring treatment evaluationPost-treatment evaluationNEW PERSPECTIVESCONCLUSION

## MSEE-44 WHERE THERE IS SMOKE THERE IS FIRE: DIAGNOSTIC CLUES OF ABDOMINAL DISEASE

Aparecido N. Martins, MD (*Abstract Co-Author*) Nothing to Disclose
Eduarda Bezerra Cirne, MD (*Abstract Co-Author*) Nothing to Disclose
Heloise Miranda (*Abstract Co-Author*) Nothing to Disclose
Fabio Lewin, MD (*Abstract Co-Author*) Nothing to Disclose

Kamila S. Albuquerque, MD (*Abstract Co-Author*) Nothing to Disclose
Lhuanna Maria Barbosa Teixeira, MD (*Abstract Co-Author*) Nothing to Disclose
Bruna Carvalho (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Teaching points: The importance of imaging methods for diagnosis when an abdominaldisease is suspected is known. However we must be aware of radiologicalsigns that can predict diseases even in cases where there is no suspicion, oreven assist diagnostic suspicion when direct signs are hidden, either due totechnical or examiner limitations.The purpose of this exhibit is to: Highlight often overlooked but relevant indirect signs of abdominaldiseases observed on computed tomography (CT) and magneticresonance imaging (MRI).Explore the correlation between imaging findings and potentialunderlying etiologies, spanning inflammatory conditions, traumaticinjuries, neoplasms, vascular diseases, infectious diseases, and otherabdominal pathologies.Provide practical pearls and pitfalls by providing insights into interpretingradiologic manifestations, including identification of common reactivefindings encountered in abdominal imaging.Discuss the importance of incorporating clinical information, such as age,acuity of symptoms, clinical signs, and patient history, to refine thedifferential diagnosis.Propose appropriate follow-up strategies for further evaluation andmanagement of identified abdominal abnormalities.

**TABLE OF CONTENTS/OUTLINE**

2. Table of contents:Introduction;Paraneoplastic manifestations;Metabolic alterations;Vascular findings;Inflamatory and infeccious diseases;Take home messages

## MSEE-45 ADVANCEMENTS IN FISTULA IMAGING TECHNIQUES FOR ONCOLOGY: A COMPREHENSIVE REVIEW AND MULTIMODALITY CORRELATION

Sumeet Virmani, MD, MS (*Abstract Co-Author*) Nothing to Disclose
Pokhraj P. Suthar, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Lauren Arsenault, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

• Highlight the importance of integrating multiple imaging modalities such as CT, MRI, PET-CT, EUS, and MRF for a comprehensive assessment of oncological fistulas.• Emphasize the strengths of each modality in providing different aspects of information, such as anatomical detail, functional assessment, and tissue characterization.• Discuss the significance of advanced imaging techniques like diffusion-weighted MRI and dynamic contrast-enhanced MRI in improving sensitivity for detecting fistulas, especially those associated with tumor involvement. Illustrate how these techniques enhance diagnostic accuracy and aid in early detection and characterization.

**TABLE OF CONTENTS/OUTLINE**

Fistulas, abnormal connections between two epithelialized surfaces, present a challenging scenario in oncology due to their potential complications and impact on patient quality of life. This abstract reviews the evolving landscape of imaging modalities used for detecting and characterizing fistulas in oncological contexts. Recent advancements in imaging technology, including diffusion-weighted MRI, dynamic contrast-enhanced MRI, and positron emission tomography-computed tomography (PET-CT), offer enhanced sensitivity and specificity in identifying fistulas, particularly in the setting of tumor involvement. Moreover, emerging modalities like endoscopic ultrasound (EUS) and magnetic resonance fistulography (MRF) provide valuable insights into fistula anatomy and surrounding tissues, aiding in treatment planning and monitoring response to therapy.

## MSEE-46 LYMPHATICS FROM HEAD TO TOE: NON ENHANCED MR LYMPHOGRAPHY IS MORE THAN AN OPTION

Lionel Arrive, MD,PhD (*Abstract Co-Author*) Nothing to Disclose
Matthias Barral, MD (*Abstract Co-Author*) Nothing to Disclose
Sanaa El Mouhadi, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

-Lymphatic anatomy is complex and challenging to explore. New imaging modalities improve understanding of many lymphatic disorders, but some of them are invasive-Non enhanced MR lymphography, a non invasive modality using heavily T2- weighted MRI sequences, has an excellent contrast and spatial resolution and can analyze both peripheral and central lymphatic system-Lymphatic disorders can be secondary to several conditions (surgery, radiation therapy) or can be congenital with localized or diffuse abnormaities. -Non contrast MR lymphography can be helpful for treatment planning and intervention procedures.

**TABLE OF CONTENTS/OUTLINE**

-Non contrast MR lymphography : technique and advantages -Anatomy and variants of the lymphatic system at non contrast MR lymphography - Lymphatic disorders from head to toe

## MSEE-47 TUBERCULOSIS: THE GREAT MIMICKER - A CASE-BASED REVIEW FROM HEAD TO TOE

**TEACHING POINTS**

Tuberculosis is a chronic granulomatous disease that can involve a spectrum of manifestations in multiple organs. Its clinical presentation can be nonspecific, and imaging exams are an auxiliary tool in the investigation. Diagnosis often becomes challenging as it can mimic various diseases, including malignancies. Therefore, it is crucial for radiologists to be familiar with the imaging spectra of tuberculosis in various organs and its differential diagnoses, in order to offer the best management for the patient. The purpose of this presentation is (1) to review the pathophysiology of tuberculosis, (2) to examine the imaging spectrum of tuberculosis through case-based studies, and (3) to discuss imaging features suggestive of extra-pulmonary tuberculosis and its differential diagnosis.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction 2. Pathophysiology of tuberculosis 3. Cases presentations and differential diagnosis. 3.1. Head. 3.2. Neck. 3.3. Chest. 3.4. Cardiovascular. 3.5. Abdomen. 3.6. Urogenital. 3.7. Skeletal. 4. Summary. 5. Take Home Messages

## MSEE-48 WHOLE BODY MRI: IMAGING HEREDITARY SYNDROMES

Thomas P. O'Donnell (*Abstract Co-Author*) Researcher, Siemens AG
Vipashyana Jadav, MBBS, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Provide an overview of the technical innovations provided by photon counting (PC)-CT 2. Discuss the patient selection and clinical applications 3. Review scanning protocols and image optimization 4. Provide tips and tricks to develop a high throughput PC-CT workflow in your practice

**TABLE OF CONTENTS/OUTLINE**

1. Background on technical development in PC-CT a. Detection of individual photons and measurement of a photon’s energy, while conventional CT measures aggregate photon energy deposition. b. Novel detector composition (cadmium telluride, cadmium zinc telluride, silicon) 2. Added benefits provided by PC-CT a. Energy discrimination and optimized spectral analysis b. Higher spatial resolution without the radiation dose penalty c. Improved contrast-to-noise ratio d. Use of reduced dose of iodinated contrast e. Lower radiation dose f. Artifact reduction 3. Clinical applications a. Mono-energy image reconstructions b. Virtual non-contrast images, iodine maps. c. Visceral organ lesion detection and characterization d. Artifact reduction in patients with metal prosthetic joints and implants. e. Opportunities for reduced dose imaging (i.e., pediatric patients) f. Future directions in quantitative imaging i). Material decomposition for renal stones and other stone diseases ii). Hepatic fat quantification 4. Development of a workflow in your practice a.

Development of a multidisciplinary PC-CT team comprised of physicists, technologists, and radiologists. b. Protocol optimization c. Patient selection d. Quality assurance

## MSEE-5 EXPLORING BOUNDARIES: IMAGING OF UNUSUAL PRESENTATIONS OF LYMPHOMA

Carolina Gutierrez Marquez, MD (*Abstract Co-Author*) Nothing to Disclose
Lina M. Cadavid Alvarez, MD (*Abstract Co-Author*) Nothing to Disclose
Juliana Bacca, MD (*Abstract Co-Author*) Nothing to Disclose

### TEACHING POINTS

Lymphoma has a wide spectrum of presentations and can involve every organ system in the body producing a variety of imaging appearances. Lymphoma is a common malignancy occurring at any age in life and presenting as imitator of other aggressive malignancies and benign conditions. This scientific exhibit will review the extranodal manifestations of lymphoma throughout the body on different imaging modalities emphasizing in atypical presentations including children and adult patients. Recognizing typical and atypical presentations of lymphoma will allow a better diagnostic approach and further treatment of patients in daily radiological practice.

### TABLE OF CONTENTS/OUTLINE

1) Review the classification of lymphoma: Hodgkin disease and non-Hodgkin lymphoma. Hodgkin disease usually present with nodal involvement. Therefore, this review will emphasize in extranodal presentations of non- Hodgkin lymphoma in different locations and highlight atypical forms. 2) Cased based examples of extranodal lymphomas in different organ systems and imaging modalities:• Head and spine• Intrathoracic disease, focused in parenchymal lung involvement• Abdomen and pelvis • Bone 3) Discuss, along with the clinical cases, the different imaging modalities used for diagnosis (US, CT, MRI, PET/CT), their limitation and strengths.

Tasmia Amjad (*Abstract Co-Author*) Nothing to Disclose
Melanie D. Duhamel, DO (*Abstract Co-Author*) Nothing to Disclose
Laurel Chen, MEng (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. PTEN hamartoma syndromes (including Cowden's syndrome) are caused by pathologic mutations of the PTEN gene. CS patients develop numerous hamartomas throughout the breast, GI tract, uterus, and subcutaneous soft tissues.2. CS also increases risk of malignant neoplasms of the breast, thyroid, kidneys, colon, and likely uterus.3. Expert consensus guidelines suggest early surveillance with mammography, thyroid ultrasound, colonoscopy. However, evidence is insufficient to recommend regular pelvic ultrasound or full body MRI.4. First think benign hamartoma, but keep malignancy in mind.

### TABLE OF CONTENTS/OUTLINE

1. Brief discussion of epidemiology and clinical relevance of dropped gallstones.2. Discussion of the relevant anatomy and both expected and less common locations of dropped gallstone pathology.3. Examples of variable appearance of dropped gallstones across multiple modalities and changes that occur with time.4. Discussion of drop gallstone induced complications.5. Case based review of key learning points and potential pitfalls.

## MSEE-52 ROSAI DORFMAN DISEASE: THE GREAT MIMICKER

Babina Gosangi, MD, MPH (*Abstract Co-Author*) Nothing to Disclose
Koustav Ghosal, MBBS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• The diagnostic and staging evaluation of patients with newly diagnosed RDD should include an assessment of disease extent, as well as evaluation for conditions either known to be associated with RDD, particularly autoimmune disorders, or known to contain an RDD-like reactive component secondary to malignancies • Most patients with RDD present with bilateral, massive, and painless cervical lymphadenopathy with or without intermittent fevers, night sweats, and weight loss • Extranodal involvement has been reported in 43% of RDD cases. Multisystem involvement occurs in 19% of cases, and prognosis is correlated with the number of extranodal systems involved.

**TABLE OF CONTENTS/OUTLINE**

Introduction Nodal Disease Extranodal disease • Intracranial lesions • Sinonasal diseae • Orbital lesions • Thoracic lesions • Liver lesions • Renal lesions • Peritoneal lesions • Vasculitis • Lytic bone lesions • Soft tissue lesions Role of imaging Differential diagnosis Systemic involvement- Lymphoma, metastases, tuberculosis, Vastleman's disease, sarcoidosis Nasopharyngeal involvement- Juveile angiofibroma, lymphoma Osseous- Osteomyelitis, fibrous dysplasia, Ewings SOFT TISSUE - Soft-tissue sarcoma, desmoid tumor, Inflammatory pseudotumor VASCULITIS- Takayasu arteritis

## MSEE-53 IMAGING OF MUSCULOSKELETAL TOXICITIES DURING ANTICANCER TREATMENT IN THE ERA OF PRECISION MEDICINE

Marta Braschi Amirfarzan, MD (*Abstract Co-Author*) Nothing to Disclose
Jonathan Rassi, MD (*Abstract Co-Author*) Nothing to Disclose
Lacey McIntosh, DO, MPH (*Abstract Co-Author*) Nothing to Disclose

**TEACHING POINTS**

Increasingly specific therapies in medicine are not without risk for complication.Radiologists reviewing follow-up therapy imaging should actively survey for therapy toxicities as the presence or absence of toxicity will influence a patient's treatment plan.

**TABLE OF CONTENTS/OUTLINE**

Review of the mechanism of action of the agents involved in musculoskeletal toxicities List of drug classes with examples of musculoskeletal side effects: Chemotherapy: Fluid retention from docetaxel, subtrochanteric femoral fracture from bisphosphonates Radiation Therapy Osteoporosis, Insufficiency Fractures, Osteonecrosis, Immune checkpoint inhibitors: Inflammatory Arthritis, Synovitis, Myositis, Sarcoid-like reaction Molecular Targeted therapies: Fluid retention from Imatinib Hormonal Treatment: osteoporosis from letrozole, osteonecrosis, fractures Cases Immune checkpoint inhibitors - inflammatory arthritis Aromatase inhibitors - osteoporosis Radiation therapy - fracture Bisphosphonates - fracture

## MSEE-54 LYMPHOMA: FROM HEAD TO TOES

Andres F. Caliz Cabrales, MD (*Abstract Co-Author*) Nothing to Disclose
Luz A. Unigarro, MD (*Abstract Co-Author*) Nothing to Disclose
Julian M. Gandur, MD (*Abstract Co-Author*) Nothing to Disclose
Alejandro Blanco Rojas, MD (*Abstract Co-Author*) Nothing to Disclose
Monica Natalia Venegas Torres, MD (*Abstract Co-Author*) Nothing to Disclose
Nicolas H. Plata, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Describe the different types of lymphomas that may affect the body and their epidemiology.Exemplify imaging findings of different lymphomas in CNS, head and neck, thorax, abdomen and bone.Determine the usefulness of different imaging modalities in diagnosis of human body lymphomas.Compare and contrast imaging findings of different lymphomas in different įreas of the body.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction2. Epidemiology3. Central nervous system4. Head and neck5. Thorax6. Abdomen7. Musculoskeletal

## MSEE-55 MUCINOUS NEOPLASMS AND THE ROLE OF HIPEC

Ahmed M. Sobieh, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Elhamy R. Heba, MD, MD (*Abstract Co-Author*) Nothing to Disclose
Michael J. Nisiewicz, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Pathogenesis of peritoneal mucinous neoplasms originates from rupture at the primary site, resulting in dissemination of malignant cells into the peritoneal cavity- HIPEC is one part of a multimodal treatment for peritoneal neoplasms. Goal of HIPEC is to treatment microscopic disease following surgical debulking/cytoreductive surgery- HIPEC is not a curative therapy, it is used for palliation and prolonged survival- Pseudomyxoma peritonei is classically defined as originating from appendiceal mucinous neoplasms. Currently, the term refers to mucinous peritoneal neoplasms originating from any abdominal or pelvic organ.

**TABLE OF CONTENTS/OUTLINE**

- Anatomy of the peritoneal cavity and pathways of disease migration- Review imaging features of various mucinous neoplasms of the abdomen and pelvis, with pathologic correlation- Definition of HIPEC, how HIPEC is performed, and its role in the treatment of mucinous neoplasms- Case review of various mucinous neoplasms, pre and post treatment

## MSEE-56 MEDICAL DEVICES IN THE ABDOMEN AND PELVIS- A PICTORIAL REVIEW FOR TRAINEES

Farah Rahman, MD (*Abstract Co-Author*) Nothing to Disclose
Sara Siddiqui (*Abstract Co-Author*) Nothing to Disclose
Yashant Aswani, MD (*Abstract Co-Author*) Nothing to Disclose
Kevin Sellers, MD (*Abstract Co-Author*) Nothing to Disclose
Denton Connor, MD (*Abstract Co-Author*) Nothing to Disclose
Anugayathri Jawahar, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Comprehensive overview of various medical devices in the abdomen and pelvis and their imaging appearances on different modalities.The clinical indications of these medical devices, normal versus aberrant locations. Complications arising from aberrant locations.

**TABLE OF CONTENTS/OUTLINE**

Iatrogenically placed catheters, tubes, and devices to assist medical management in the abdomen and pelvis are common. New devices are coming to the market regularly, and radiologists need to know the imaging findings of these medical devices, understand the role of different devices in medical care, and differentiate between normal and appropriate positions. It is crucial to identify when these devices are outside their territory and recognize potential complications associated with them when in abnormal locations. This educational exhibit aims to provide a comprehensive overview of the radiographic appearances and clinical implications of short-term retrievable, long-term retrievable, and permanent devices within the abdomen and

pelvis.IntroductionDescribe the medical devices in relation to indication, expected position, abnormal location, and expected complication with the abnormal location. Short Term Retrievable Devices (Nasogastric Tubes, Biliary Stents, Capsule Endoscope, Intra-aortic Balloon Pump) Long Term Retrievable Devices (Gastric Lap Bands, Neurostimulator Device, Antibiotic Beads, Intrauterine Device, Vaginal Pessary, NuvaRing, IVC filter)Permanent/Non-Retrievable Devices (Vasectomy Clips, Penile Prosthesis types, Tubal Ligation Clips, Hernial Plug)Summary and take home points

## MSEE-57 FROM HEAD TO TOE: UNUSUAL LOCATIONS OF EXTRANODAL LYMPHOMAS

Yanet Y. Torres Maza (*Abstract Co-Author*) Nothing to Disclose

Marycarmen E. Flores Duenas, MD (*Abstract Co-Author*) Nothing to Disclose
Romy L. Ames Caro, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Lymphoma is a neoplastic proliferation of lymphoid cells in lymph nodes and lymphatic tissues primarily, with bone marrow, spleen, and thymus involvement in many cases, but it can have an extranodal location, with or without nodalinvolvement.The extranodal engagement occurre more frequently for non-Hodgkin lymphomas (NHL, 25-40%) than for Hodgkin lymphomas (HL, 1%).The most common types of extranodal lymphomas (ENL) are diffuse large B-cell lymphoma (DLBCL) and Malt lymphoma.The gastrointestinal tract is affected in 43%, followed by head and neck with 14%, lung (2%), skin (7%), bone (5%), and brain (6-7%).On imagens one of the main characteristics is that the majority of these tumors show hyposignal in T2 sequences, enhancement on contrast and show marked restriction diffusion.Cross-sectional imaging (MRI and CT) are advised as techniques in the diagnosis, staging and follow-up, mainly in the diagnosis since many of these tumors are not surgical of first intention, therefore their recognition and accurate diagnosis make this pathology an important issue to take into account.

### TABLE OF CONTENTS/OUTLINE

Primary Thyroid Lymphoma, primary suprasellar Lymphoma, Primary uterine cervix lymphoma, Primary rectal lymphoma, Anal plasmablatic lymphoma, Primary bone lymphoma

## MSEE-58 DENGUE FEVER: A GUIDE FOR A MULTIMODAL APPROACH TO MULTISYSTEMIC COMPLICATIONS

Eduardo Gomes De Menezes JR, MD (*Abstract Co-Author*) Nothing to Disclose
Gabriel Alves (*Abstract Co-Author*) Nothing to Disclose
Fernando Yamauchi (*Abstract Co-Author*) Nothing to Disclose
Carolina Carotenuto Ramos, MD (*Abstract Co-Author*) Nothing to Disclose
Helena A. Pereira, MD (*Abstract Co-Author*) Nothing to Disclose
Matheus Brunetto, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Dengue is the most important mosquito-borne viral disease in the world. The prevalence of the infection has increased dramatically in recent decades. The disease is now endemic in more than 100 countries worldwide.2. Dengue has a wide spectrum of clinical signs and symptoms, ranging from asymptomatic infection to severe, lethal manifestations. The early diagnosis of dengue can be established provisionally by clinical observation and readily available laboratory tests.3. According to the 2009 World Health Organization guidelines, patients are categorized as having the non-severe form (subdivided into those with warning signs and those without) or the severe form, according to clinical, laboratory and radiological criteria.4. Therefore, there is growing interest in the early identification of image characteristics related to disease with multisystemic representation, playing a highly relevant role in clinical management, through adequate identification, reporting and multimodality radiological characterization.

### TABLE OF CONTENTS/OUTLINE

1. INTRODUCTION- OVERVIEW- PHYSIOPATHOLOGY- DIAGNOSIS - CLINICAL FORMS2. SYSTEMIC COMPLICATIONS AND REPORTING- ABDOMINAL- THORACIC - NEUROLOGYCAL - CARDIOVASCULAR- MUSCULOSKELETAL3. FRONT LINE APPROACH - ULTRASOUND- X-RAY4. GUIDED SYMPTOM APPROACH5. CONCLUSION

## MSEE-6 NOT ALL THAT IS STENOSED IS ATHEROSCLEROSED: THE VARIOUS FACES OF FIBROMUSCULAR DYSPLASIA AND ITS MIMICKERS

David M. Yousem, MD, MBA (*Abstract Co-Author*) Royalties, RELX;Speaker, MRI Online;Board Member, MRI Online;
Mohab Elnashar (*Abstract Co-Author*) Nothing to Disclose
Yasmin Aly (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Understanding the pathogenesis and the histopathological characteristics of Fibromuscular Dysplasia (FMD). 2. Explore the diverse morphological presentations of FMD observed on angiograms, ranging from the common "string of beads" pattern to less familiar atypical forms such as carotid webs and artery dissections. 3. Understanding the clinical context surrounding FMD including patients' demographics and presenting symptoms. 4. Brief discussion on the differential diagnosis of FMD seen on angiographic imaging and how to differentiate them apart. 5. Illustrate the role of Radiology in treatment of FMD.

### TABLE OF CONTENTS/OUTLINE

1. Introduction: a. Definition. b. Epidemiology of FMD. c. The reason behind the growing interest in FMD. 2. Pathophysiology: a. The pathogenesis theorized leading to FMD. b. Histopathological classification of FMD. 3. Review of the different angiographic variants of FMD. 4. A case-based review: Providing sample scenarios illustrating the clinical findings and the angiographic findings of FMD. 5. Differential diagnosis of FMD on angiograms including, atherosclerosis, standing waves, segmental medial arteriolysis (SAM) and arterial tortuosity caused by multiple diseases to be discussed. 6. Summary and takeaway points.

## MSEE-60 POST-SURGICAL COMPLICATIONS: FLUOROSCOPIC FINDINGS OF PERFORATIONS, LEAKS, AND FISTULAS

Madeleine Nguyen (*Abstract Co-Author*) Nothing to Disclose
Alex Nguyen (*Abstract Co-Author*) Nothing to Disclose
Ryan Ko (*Abstract Co-Author*) Nothing to Disclose
Don N. Nguyen, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Although utilization numbers show fluoroscopy is not the cornerstone in diagnostic radiology with continued emphasis on cross sectional imaging, it is important to recognize its critical role particularly in the post-operative setting. The purpose of this educational exhibit is to familiarize radiologists with a series of cases highlighting fluoroscopic findings of worrisome complications following surgery. After review, the audience will be able to:1. Recognize different fluoroscopic studies and technique to help diagnose post-surgical complications2. Identify important fluoroscopic imaging findings that would prompt emergent intervention3. Discuss implications of different post-surgical complications on patient management, treatment and overall prognosis

**TABLE OF CONTENTS/OUTLINE**

I. Background on FluoroscopyII. Types of Fluoroscopic Studies (Indications, Oral Contrast Agents, Techniques)III. Cases of Post Surgical Complications:1. Boerhaave syndrome- Post operative nausea/vomiting (Esophagram)2. Gastrobronchial fistula- Esophagectomy with gastric pull through ('Tracheobronchogram')3. Gastric pouch leak- Roux en Y gastric bypass (Upper GI series)4. Feculent peritonitis- Partial colectomy for colonic neoplasm (Barium enema)5. Vesicovaginal fistula- Hysterectomy for cervical cancer (Cystogram)IV. Review of Fluoroscopic Findings (Perforations, Leaks and Fistulas)V. Patient Management/PrognosisVI. Clinical and Imaging Pearls

## MSEE-61 HYDATID DISEASE BEYOND HEPATIC INVOLVEMENT: A PICTORIAL REVIEW

**Awards**
**Certificate of Merit**

Ayse Ibis, MD (*Abstract Co-Author*) Nothing to Disclose
Mustafa Durmaz, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Review the lifecycle and route of transmission for the causative agent (E. granularis) responsible for Hydatid disease and its epidemiology.Learn about the clinical signs and symptoms and how to confirm the diagnosisReview characteristic imaging findings at various parts of body with multimodality approach(US, CT and MRI) and staging.List possible differential diagnoses and how to approach to cystic lesions in atypical locationsLearn about the treatment options

**TABLE OF CONTENTS/OUTLINE**

Introduction to Hydatid DiseaseLife cycle of E. granulosus and TransmissionClinical Manifestations and DiagnosisInvolvement of Different Organs and Systems/Imaging FindingsTreatment

## MSEE-62 ESSENTIAL GUIDE FOR THE RADIOLOGIST IN IMAGES PREPARATION FOR SCIENTIFIC OR EDUCATION PRESENTATIONS

Orlando Catalano, MD (*Abstract Co-Author*) Nothing to Disclose
Vittoria Nunziata (*Abstract Co-Author*) Nothing to Disclose
Antonio Nunziata, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The most of the native images in Radiology are in DICOM format, not suitable for digital presentations and for rewiev articles. For this purpose they have to be converted in other formats. They have to have a suitable resolution, appropriated color codify, light compression and discreet evidence of the pathological focus. The purpose of the presentation is to give a guide to the Radiologist on how to prepare images and drawings for presentations on screen or on papery support.

**TABLE OF CONTENTS/OUTLINE**

The DICOM format represents the standard used by all the builders of Radiologic equipments. The DICOM files contains patient data, type of equipment, image parameters and finally the digital image, generally in Jpeg format, with a light level of compression. The DICOM files is not suitable for screen presentation softwares (PowerPoint or similars). The images extracted in the formats JPEG, PDF, PNG, GIF can be inserted, with a resolution at least of 150 dpi ( 300 dpi in 4K screens), with RGB color codify or in the greyscale. To be printed on papery supports (blackboard panel, rewiev articles, etc.), the images possibly have to be in TIFF format, resolution of at least of 400 dpi, CMYK color codify or in greyscale. The compression deteriorates in proportional way the image quality. The various digital images, the various color modes, the effects of compression on the image quality and a final toolkit for the optimal preparation of the images are illustrated in uploaded pdf.

## MSEE-63 EXPANDING THE DIFFERENTIAL FOR PELVIC MASSES: EXPLORING ATYPICAL PRESENTATIONS OF CLASSIC DIAGNOSES IN THE PELVIS

Ece I. Akduman, MD (*Abstract Co-Author*) Nothing to Disclose
Amirhossein Mohammadian Bajgiran, MD (*Abstract Co-Author*) Nothing to Disclose
Christopher Dilli (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The pelvis houses many structures including the rectum, bowel, bladder, reproductive organs, bone, soft tissue and lymphatics, from which myriad pathologies can arise. Pelvic masses presenting with atypical size, location, progression and arising structures can confuse the diagnosis for even the experienced radiologist. Careful comparison of key radiologic findings and diagnostic criteria between pelvic masses and their differentials is important for accurate reporting. Understanding of the pathologic basis behind pelvic masses can aid in the interpretation of their radiographic findings.

**TABLE OF CONTENTS/OUTLINE**

1. Extramedullary rectal plasma cell neoplasm a. Case study b. Diagnosis and key features c. Comparisons with bone-associated plasma cell neoplasm and DLBCL 2. Pelvic extra-adrenal myelolipoma a. Case study b. Diagnosis and key features c. Comparison with teratoma, liposarcoma and lipoma 3. Pelvic schwannoma a. Case study b. Diagnosis and key features c. Comparison with spindle cell sarcoma and GIST 4. Extra-uterine leiomyosarcoma a. Case study b. Diagnosis and key features c. Comparison with uterine leiomyosarcoma and parasitic fibroid 5. Periurethral leiomyoma a. Case study b. Diagnosis and key features c. Comparisons with uterine leiomyoma and urothelial carcinoma 6. Bladder small cell carcinoma a. Case study b. Diagnosis and key features c. Comparisons with urothelial carcinoma 7. Immature teratoma a. Case study (35 cm mass from pelvis to gallbladder fossa) b. Diagnosis and key features c. Comparisons with 30 cm mature teratoma and clear cell ovarian carcinoma 8. Rectal neuroendocrine carcinoma a. Case study b. Diagnosis and key features c. Comparisons with rectal NET and adenocarcinoma

## MSEE-64 TOWARD A CROSS-ORGAN AND COMPREHENSIVE UNDERSTANDING OF CARCINOSARCOMA OR SARCOMATOID CARCINOMA IN THE ABDOMEN AND PELVIS

Orito Ikeda (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Cancer cells originating from diverse organs, referred to as carcinosarcomas or sarcomatoid carcinomas, may be accompanied by sarcomas or sarcoma-like cells. These occurrences are uncommon, typically associated with an unfavorable prognosis, and often present challenges in terms of effective treatment. Additionally, the World Health Organization (WHO) classification is not unified for each organ. 2. In recent years, efforts have been made to identify shared characteristics among these tumors and investigate them in a cross-organ fashion. This implies that radiologists may be required to understand these tumors from a cross-sectional perspective in the future. 3. Here, we systematically compiled WHO classifications and clinical characteristics. We discussed a comprehensive, cross-sectional approach to imaging findings based on insights from our cases.

**TABLE OF CONTENTS/OUTLINE**

(1) Introduction (2) Female Genital Tumors (3) Urinary and Male Genital Tumors (4) Digestive System Tumors (5) Discussion (6) Summary (7) References

## MSEE-65 DEVELOPING PATIENT-SPECIFIC ORTHOPAEDIC AND SPINE ANATOMICAL MODELS AND OSTEOTOMY SURGICAL GUIDES FROM MEDICAL IMAGING AS AN IN-HOSPITAL CLINICAL 3D PRINTING SERVICE

**Awards**
**Cum Laude**

Mark B. Tan, MBBS, FRCR (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Applications and value proposition of designing, developing and producing patient-specific 3D printed orthopaedic and spine anatomical models and osteotomy surgical guides via an in-hospital clinical 3D printing serviceImaging acquisition, segmentation and surgical guide design principles and considerations of these models and guidesCase examples

**TABLE OF CONTENTS/OUTLINE**

Applications of patient-specific 3D printed orthopaedic and spine anatomical models and osteotomy surgical guides.Value proposition of an in-hospital clinical 3D printing service for these devices.Image acquisition considerations for 3D printed orthopaedic and spine models and osteotomy surgical guides, i.e.CT: Utilisation of thin slices, contiguous slice intervalsMRI: Optimum sequence acquisition for modellingSegmentation considerations, i.e.Tumour segmentationCT-MRI-PET co-registrationSurgical guide design considerations, i.e.Design envelopes Fiducial and anchoring points, cutting slotsMaterial selection e.g. ability to be sterilised, stiffness, etc.These considerations are structured as case based teaching points, including the following casesCongenital - Foot Polydactyly supernumerary toe excision and 5th metatarsal osteotomy and bone graftingCongenital - Blount disease: Osteotomy with external fixation and gradual correctionPost traumatic - Distal Ulna post-traumatic deformity: Osteotomy and correctionPost-infection - Distal ankle deformity secondary to poliomyelitis: Osteotomy and realignment Spine - Atlantoaxial instability: C1-C2 instrumented fusionTumour (benign) - Humerus osteochondromaTumour (malignant) - Pelvic chordoma

## MSEE-66 ADPKD BEYOND KIDNEYS: THE ROLE OF DEEP LEARNING IN PRACTICAL IMPLEMENTATION OF EXTRARENAL MRI IMAGING BIOMARKERS

Hreedi Dev (*Abstract Co-Author*) Nothing to Disclose
Chenglin Zhu (*Abstract Co-Author*) Nothing to Disclose
Martin R. Prince, MD, PhD (*Abstract Co-Author*) Patent agreement, General Electric Company;

Arman Sharbatdaran, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Autosomal Dominant Polycystic Kidney Disease (ADPKD) is a systemic disease primarily affecting kidneys and other organs requiring a comprehensive analysis when imaged by abdominal MRI or CT. MRI emerges as a transformative approach allowing for efficient and reproducible calculation of several clinically meaningful metrics assisting with currently limited treatment options due to incomplete evaluation of many imaging features.

**TABLE OF CONTENTS/OUTLINE**

Already well-known implemented imaging biomarkers: 1. ORGANS:I)Native kidneys- Height-adjusted Total kidney volume II) Liver-Volume III) Spleen - VolumeRecently developed imaging biomarkers and their role in clinical management. 1. ORGANS: I) Native kidneys: -Height adjusted Total kidney volume averaging 5 sequences on multiple scans -Exophytic simple renal cyst -Exophytic complex renal cysts -Complex renal cysts -Simple renal cysts -Transplant kidney volume II)Liver: -Fat fraction -Cyst Count -Cyst fraction (%) -Complex cystsIII) Pancreas: - Volume - Pancreatic cystsIV) Stomach: -Confinement by adjacent enlarged organsV) Gallbladder :- Bile accumulation rateVI) Seminal vesicles: - Volume (megavesicles)VII) Prostate: - Midline CystVIII) Bladder: - Volume - Urine output and ureteral jet effect2. VASCULAR STRUCTURESI) Aorta:- Volume - Aortic pulsatilityII) IVC Compression3. FLUID ACCUMULATIONSI) Pleural effusion: - volumeII) Pericardial effusion: - volumeIII) Ascites/free pelvic fluid: - volume4. BODY COMPOSITIONI) Visceral fat: - volumeII) Subcutaneous fat:- volumeIII) Paraspinal and abdominal wall muscle5. OTHERI) Nerve root sheath cysts

## MSEE-67 MAMMARY-TYPE MYOFIBROBLASTOMA: LOCATIONS AND IMAGING FEATURES WITH PATHOLOGIC CORRELATION

Ruifeng Guo (*Abstract Co-Author*) Nothing to Disclose
Ba D. Nguyen, MD (*Abstract Co-Author*) Nothing to Disclose
Steven Herber, MD, BS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. To present the epidemiology, pathogenesis, clinical manifestations and differential diagnosis of mammary-type myofibroblastoma. 2. To show the different locations of mammary-type myofibroblastoma with its multi-modality imaging including radiography, ultrasound, CT, MR and PET/CT.

**TABLE OF CONTENTS/OUTLINE**

Mammary-type myofibroblastoma (MTMF) is a benign mesenchymal tumor initially reported by Wargotz et al. as a tumor in the breast of older men, also known as "benign spindle cell tumor of the breast", "spindle cell lipoma," "fibroma," "myogenic stromal tumor," or "solitary fibrous tumor" of the breast. It is theorized to arise from accessory breast tissue occurring along the embryonic milk-line from the axilla to the medial groin. Almost half of cases are found in the pelvis or inguinal region. About 25% of MTMF occur outside the embryonic milk-line, in the head and neck, abdomen, lower extremity, and to a lesser extend upper limb. The pathogenesis of mammary-type myofibroblastoma outside the embryonic milk-line distribution is still not totally elucidated. The exhibit presents the spectrum of MTMF features on ultrasound, CT, MR and PET/CT imaging and discusses their differential diagnosis based on early or advanced stages of the lesion. The exhibit also reviews the different sites of mammary-type myofibroblastoma such as pelvis, ischio-rectal region, back, retroperitoneum, inguina, thoracic wall, breast and lower extremity. An instance of recurrent tumor is also discussed and illustrated.

## MSEE-68 A DANGEROUS FRIENDLY FIRE: THE RADIOLOGICAL FEATURES OF IMMUNOTHERAPY-RELATED ADVERSE EFFECTS

**Awards**
**Certificate of Merit**

Helena A. Pereira, MD (*Abstract Co-Author*) Nothing to Disclose
Cassia T. Guimaraes, MD (*Abstract Co-Author*) Nothing to Disclose
Renata F. dos Anjos, MD,MSc (*Abstract Co-Author*) Nothing to Disclose
Luciana Ramacho Rolim Araujo, MD (*Abstract Co-Author*) Nothing to Disclose
Matheus Brunetto, MD (*Abstract Co-Author*) Nothing to Disclose
Eduardo Gomes De Menezes JR, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Immunotherapy has revolutionized cancer management and diagnosis. Although the immune checkpoint inhibitors (ICIs) are successfully used to treat a wide variety of neoplasms, sometimes in advanced stages, they are related to patterns of disease progression and especially to negative effects or complications, named immune-related adverse events (irAEs).2. The immune-related adverse events (irAEs) should be graded according to their severity, requiring rapid recognition and management, given the spectrum of alterations, from indolent to potentially fatal. In this context, Diagnostic Imaging play a key role in front-line patient care.3. We proposed an approach based on questions and clinical cases to review the main concepts related to immunotherapy in a didactic and structured way, with a focus on clinical and radiological aspects of immune-related adverse events (irAEs).

**TABLE OF CONTENTS/OUTLINE**

1. Introduction- Key Concepts about Immunotherapy - The lexicon: ICIs and patterns of progression and response 2. Immune-related Adverse Events- Grading Severity Scale- Thoracic - Pneumonitis - Sarcoid-like reaction- Cardiovascular - Myocarditis - Vasculitis - Pericarditis- Gastrointestinal - Colitis - Gastroenteritis - Hepatitis - Pancreatitis - Cholangitis - Cholecystitis- Endocrine - Hypophysitis - Thyroiditis - Adrenalitis - Musculoskeletal - Arthritis (Inflammatory)- Central Nervous System - Encephalopathy 3. Conclusion

## MSEE-69 SPINE-TINGLING ENCOUNTERS WITH THE EXTRASPINAL KIND: INCIDENTAL FINDINGS ON LUMBAR SPINE MRI

Lawrence Wang, DO (*Abstract Co-Author*) Nothing to Disclose
Erwin Ho (*Abstract Co-Author*) Nothing to Disclose
Maryam Golshan Momeni, MD (*Abstract Co-Author*) Nothing to Disclose
Christopher Sahagian (*Abstract Co-Author*) Nothing to Disclose
Cassidy Tung (*Abstract Co-Author*) Nothing to Disclose
Elliott Lebby, MD (*Abstract Co-Author*) Nothing to Disclose
Kasha Chen (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To review the spectrum of incidental extraspinal findings on lumbar spine magnetic resonance imaging (MRI). To highlight imaging features of incidental extraspinal findings on lumbar spine MRI and review potential blind spots and pitfalls in commonly missed lesions.

**TABLE OF CONTENTS/OUTLINE**

MRI of the lumbar spine is commonly performed in routine evaluation for low back pain. Approximately 23% of American adults report they will seek diagnostic evaluation with MRI for this indication. MRI of the lumbar spine can reveal a range of incidental extraspinal findings within the organs in the field of view. Importantly, clinically significant extraspinal findings may be treatable and a systematic approach to diagnosis may reduce delay for treatment or unnecessary medical costs. This educational exhibit will: (1) review clinically significant incidental findings on magnetic resonance imaging (MRI) of the lumbar spine with illustrative cases within musculoskeletal, vascular, gastrointestinal, endocrine, and genitourinary systems, and (2) highlight imaging features and potential blind spots in the assessment of incidental pathologies including chest wall hematoma, lymphatic metastases, retroperitoneal hemorrhage, abdominal aortic aneurysms, gastrointestinal stromal tumor, cholelithiasis, choledocholithiasis, adrenal lesions, renal cell carcinoma, and ovarian cysts.

## MSEE-7 COWDEN SYNDROME: GENOMICS, ONCOGENESIS AND IMAGING REVIEW FOR ASSOCIATED PATHOLOGIES

Akram M. Shaaban, MBBCh (*Abstract Co-Author*) Royalties, RELX
Usama I. Salem, MBBCh, MD (*Abstract Co-Author*) Nothing to Disclose
Silvana C. Faria, MD (*Abstract Co-Author*) Nothing to Disclose
Ahmed Taher, MD (*Abstract Co-Author*) Nothing to Disclose
Khaled M. Elsayes, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Review the genomics, oncogenesis and epidemiology of Cowden Syndrome (CS). 2. Outline the major and minor diagnostic criteria of CS. 3. Discuss the various tumor presentations of CS. 4. Illustrate the spectrum of associations and imaging features of associated benign lesions and malignancies. 4. Describe the current screening program for CS patients.

**TABLE OF CONTENTS/OUTLINE**

a. Epidemiology of CS i. Age/gender ii. Geographic distribution, populations at risk iii. Pattern of inheritance, discovery by Lloyd and Dennis in 1963 b. Pathophysiology of CS i. Genomics ii. Oncogenesis iii. Histopathology c. Surveillance imaging techniques d. Specific imaging examples of associated benign lesions and cancers that can be seen with surveillance i. Lhermitte-Duclos disease ii. Breast cancer/benign breast lesions iii. Thyroid carcinoma/benign thyroid growths iv. Endometrial cancer/uterine fibroid v. Colon cancer/polyps vi. Renal cell carcinoma vii. Melanoma/benign skin lesions e. Recommendations regarding management and genetic counseling

## MSEE-70 HOW ABOUT ACTINOMYCOSIS?

### TEACHING POINTS

To describe the physiopathology and the radiological features of the major forms of systemic actinomycosis and their differential diagnosis.

### TABLE OF CONTENTS/OUTLINE

Actinomyces is a gram-positive branching anaerobic bacteria that causes an indolent and recurrent suppurative infection. Although it predominantly affects the cervicofacial area, it can invade nearly any organ in the organism.Early treatment is crucial and typically results in a favourable prognosis. However, the locally invasive and disseminated forms may require aggressive surgical intervention. Therefore, early diagnosis is vital for successful management.Actinomycosis is a challenging diagnosis to be made based on radiological features, as its aggressive infiltrating behavior can mimic many other diseases, including both inflammatory and neoplastic lesions, requiring frequent histological confirmation.The three main characteristics that every radiologist must keep in mind in order to recognize this disease are its chronicity, its tendency to propagate across tissue planes conforming complex abscesses, and its typical initial response to antibiotic treatment followed by continuous relapses.In this review, we present a series of cases involving different forms of this condition, including cervicofacial, intestinal, gynaecological, genitourinary, thoracic, and central nervous system manifestations, summarizing the key imaging features and their differential diagnoses to aid in accurate identification and timely management of the disease.

## MSEE-71 VASCULAR ABNORMALITIES IN ATHLETES: STATE-OF-THE-ART MULTIMODALITY IMAGING

**Awards**
**Magna Cum Laude**

Prabhakar Rajiah, MD, FRCR (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. To discuss the vascular abnormalities that can be seen in athletes 2. To highlight the role of multimodality imaging in the evaluation of vascular abnormalities in athletes. 3. To discuss illustrate these vascular issues with case examples

### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Vascular abnormalities in athletes- Etiology and pathophysiology 3. Risk factors- repetitive extremity movements, muscle hypertrophy, anatomic anomalies 4. Presentations- pain, swelling, ischemia 5. Imaging modalities- ultrasound, CT, MRI, angiography 6. Discussion (including sports and predisposing factors) and illustration of the following vascular abnormalities with case examples a) Thoracic outlet syndrome (baseball pitchers, tennis) - Paget Schroetter syndrome - Aneurysms/ stenosis of subclavian/ axillary arteries b) Quadrilateral space syndrome (baseball, volleyball) c) Palmar arch injury-Hypothenar hammer syndrome (cricket, baseball, handball) d) Digital ischemia (football, baseball) e) Arterial thromboembolism f) External iliac artery endofibrosis (cycling, long-distance running) g) External iliac artery dissection h) Adductor canal syndrome (running, skiing) i) Chronic exertional compartmental syndrome (long-distance running, rugby, tennis) j) Popliteal artery entrapment (basketball, football, rugby) k) Popliteal vein entrapment (football, rugby, soccer) l) Cystic adventitial necrosis m) Venous thromboembolism n) Venous insufficiency (distance running, cycling, tennis, weightlifting) o) Mesenteric ischemia p) GI bleed q) Coronary artery disease r) Pulmonary hypertension

## MSEE-72 LOOSE TRIGGER OR SAFETY ON: MRI AFTER BALLISTIC INJURY

Irfan Nazir Hassan, MBBS (*Abstract Co-Author*) Nothing to Disclose
Sultan Bukhari (*Abstract Co-Author*) Nothing to Disclose
David Oommen (*Abstract Co-Author*) Nothing to Disclose
Esther A. Nimchinsky, MD,PhD (*Abstract Co-Author*) Nothing to Disclose
Daniel Giraldo Herrera, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Civilian bullets fired in the US have distinct imaging appearances in human tissue, depending on their ferromagnetic and non-ferromagnetic metal alloy compositions. 2. Review of available imaging should be performed if there is a known history of gunshot injury. Allowing patients with deformed or destroyed bullets to pass beyond MR Zone 3 may be associated with a lower risk of adverse events than previously thought. 3. Tissue location of bullets, or acuity of the wound, does not appear to be associated with clinically significant displacement or rotation at 1.5 T. 4. MRI of non-ferromagnetic bullets within the study field of view is subject to minor local artifacts and can still be of diagnostic quality if planned appropriately, including the use of inversion recovery sequences.

### TABLE OF CONTENTS/OUTLINE

1. Background and Literature Review. 2. Level-1 Trauma Center Retrospective EMR Search. 3. Preliminary Case Series. 4. Suggested Clinical Approach.

## MSEE-73 IMAGING OF THE UMBILICUS: WHERE IS YOUR MOTHER?

**Awards**
**Certificate of Merit**

Yoshitake Yamada, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Hirotaka Akita (*Abstract Co-Author*) Nothing to Disclose
Masahiro Jinzaki, MD, PhD (*Abstract Co-Author*) Support, Canon Medical Systems Corporation;Support, General Electric Company
Fumiko Yagi, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

(1) Understanding embryonic development and anatomy of the umbilicus(2) Understanding useful radiological features of umbilical and periumbilical lesions

**TABLE OF CONTENTS/OUTLINE**

I. IntroductionII. Embryonic development of the umbilicusIII. Anatomy of the umbilicusIV. Umbilicus and umbilical lesionsA. Urachal remnant- Congenital urachal anomalies (patent urachus, urachal cyst, umbilical-urachal sinus, bladder diverticulum)- Complications of the urachal remnants (infection/inflammation and urachal carcinoma)B. Omphalomesenteric duct remnants- Omphalomesenteric duct anomalies (omphalomesenteric sinus, fistula, band, cyst, and Meckel's diverticulum)- Complications of Meckel's diverticulaC. Obliterated umbilical arteriesD. Obliterated umbilical veins- Right-sided round ligament of the liver- Abscess of the round ligament of the liverE. Recanalization of the paraumbilical veinsF. Umbilical ring lesions- Congenital hernia of the umbilical cord- Gastroschisis- Umbilical hernia- Endometriosis- Sister Mary Joseph's nodule- Atheroma G. Iatrogenic lesions- Port site hernia- Port-site seroma/abscesses- Central venous catheter misplacement- Umbilical venous catheterH. Others- Umbilical ring- Acupuncture needle- Adhesion after cesarean section

## MSEE-74 WORKLOAD ASSESSMENT OF SURGERY-ASSISTED SIMULATION USING VIRTUAL REALITY TECHNOLOGY: A WORKLOAD STUDY

Hirotaka Nakashima, MSc, RT (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. 3D images can be observed from multiple directions in a virtual reality space, enabling a different kind of surgical simulation.2. A questionnaire survey using the NASA Task Load Index was conducted to investigate the workload of the new surgery-assisted simulation.3. The survey was administered to 15 subjects (7 orthopedic surgeons from the Spine Center and 8 thoracic surgeons).4. Compared to the conventional simulation method using monitors, the overall workload remained the same and resulted in improved work performance.

**TABLE OF CONTENTS/OUTLINE**

To ensure a smooth and safe surgery, it is crucial to have a thorough understanding of the location and arrangement of blood vessels and anatomical structures beforehand. While surgical simulations using 3D images have been developed, there are limitations in accurately reproducing the surgical field due to the use of 2D monitors for observation. In recent years, virtual reality (VR) technology has gained momentum in surgical simulations, enabling objects to be viewed from all angles within a virtual space, and providing an easier grasp of the positioning of structures. However, there are concerns about the potential for increased physician burden. To address this concern, we conducted an experiment comparing the workload of surgical simulations using VR technology to those using conventional 2D monitors, utilizing NASA's Task Load Index. The results revealed that surgical simulation using VR technology improved work performance without increasing physician workload compared to the conventional method. These findings suggest that VR technology has the potential to enhance surgical simulations and improve patient outcomes.

## MSEE-75 WE ARE GOING TO THE ZOO! YOU CAN COME TOO! MULTISYSTEM ANIMAL SIGNS

Jennifer S. Weaver, MD (*Abstract Co-Author*) Nothing to Disclose
Sherry S. Wang, MBBS, FRANZCR (*Abstract Co-Author*) Royalties, RELX
Jonathan Revels, DO (*Abstract Co-Author*) Nothing to Disclose
Sarah Bastawrous, DO (*Abstract Co-Author*) Nothing to Disclose
Saeed Elojeimy, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Hayden Swartz, MD (*Abstract Co-Author*) Nothing to Disclose
Arafat Ali, DO (*Abstract Co-Author*) Nothing to Disclose
Shelby Stewart, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Identify animal signs applicable to adult and pediatric patients.2. Explain and illustrate the animal signs' associated diagnoses across multiple systems and modalities.

**TABLE OF CONTENTS/OUTLINE**

1. Big cats -Tiger -Eye of tiger sign of pantothenate kinase-associated neurodegeneration -Tiger stripe appearance in Lhermitte-Duclos -Feline esophagus 2. Aviary -Bird beak sign of achalasia -Hummingbird/penguin sign of midbrain atrophy -Gull wing appearance of erosive osteoarthritis -Winking owl sign of an absent pedicle -Pooping duck sign of triquetral fracture 3. Reptiles -Cobra head sign of ureterocele -Turtleback sign of schistosomiasis -Serpent sign of ruptured hydatid cyst 4. Butterfly garden -Butterfly glioma -Butterfly vertebra sign of sagittal cleft vertebra -Fracture with butterfly fragment -Caterpillar sign of pyloric stenosis -Cocoon of encapsulating peritoneal sclerosis 5. Animals from Africa -Elephant for the ivory phalanx of psoriatic arthritis and ivory vertebra sign of opacified vertebra -Zebra sign of osteogenesis imperfecta, spleen enhancement, remote cerebellar hemorrhage -Giraffe sign of Hashimoto thyroiditis -Camel sign of Dromedary hump -Anteater nose sign of calcaneonavicular coalition 6. Animals from Asia -Panda sign of Wilson disease -Racoon eyes of base of skull fractures 7. Animals from America -Bear's paw sign of xanthrogranulomatous pyelonephritis -Moose head of corpus callosal dysgenesis -Staghorn calculus of struvite calculi 8. Aquarium -Fish vertebra of osteoporosis -Fishtail pancreas of pancreas bifidum -Lobster claw of papillary necrosis -Manta ray of bladder exstrophy -Vertebral scalloping of abnormal bone and/or abnormal forces

## MSEE-76 ABDOMINAL MANIFESTATIONS OF EXTRANODAL LYMPHOMA: IMAGING SPECTRUM

Ernesto Garcia Santana, MD (*Abstract Co-Author*) Nothing to Disclose
Ernesto Santana, MD (*Abstract Co-Author*) Nothing to Disclose
Patricia Aleman Flores (*Abstract Co-Author*) Nothing to Disclose
Carlos Fernandez Cabrera (*Abstract Co-Author*) Nothing to Disclose
Alejandro Santana Hernandez, MD (*Abstract Co-Author*) Nothing to Disclose
Carmen Rodriguez Fuentes, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To describe the extranodal manifestations of lymphoma and the imaging findings. To illustrate the imaging spectrum of extranodal lymphoma.

**TABLE OF CONTENTS/OUTLINE**

Lymphoma has the potential to impact virtually every abdominal organ and tissue, resulting in a variety of imaging spectrums. Lymphoma usually presents with nodal disease, which includes the involvement of the lymph nodes, thymus, tonsils, and Waldeyer's ring. Involvement of other organs is considered extranodal disease, except for splenic involvement, which is considered nodal in Hodgkin Lymphoma (HL), and extranodal in Non-Hodgkin Lymphoma (NHL). Extranodal involvement indicates a worse prognosis and can simulate other diseases. Common locations of abdominal extranodal lymphoma include the spleen, liver, and gastrointestinal tract. Among them, primary extranodal lymphoma is very rare, with secondary involvement more frequently found with another primary neoplasm. In both cases, extranodal affectation is more common in NHL than in HL. Although the definitive diagnosis is with biopsy, imaging techniques have an important role in the management of extranodal lymphoma.

## MSEE-77 ONCOLOGICAL PITFALLS AND MIMICS IN THE ABDOMEN AND PELVIS

Matthew T.

Heller, MD (*Abstract Co-Author*) Nothing to Disclose
Anup S. Shetty, MD (*Abstract Co-Author*) Nothing to Disclose
Nelly Tan, MD (*Abstract Co-Author*) Nothing to Disclose
Maria Zulfiqar, MD, MBBS (*Abstract Co-Author*) Nothing to Disclose
Cole P. Thompson, MD (*Abstract Co-Author*) Nothing to Disclose
Kristina Yancey, MD (*Abstract Co-Author*) Nothing to Disclose
Khaled M. Elsayes, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Nicole Warrington, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Illustrate differences between a pitfall and a mimic in the setting of oncological imaging.Provide case-based review of various oncological pitfalls and mimics in the abdomen and pelvis.

**TABLE OF CONTENTS/OUTLINE**

Pitfalls • Spontaneous regression of primary malignancy HCC; Burnt out seminoma • Neoplasms resembling benign entities Cystic pancreatic NET, Cystic RCC, Mucinous GI malignancy, Adrenal mets from HCC or RCC, Pheochromocytomas. • Eye-catching benign pathology with superimposed malignancy Rectal hemangioma with superimposed malignant mass. • Peri-organ infiltration of malignancy resembling benign entities: Biliary lymphoma, linitis plastica, infiltrative TCC. • Progression of disease Growing teratoma syndrome; pseudoprogression in the setting of immunotherapy. • Prozone effect Choriocarcinoma • Concomitant complications: Ovarian torsion with adnexal tumors. Mimics • Benign tumors with aggressive appearing features Renal AML, uterine leiomyoma with IVC thrombus; endometriosis; Sternberg tumor; subserosal uterine adenomyomatous polyp. • Benign entities with malignant appearing enhancement patterns: Hepatic splenosis, splenic PSA.• Infection/inflammation looking like malignancy BCG prostatitis, XG cholecystitis, IgG4 pancreatitis, Actinomycosis, peritoneal TB or disseminated fungal infection.• Foreign body reactions Gossypiboma, gluteal silicone granulomatosis, mesh plug, bulking agents. • Anatomical structures mimicking masses Colonic diverticulosis, gastric fundal diverticulum, ectopic pancreatic rest, Meckel's diverticulum.

## MSEE-78 THE RADIOLOGICAL PALETTE OF ABDOMINAL LYMPHOMA

Yashant Aswani, MD (*Abstract Co-Author*) Nothing to Disclose
Harshitha Shetty, MBBS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. To describe the risk factors, etiopathogenesis, classification and staging of lymphoma. 2. To illustrate the salient imaging features and spectrum of appearances of lymphoma in the abdomen 3. To discuss the imaging features of extranodal lymphoma from other organ-specific neoplastic and inflammatory mimics.

**TABLE OF CONTENTS/OUTLINE**

1. Etiopathogenesis of lymphoma with risk factors for the various organ-specific lymphomas • Bacterial infection- H. pylori, Viral infection- EBV, HTLV, HIV • Immunosuppression- Post transplant lymphoproliferative disorder • Inflammatory diseases- Celiac disease, Atrophic gastritis 2. Classification - 2022 WHO classification of tumors of hematopoietic and lymphoid tissues based on the cell of origin (B cell, T cell, NK cells) and further categories. 3. Staging of lymphoma. 4. Imaging features of lymphoma in the abdomen • GI: Stomach, duodenum, ileum, appendix, colon • Hepatobiliary and pancreas • GU: Adrenal, renal/perirenal, ovarian and testicular • Splenic • Lymph nodal 5. Imaging mimics of lymphoma • Hepatic lymphoma- liver abscess, tubercular granuloma, metastatic liver lesion • Pancreatic lymphoma- pancreatic adenocarcinoma, autoimmune pancreatitis • Nodal lymphoma- disseminated tuberculosis, metastasis • Adrenal lymphoma- adrenal tuberculosis, histoplasmosis, adrenocortical carcinoma • Renal/perirenal lymphoma- IgG4-related retroperitoneal fibrosis, Erdheim-Chester disease, Rosai-Dorfman disease, retroperitoneal lymphatic malformation • Ovarian lymphoma- ovarian metastasis, malignant epithelial ovarian cancers 6. Discuss the treatment and post-treatment imaging appearances of lymphoma.

## MSEE-79 IDENTIFYING ADVERSE EFFECTS OF IMMUNOTHERAPY: KEY CONSIDERATIONS FOR RADIOLOGISTS

Alvaro Rueda-de-Eusebio, MD (*Abstract Co-Author*) Nothing to Disclose
Maria Guerrero Martin (*Abstract Co-Author*) Nothing to Disclose
Maria del Carmen Polidura Aaruga, MBBCHIR (*Abstract Co-Author*) Nothing to Disclose
Natividad Gomez JR, MD (*Abstract Co-Author*) Nothing to Disclose
Sonia Lon, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The use of immune mediated treatment of cancer is improving dramatically the patient's outcome and comfort, but it also carries new toxicity profiles. While standard antineoplastic therapy is associated with immunosuppression and infections, these new therapies induce overwhelming inflammation and autoimmunity. The vast majority of these adverse events can be classified as mild or moderate, but severe and life-threatening complications requiring ICU admission can also occur.A considerable part of adverse effects related to immunotherapy can be diagnosed by imaging methods. This situation makes the role of the radiologist key when it comes to optimizing treatment individually for each patient, taking into account the risks and benefits of the different therapies.This review will focus on the radiological approach to the new challenge that is to make an accurate and early diagnosis of these complications.

**TABLE OF CONTENTS/OUTLINE**

## MSEE-8 UNVEILING THE UNINTENDED AND BEYOND THE OBVIOUS: EXPLORING INCIDENTAL FINDINGS IN CT KUB EXCLUDING STONES

Pratik Mukherjee, MBBS, FRCR (*Abstract Co-Author*) Nothing to Disclose
WAKADE AKSHAY DIPAKRAO, FRCR, MMEd (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Non-urinary and Urinary pathologies excluding stones are commonly seen on CT KUB studies, some of which are potentially life threatening.2. It is essential for radiologists to look out beyond stones, both for the expected mimics and more importantly for the unexpected significant incidentals.3. Timely early workup and intervention in these subset of cases can potentially reduce mortality, morbidity and improve patient outcomes by changing the management.

**TABLE OF CONTENTS/OUTLINE**

Definition Computed tomography of kidneys, ureters and bladder (CT KUB) is a quick, non-invasive technique for diagnosis of urolithiasis. It is usually considered the initial imaging modality for suspected urolithiasis in an emergency setting.CT KUB is also advantageous to detect alternate cause of flank pain. Apart from calculi and mimics of urinary colic, often significant incidental significant findings affecting a wide range of organs is detected. It is interesting to note, that most of these findings are not clinically suspected at the time of presentation.Following are few of the examples of patients who presented with flank pain/renal colic but various other incidental findings are detected:Genito-urinary Renal Cell Carcinoma, Ovarian Dermoid cyst.Hepatobiliary Acute calculous cholecystitis, Multiple Hepatic abscesses, Cystic Pancreatic mass.Gastrointestinal Acute Appendicitis, Appendicular phlegmon, Appendix mucocele, Acute colonic diverticulitis, Intussusception, Sigmoid Carcinoma with hepatic metastasis.Vascular Aortic dissection, Aortic aneurysm.Musculoskeletal Multiple myeloma, Spondylodiscitis with psoas abscess.Miscellaneous Lymphoma, Retroperitoneal fibrosis.

## MSEE-81 AN AESTHETIC NIGHTMARE. THE US, CT, PET-CT, AND MRI DETECTION OF SILICONE OIL: WHAT THE RADIOLOGIST NEEDS TO KNOW

Guillermo P. Sangster, MD (*Abstract Co-Author*) Nothing to Disclose
Ximena L. Wortsman, MD (*Abstract Co-Author*) Speakers Bureau, AbbVie Inc;Royalties, Springer Nature
Carolina Andrea Mariluis (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Silicone oil is a non-FDA-approved permanent filler injected in many countries for cosmetic purposes. It presents a high rate of complications, and its detection should be familiar to any radiologist.- Ultrasound is the first-choice imaging technique due to its high sensitivity in distinguishing cosmetic fillers. Silicone oil presents as hyperechoic deposits that show a diffuse posterior acoustic reverberance, also known as a “snowstorm” artifact.- Magnetic resonance imaging (MRI) silicone oil-specific sequences can provide an accurate extent of the deposits.- The “Bright Multi-Bubble sign” identified in T2 and STIR sequences can be useful for diagnosis in cases of lack of silicone-specific sequences.- Radiologists have a critical role in diagnosing and characterizing this filler and its complications.

**TABLE OF CONTENTS/OUTLINE**

1. To Illustrate expected imaging findings and complications in patients receiving silicone oil injections.2. To depict common and uncommon imaging patterns in ultrasound (US), computed tomography (CT), PET-CT, and MRI exams.3. To discuss the most common differential diagnosis.4. Proposal of a new radiological sign for MRI exams: Bright Multi-Bubble sign.

## MSEE-82 EXPLORING LIPEDEMA ULTRASONOGRAPHIC FINDINGS AND CLINICAL IMPLICATIONS

Marco de Andrade Bianchi (*Abstract Co-Author*) Nothing to Disclose
Deise Vargas (*Abstract Co-Author*) Nothing to Disclose
Amanda Martins E. Ribeiro Dos Santos, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Lipedema is a chronic condition characterized by the disproportionate accumulation of fat in the limbs, especially in women after puberty, with an estimated prevalence of 12.3% in the population of Brazilian women. Its clinical significance lies in the impact on the patient's quality of life due to symptoms. The purpose of this article is:- Definition and Clinical Relevance of Lipedema.- Demonstration of Lipedema Presentation on Ultrasound Image.- Presentation of the “Marbleized Pattern” in Morphological Evaluation via Ultrasound as an Auxiliary Diagnostic Criterion.

**TABLE OF CONTENTS/OUTLINE**

- Description of lipedema, a condition characterized by disproportionate fat accumulation, and its analysis by ultrasound.- Retrospective analysis of ultrasound exams to identify morphological differences in the hypodermis of patients with and without lipedema.- Identification of a specific morphological pattern, termed "marble pattern," in patients with lipedema during ultrasound exams.- Discussion on the utility of morphological evaluation of the hypodermis by ultrasound in the diagnosis and clinical management of lipedema.- Exploration of the clinical implications of identifying the “marble pattern” and recommendations for the diagnosis and treatment of lipedema based on ultrasound findings.In summary, the diagnosis of Lipedema through ultrasound is something recent, still frequently confused with more frequent conditions and this work brings the morphological assessment of the hypodermis through ultrasound as auxiliary diagnostic classifications and mapping of the disease.

## MSEE-83 EPITHELIOID HEMANGIOENDOTHELIOMA FROM HEAD TO TOE: A PRIMER FOR THE RADIOLOGIST

Gregory N. Emmanuel, MD (*Abstract Co-Author*) Nothing to Disclose
Jiyae Lee, MD (*Abstract Co-Author*) Nothing to Disclose
Marta Braschi Amirfarzan, MD (*Abstract Co-Author*) Nothing to Disclose
Jyothi Priya Jagannathan, MD (*Abstract Co-Author*) Nothing to Disclose
Richard Thomas, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Mohammad A. Nouh, MBBS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

• Variable clinical presentations of EHE based on the site of the primary tumor • Role of different imaging modalities to establish diagnosis, assess for metastatic lesions, guide biopsy and local therapy, and monitor treatment response therapy related toxicities. • Histopathologic features of EHE how it correlates with imaging findings. • Different treatment options including local and systemic therapy tailored to the clinical presentation.

**TABLE OF CONTENTS/OUTLINE**

• Definition and etiology of EHE • Clinical presentation based on tumor site. • Imaging features of EHE: Case-based approach o Hepatic EHE: Imaging features on Ultrasound, CT and MRI o Thoracic EHE: Different patterns of disease. o Osseous and soft tissue EHE o Other less common sites of disease o Role of Bone scintigraphy and PET/CT • Local and systemic treatment options. o Role of imaging to monitor treatment response and treatment related toxicity.

## MSEE-84 FROM BARNYARDS TO JUNGLES: INJURIES IN HUMAN-ANIMAL INTERACTIONS

Mihra S. Taljanovic, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Jonathan Revels, DO (*Abstract Co-Author*) Nothing to Disclose
Erica M. Lanser, MD (*Abstract Co-Author*) Nothing to Disclose
Mariam Moshiri, MD (*Abstract Co-Author*) I am the Editor of RSNA Case Collection
Sherry S. Wang, MBBS, FRANZCR (*Abstract Co-Author*) Royalties, RELX
Robert O. Cone III, MD (*Abstract Co-Author*) Nothing to Disclose
Jamie M. Elifritz, BS, MD (*Abstract Co-Author*) Officer, Forensic Radiology Group;Partner, Forensic Radiology Group

Melissa M. Picard, MD (*Abstract Co-Author*) Nothing to Disclose
Jennifer S. Weaver, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Understand the ecology and context of animal vs human traumas; Describe common and unique injury mechanisms related to animal vs human traumas; Recognize radiological manifestations of these encounters; Describe the prognoses and treatment options of the associated injuries;

**TABLE OF CONTENTS/OUTLINE**

Introduction Throughout human history, human encounters with animals have often resulted in traumatic injuries. These incidents occur across various settings, including agricultural, wild, domestic, and recreational environments. In this exhibit, we explore the spectrum of traumatic injuries stemming from these encounters, including their mechanisms of injury and radiological manifestations, with a special focus on potential findings from post mortem CT examinations. Context Recreational (Rodeo, equestrian, circus, personal exotic animals); Agricultural/Farming (Cow/bulls, pigs, poultry, sheep); Domestic (Dogs, cats, pigs, reptiles); Wild (Bears, big game cats, deer, moose reptiles)Mechanisms of injury, radiological manifestations, prognoses, and treatments Osseous: Fractures, dislocations; Neurologic: Concussion, bleeding, and other Soft tissue: Amputation, ligament/tendon injury, bite, laceration, impalement/gouging, cellulitis/infection, predation;Conclusion

## MSEE-85 EXTRANODAL LYMPHOMA FROM HEAD TO TOE: A MULTISYSTEMIC IMAGING ATLAS

Claudia Ortega Mogilevich, MD (*Abstract Co-Author*) Nothing to Disclose
Juan Pablo Cruz, MD (*Abstract Co-Author*) Nothing to Disclose
Daniel Vargas, MD (*Abstract Co-Author*) Nothing to Disclose
Juan Munoz, MD (*Abstract Co-Author*) Nothing to Disclose
Carolina A. Weitz, MD (*Abstract Co-Author*) Nothing to Disclose
Matias F. Callejas, MD (*Abstract Co-Author*) Nothing to Disclose
Kate Hanneman, MD, MPH (*Abstract Co-Author*) Speaker, Groupe Sanofi;Speaker, Amicus Therapeutics, Inc
Felipe A. Sanchez, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Approximately 30% of lymphomas arise from sites other than the lymph nodes. Extranodal involvement can occur in extensive nodal or multisystemic disease (secondary lymphoma) or in the absence of noticeable lymph node enlargement (primary lymphoma).
- Noninvasive imaging plays a crucial role in the diagnosis of extranodal lymphoma. Findings suggestive of extranodal disease can be identified on multiple modalities, including X-ray, CT, MR, and PET.
- Extranodal lymphoma can involve virtually any organ in the body and mimic various benign and malignant pathologies. Concomitant multiorgan involvement, splenomegaly, and lymphadenopathy identified on imaging is a key indication of the potential diagnosis.
- The majority of the cases are caused by non-Hodking lymphoma, and diffuse large B-cell lymphoma is the most common subvariant. The objective of this educational exhibit is to demonstrate the appearance of primary and secondary lymphoma across multiple organ systems and imaging modalities, with a focus on practical tips and differential diagnosis.

**TABLE OF CONTENTS/OUTLINE**

- Background
- Types of lymphoma
- Primary versus secondary lymphoma
- Imaging modalities: strengths and limitations
- Sites of involvement: a) CNS, b) Head and neck, c) Thoracic, d) Cardiac/pericardial, e) Gastrointestinal, f) Genitourinary, g) Solid abdominal organs, h) MSK
- Conclusion

## MSEE-86 ANGIOSARCOMA: IN SEARCH OF RADIOLOGICAL DIAGNOSTIC "CLUES" FOR A RARE TUMOR

Diana Hernandez (*Abstract Co-Author*) Nothing to Disclose
Pompeu Pascual, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- To expose the radiological findings of angiosarcoma on CT-scan and MRI in different organs and systems.- To review the histological and immunophenotypic characteristics of angiosarcoma.

**TABLE OF CONTENTS/OUTLINE**

- Introduction. Angiosarcoma is a rare malignant mesenchymal tumor with endothelial differentiation and very poor prognosis that may arise in different locations. The most common presentation is as cutaneous angiosarcoma, although it can also appear in soft tissue, bone, breast, and solid organs such as liver, spleen, ovary and heart. Hematogenous spread is the hallmark of this disease, with metastatic lesions appearing most frequently in lung, liver, and bone.- Diagnosis. The diagnosis of angiosarcoma is initially suspected based on imaging findings which must be confirmed by histological study. CT-scan and MRI are useful techniques both for diagnosis and for detecting complications such as spontaneous bleeding. In turn, the biopsy confirms the diagnosis and evaluates the tumor's aggressiveness.- Our experience. This study presents a comprehensive review of the radiological findings in a series of 74 angiosarcomas diagnosed at a single institution between 2000 and 2023, and the main histological and immunophenotypic features of these tumors.

## MSEE-87 ILLUMINATING THE FRAMEWORK: THE PHOTON-COUNTING-DETECTOR SCANNER'S REVOLUTION IN MUSCULOSKELETAL CT

Alex Dias, MD (*Abstract Co-Author*) Nothing to Disclose
Enzo Calheiros, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Global incidence of dengue fever has grown dramatically, with an estimated 100-400 million infections occurring each year, primarily in tropical and subtropical areas.- Although most of the patients have no or mild symptoms, a change in the spectrum of clinical manifestations has been recently noted with some specific complications being recognized more frequently, specially related to endothelial dysfunction in diverse systems.- Imaging techniques including ultrasound, computed tomography (CT), magnetic resonance imaging (MRI), and positron emission tomography (PET) have yielded valuable insights into the pathophysiological mechanisms and associated complications of dengue fever.- This pictorial review aims to illustrate the diverse spectrum of imaging manifestations across different organ systems in dengue fever, highlighting the applications of imaging techniques in diagnosing complications and guiding therapeutic interventions.

**TABLE OF CONTENTS/OUTLINE**

1. Background- Epidemiology and pathogenesis- Clinical diagnosis: warning signs and severe dengue (hemorrhagic fever and shock syndrome)- Laboratory diagnosis2. Multimodality Imaging: applications, strengths, and limitations3. Neurological findings: encephalopathy, encephalitis, dengue-associated stroke and neuromuscular complications4. Thoracic findings: lungs, pleura, and heart5. Abdominal findings: gallbladder, liver, spleen, abdominal compartment syndrome 6. Other findings and clinical scenarios: viral arthritis, pregnancy, post-dengue syndrome7. Take home messages

**TEACHING POINTS**

To delineate the spectrum of imaging findings observed in various paraneoplastic syndromes and illustrate the clinical manifestations precipitated by these syndromes.

**TABLE OF CONTENTS/OUTLINE**

Paraneoplastic Syndromes (PNSs) compromise a constellation of disease manifestations arising from underlying neoplasms without direct tumor invasion. They lead to a range of symptoms affecting different organs or systems, complicating diagnosis and treatment.These manifestations, often mediated by cytokines, hormones, or immune reactions, include endocrine, neurological, rheumatological/dermatological, hematologic, and miscellaneous syndromes. Based on our clinical experience, we have encountered numerous paraneoplastic syndromes.This presentation utilizes radiological images sourced from our institution to elucidate the underlying radiographic findings defining these syndromes.Early identification is crucial for optimal management and patient prognosis. Radiologists must be familiar with common PNSs and their distinct imaging features to facilitate timely diagnosis and treatment.

### TEACHING POINTS

1. - Illustrate pathophysiology and mechanism of spread of Coccidioidomycosis. 2. -Provide multisystem case-based review of the imaging features of Coccidioidomycosis.

### TABLE OF CONTENTS/OUTLINE

• Coccidioidomycosis (aka “Valley Fever”) is a fungal infection found in dry desert soil. Symptomatic cases can range from mild pulmonary involvement to invasive multisystem infection particularly in the elderly and immunocompromised patients.• Intracranial findings: meningitis; hydrocephalus; vasculitis, arterial occlusion, cerebral infarction; focal parenchymal lesions, abscess, scattered T2 hyperintense white matter abnormalities.• Spinal findings: Discitis osteomyelitis +/- epidural abscess, spinal arachnoiditis, intramedullary edema/syrinx, intradural extramedullary lesions, syringomyelia/bulbia.• Chest: Acute: parenchymal ground glass or nodular consolidation +/- cavitation; intrathoracic adenopathy, pleural effusions, peribronchial thickening, miliary nodules; Chronic: residual nodule, chronic cavitation, and pneumonia, mycetoma, abscess, bronchopleural fistula• Abdomen and pelvis: Peritonitis (most common site in abdomen), hepatosplenic abscesses, lymphadenitis, pyelonephritis and renal mycetoma, prostatitis, epididymoorchitis, PID.• Musculoskeletal system Osteomyelitis, synovitis, soft tissue abscesses, cellulitis.Summary: Due to the potential multisystem involvement of Coccidioidomycosis, this exhibit is designed to help the radiologist identify spectrum of imaging features associated with each organ system, as well as provide examples where infection can mimic malignancy such as peritoneal carcinomatosis and osseous metastatic disease.

Douglas da Cunha Khalil, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Imagine you have just been hired as the primary radiologist for a traveling circus. To succeed in your new role, you must familiarize yourself with several conditions that may become occupational hazards for your patients.This presentation will highlight the following main points: Recall common and uncommon diseases that are related to circus activities; Review the imaging patterns of different health issues; Imagine the diseases to be aware of when joining a traveling carnival; Discuss when the performer should be referred for a US, CT, or MRI scan.

### TABLE OF CONTENTS/OUTLINE

What are the conditions that may affect circus performers? Imagine what an occupational medicine physician would have to recognize, evaluate, and manage when deciding to join a traveling carnival.Various diseases and injuries can lead to a loss of productive work time among circus performers. Efficient use of diagnostic imaging can lead to proper diagnosis, quicker recovery rates, and, therefore, reduced lost work time for the troupe.Prepare to be amazed and dive into the magic of the circus. Before the curtain drops, the audience must understand the potential hazards that could lie in waiting for the troupe. This study presents a series of cases involving lesions and diseases that could create a stressful night for the circus ringmaster. But as any performer knows all too well, "the show must go on!".

## PEUTZ-JEGHERS SYNDROME; GENOMICS, SURVEILLANCE, ONCOGENESIS AND IMAGING REVIEW OF ASSOCIATED PATHOLOGIES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Abdelrahman A. Abusaif, MBBCh (*Abstract Co-Author*) Nothing to Disclose
James M. Jing, MD (*Abstract Co-Author*) Nothing to Disclose
Khaled M. Elsayes, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Introduce the genetic epidemiologic background of Peutz-Jeghers Syndrome (PJS). 2. Discuss the different common presentations diagnostic criteria of PJS. 3. Summarize the risk of different cancers in PJS patients, according to current literature. 4. Learn various imaging modalities for cancer screening in established PJS cases. 5. Illustrate cancers diagnosed by imaging in PJS. 6. Demonstrate the impact of imaging surveillance on patient outcomes.

### TABLE OF CONTENTS/OUTLINE

1) Introduction to PJS a) Incidence and etiology of PJS. b) Genetic error mode of inheritance. 2) Diagnosis of PJS a) Frequent presentations: i. Mucocutaneous pigmentation ii. Intussusception b) Diagnostic criteria: i. Indications of genetic testing ii. Indications suggested frequency of colonoscopy upper endoscopy 3) Prognosis cancer risk a) Overall cancer risk b) Strongly associated GIT pancreatic cancers c) Strongly associated Gynecologic cancers d) Lung cancer risk e) Other associated cancers 4) Imaging surveillance for cancers in PJS: a) Pancreatic CT / MRI examination b) Gastro-intestinal series. c) Pelvic / testicular Ultrasonography. d) Mammography and breast MRI 5) Examples of cancer cases diagnosed by imaging screening 6) Screening impact on patient outcome.

## MASTOCYTOSIS: PATHOGENESIS, WHO CLASSIFICATION, IMAGING FEATURES WITH PATHOLOGIC CORRELATION

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Mamie Gao, MD (*Abstract Co-Author*) Nothing to Disclose
Hagar S. Mahmoud, MBBCh (*Abstract Co-Author*) Nothing to Disclose
Khaled M. Elsayes, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Review the pathology and clinical entities of mastocytosis. 2. Highlight the imaging features of mastocytosis in multiple organ systems including the lungs, lymph nodes, gastrointestinal tract, liver, kidneys, skin and musculoskeletal system 3. Discuss the potential mimics and pitfalls that may simulate the imaging features of mastocytosis.

### TABLE OF CONTENTS/OUTLINE

1-Mastocytosis pathology and pathophysiology: cutaneous mastocytosis, systemic mastocytosis (with or without cutaneous manifestations), and mast cell sarcoma. 2. Subtypes of systemic mastocytosis • indolent systemic mastocytosis (most common) • Smoldering systemic mastocytosis • Systemic mastocytosis with an associated hematological neoplasm • Aggressive systemic mastocytosis • Mast cell leukemia 2. Multisystem review of mastocytosis is a systemic disease that may affect any organ (lung, liver, spleen, musculoskeletal, gastrointestinal tract, kidneys, lymph nodes, and skin) 3. Imaging findings of mastocytosis on the US, MR, and CT is a pattern of diseases characterized by abnormal proliferation and infiltration of mast cells in different organs with inflammatory mediator release.

Bradley Eichar (*Abstract Co-Author*) Nothing to Disclose
Mark J. Hoegger, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Fluoroscopic image acquisition and interpretation of conditions affecting the gastrointestinal and genitourinary systems remains a crucial skill set for the radiologist. However, advances in other technologies may make fluoroscopy less familiar to the practicing radiologist. The purpose of this exhibit is to: 1. Explain the principles of contrast agent mechanism and selection. 2. Describe the practical function of fluoroscopy cameras. 3. Display the basics of patient positioning and fluoroscopic image acquisition. 4. Provide principles and steps of the most common fluoroscopy studies.

### TABLE OF CONTENTS/OUTLINE

1. Contrast agents: physics fundamentals, types of agents, specific indications, and contraindications. 2. Patient considerations: patient positioning, limited examinations, and fluoroscopic views. 3. Fluoroscopy camera standardized function: magnification, image acquisition, patient maneuvers, and collimation. 4. Principles of common fluoroscopy examinations: barium swallow/esophagram, upper GI, hysterosalpingogram, enemas, and cystography.

## MULTIMODALITY IMAGING OF HEREDITARY CANCER SYNDROMES IN THE ABDOMEN

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Cum Laude**

Avinash Nehra, MD (*Abstract Co-Author*) Nothing to Disclose
Garima Suman, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Hereditary cancer syndromes account for 5-10% of all cancers. Imaging plays a vital role in diagnosis, screening, and surveillance of patients diagnosed or at risk for hereditary cancer syndromes. Radiologists may be able to suggest the diagnosis of underlying genetic disease, particularly in patients with multiple neoplasms at a young age. Basic knowledge of screening and surveillance guidelines and genetic mutations associated with cancer syndromes is essential for radiologists to provide optimal clinical care. In this exhibit, we will provide a comprehensive illustration of the abdominal manifestations of cancer syndromes relevant to day-to-day practice.

### TABLE OF CONTENTS/OUTLINE

1. Overview of abdominal manifestations of various hereditary cancer syndromes.2. Review epidemiology, genetics, current screening and surveillance guidelines, and how imaging plays a role.3. Describe imaging features of the following syndromes:- Lynch Syndrome- Familial Adenomatous Polyposis- Peutz Jeghers Syndrome- Multiple Endocrine Neoplasia Types 1 and 2- Von-Hipple Lindau Disease- Birt Hogg Dube syndrome - Hereditary Diffuse Gastric Cancer- Hereditary Pancreatic Ductal Adenocarcinoma- BRCA1 and 2 associated cancer syndromes- Tuberous Sclerosis- Cowden syndrome- Hereditary pancreatic ductal adenocarcinoma- Li Fraumeni syndrome- Hereditary paraganglioma-pheochromocytoma syndrome

## WHEN TB STRIKES BELOW: UNVEILING THE ABDOMINAL MANIFESTATIONS OF TUBERCULOSIS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Marcella R. Prado, MD (*Abstract Co-Author*) Nothing to Disclose
ALEXANDRE BEZERRA (*Abstract Co-Author*) Nothing to Disclose
Mayra V. Soares, MD (*Abstract Co-Author*) Nothing to Disclose
Tiago Bertoncini, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To recognize the pathophysiology and contamination forms of tuberculosis.To learn about most abdominal radiological manifestations of tuberculosis, improving diagnostic performance.To discuss differential imaging diagnosis of TB, especially in immunosuppressed patients.

### TABLE OF CONTENTS/OUTLINE

Tuberculosis (TB) is an infectious, transmissible, chronic disease caused by Mycobacterium tuberculosis and a worldwide public health problem. Infection is secondary to inhaling suspended particles after forced breathing maneuvers, such as coughing. For this reason, lung infection is its most prevalent and best-known manifestation. However, other forms of dissemination are observed, resulting in nervous, musculoskeletal, and abdominal system involvement.Abdominal and other extrapulmonary TB manifestations correspond to 15-25% of cases, usually associated with immunosuppression, especially in individuals with HIV-acquired immunodeficiency syndrome. Imaging investigation is crucial since abdominal manifestations can result in extensive differential diagnosis. While findings are not pathognomonic, clinical-radiological correlation allows for the correct diagnosis and eventual complications, contributing to adequate treatment.A favorable clinical scenario, associated with knowledge of pathophysiology and familiarity with the multiple abdominal radiological manifestations of tuberculosis, contributes to the diagnosis, reducing morbidity and mortality and the social impact of the disease.

Leticia Cavalcante (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- To illustrate the ultra-high-frequency (UHF) ultrasound characteristics of the most common benign and malignant cutaneous lesions in B-mode and Doppler.- To demonstrate the association between the UHF ultrasound findings with the dermatoscopy and anatomopatologic results.

### TABLE OF CONTENTS/OUTLINE

Ultrasound has been a staple medical diagnostic tool for over half a century. In dermatology, its utilization is more recent, particularly with the advent of UHF ultrasound (> 15 MHz), enabling meticulous scrutiny of the skin and its appendages. Classically, UHF ultrasound is used to study changes in the hypoderma, as nodules and inflammatory processes. In cutaneous oncology, it can be used to identify and delimit the lesions, as well as assess the depth and invasion of neighboring structures by the tumor. In surgical planning, determining margins is of great importance and can avoid incomplete resections and unnecessary reinterventions. Ultrasound can also help in the differential diagnosis between benign and malignant cutaneous tumors, however it is essential that the radiologist learn to correlate ultrasound features with clinical / dermatoscopic evaluation as well as histological results.

## GETTING THE MOST OUT OF MULTIDISCIPLINARY CASE CONFERENCE (MDC): THE RADIOLOGIST'S PERSPECTIVE FOR BEST PATIENT CARE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Zeyad Elias (*Abstract Co-Author*) Nothing to Disclose
Hayley Panet (*Abstract Co-Author*) Nothing to Disclose
Ania Z. Kielar, MD, FRCPC (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Regardless of the type of MDC there are common themes that can help radiologists best prepare, in a time effective manner. This educational poster will address opportunities to improve efficiency, standardize MDC with an ultimate goal of improving patient management and outcomes.

### TABLE OF CONTENTS/OUTLINE

Considerations:1. Standardizing information presented to radiologists- Adequate history (AI may help to pull relevant information about diagnosis, prior patient therapies, and other intervention)- Knowing where to quickly find imaging if not on institutional PACS- Creating an environment of professionalism: encouraging physicians who submit patients for MDC to be present for their discussion or to send a delegate rather than delaying to another time- Use of standard template reporting by other radiologists to help those radiologists preparing MDC to find relevant information quickly 2. Ways to come to consensus at MDC on which guidelines to follow for each disease entity 3. Addressing volume of work for the radiologists a. What is a reasonable number of patients to review and discuss at MDC? i. Are all cases discussed relevant/necessary?b. Cost of increasing number of MDC if cannot accommodate patient volumes 4. Providing support to radiologists preparing MDC a. Options include time off the clinical schedule, or a lighter scheduleb. Including fellows in MDC preparation and presentationEquitably distributing MDC participation across the department

### TEACHING POINTS

Sickle cell anemia is an inherited disease caused by abnormal hemoglobin production that alters the shape of red blood cells and causes vascular occlusion, chronic hemolytic anemia, and infection. It can affect any part of the body with a variety of clinical and radiological manifestations. This scientific exposition will review the imaging manifestations of sickle cell anemia throughout the body in different imaging modalities, with emphasis on atypical presentations, including pediatric and adult patients. Recognizing the typical and atypical presentations of sickle cell anemia will allow a better approach to diagnosis and treatment of patients.

### TABLE OF CONTENTS/OUTLINE

Review of the different radiological manifestations of sickle cell anemia throughout the body, highlighting rare findings. Examples based on cases (common and uncommon features) of sickle cell anemia throughout the body with different imaging modalities: Head and neck. Chest. Abdomen and pelvis. Musculoskeletal Multi-organic. Discussion with clinical cases and different imaging modalities used for diagnosis (US, CT, MRI), with their limitations and strengths.

### TEACHING POINTS

Tuberculosis (TB) manifests across a wide spectrum of presentations. While the pulmonary system is the most commonly affected, TB can extend its reach to involve every organ system in the body. This results in a diverse array of imaging appearances, often resembling radiologic features of other conditions. This scientific exhibit will review rare extrapulmonary manifestations of TB throughout the body on different imaging modalities, with emphasis in atypical presentations including children and adult patients. Recognizing atypical presentations of TB will allow a better diagnostic approach and further treatment of patients in daily radiological practice given the high prevalence of the disease.

### TABLE OF CONTENTS/OUTLINE

1) Review the different systems involved by the disease, highlighting atypical forms.2) Cased based examples of extrapulmonary TB infections in different organ systems and imaging modalities:· Genitourinary· Abdomen and pelvis· Bone · Head3) Discuss the relevance of each diagnostic modalities used in the approach of TB infection through the different case scenarios.

Flavia P. Lopes, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

MGUS, a premalignant hematological condition prevalent in the elderly, carries a yearly progression rate to multiple myeloma (MM) of approximately 1%. It's imperative to explore potential related diseases stemming from MGUS and conduct investigations to exclude the presence of a malignant form. Rheumatologic diseases (RDs) influence the biology of MGUS, elevating the risk of progression to multiple myeloma (MM) or associated lymphoproliferative malignancies. WBMRI is a sensitive imaging modality that provide comprehensive coverage with high soft tissue contrast and spatial resolution in a condensed timeframe. It proves instrumental in the assessment of various multisystemic diseases and to detect and characterize multifocal or systemic conditions, both oncological and non-oncological. Achieving accurate diagnosis and effective surveillance demands a multidisciplinary approach, integrating radiological expertise to mitigate the risk of end-organ damage. As a cost-effective diagnostic imaging tool, WBMRI streamlines the process of diagnosis, therapeutic monitoring, and treatment decision-making, thereby enhancing patient care and outcomes.

### TABLE OF CONTENTS/OUTLINE

Monoclonal Gammopathy of Undetermined Significance (MGUS): Clinical and Epidemiological Insights Diagnosis of MGUS Imaging Diagnosis: Whole-Body Diffusion-Weighted Magnetic Resonance Imaging Technique Exploration of Different Diseases Associated with MGUS, including: • Smoldering Myeloma • Multiple Myeloma • Non-Hodgkin Lymphomas • Waldenstrom Macroglobulinemia • Amyloid Light-chain and Amyloidosis • POEMS Syndrome (Osteosclerotic Myeloma) • Chronic Inflammatory Rheumatic Diseases

Tiffany A. Kumala (*Abstract Co-Author*) Nothing to Disclose
Vidhyulatha Sanata, MD, MBBS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Bullet injuries are prevalent in urban areas, particularly in regions with high rates of gun ownership, such as the United States. Imaging plays a crucial role in assessing the trajectory of the bullet and identifying internal organ injuries in the emergency setting. Generally, retained intact bullets or fragments are harmless unless they migrate, or their location causes internal damage. However, they pose a challenge for radiologists during MRI scans or when MRI clearance is required, especially if the bullet's history or composition hasn't been assessed previously. The goal of this presentation is to familiarize the radiologist with the most common types of guns and bullets, review different bullet compositions and how it affects our practice as radiologists in terms of artifacts and MRI clearance, and to describe the importance of a comprehensive assessment of bullet-related injuries, given the frequency of such incidents in communities with prevalent gun culture.

### TABLE OF CONTENTS/OUTLINE

Table of Contents/Outline:
- Guns and Bullet types: Gun type: Handguns, Shotguns, Rifles. Bullet type: Round nose, ward cutter, semi-wad cutter, Full metal jacket, Hollow point. Composition of bullets: Lead, steel, copper, bullet core Jacket steel, nickel, or copper
- Bullet composition based on radiologic appearance: determining MRI clearance.
- Imaging Assessment: Acute and Chronic Injuries (Wound track, Internal injuries, Retained bullets, Anatomical Location)
- Imaging Artifacts and potential workarounds

### TEACHING POINTS

CAR T-cell therapy was initially developed for the treatment of refractory hematological malignancies. Currently, its indications are being expanded to include some types of solid tumors. The responses to this therapy have some particularities and knowing the expected evolution and correlation with the treatment chronogram is essential. The aim of this presentation is emphasize the role of imaging in this scenario (pre- and post-treatment), demonstrate the radiological findings that define evolutionary behavior, with a focus on FDG PET-CT, for the purpose of making unskilled radiologists more familiar with the therapy, to help them to identify the critical points.

### TABLE OF CONTENTS/OUTLINE

Case-based didactic review of CAR T-cell therapy literature, with FDG PET-CT findings and others imaging methods, including the severe complications, and correlating on our service´s digital archive.

## ABDOMINAL INVOLVEMENT IN LYMPHOMA: IMAGING FINDINGS BEYOND THE LYMPH NODE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Rodrigo P. Polizio, MD (*Abstract Co-Author*) Nothing to Disclose
Matheus M. Gomes SR, MD (*Abstract Co-Author*) Nothing to Disclose
Maria Carolina De Moraes Sarmento (*Presenter*) Nothing to Disclose

### TEACHING POINTS

THE PURPOSE OF THIS EXHIBIT IS: 1. Review the most common sites of extranodal lymphoma, knowing that this entity has the potencial to affect any organ or tissue, in a variety of presentations that can mimic many other conditions.2. Recognize unusual and little-reported patterns of extranodal lymphoma through illustrative clinical cases (including CT, MRI and functional imaging methods).3. Highlight the role of the radiologist in decision-making in a multidisciplinary team.

### TABLE OF CONTENTS/OUTLINE

1. Introduction 1.a Definitions, clinical, pathophysiological aspects 1.b CT and MRI protocols (Hints at evaluation of images; Potential "blind spots; Pearls and Pitfalls).2. Illustrative clinical cases: 2.a The main CT and MRI findings assessment of disease 2.b Atypical sites, clinical and imaging features 2.c Liver and Spleen 2.d Gastrointestinal tract 2.e Geniturinary tract 2.f Biliary tract 2.g Adrenal gland 2.h Peritoneum and Peritoneal Reflections 2.i Abdominal Wall3. Take-home messages 3.a Extranodal lymphoma can simulate other neoplasms or inflammatory conditions. 3.b Raising suspicion for this condition, especially in atypical epidemiological groups and in unexpected contexts, can make a difference in patient management, decision to biopsy, staging, or in detection of reccurrence and complications.

### TEACHING POINTS

Review of the most common cosmetic plastic surgery procedures and their expected radiologic appearance. Identify abnormal findings and complications related to cosmetic plastic surgery procedures. Recognize the potential systemic complications and their radiologic features.

### TABLE OF CONTENTS/OUTLINE

Introduction Common procedures: Facial (bichectomy, rhinoplasty, blepharoplasty, rhytidectomy, Dermal filler injections, Botox and hyaluronic acid), breast (augmentation, removal and mastopexy), abdominal (liposuction, belt lipectomy, abdominoplasty), Buttock augmentation, penile implants. Expected radiographic appearance and normal postoperative findings: what is normal and what is not. Complications: Acute: infection, collections, abscess, skin necrosis and fasciitis, lymphedema. Chronic: capsular contracture, breast or buttock prothesis rupture, iatrogenic allogenosis, gastrointestinal tract perforation, intra-abdominal injury, collections, fistula. Systemic complications: pulmonary embolism, pulmonary fat embolism, SDRA, deep vein thrombosis. Pitfalls Take home points.

### TEACHING POINTS

-Discuss the most common radiological signs inspired by landscapes. -Explain the background, etiology, and radiological uses of each of the discussed signs. -Describe the signs through example cases and illustrations using various imaging modalities.

### TABLE OF CONTENTS/OUTLINE

-I. Educational Objectives and Introduction- II. Discuss signs in the following categories: Urban, Rural, Marine and Snow land- III. Imaging examples- IV. Review importance in recognition- V. Self-assessment with multiple cases in quiz format- IX. ConclusionIn this comprehensive pictorial review, we will showcase a series of classic radiological signs inspired by different landscapes, such as rural, urban, marine, and snowland environments. These signs, visible across various imaging modalities, will be illustrated with example cases from our institution. Each sign will be presented alongside a public domain image or diagram of the object that inspired its name, allowing for easier association and recognition. Additionally, a concise explanation of the underlying pathology and pertinent information will be provided.-Urban Signs: Include the inverted Mercedes-Benz, racing car, flat tire, spoke wheel, steeple, lead pipe, tram track, and crazy paving signs.-Rural Signs: Include Mount Fuji, apple core, cotton wool, tulip bulb, and tree in bud signs.-Marine Signs: Include the whirlpool, bone island, seashore, sail, double bubble, triple bubble, and atoll signs.-Snowland Signs: Include snowman and snowstorm signs. By exploring these different landscape-themed signs, the pictorial review aims to enhance the recognition and understanding of various pathologies.

### TEACHING POINTS

Aesthetic procedures are increasingly being performed using injectable materials. In this context, the radiologist has been requested to recognize their usual aspects. To achieve accurate and timely detection and an appropriate approach for each case, High-frequency ultrasound (HFUS) is the most effective method. It is well established in the literature that ultrasound can identify the type of filler material injected, however, few studies address the aspects that can influence this identification. Correct knowledge of these aspects as well as the limitations of the devices should be known to the radiologist. This study aims to discuss and illustrate the factors that influence product evaluation and distinction.The purpose of this exhibit is:- To show and describe the main image patterns of cosmetic fillers that allow its identification (morphology, echogenicity, matrix, posterior artifacts), and teach how to report it;- To list, classify, and describe the different injectables and procedural aspects (dilution, rheology, manufacturer/trades, application site, injection technique, purpose, time of injection, and integration) and their influence on imaging;- To highlight the importance of different HFUS devices, transducers, and image settings in the product distinction;- To show and describe a practical chart that may help reach the correct product’s approach in daily practice;

### TABLE OF CONTENTS/OUTLINE

1. INTRODUCTION: why is it important?2. HOW TO IDENTIFICATE AND REPORT INJECTABLE MATERIALS3. WHICH FACTORS INFLUENCES?4. STEP-BY-STEP APPROACH5. WHAT SHOULD WE CARE ABOUT?5. CONCLUSION: new perspectives

### TEACHING POINTS

This pictorial review aims to concisely summarise notable features identified in seven main vascular syndromes within the abdomen and pelvis using examples from different imaging modalities including ultrasound, fluoroscopy, CT and MRI. These relatively rare syndromes are often poorly understood and can be easily overlooked. They can be asymptomatic and identified incidentally or may manifest symptomatically.

### TABLE OF CONTENTS/OUTLINE

Table of contents • Median Arcuate Ligament Syndrome • Superior Mesenteric Artery Syndrome • Nutcracker Syndrome • May-Thurner Syndrome • Ureteropelvic Junction Obstruction • Retrocaval Ureter • Ovarian Vein Syndrome • Portal BiliopathyOutline This educational exhibit will primarily focus on the imaging features commonly encountered with the above entities. Information will be highlighted by providing case examples using a range of different imaging modalities. A brief overview on each syndrome demographics as well as potential treatment options will be explored. A table summarising the main key findings will also be provided to summarise the main imaging teaching points.

### TEACHING POINTS

Doppler US is a non-invasive and cost-effective imaging method useful for assessing vascularization patterns of organs and structures, including solid tumors. The most common modalities commercially available include spectral Doppler, color Doppler, and power Doppler.Microvascular flow imaging (MVFI) is a novel technique based on different filters from Doppler imaging, which excels in characterizing slow flow in small vessels, a challenge for conventional Doppler methods.MVFI applications in oncologic imaging are still evolving, with great potential in the diagnosis and follow-up of hepatobiliary, genitourinary, vascular, gastrointestinal, skin, and muscular tumors.This pictorial review aims to provide a practical overview of MVFI's main applications and limitations in oncologic imaging. It emphasizes key points and potential challenges for integrating MVFI into clinical practice.

### TABLE OF CONTENTS/OUTLINE

Background: perfusion imaging US techniques (advantages and disadvantages)- Doppler imaging- Contrast-enhanced US- Microvascular flow imagingPrinciples of MVFI - Recognizing microvascular patterns: a practical approachApplications of MVFI in oncologic imaging: a case-based review with multimodality imaging correlations- Skin- Thyroid- Lymph nodes- Liver- Kidney- Colon- Other tumorsClinical use: pearls and pitfallsSummary and take home messages

### TEACHING POINTS

Systemic sclerosis (Scleroderma) is a clinically heterogeneous disorder with protean manifestations, a chronic and frequently progressive course, and significant disability, disfigurement and mortality. Virtually every organ can be affected. This exhibit discusses scleroderma in detail and at the conclusion of the module, the learner should be able to:
- Familiarize with the pathogenesis and clinical features of scleroderma
- Understand the role imaging in the diagnosis and evaluation of scleroderma
- Discuss radiological findings seen in scleroderma
- Describe current treatment strategies, newer techniques as well as common confounding drug-induced manifestations

### TABLE OF CONTENTS/OUTLINE

- Introduction
- Epidemiology
- Pathology and pathogenesis
- Disease classification
- Diagnosis and role of serum markers
- Mixed connective tissue disease (MCTD)
- Role of Imaging
- Manifestations of Scleroderma (reduced oral aperture, mucocutaneous telangiectasia, joint contractures, digital ischemic ulcers, cardiomyopathy, gastrointestinal hypomotility and bacterial overgrowth)
- Cutaneous Manifestations
- Respiratory involvement (interstitial lung disease and pulmonary arterial hypertension)
- Gastrointestinal Manifestations (upper tract, lower tract and anorectal)
- Renal involvement and scleroderma renal crisis
- Musculoskeletal Manifestations
- Cardiovascular involvement
- Urinary system Manifestations
- Nervous System Involvement
- Miscellaneous Features
- Cancer in Scleroderma
- Prognostic Factors
- Treatment Strategies
- Drug-induced manifestations

Arnaud Pouvelle (*Abstract Co-Author*) Nothing to Disclose
Mohamed A. Haouari I, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Perineal suppurations are pathological conditions with diverse clinical manifestations. They vary in severity and may be life-threatening. Regardless of the acute or chronic presentation, imaging plays a fundamental role in the initial assessment and post-treatment evaluation. CT scan is generally sufficient to establish the diagnosis of extensive perineal suppuration. MRI is necessary for assessment of fistula in-ano and for etiological assessment. Perineal suppurative lesions include abscesses, inflammatory masses, fistulous tracts, and fasciitis. Perineal suppuration may be of anorectal, cutaneous, genital, or urological origin. In the postoperative period of pelvic or perineal surgery, suppuration usually consists of infection of an implanted prosthetic material or anastomotic leakage. Imaging helps establishing the right diagnosis by showing specific or highly suggestive findings of some pathologies.

### TABLE OF CONTENTS/OUTLINE

Overview of the male and female perineal anatomy. Discuss the indications and limitations of the different imaging modalities according to the acute or chronic nature of the clinical presentation and its severity. Discuss suppurative perineal conditions according to patient sex, clinical presentation, anatomical location and origin, and relation to the anal canal of the suppuration (communicating or not). Identify specific or highly suggestive imaging features of every etiology.

### TEACHING POINTS

Cancer immunotherapies have revolutionized the therapeutic management of a wide number of malignancies. However, local, or systemic adverse events, so called immune- related adverse events (irAEs) are major complications. Radiologists play a fundamental role in the identification irAEs, both essential to be able to deliver the best care possible for the patient. This exhibit aims to: • Review the pathophysiology of irAES. • List the most common adverse effects, the incidence, and the median time to onset. • Recognize these findings on imaging to stablish a specific treatment.

### TABLE OF CONTENTS/OUTLINE

1. Pathophysiological mechanisms of irAES. 2. Clinical significance and risk factors. 3. Timeline and Incidence, 4. Subtypes of irAES- The Essentials: colitis and pneumonitis.- The Killers: cardiac toxicities. - The Forgotten ones: vasculitis, polyarthritis, pneumatosis.- The Misreaded: acute kidney injury.- The Mimickers: sarcoid-like reaction, adrenalitis, and others. 5. Take home points. 6. Conclusions

### TEACHING POINTS

High frequency ultrasound (HFUS) is increasingly gaining more space in the evaluation of skin tumors due to its high anatomical definition and diagnostic accuracy. It allows in vivo analysis of primary lesion as well as locoregional staging, essential for a better surgical planning and important in the postoperative follow-up of the patients.This study aims to discuss and illustrate the radiologist's role in the evaluation of skin tumors with HFUS. The knowledge of tumors characteristics and specific imaging findings is essential for correct diagnosis and management of patients.The purpose of this exhibit is:- To describe a practical step by step approach of the skin tumors;- To show the main image patterns of the most common skin tumors and its subtypes;- To list, illustrate and describe characteristic imaging findings of rare skin tumors: dermatofibrosarcoma protuberans, cutaneous lymphoma, Kaposi sarcoma- To highlight the importance of HFUS in tumors diagnosis, staging and therapeutic planning;- To illustrate the use of HFUS in evaluation of therapeutic success, recurrence and complication;- To keep in mind important teaching points in skin tumors evaluation

## WHERE THERE IS SMOKE THERE IS FIRE: DIAGNOSTIC CLUES OF ABDOMINAL DISEASE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Aparecido N. Martins, MD (*Abstract Co-Author*) Nothing to Disclose
Eduarda Bezerra Cirne, MD (*Abstract Co-Author*) Nothing to Disclose
Heloise Miranda (*Abstract Co-Author*) Nothing to Disclose
Fabio Lewin, MD (*Abstract Co-Author*) Nothing to Disclose
Felipe Batista Rodrigues, MD (*Abstract Co-Author*) Nothing to Disclose
Kamila S. Albuquerque, MD (*Abstract Co-Author*) Nothing to Disclose
Lhuanna Maria Barbosa Teixeira, MD (*Abstract Co-Author*) Nothing to Disclose
Bruna Carvalho (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Teaching points: The importance of imaging methods for diagnosis when an abdominaldisease is suspected is known. However we must be aware of radiologicalsigns that can predict diseases even in cases where there is no suspicion, oreven assist diagnostic suspicion when direct signs are hidden, either due totechnical or examiner limitations.The purpose of this exhibit is to: Highlight often overlooked but relevant indirect signs of abdominaldiseases observed on computed tomography (CT) and magneticresonance imaging (MRI).Explore the correlation between imaging findings and potentialunderlying etiologies, spanning inflammatory conditions, traumaticinjuries, neoplasms, vascular diseases, infectious diseases, and otherabdominal pathologies.Provide practical pearls and pitfalls by providing insights into interpretingradiologic manifestations, including identification of common reactivefindings encountered in abdominal imaging.Discuss the importance of incorporating clinical information, such as age,acuity of symptoms, clinical signs, and patient history, to refine thedifferential diagnosis.Propose appropriate follow-up strategies for further evaluation andmanagement of identified abdominal abnormalities.

### TABLE OF CONTENTS/OUTLINE

2. Table of contents:Introduction;Paraneoplastic manifestations;Metabolic alterations;Vascular findings;Inflamatory and infeccious diseases;Take home messages

## ADVANCEMENTS IN FISTULA IMAGING TECHNIQUES FOR ONCOLOGY: A COMPREHENSIVE REVIEW AND MULTIMODALITY CORRELATION

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Sumeet Virmani, MD, MS (*Abstract Co-Author*) Nothing to Disclose
Pokhraj P. Suthar, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Lauren Arsenault, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• Highlight the importance of integrating multiple imaging modalities such as CT, MRI, PET-CT, EUS, and MRF for a comprehensive assessment of oncological fistulas.• Emphasize the strengths of each modality in providing different aspects of information, such as anatomical detail, functional assessment, and tissue characterization.• Discuss the significance of advanced imaging techniques like diffusion-weighted MRI and dynamic contrast-enhanced MRI in improving sensitivity for detecting fistulas, especially those associated with tumor involvement. Illustrate how these techniques enhance diagnostic accuracy and aid in early detection and characterization.

### TABLE OF CONTENTS/OUTLINE

Fistulas, abnormal connections between two epithelialized surfaces, present a challenging scenario in oncology due to their potential complications and impact on patient quality of life. This abstract reviews the evolving landscape of imaging modalities used for detecting and characterizing fistulas in oncological contexts. Recent advancements in imaging technology, including diffusion-weighted MRI, dynamic contrast-enhanced MRI, and positron emission tomography-computed tomography (PET-CT), offer enhanced sensitivity and specificity in identifying fistulas, particularly in the setting of tumor involvement. Moreover, emerging modalities like endoscopic ultrasound (EUS) and magnetic resonance fistulography (MRF) provide valuable insights into fistula anatomy and surrounding tissues, aiding in treatment planning and monitoring response to therapy.

### TEACHING POINTS

Tuberculosis is a chronic granulomatous disease that can involve a spectrum of manifestations in multiple organs. Its clinical presentation can be nonspecific, and imaging exams are an auxiliary tool in the investigation. Diagnosis often becomes challenging as it can mimic various diseases, including malignancies. Therefore, it is crucial for radiologists to be familiar with the imaging spectra of tuberculosis in various organs and its differential diagnoses, in order to offer the best management for the patient. The purpose of this presentation is (1) to review the pathophysiology of tuberculosis, (2) to examine the imaging spectrum of tuberculosis through case-based studies, and (3) to discuss imaging features suggestive of extra-pulmonary tuberculosis and its differential diagnosis.

### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Pathophysiology of tuberculosis 3. Cases presentations and differential diagnosis. 3.1. Head. 3.2. Neck. 3.3. Chest. 3.4. Cardiovascular. 3.5. Abdomen. 3.6. Urogenital. 3.7. Skeletal. 4. Summary. 5. Take Home Messages

### TEACHING POINTS

1. Provide an overview of the technical innovations provided by photon counting (PC)-CT 2. Discuss the patient selection and clinical applications 3. Review scanning protocols and image optimization 4. Provide tips and tricks to develop a high throughput PC-CT workflow in your practice

### TABLE OF CONTENTS/OUTLINE

1. Background on technical development in PC-CT a. Detection of individual photons and measurement of a photon’s energy, while conventional CT measures aggregate photon energy deposition. b. Novel detector composition (cadmium telluride, cadmium zinc telluride, silicon) 2. Added benefits provided by PC-CT a. Energy discrimination and optimized spectral analysis b. Higher spatial resolution without the radiation dose penalty c. Improved contrast-to-noise ratio d. Use of reduced dose of iodinated contrast e. Lower radiation dose f. Artifact reduction 3. Clinical applications a. Mono-energy image reconstructions b. Virtual non-contrast images, iodine maps. c. Visceral organ lesion detection and characterization d. Artifact reduction in patients with metal prosthetic joints and implants. e. Opportunities for reduced dose imaging (i.e., pediatric patients) f. Future directions in quantitative imaging i). Material decomposition for renal stones and other stone diseases ii). Hepatic fat quantification 4. Development of a workflow in your practice a. Development of a multidisciplinary PC-CT team comprised of physicists, technologists, and radiologists. b. Protocol optimization c. Patient selection d. Quality assurance

### TEACHING POINTS

Lymphoma has a wide spectrum of presentations and can involve every organ system in the body producing a variety of imaging appearances. Lymphoma is a common malignancy occurring at any age in life and presenting as imitator of other aggressive malignancies and benign conditions. This scientific exhibit will review the extranodal manifestations of lymphoma throughout the body on different imaging modalities emphasizing in atypical presentations including children and adult patients. Recognizing typical and atypical presentations of lymphoma will allow a better diagnostic approach and further treatment of patients in daily radiological practice.

### TABLE OF CONTENTS/OUTLINE

1) Review the classification of lymphoma: Hodgkin disease and non-Hodgkin lymphoma. Hodgkin disease usually present with nodal involvement. Therefore, this review will emphasize in extranodal presentations of non- Hodgkin lymphoma in different locations and highlight atypical forms. 2) Cased based examples of extranodal lymphomas in different organ systems and imaging modalities:• Head and spine• Intrathoracic disease, focused in parenchymal lung involvement• Abdomen and pelvis • Bone 3) Discuss, along with the clinical cases, the different imaging modalities used for diagnosis (US, CT, MRI, PET/CT), their limitation and strengths.

## COWDEN'S SYNDROME: MULTIMODALITY IMAGING REVIEW AND INSTITUTIONAL EXPERIENCE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Brian J. Di Giacinto, DO (*Abstract Co-Author*) Nothing to Disclose
Tasmia Amjad (*Abstract Co-Author*) Nothing to Disclose
Melanie D. Duhamel, DO (*Abstract Co-Author*) Nothing to Disclose
Laurel Chen, MEng (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. PTEN hamartoma syndromes (including Cowden's syndrome) are caused by pathologic mutations of the PTEN gene. CS patients develop numerous hamartomas throughout the breast, GI tract, uterus, and subcutaneous soft tissues.2. CS also increases risk of malignant neoplasms of the breast, thyroid, kidneys, colon, and likely uterus.3. Expert consensus guidelines suggest early surveillance with mammography, thyroid ultrasound, colonoscopy. However, evidence is insufficient to recommend regular pelvic ultrasound or full body MRI.4. First think benign hamartoma, but keep malignancy in mind.

### TABLE OF CONTENTS/OUTLINE

1. Brief discussion of epidemiology and clinical relevance of dropped gallstones.2. Discussion of the relevant anatomy and both expected and less common locations of dropped gallstone pathology.3. Examples of variable appearance of dropped gallstones across multiple modalities and changes that occur with time.4. Discussion of drop gallstone induced complications.5. Case based review of key learning points and potential pitfalls.

### TEACHING POINTS

Comprehensive overview of various medical devices in the abdomen and pelvis and their imaging appearances on different modalities.The clinical indications of these medical devices, normal versus aberrant locations. Complications arising from aberrant locations.

### TABLE OF CONTENTS/OUTLINE

Iatrogenically placed catheters, tubes, and devices to assist medical management in the abdomen and pelvis are common. New devices are coming to the market regularly, and radiologists need to know the imaging findings of these medical devices, understand the role of different devices in medical care, and differentiate between normal and appropriate positions. It is crucial to identify when these devices are outside their territory and recognize potential complications associated with them when in abnormal locations. This educational exhibit aims to provide a comprehensive overview of the radiographic appearances and clinical implications of short-term retrievable, long-term retrievable, and permanent devices within the abdomen and pelvis.IntroductionDescribe the medical devices in relation to indication, expected position, abnormal location, and expected complication with the abnormal location. Short Term Retrievable Devices (Nasogastric Tubes, Biliary Stents, Capsule Endoscope, Intra-aortic Balloon Pump) Long Term Retrievable Devices (Gastric Lap Bands, Neurostimulator Device, Antibiotic Beads, Intrauterine Device, Vaginal Pessary, NuvaRing, IVC filter)Permanent/Non-Retrievable Devices (Vasectomy Clips, Penile Prosthesis types, Tubal Ligation Clips, Hernial Plug)Summary and take home points

### TEACHING POINTS

Lymphoma is a neoplastic proliferation of lymphoid cells in lymph nodes and lymphatic tissues primarily, with bone marrow, spleen, and thymus involvement in many cases, but it can have an extranodal location, with or without nodalinvolvement.The extranodal engagement occurre more frequently for non-Hodgkin lymphomas (NHL, 25-40%) than for Hodgkin lymphomas (HL, 1%).The most common types of extranodal lymphomas (ENL) are diffuse large B-cell lymphoma (DLBCL) and Malt lymphoma.The gastrointestinal tract is affected in 43%, followed by head and neck with 14%, lung (2%), skin (7%), bone (5%), and brain (6-7%).On imagens one of the main characteristics is that the majority of these tumors show hyposignal in T2 sequences, enhancement on contrast and show marked restriction diffusion.Cross-sectional imaging (MRI and CT) are advised as techniques in the diagnosis, staging and follow-up, mainly in the diagnosis since many of these tumors are not surgical of first intention, therefore their recognition and accurate diagnosis make this pathology an important issue to take into account.

Carolina Carotenuto Ramos, MD (*Abstract Co-Author*) Nothing to Disclose
Helena A. Pereira, MD (*Abstract Co-Author*) Nothing to Disclose
Matheus Brunetto, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Dengue is the most important mosquito-borne viral disease in the world. The prevalence of the infection has increased dramatically in recent decades. The disease is now endemic in more than 100 countries worldwide.2. Dengue has a wide spectrum of clinical signs and symptoms, ranging from asymptomatic infection to severe, lethal manifestations. The early diagnosis of dengue can be established provisionally by clinical observation and readily available laboratory tests.3. According to the 2009 World Health Organization guidelines, patients are categorized as having the non-severe form (subdivided into those with warning signs and those without) or the severe form, according to clinical, laboratory and radiological criteria.4. Therefore, there is growing interest in the early identification of image characteristics related to disease with multisystemic representation, playing a highly relevant role in clinical management, through adequate identification, reporting and multimodality radiological characterization.

### TABLE OF CONTENTS/OUTLINE

1. INTRODUCTION- OVERVIEW- PHYSIOPATHOLOGY- DIAGNOSIS - CLINICAL FORMS2. SYSTEMIC COMPLICATIONS AND REPORTING- ABDOMINAL- THORACIC - NEUROLOGYCAL - CARDIOVASCULAR- MUSCULOSKELETAL3. FRONT LINE APPROACH - ULTRASOUND- X-RAY4. GUIDED SYMPTOM APPROACH5. CONCLUSION

## NOT ALL THAT IS STENOSED IS ATHEROSCLEROSED: THE VARIOUS FACES OF FIBROMUSCULAR DYSPLASIA AND ITS MIMICKERS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

David M. Yousem, MD, MBA (*Abstract Co-Author*) Royalties, RELX;Speaker, MRI Online;Board Member, MRI Online;
Mohab Elnashar (*Abstract Co-Author*) Nothing to Disclose
Yasmin Aly (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Understanding the pathogenesis and the histopathological characteristics of Fibromuscular Dysplasia (FMD). 2. Explore the diverse morphological presentations of FMD observed on angiograms, ranging from the common "string of beads" pattern to less familiar atypical forms such as carotid webs and artery dissections. 3. Understanding the clinical context surrounding FMD including patients' demographics and presenting symptoms. 4. Brief discussion on the differential diagnosis of FMD seen on angiographic imaging and how to differentiate them apart. 5. Illustrate the role of Radiology in treatment of FMD.

### TABLE OF CONTENTS/OUTLINE

1. Introduction: a. Definition. b. Epidemiology of FMD. c. The reason behind the growing interest in FMD. 2. Pathophysiology: a. The pathogenesis theorized leading to FMD. b. Histopathological classification of FMD. 3. Review of the different angiographic variants of FMD. 4. A case-based review: Providing sample scenarios illustrating the clinical findings and the angiographic findings of FMD. 5. Differential diagnosis of FMD on angiograms including, atherosclerosis, standing waves, segmental medial arteriolysis (SAM) and arterial tortuosity caused by multiple diseases to be discussed. 6. Summary and takeaway points.

Don N. Nguyen, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Although utilization numbers show fluoroscopy is not the cornerstone in diagnostic radiology with continued emphasis on cross sectional imaging, it is important to recognize its critical role particularly in the post-operative setting. The purpose of this educational exhibit is to familiarize radiologists with a series of cases highlighting fluoroscopic findings of worrisome complications following surgery. After review, the audience will be able to:1. Recognize different fluoroscopic studies and technique to help diagnose post-surgical complications2. Identify important fluoroscopic imaging findings that would prompt emergent intervention3. Discuss implications of different post-surgical complications on patient management, treatment and overall prognosis

### TABLE OF CONTENTS/OUTLINE

I. Background on FluoroscopyII. Types of Fluoroscopic Studies (Indications, Oral Contrast Agents, Techniques)III. Cases of Post Surgical Complications:1. Boerhaave syndrome- Post operative nausea/vomiting (Esophagram)2. Gastrobronchial fistula- Esophagectomy with gastric pull through ('Tracheobronchogram')3. Gastric pouch leak- Roux en Y gastric bypass (Upper GI series)4. Feculent peritonitis- Partial colectomy for colonic neoplasm (Barium enema)5. Vesicovaginal fistula- Hysterectomy for cervical cancer (Cystogram)IV. Review of Fluoroscopic Findings (Perforations, Leaks and Fistulas)V. Patient Management/PrognosisVI. Clinical and Imaging Pearls

## ESSENTIAL GUIDE FOR THE RADIOLOGIST IN IMAGES PREPARATION FOR SCIENTIFIC OR EDUCATION PRESENTATIONS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Orlando Catalano, MD (*Abstract Co-Author*) Nothing to Disclose
Vittoria Nunziata (*Abstract Co-Author*) Nothing to Disclose
Antonio Nunziata, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The most of the native images in Radiology are in DICOM format, not suitable for digital presentations and for rewiev articles. For this purpose they have to be converted in other formats. They have to have a suitable resolution, appropriated color codify, light compression and discreet evidence of the pathological focus. The purpose of the presentation is to give a guide to the Radiologist on how to prepare images and drawings for presentations on screen or on papery support.

### TABLE OF CONTENTS/OUTLINE

The DICOM format represents the standard used by all the builders of Radiologic equipments. The DICOM files contains patient data, type of equipment, image parameters and finally the digital image, generally in Jpeg format, with a light level of compression. The DICOM files is not suitable for screen presentation softwares (PowerPoint or similars). The images extracted in the formats JPEG, PDF, PNG, GIF can be inserted, with a resolution at least of 150 dpi ( 300 dpi in 4K screens), with RGB color codify or in the greyscale. To be printed on papery supports (blackboard panel, rewiev articles, etc.), the images possibly have to be in TIFF format, resolution of at least of 400 dpi, CMYK color codify or in greyscale. The compression deteriorates in proportional way the image quality. The various digital images, the various color modes, the effects of compression on the image quality and a final toolkit for the optimal preparation of the images are illustrated in uploaded pdf.

## EXPANDING THE DIFFERENTIAL FOR PELVIC MASSES: EXPLORING ATYPICAL PRESENTATIONS OF CLASSIC DIAGNOSES IN THE PELVIS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Ece I. Akduman, MD (*Abstract Co-Author*) Nothing to Disclose
Amirhossein Mohammadian Bajgiran, MD (*Abstract Co-Author*) Nothing to Disclose
Christopher Dilli (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The pelvis houses many structures including the rectum, bowel, bladder, reproductive organs, bone, soft tissue and lymphatics, from which myriad pathologies can arise. Pelvic masses presenting with atypical size, location, progression and arising structures can confuse the diagnosis for even the experienced radiologist. Careful comparison of key radiologic findings and diagnostic criteria between pelvic masses and their differentials is important for accurate reporting. Understanding of the pathologic basis behind pelvic masses can aid in the interpretation of their radiographic findings.

### TABLE OF CONTENTS/OUTLINE

1. Extramedullary rectal plasma cell neoplasm a. Case study b. Diagnosis and key features c. Comparisons with bone-associated plasma cell neoplasm and DLBCL 2. Pelvic extra-adrenal myelolipoma a. Case study b. Diagnosis and key features c. Comparison with teratoma, liposarcoma and lipoma 3. Pelvic schwannoma a. Case study b. Diagnosis and key features c. Comparison with spindle cell sarcoma and GIST 4. Extra-uterine leiomyosarcoma a. Case study b. Diagnosis and key features c. Comparison with uterine leiomyosarcoma and parasitic fibroid 5. Periurethral leiomyoma a. Case study b. Diagnosis and key features c. Comparisons with uterine leiomyoma and urothelial carcinoma 6. Bladder small cell carcinoma a. Case study b. Diagnosis and key features c. Comparisons with urothelial carcinoma 7. Immature teratoma a. Case study (35 cm mass from pelvis to gallbladder fossa) b. Diagnosis and key features c. Comparisons with 30 cm mature teratoma and clear cell ovarian carcinoma 8. Rectal neuroendocrine carcinoma a. Case study b. Diagnosis and key features c. Comparisons with rectal NET and adenocarcinoma

### TEACHING POINTS

1. Cancer cells originating from diverse organs, referred to as carcinosarcomas or sarcomatoid carcinomas, may be accompanied by sarcomas or sarcoma-like cells. These occurrences are uncommon, typically associated with an unfavorable prognosis, and often present challenges in terms of effective treatment. Additionally, the World Health Organization (WHO) classification is not unified for each organ. 2. In recent years, efforts have been made to identify shared characteristics among these tumors and investigate them in a cross-organ fashion. This implies that radiologists may be required to understand these tumors from a cross-sectional perspective in the future. 3. Here, we systematically compiled WHO classifications and clinical characteristics. We discussed a comprehensive, cross-sectional approach to imaging findings based on insights from our cases.

## MAMMARY-TYPE MYOFIBROBLASTOMA: LOCATIONS AND IMAGING FEATURES WITH PATHOLOGIC CORRELATION

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Ruifeng Guo (*Abstract Co-Author*) Nothing to Disclose
Ba D. Nguyen, MD (*Abstract Co-Author*) Nothing to Disclose
Steven Herber, MD, BS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. To present the epidemiology, pathogenesis, clinical manifestations and differential diagnosis of mammary-type myofibroblastoma. 2. To show the different locations of mammary-type myofibroblastoma with its multi-modality imaging including radiography, ultrasound, CT, MR and PET/CT.

### TABLE OF CONTENTS/OUTLINE

Mammary-type myofibroblastoma (MTMF) is a benign mesenchymal tumor initially reported by Wargotz et al. as a tumor in the breast of older men, also known as “benign spindle cell tumor of the breast”, “spindle cell lipoma,” “fibroma,” “myogenic stromal tumor,” or “solitary fibrous tumor” of the breast. It is theorized to arise from accessory breast tissue occurring along the embryonic milk-line from the axilla to the medial groin. Almost half of cases are found in the pelvis or inguinal region. About 25% of MTMF occur outside the embryonic milk-line, in the head and neck, abdomen, lower extremity, and to a lesser extend upper limb. The pathogenesis of mammary-type myofibroblastoma outside the embryonic milk-line distribution is still not totally elucidated. The exhibit presents the spectrum of MTMF features on ultrasound, CT, MR and PET/CT imaging and discusses their differential diagnosis based on early or advanced stages of the lesion. The exhibit also reviews the different sites of mammary-type myofibroblastoma such as pelvis, ischio-rectal region, back, retroperitoneum, inguina, thoracic wall, breast and lower extremity. An instance of recurrent tumor is also discussed and illustrated.

Matheus Brunetto, MD (*Abstract Co-Author*) Nothing to Disclose
Eduardo Gomes De Menezes JR, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Immunotherapy has revolutionized cancer management and diagnosis. Although the immune checkpoint inhibitors (ICIs) are successfully used to treat a wide variety of neoplasms, sometimes in advanced stages, they are related to patterns of disease progression and especially to negative effects or complications, named immune-related adverse events (irAEs).2. The immune-related adverse events (irAEs) should be graded according to their severity, requiring rapid recognition and management, given the spectrum of alterations, from indolent to potentially fatal. In this context, Diagnostic Imaging play a key role in front-line patient care.3. We proposed an approach based on questions and clinical cases to review the main concepts related to immunotherapy in a didactic and structured way, with a focus on clinical and radiological aspects of immune-related adverse events (irAEs).

### TABLE OF CONTENTS/OUTLINE

1. Introduction- Key Concepts about Immunotherapy - The lexicon: ICIs and patterns of progression and response 2. Immune-related Adverse Events- Grading Severity Scale- Thoracic - Pneumonitis - Sarcoid-like reaction- Cardiovascular - Myocarditis - Vasculitis - Pericarditis- Gastrointestinal - Colitis - Gastroenteritis - Hepatitis - Pancreatitis - Cholangitis - Cholecystitis- Endocrine - Hypophysitis - Thyroiditis - Adrenalitis - Musculoskeletal - Arthritis (Inflammatory)- Central Nervous System - Encephalopathy 3. ### TEACHING POINTS

To review the spectrum of incidental extraspinal findings on lumbar spine magnetic resonance imaging (MRI). To highlight imaging features of incidental extraspinal findings on lumbar spine MRI and review potential blind spots and pitfalls in commonly missed lesions.

### TABLE OF CONTENTS/OUTLINE

MRI of the lumbar spine is commonly performed in routine evaluation for low back pain. Approximately 23% of American adults report they will seek diagnostic evaluation with MRI for this indication. MRI of the lumbar spine can reveal a range of incidental extraspinal findings within the organs in the field of view. Importantly, clinically significant extraspinal findings may be treatable and a systematic approach to diagnosis may reduce delay for treatment or unnecessary medical costs. This educational exhibit will: (1) review clinically significant incidental findings on magnetic resonance imaging (MRI) of the lumbar spine with illustrative cases within musculoskeletal, vascular, gastrointestinal, endocrine, and genitourinary systems, and (2) highlight imaging features and potential blind spots in the assessment of incidental pathologies including chest wall hematoma, lymphatic metastases, retroperitoneal hemorrhage, abdominal aortic aneurysms, gastrointestinal stromal tumor, cholelithiasis, choledocholithiasis, adrenal lesions, renal cell carcinoma, and ovarian cysts.

### TEACHING POINTS

To describe the physiopathology and the radiological features of the major forms of systemic actinomycosis and their differential diagnosis.

### TABLE OF CONTENTS/OUTLINE

Actinomyces is a gram-positive branching anaerobic bacteria that causes an indolent and recurrent suppurative infection. Although it predominantly affects the cervicofacial area, it can invade nearly any organ in the organism.Early treatment is crucial and typically results in a favourable prognosis. However, the locally invasive and disseminated forms may require aggressive surgical intervention. Therefore, early diagnosis is vital for successful management.Actinomycosis is a challenging diagnosis to be made based on radiological features, as its aggressive infiltrating behavior can mimic many other diseases, including both inflammatory and neoplastic lesions, requiring frequent histological confirmation.The three main characteristics that every radiologist must keep in mind in order to recognize this disease are its chronicity, its tendency to propagate across tissue planes conforming complex abscesses, and its typical initial response to antibiotic treatment followed by continuous relapses.In this review, we present a series of cases involving different forms of this condition, including cervicofacial, intestinal, gynaecological, genitourinary, thoracic, and central nervous system manifestations, summarizing the key imaging features and their differential diagnoses to aid in accurate identification and timely management of the disease.

## WORKLOAD ASSESSMENT OF SURGERY-ASSISTED SIMULATION USING VIRTUAL REALITY TECHNOLOGY: A WORKLOAD STUDY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Hirotaka Nakashima, MSc, RT (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. 3D images can be observed from multiple directions in a virtual reality space, enabling a different kind of surgical simulation.2. A questionnaire survey using the NASA Task Load Index was conducted to investigate the workload of the new surgery-assisted simulation.3. The survey was administered to 15 subjects (7 orthopedic surgeons from the Spine Center and 8 thoracic surgeons).4. Compared to the conventional simulation method using monitors, the overall workload remained the same and resulted in improved work performance.

### TABLE OF CONTENTS/OUTLINE

To ensure a smooth and safe surgery, it is crucial to have a thorough understanding of the location and arrangement of blood vessels and anatomical structures beforehand. While surgical simulations using 3D images have been developed, there are limitations in accurately reproducing the surgical field due to the use of 2D monitors for observation. In recent years, virtual reality (VR) technology has gained momentum in surgical simulations, enabling objects to be viewed from all angles within a virtual space, and providing an easier grasp of the positioning of structures. However, there are concerns about the potential for increased physician burden. To address this concern, we conducted an experiment comparing the workload of surgical simulations using VR technology to those using conventional 2D monitors, utilizing NASA's Task Load Index. The results revealed that surgical simulation using VR technology improved work performance without increasing physician workload compared to the conventional method. These findings suggest that VR technology has the potential to enhance surgical simulations and improve patient outcomes.

### TEACHING POINTS

To describe the extranodal manifestations of lymphoma and the imaging findings. To illustrate the imaging spectrum of extranodal lymphoma.

### TABLE OF CONTENTS/OUTLINE

Lymphoma has the potential to impact virtually every abdominal organ and tissue, resulting in a variety of imaging spectrums. Lymphoma usually presents with nodal disease, which includes the involvement of the lymph nodes, thymus, tonsils, and Waldeyer's ring. Involvement of other organs is considered extranodal disease, except for splenic involvement, which is considered nodal in Hodgkin Lymphoma (HL), and extranodal in Non-Hodgkin Lymphoma (NHL). Extranodal involvement indicates a worse prognosis and can simulate other diseases. Common locations of abdominal extranodal lymphoma include the spleen, liver, and gastrointestinal tract. Among them, primary extranodal lymphoma is very rare, with secondary involvement more frequently found with another primary neoplasm. In both cases, extranodal affectation is more common in NHL than in HL. Although the definitive diagnosis is with biopsy, imaging techniques have an important role in the management of extranodal lymphoma.

### TEACHING POINTS

Illustrate differences between a pitfall and a mimic in the setting of oncological imaging.Provide case-based review of various oncological pitfalls and mimics in the abdomen and pelvis.

### TABLE OF CONTENTS/OUTLINE

Pitfalls • Spontaneous regression of primary malignancy HCC; Burnt out seminoma • Neoplasms resembling benign entities Cystic pancreatic NET, Cystic RCC, Mucinous GI malignancy, Adrenal mets from HCC or RCC, Pheochromocytomas. • Eye-catching benign pathology with superimposed malignancy Rectal hemangioma with superimposed malignant mass. • Peri-organ infiltration of malignancy resembling benign entities: Biliary lymphoma, linitis plastica, infiltrative TCC. • Progression of disease Growing teratoma syndrome; pseudoprogression in the setting of immunotherapy. • Prozone effect Choriocarcinoma • Concomitant complications: Ovarian torsion with adnexal tumors. Mimics • Benign tumors with aggressive appearing features Renal AML, uterine leiomyoma with IVC thrombus; endometriosis; Sternberg tumor; subserosal uterine adenomyomatous polyp. • Benign entities with malignant appearing enhancement patterns: Hepatic splenosis, splenic PSA.• Infection/inflammation looking like malignancy BCG prostatitis, XG cholecystitis, IgG4 pancreatitis, Actinomycosis, peritoneal TB or disseminated fungal infection.• Foreign body reactions Gossypiboma, gluteal silicone granulomatosis, mesh plug, bulking agents. • Anatomical structures mimicking masses Colonic diverticulosis, gastric fundal diverticulum, ectopic pancreatic rest, Meckel's diverticulum.

## THE RADIOLOGICAL PALETTE OF ABDOMINAL LYMPHOMA

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Yashant Aswani, MD (*Abstract Co-Author*) Nothing to Disclose
Harshitha Shetty, MBBS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. To describe the risk factors, etiopathogenesis, classification and staging of lymphoma. 2. To illustrate the salient imaging features and spectrum of appearances of lymphoma in the abdomen 3. To discuss the imaging features of extranodal lymphoma from other organ-specific neoplastic and inflammatory mimics.

### TABLE OF CONTENTS/OUTLINE

1. Etiopathogenesis of lymphoma with risk factors for the various organ-specific lymphomas • Bacterial infection- H. pylori, Viral infection- EBV, HTLV, HIV • Immunosuppression- Post transplant lymphoproliferative disorder • Inflammatory diseases- Celiac disease, Atrophic gastritis 2. Classification - 2022 WHO classification of tumors of hematopoietic and lymphoid tissues based on the cell of origin (B cell, T cell, NK cells) and further categories. 3. Staging of lymphoma. 4. Imaging features of lymphoma in the abdomen • GI: Stomach, duodenum, ileum, appendix, colon • Hepatobiliary and pancreas • GU: Adrenal, renal/perirenal, ovarian and testicular • Splenic • Lymph nodal 5. Imaging mimics of lymphoma • Hepatic lymphoma- liver abscess, tubercular granuloma, metastatic liver lesion • Pancreatic lymphoma- pancreatic adenocarcinoma, autoimmune pancreatitis • Nodal lymphoma- disseminated tuberculosis, metastasis • Adrenal lymphoma- adrenal tuberculosis, histoplasmosis, adrenocortical carcinoma • Renal/perirenal lymphoma- IgG4-related retroperitoneal fibrosis, Erdheim-Chester disease, Rosai-Dorfman disease, retroperitoneal lymphatic malformation • Ovarian lymphoma- ovarian metastasis, malignant epithelial ovarian cancers 6. Discuss the treatment and post-treatment imaging appearances of lymphoma.

## IDENTIFYING ADVERSE EFFECTS OF IMMUNOTHERAPY: KEY CONSIDERATIONS FOR RADIOLOGISTS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Alvaro Rueda-de-Eusebio, MD (*Abstract Co-Author*) Nothing to Disclose
Maria Guerrero Martin (*Abstract Co-Author*) Nothing to Disclose
Maria del Carmen Polidura Aaruga, MBBCHIR (*Abstract Co-Author*) Nothing to Disclose
Natividad Gomez JR, MD (*Abstract Co-Author*) Nothing to Disclose
Sonia Lon, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The use of immune mediated treatment of cancer is improving dramatically the patient's outcome and comfort, but it also carries new toxicity profiles. While standard antineoplastic therapy is associated with immunosuppression and infections, these new therapies induce overwhelming inflammation and autoimmunity. The vast majority of these adverse events can be classified as mild or moderate, but severe and life-threatening complications requiring ICU admission can also occur.A considerable part of adverse effects related to immunotherapy can be diagnosed by imaging methods. This situation makes the role of the radiologist key when it comes to optimizing treatment individually for each patient, taking into account the risks and benefits of the different therapies.This review will focus on the radiological approach to the new challenge that is to make an accurate and early diagnosis of these complications.

### TABLE OF CONTENTS/OUTLINE

## UNVEILING THE UNINTENDED AND BEYOND THE OBVIOUS: EXPLORING INCIDENTAL FINDINGS IN CT KUB EXCLUDING STONES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Pratik Mukherjee, MBBS, FRCR (*Abstract Co-Author*) Nothing to Disclose
WAKADE AKSHAY DIPAKRAO, FRCR, MMEd (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Non-urinary and Urinary pathologies excluding stones are commonly seen on CT KUB studies, some of which are potentially life threatening.2. It is essential for radiologists to look out beyond stones, both for the expected mimics and more importantly for the unexpected significant incidentals.3. Timely early workup and intervention in these subset of cases can potentially reduce mortality, morbidity and improve patient outcomes by changing the management.

### TABLE OF CONTENTS/OUTLINE

Definition Computed tomography of kidneys, ureters and bladder (CT KUB) is a quick, non-invasive technique for diagnosis of urolithiasis. It is usually considered the initial imaging modality for suspected urolithiasis in an emergency setting.CT KUB is also advantageous to detect alternate cause of flank pain. Apart from calculi and mimics of urinary colic, often significant incidental significant findings affecting a wide range of organs is detected. It is interesting to note, that most of these findings are not clinically suspected at the time of presentation.Following are few of the examples of patients who presented with flank pain/renal colic but various other incidental findings are detected:Genito-urinary Renal Cell Carcinoma, Ovarian Dermoid cyst.Hepatobiliary Acute calculous cholecystitis, Multiple Hepatic abscesses, Cystic Pancreatic mass.Gastrointestinal Acute Appendicitis, Appendicular phlegmon, Appendix mucocele, Acute colonic diverticulitis, Intussusception, Sigmoid Carcinoma with hepatic metastasis.Vascular Aortic dissection, Aortic aneurysm.Musculoskeletal Multiple myeloma, Spondylodiscitis with psoas abscess.Miscellaneous Lymphoma, Retroperitoneal fibrosis.

## AN AESTHETIC NIGHTMARE. THE US, CT, PET-CT, AND MRI DETECTION OF SILICONE OIL: WHAT THE RADIOLOGIST NEEDS TO KNOW

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Guillermo P. Sangster, MD (*Abstract Co-Author*) Nothing to Disclose
Ximena L. Wortsman, MD (*Abstract Co-Author*) Speakers Bureau, AbbVie Inc;Royalties, Springer Nature
Carolina Andrea Mariluis (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Silicone oil is a non-FDA-approved permanent filler injected in many countries for cosmetic purposes. It presents a high rate of complications, and its detection should be familiar to any radiologist.- Ultrasound is the first-choice imaging technique due to its high sensitivity in distinguishing cosmetic fillers. Silicone oil presents as hyperechoic deposits that show a diffuse posterior acoustic reverberance, also known as a “snowstorm” artifact.- Magnetic resonance imaging (MRI) silicone oil-specific sequences can provide an accurate extent of the deposits.- The “Bright Multi-Bubble sign” identified in T2 and STIR sequences can be useful for diagnosis in cases of lack of silicone-specific sequences.- Radiologists have a critical role in diagnosing and characterizing this filler and its complications.

### TABLE OF CONTENTS/OUTLINE

1. To Illustrate expected imaging findings and complications in patients receiving silicone oil injections.2. To depict common and uncommon imaging patterns in ultrasound (US), computed tomography (CT), PET-CT, and MRI exams.3. To discuss the most common differential diagnosis.4. Proposal of a new radiological sign for MRI exams: Bright Multi-Bubble sign.

## EXPLORING LIPEDEMA ULTRASONOGRAPHIC FINDINGS AND CLINICAL IMPLICATIONS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Marco de Andrade Bianchi (*Abstract Co-Author*) Nothing to Disclose
Deise Vargas (*Abstract Co-Author*) Nothing to Disclose
Amanda Martins E. Ribeiro Dos Santos, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Lipedema is a chronic condition characterized by the disproportionate accumulation of fat in the limbs, especially in women after puberty, with an estimated prevalence of 12.3% in the population of Brazilian women. Its clinical significance lies in the impact on the patient's quality of life due to symptoms. The purpose of this article is:- Definition and Clinical Relevance of Lipedema.- Demonstration of Lipedema Presentation on Ultrasound Image.- Presentation of the “Marbleized Pattern” in Morphological Evaluation via Ultrasound as an Auxiliary Diagnostic Criterion.

### TABLE OF CONTENTS/OUTLINE

- Description of lipedema, a condition characterized by disproportionate fat accumulation, and its analysis by ultrasound.- Retrospective analysis of ultrasound exams to identify morphological differences in the hypodermis of patients with and without lipedema.- Identification of a specific morphological pattern, termed "marble pattern," in patients with lipedema during ultrasound exams.- Discussion on the utility of morphological evaluation of the hypodermis by ultrasound in the diagnosis and clinical management of lipedema.- Exploration of the clinical implications of identifying the “marble pattern” and recommendations for the diagnosis and treatment of lipedema based on ultrasound findings.In summary, the diagnosis of Lipedema through ultrasound is something recent, still frequently confused with more frequent conditions and this work brings the morphological assessment of the hypodermis through ultrasound as auxiliary diagnostic classifications and mapping of the disease.

### TEACHING POINTS

Understand the ecology and context of animal vs human traumas; Describe common and unique injury mechanisms related to animal vs human traumas; Recognize radiological manifestations of these encounters; Describe the prognoses and treatment options of the associated injuries;

### TABLE OF CONTENTS/OUTLINE

Introduction Throughout human history, human encounters with animals have often resulted in traumatic injuries. These incidents occur across various settings, including agricultural, wild, domestic, and recreational environments. In this exhibit, we explore the spectrum of traumatic injuries stemming from these encounters, including their mechanisms of injury and radiological manifestations, with a special focus on potential findings from post mortem CT examinations. Context Recreational (Rodeo, equestrian, circus, personal exotic animals); Agricultural/Farming (Cow/bulls, pigs, poultry, sheep); Domestic (Dogs, cats, pigs, reptiles); Wild (Bears, big game cats, deer, moose reptiles)Mechanisms of injury, radiological manifestations, prognoses, and treatments Osseous: Fractures, dislocations; Neurologic: Concussion, bleeding, and other Soft tissue: Amputation, ligament/tendon injury, bite, laceration, impalement/gouging, cellulitis/infection, predation;Conclusion

Kate Hanneman, MD, MPH (*Abstract Co-Author*) Speaker, Groupe Sanofi;Speaker, Amicus Therapeutics, Inc
Felipe A. Sanchez, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Approximately 30% of lymphomas arise from sites other than the lymph nodes. Extranodal involvement can occur in extensive nodal or multisystemic disease (secondary lymphoma) or in the absence of noticeable lymph node enlargement (primary lymphoma).
- Noninvasive imaging plays a crucial role in the diagnosis of extranodal lymphoma. Findings suggestive of extranodal disease can be identified on multiple modalities, including X-ray, CT, MR, and PET.
- Extranodal lymphoma can involve virtually any organ in the body and mimic various benign and malignant pathologies. Concomitant multiorgan involvement, splenomegaly, and lymphadenopathy identified on imaging is a key indication of the potential diagnosis.
- The majority of the cases are caused by non-Hodking lymphoma, and diffuse large B-cell lymphoma is the most common subvariant. The objective of this educational exhibit is to demonstrate the appearance of primary and secondary lymphoma across multiple organ systems and imaging modalities, with a focus on practical tips and differential diagnosis.

### TABLE OF CONTENTS/OUTLINE

- Background
- Types of lymphoma
- Primary versus secondary lymphoma
- Imaging modalities: strengths and limitations
- Sites of involvement: a) CNS, b) Head and neck, c) Thoracic, d) Cardiac/pericardial, e) Gastrointestinal, f) Genitourinary, g) Solid abdominal organs, h) MSK
- Conclusion

Pompeu Pascual, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- To expose the radiological findings of angiosarcoma on CT-scan and MRI in different organs and systems.- To review the histological and immunophenotypic characteristics of angiosarcoma.

### TABLE OF CONTENTS/OUTLINE

- Introduction. Angiosarcoma is a rare malignant mesenchymal tumor with endothelial differentiation and very poor prognosis that may arise in different locations. The most common presentation is as cutaneous angiosarcoma, although it can also appear in soft tissue, bone, breast, and solid organs such as liver, spleen, ovary and heart. Hematogenous spread is the hallmark of this disease, with metastatic lesions appearing most frequently in lung, liver, and bone.- Diagnosis. The diagnosis of angiosarcoma is initially suspected based on imaging findings which must be confirmed by histological study. CT-scan and MRI are useful techniques both for diagnosis and for detecting complications such as spontaneous bleeding. In turn, the biopsy confirms the diagnosis and evaluates the tumor's aggressiveness.- Our experience. This study presents a comprehensive review of the radiological findings in a series of 74 angiosarcomas diagnosed at a single institution between 2000 and 2023, and the main histological and immunophenotypic features of these tumors.

### TEACHING POINTS

- Global incidence of dengue fever has grown dramatically, with an estimated 100-400 million infections occurring each year, primarily in tropical and subtropical areas.- Although most of the patients have no or mild symptoms, a change in the spectrum of clinical manifestations has been recently noted with some specific complications being recognized more frequently, specially related to endothelial dysfunction in diverse systems.- Imaging techniques including ultrasound, computed tomography (CT), magnetic resonance imaging (MRI), and positron emission tomography (PET) have yielded valuable insights into the pathophysiological mechanisms and associated complications of dengue fever.- This pictorial review aims to illustrate the diverse spectrum of imaging manifestations across different organ systems in dengue fever, highlighting the applications of imaging techniques in diagnosing complications and guiding therapeutic interventions.

### TABLE OF CONTENTS/OUTLINE

1. Background- Epidemiology and pathogenesis- Clinical diagnosis: warning signs and severe dengue (hemorrhagic fever and shock syndrome)- Laboratory diagnosis2. Multimodality Imaging: applications, strengths, and limitations3. Neurological findings: encephalopathy, encephalitis, dengue-associated stroke and neuromuscular complications4. Thoracic findings: lungs, pleura, and heart5. Abdominal findings: gallbladder, liver, spleen, abdominal compartment syndrome 6. Other findings and clinical scenarios: viral arthritis, pregnancy, post-dengue syndrome7. Take home messages

### TEACHING POINTS

To delineate the spectrum of imaging findings observed in various paraneoplastic syndromes and illustrate the clinical manifestations precipitated by these syndromes.

### TABLE OF CONTENTS/OUTLINE

Paraneoplastic Syndromes (PNSs) compromise a constellation of disease manifestations arising from underlying neoplasms without direct tumor invasion. They lead to a range of symptoms affecting different organs or systems, complicating diagnosis and treatment.These manifestations, often mediated by cytokines, hormones, or immune reactions, include endocrine, neurological, rheumatological/dermatological, hematologic, and miscellaneous syndromes. Based on our clinical experience, we have encountered numerous paraneoplastic syndromes.This presentation utilizes radiological images sourced from our institution to elucidate the underlying radiographic findings defining these syndromes.Early identification is crucial for optimal management and patient prognosis. Radiologists must be familiar with common PNSs and their distinct imaging features to facilitate timely diagnosis and treatment.

NMMIEE

**Nuclear Medicine & Molecular Imaging Education Exhibits**

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Sub-Events**

## NMMIEE-1 BOMBARDMENT TO BEDSIDE: BEHIND THE SCENES OF NUCLEAR MEDICINE

Prem P. Batchala, MD (*Abstract Co-Author*) Nothing to Disclose
Wayne Dell, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

We recognize that there is limited exposure of radiology trainees to "behind the scenes" events during their 16 week exposure in Nuclear Medicine. However, understanding the events that lead to gamma and PET image production is critical in guiding patient preparation, as well as understanding technologist/patient/public safety, radiotracer biodistribution, and artifacts that influence interpretation. In this exhibit we attempt to highlight important practical steps involved in the most common nuclear medicine exams focused towards radiology trainees.

### TABLE OF CONTENTS/OUTLINE

1. Synthesis of most common radionuclides (99mTc, 18F) and radiopharmaceuticals including QA/QC procedures (e.g. Impurity testing)2. Radiopharmacy, Labeling methods (e.g. 99mTc labeling of RBCs, WBCs, sulfur colloid)3. Transport and receipt of radiopharmaceuticals4. Dose calibrator, radiopharmaceutical administration5. Area surveys, Waste disposal6. Camera (Gamma and PET) QC7. NRC guidelines, Authorized user, written directive

## NMMIEE-10 18F-FLUOROESTRADIOL (FES) PET IMAGING: INDICATIONS, IMAGING REVIEW AND IMPACT ON CLINICAL MANAGEMENT OF ESTROGEN RECEPTOR POSITIVE BREAST CANCER

Janice Thai, MD (*Abstract Co-Author*) Nothing to Disclose
Rachel E. Grenier, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1) To review indications and relative indications for 18F-Fluoroestradiol (FES) PET. 2) To demonstrate how FES PET is used to direct clinical management in patients with estrogen receptor (ER) positive breast cancer. 3) To review current limitations of FES PET.

### TABLE OF CONTENTS/OUTLINE

1) Indications for FES PET, including a) Official U.S. Food and Drug administration (FDA) approval, and b) Society of Nuclear Medicine and Molecular Imaging (SNMMI) appropriate use criteria. 2) Mechanism of action and normal biodistribution of FES. 3) Highlight clinical cases in which FES PET was used and how it impacted patient management, specifically: a) Diagnosing progression of metastatic disease in lieu of biopsy; b) Distinguishing between skeletal degenerative change and metastases; c) Diagnosing tumor recurrence that would not have otherwise been identified on diagnostic CT, F18-FDG PET or Tc-99m methylene diphosphonate (MDP) bone scan; and d) Differentiating between post treatment change and tumor recurrence.

## NMMIEE-11 REVISITING CLASSICAL NUCLEAR MEDICINE: THYROID AND SALIVARY GLAND SCINTIGRAPHY IN MODERN RADIOLOGY

### TEACHING POINTS

The objective of this exhibition is:Highlight radiological signs of response in patients with neoplasia after the use of yttrium-90 in different imaging modalities, including magnetic resonance imaging (MRI), computed tomography (CT) and PET-CT;Identify possible adverse effects of local therapy with TARE that are already known and associate them with the success or failure of this therapy;Understanding possible post-treatment changes is essential for correct radiological interpretations during the follow-up of patients undergoing TARE.Provide practical information and pitfalls in the interpretation of radiological manifestations, including radiopharmaceutical response time, differentiation between imaging findings directly related to neoplastic disease and secondary but expected manifestations.

### TABLE OF CONTENTS/OUTLINE

Hepatocellular carcinoma (HCC) is the most common primary liver cancer and the second most common cause of cancer mortality worldwide. This growing incidence has led to the evolution of treatment for HCC and several techniques have emerged, including everything from surgical resection to local ablation, transplantation, transcatheter arterial chemoembolization (TACE), TARE and systemic treatments, in order to reduce morbidity and mortality. Therefore, correct and individualized treatment planning is essential to obtain good results.Among the treatment options, TARE using yttrium-90, also called radioembolization or selective internal radiotherapy, has been gaining prominence and is based on a technique involving nuclear medicine and interventional radiology accepted for the treatment of HCC.

## NMMIEE-13 DON’T TREMBLE: USE OF PET MRI IN PARKINSON DISEASE AND ATYPICAL PARKINSONIAN SYNDROMES

Majid Assadi, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. 68Ga-Fibroblast Activation Protein Inhibitor (FAPI) provides a readout to quantitatively measure the levels of activated fibroblasts in Interstitial Lung Diseases (ILD) with two common histological features, inflammation and fibrosis, regardless of their underlying causes. 2. GGO as a challenging finding on HRCT, raises questions about whether it represents inflammatory changes or interstitial fibrosis. 3. Distinguishing between inflammatory and fibrotic processes is crucial for treatment decisions, therapies focusing on inflammation may not work for patients with dominant fibrosis, while antifibrotic agents may be ineffective for patients with dominant inflammation. 4. FAP imaging is able to differentiate between regions of the lung with active fibrotic remodeling and those without fibrosis.5. The combination of 68Ga-FAPI PET/CT and HRCT yields an additive effect for evaluating ILD-related fibrosis and inflammatory processes over using either modality alone. 6. FAP-positive signals in the entire lung, suggesting different stages of fibrosis. Patients with many FAP-positive cells may be in active fibrosis, while those without may have stable fibrosis.

### TABLE OF CONTENTS/OUTLINE

1. FAPI imaging differentiates inflammatory changes and interstitial fibrosis2. Accurate and precise treatment approach for patients with dominant fibrosis using FAPI imaging3. Giving valuable insights into the complexities associated with ILD using FAPI imaging4. The different scenarios of either inflammation or active fibrosis based on FAPI imaging and HRCT.5. The potential diagnostic value of FAPI imaging in identifying tissue remodeling associated with chronic inflammations throughout the body.

## NMMIEE-15 FIBROBLAST ACTIVATION PROTEIN INHIBITOR (FAPI)- A NEW FRONTIER IN CARDIAC IMAGING

Narges Jokar (*Abstract Co-Author*) Nothing to Disclose
Esmail Jafari (*Abstract Co-Author*) Nothing to Disclose
Mohammadreza Pourbehi (*Abstract Co-Author*) Nothing to Disclose
Majid Assadi, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

New FAP-targeting PET radiotracers that originally developed for oncologic imaging could serve as a noninvasive method for evaluating the active and fibrosis process process in the early days after myocardial infarction in a patient. Advantages are myocardial imaging with FAPI is Identification of early changes in fibroblast dynamics and profibrotic activity. Identification of subjects at elevated risk of heart failure Identification of patients who may benefit most from specific therapeutic interventions directed against adverse interstitial myocardial fibrosis. Differentiation between active and end-stage disease Monitoring of disease progression and treatment response Enhancing patient care and clinical outcomes Identifying active myofibroblasts would enhance comprehension of their presence in the injured myocardium. Assess the effectiveness of antifibrosis treatments. Offers indirect clues about the extent of fibrogenesis or collagen deposition. Potentially pinpointing a critical time window for preventing fibrosis. FAPI myocardial imaging should be aligned with the advancements in understanding cardiac fibrosis and the development of targeted antifibrotic interventions

**TABLE OF CONTENTS/OUTLINE**

1. Uptake distribution of 68Ga-FAPI-46 presumably representing worsening myocardial stiffness2. The FAPI tracer signal contribute to the development of interstitial fibrosis.3.FAPI imaging for assessing the active fibrosis process, which may persist as a chronic condition.4. Potential diagnostic value of FAPI imaging in identifying tissue remodeling throughout the body5. Dual tracers may improve the diagnostic accuracy for characterizing fibroinflammatory processes.

## NMMIEE-16 ENLIGHTENING RECTAL CANCER: [18F]FDG PET/MRI, A USEFUL TOOL FOR PRECISE STAGING

Diego Cecchin, MD (*Abstract Co-Author*) Nothing to Disclose
Carlo D'Alessandro, MD (*Abstract Co-Author*) Nothing to Disclose
Emilio Quaia, MD (*Abstract Co-Author*) Speakers Bureau, Bracco Group
Filippo Crimi, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Pietro Zucchetta (*Abstract Co-Author*) Nothing to Disclose
Gaya Spolverato (*Abstract Co-Author*) Nothing to Disclose
Giovanni Sussan, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Colorectal cancer, the most common gastrointestinal malignancy globally and the third leading cause of cancer-related death, includes rectal cancer, which comprises about one-third of cases. Guidelines recommend MRI for local staging and contrast-enhanced CT for detecting distant metastases. [18F] FDG PET/MRI appears to be a valuable tool for achieving highly precise diagnoses:
- It has been observed that the tumor response to pCRT often involves replacement of viable tumor tissue with fibrosis. Consequently, tumor understaging in this context may stem from the limitations of PET/CT to detect small clusters of residual disease. PET/MRI appears capable of accurately restaging patients following pCRT;
- [18F]FDG PET/MRI could increase the detection rate of potentially metastatic lymph nodes in rectal cancer patients;
- For M staging, [18F]FDG PET/MRI outperformed [18F]FDG PET/CT and CT in detecting metastases in solid organs, whereas it performed worse for lung metastases.

**TABLE OF CONTENTS/OUTLINE**

1) T-staging: the capability of [18F]FDG PET/MRI to precisely detect lesions remains intact even in the presence of local fibrosis; 2) N-staging: especially in cases of uncertainty, the combination of [18F]FDG PET/MRI detects hypermetabolic lymph nodes more effectively than MRI alone; 3) M-staging: [18F]PET/MRI provides high soft-tissue contrast, making it useful for examining solid organs such as the liver. Additionally, it can be utilized with specific MRI sequences, such as DWI, as needed.

## NMMIEE-17 CLINICAL EFFICACY AND PITFALLS OF DEEP LEARNING-BASED RECONSTRUCTION FOR PET IMAGING

Ryuji Akita, RT, MS (*Abstract Co-Author*) Nothing to Disclose
Kazuo Awai, MD (*Abstract Co-Author*) Research Grant, Canon Medical Systems Corporation;Research Grant, Hitachi, Ltd;Research Grant, Fujitsu Limited;Research Grant, Nemoto Kyorindo co, Ltd;Research Grant, FUJIFILM Holdings Corporation

Fuminari Tatsugami, MD (*Abstract Co-Author*) Nothing to Disclose
Mana Ishibashi (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Recently, Deep Learning-based Reconstruction (DLR) for PET imaging has been developed to provide higher signal-to-noise ratio (SNR) images. In the training process of the DLR, the DLR for PET iteratively optimizes filters of its deep convolutional neural network (DCNN) layers to minimize the differences between low-quality images (noisy image) and their paired high-quality images (targets), and the trained DLR can be applied to new data to output new high-quality images. Image quality was significantly improved with DLR-PET compared to conventional PET/CT images. The noise reduction and improved lesion-normal tissue contrast achieved with the DLR-PET may improve lesion detectability and allow more accurate prediction of treatment response. In addition, the PET image quality is maintained with shorter acquisition time or low doses. On the other hand, lesions that appear to have faint or mild FDG uptake on conventional reconstructed PET images may be false-positive due to overall increased uptake on the DLR-PET, so careful interpretation is required.

**TABLE OF CONTENTS/OUTLINE**

1. Principle of Deep Learning-based Reconstruction (DRL) for PET imaging 2. Results of our phantom study 3. Clinical case presentation 4. Pitfalls in interpretating the DLR images for PET 5. Future aspects of the DLR for PET imaging

## NMMIEE-18 FLUORESCENT INSIGHTS: A NUCLEAR MEDICINE GUIDE TO MUSCULOSKELETAL INFECTIONS

Harikrishnan Nandakumar, MD (*Abstract Co-Author*) Nothing to Disclose
David J. Lubin, MD (*Abstract Co-Author*) Nothing to Disclose
Sukrita Menon, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Understand the mechanism and common uses of conventional radionuclides utilized for musculoskeletal (MSK) scintigraphic imaging.2. Primary categories of adult MSK infections: Exploring various NM studies in each category which are helpful aids to conventional imaging.3. Review the radionuclide imaging algorithm to assess and choose the best modality optimized for each infection category.4. Explore the utility of hybrid NM techniques in differentiation infection from other pathology in the same region (prosthetic infection vs aseptic prosthetic loosening).5. Fundamental challenges and issues with conventional NM techniques such as false positives/negatives.6. Discuss upcoming developments (new radionuclides and techniques) and their potential role in revolutionizing current understanding of NM studies.

**TABLE OF CONTENTS/OUTLINE**

1.Conventional radionuclides and techniques in MSK scintigraphy: Mechanism and clinical indication (Bone Scintigraphy, Ga 67, Labelled leucocyte scintigraphy, In-111, F18-FDG, Ga 68). 2.Primary categories of adult MSK infectionsa. Peripheral Osteomyelitisb. Spondylodiscitisc. Prosthetic Joint Infection 3.Nuclear medicine imaging algorithm for study selection for adult MSK infections. 4.Hybrid NM techniques- SPECT/CT with 99mTc, Ga67, F18 FDG PET/CT, PET/MR 5. Fundamental diagnostic challenges with conventional scintigraphy.6. Future of NM in MSK infections - New techniques and radionuclides. a. Gallium-68-Citrate (68Ga) b. Tc labelled Interleukin-8 c. Sodium Fluoride (18F-NaF) d. Radiolabelled Antibiotics. Novel PET Tracers like 68Ga-NOTA-UBI, 18F-maltohexaose, nanopeptides etc.f. Dynamic whole-body multiparametric PET imaging.

## NMMIEE-19 LIVER METASTASES FROM UVEAL MELANOMA: MRI VERSUS FDG PET/CT

Ciara OBrien (*Abstract Co-Author*) Nothing to Disclose
Claudia Ortega Mogilevich, MD (*Abstract Co-Author*) Nothing to Disclose
Vanessa Murad, MD (*Abstract Co-Author*) Nothing to Disclose
Aleena Malik, BSC (*Abstract Co-Author*) Nothing to Disclose
Zeyad Elias (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. To demonstrate on a case-review basis, the role of MRI and FDG PET/CT in detection of uveal melanoma liver metastases.2. To review the classic imaging features of uveal melanoma metastases on MRI and demonstrate, through a case series, the variable degree of FDG uptake in this particular entity.3. Raise awareness among general radiologists that uveal melanoma liver metastases can exhibit low or variable radiotracer uptake in PET/CT scans, which may aid in avoiding false-negative restaging based solely on PET results.

**TABLE OF CONTENTS/OUTLINE**

1. Background demographics of mucosal versus non-mucosal melanomas.2. Description of diagnosis, natural history, and therapy options for uveal melanoma.3. Depict on a case-review series MRI features of liver metastases and their correlation with FDG PET/CT modality.4. Assessment of potential reasons for the variable degree of FDG uptake in this particular entity that behaves different than highly FDG avid mucosal melanomas.5. Conclusions

## NMMIEE-2 ALL THAT GLITTERS ISN'T GOLD: FALSE POSITIVES AT PSMA PET/CT

**Awards**
**Certificate of Merit**

Austin Pantel, MD (*Abstract Co-Author*) Institutional research support, Lantheus Holdings;Consultant, Blue Earth Diagnostics Ltd;Consultant, General Electric Company;Consultant, Lantheus Holdings

Ali Salehpoor, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Prostate-specific membrane antigen (PSMA) is a membrane protein that is over-expressed in high-risk prostate cancer. PSMA-targeted PET/CT is a valuable tool for detection, staging, and restaging of prostate cancer. However, many non-prostatic malignancies are known to express the PSMA receptor and thus may be seen on PSMA-targeted PET/CT. Knowledge of the biodistribution of PSMA-targeted radiopharmaceuticals and potential false positives is crucial in preventing misdiagnosis and unnecessary treatment. After reviewing this exhibit, radiologists will: 1) Understand normal biodistribution of PSMA as seen on PSMA-targeted PET/CT, 2) Identify causes of uptake that are not due to prostate cancer, and 3) Identify non-prostatic malignancies that express the PSMA receptor and which may have uptake on PSMA-targeted PET/CT.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction a. Overview of the PSMA membrane protein b. Overview of PSMA-targeted PET/CT 2. Normal physiologic distribution seen on PSMA-targeted PET/CT a. Lacrimal, salivary glands b. Kidneys c. Liver d. Spleen e. Bowel f. Ganglia (such as celiac and stellate ganglia) g. Normal excretion in urine 3. False positives a. Granulomatous disease b. Bone pathology i. Paget's disease ii. Fibrous dysplasia iii. Healing fractures c. Benign soft tissue lesions i. Schwannoma ii. Meningioma iii. Hemangioma d. Malignant lesions i. Renal cell carcinoma ii. Lymphoma iii. Thyroid carcinoma iv. Multiple myeloma v. Neuroendocrine tumor vi. Gastrointestinal stromal tumor 4. Conclusion

## NMMIEE-20 MOST PROMISING "THE HOPEFUL EIGHT" RADIONUCLIDES FOR TARGETED ALPHA THERAPY: A BOOM TO THE FUTURE OF NUCLEAR MEDICINE

Johnny Yang, BS, BA (*Abstract Co-Author*) Nothing to Disclose
Nicholas Gatto, DO, MS (*Abstract Co-Author*) Nothing to Disclose
Lasya Daggumati (*Abstract Co-Author*) Nothing to Disclose
Vani Vijayakumar, MD (*Abstract Co-Author*) Nothing to Disclose
Marjorie Lam (*Abstract Co-Author*) Nothing to Disclose
Chanukya Cherukuri (*Abstract Co-Author*) Nothing to Disclose
John Hollis Tackett, BS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To outline the strengths weaknesses of the eight radionuclides with great potential for use in targeted alpha therapy.To describe potential clinical uses and applications for each of these radionuclides.

**TABLE OF CONTENTS/OUTLINE**

Visualization of radionuclide distribution on imaging and the irradiation of malignant cells are two of the primary goals of Nuclear Medicine. An advantageous method of treating malignancies is through targeted radionuclide therapy (TRT), as it delivers highly concentrated doses of radiation directly to tumor cells or to the surrounding microenvironment, while being a minimally invasive procedure. Targeted alpha therapy (TAT) is a form of TRT that focuses on alpha-emitting radionuclides. To provide the most efficacious treatment through TAT, the radionuclide decay pathway, particle emission range, relative biological effectiveness, and physical characteristics (half-life, method of production, radionuclidic purity, etc.) and biochemical characteristics (in-vivo stability, tissue targeting, toxicity, etc.) must be considered and optimized for the chosen radionuclide.Recently, studies have shown that there are eight alpha-emitting radionuclides with the most potential for use in targeted alpha therapy: actinium-225, astatine-211, bismuth-212, bismuth-213, lead-212, radium-223, terbium-149, and thorium-227. This exhibit will discuss these radionuclides in detail, exploring their potential applications in a clinical setting and the advantages and disadvantages for each.

## NMMIEE-21 [18F]FDOPA HYBRID PET/ MRI. AN EXPLORATION IN THE DIAGNOSIS OF TUMOR VIABILITY FROM TREATMENT-RELATED CHANGES IN BRAIN TUMOURS

Michal Pudis (*Abstract Co-Author*) Nothing to Disclose
Marina Suarez-Pinera (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

• The assessment of treatment response in brain tumours and, more specifically, the differentiation between tumour recurrence and treatment related changes (TRC) remains a clinical and neuroimaging challenge. Main neuro-oncology societies (EANO, RANO, SNMMI, EANM) have recommended the use of MR and amino acid PET, both techniques, in this diagnosis. • The new generation of hybrid PET/MR scanners provides a multidisciplinary approach offering additional diagnostic information in a single scan. • The purpose of this exhibit is to evaluate the role of hybrid images in the differential diagnosis of tumour viability versus treatment-related changes.

**TABLE OF CONTENTS/OUTLINE**

1. A brief overview of the pathophysiological basis and analysis of [18F]FDOPA PET in brain tumours. 2. Conventional and advanced MRI sequences in neuro-oncology. 3. [18F]FDOPA PET/MRI images of cases from our department and correlation with histopathological findings. 4. Take-home messages.

**TEACHING POINTS**

1. Paragangliomas (PGLs) are rare neuroendocrine tumors arising from chromaffin cells along with elevated catecholamines (epinephrine, norepinephrine, and dopamine) and/or their respective metabolites (metanephrine, normetanephrine, and methoxytyramine).2. PGLs are the most hereditary tumor among all endocrine and non-endocrine neoplasms and are currently divided into three clinically relevant genetic clusters (1[a,b], 2, and 3).3. Not only the clinical, biochemical, but functional (molecular) imaging phenotype is dependent upon genetic makeup of these tumors.4. There are 3 specific targets found in PGLs (somatostatin receptor, norepinephrine transporter, and L-type amino acid transporter).5. 68Ga-DOTATATE (targets somatostatin receptor) is the functional imaging phenotype in cluster 1a (SDHx-related) - primary or metastatic PGLs, metastatic sporadic, and head and neck PGLs.6. 18F-FDOPA (targets L-type amino acid transporter) is the functional imaging phenotype in cluster 1b, 2, and primary sporadic pheochromocytoma.7. Selection of targeted radiotherapy (177Lu-DOTATATE or 131I-MIBG) for metastatic patients depend upon uptake on 68Ga-DOTATATE and 123I-MIBG (targets norepinephrine transporter).

**TABLE OF CONTENTS/OUTLINE**

1. Definition and location of PGLs including rare locations.2. Genetic cluster classification. 3. Definition of theranostics and various theranostic targets in PGLs.4. Mechanism of action of radiopharmaceuticals.5. Demonstration of functional imaging phenotypes in various clusters and cohorts.6. Algorithm for identifying functional imaging phenotype when genotype is known.7. Application of functional imaging to select between targeted radiotherapies.

## NMMIEE-23 SARCOID-LIKE REACTIONS AFTER CANCER REMISSION: RADIOLOGY-PATHOLOGY CORRELATION

**Awards**
**Certificate of Merit**

Hina Shah, MD (*Abstract Co-Author*) Nothing to Disclose
Igor Odintsov (*Abstract Co-Author*) Nothing to Disclose
Aparna Singh, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Sarcoid-like reactions, resembling malignancy, require histologic confirmation for accurate diagnosis in post-cancer patients. 2. Histological evaluation is crucial to differentiate sarcoid-like reactions from malignancy. 3. Awareness of these reactions is crucial to prevent misdiagnosis and unwarranted treatment interventions. 4. Utilization of FDG-PET/CT aids in the detection and monitoring of sarcoid-like reactions, guiding clinical management decisions effectively.

**TABLE OF CONTENTS/OUTLINE**

I. Introduction A. Background on Sarcoid-like Reactions B. Importance of Accurate Diagnosis in Oncologic Patients II. Radiological-Pathological Correlation A. Imaging Features of Sarcoid-Like Reactions: PET/CT findings highlighting the challenges in diagnosing sarcoid-like reactions and the impact on treatment decisions. Characteristic imaging findings such as lymphadenopathy and pulmonary nodules distinguishing sarcoid-like reactions from malignancy. B. Sarcoid like reaction associated with various treatments such as immunotherapy, targeted therapy, and chemotherapy such as carboplatin. C. Importance of Histological Evaluation: Radiology pathology correlation in cases on sarcoidosis like reaction. D. Clinical Presentation and Diagnostic Challenges III. Conclusion A. Summary of Key Findings B. Recommendations for Clinical Practice C. Future Directions in Research

## NMMIEE-24 UNLOCKING ACCURACY: A COMPREHENSIVE GUIDE TO PRE-SCAN OPTIMIZATION FOR PET-CT

Yean P. Silva Hidalgo, MD (*Abstract Co-Author*) Nothing to Disclose
Alberto P. Silva Hidalgo, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Scanner components and their roles in image acquisitionKey factors influencing PET-CT imagePre-scan parameters to optimize PET-CT image qualityImage acquisition protocols and considerationsQuality control measures for PET-CT imaging

**TABLE OF CONTENTS/OUTLINE**

IntroductionPET-CT Scanner Components PET detector system: Scintillator crystals, photomultiplier tubes, and data acquisition electronics Computed tomography (CT) scanner Image reconstruction system: Algorithms for generating PET and CT imagesFactors Influencing PET-CT Image QualityPatient-related factors Physiological parameters, tracer uptake, and motion artifactsScanner-related factors Detector sensitivity, spatial resolution, and system noiseAcquisition-related factors Tracer dose, scan duration, and reconstruction parametersPre-Scan Modifications for Optimal Image QualityPatient preparation Dietary restrictions, hydration status, and bladder emptyingTracer administration Timing of injection, route of administration, and dosagePositioning and immobilization CT scan parametersImage Acquisition Protocols and ConsiderationsStandard PET-CT protocolsSpecialized protocolsQuality Control Measures for PET-CT ImagingPhantom studies Daily and weekly performance checks Standardized uptake value (SUV) normalization Quantitative analysis of tracer uptakeVisual assessment Image artifacts, noise levels, and overall image qualityConclusion Significance of pre-scan modifications for achieving high-quality PET-CT images Continuous advancements in PET-CT technology and image acquisition protocols

## NMMIEE-25 IMMUNOTHERAPY: A REVIEW OF IMMUNE POSITRON EMISSION TOMOGRAPHY RESPONSE CRITERIA

Loja L. Miriam SR, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- To learn how immunotherapy works at the cellular level - To review the types of immune checkpoint inhibitors according to cancer type. - To describe the update of metabolic response criteria in immunotherapy. IPERCIST - To understand unusual metabolic response patterns in immunotherapy

**TABLE OF CONTENTS/OUTLINE**

- Immunotherapy. Introduction - immune checkpoint inhibitors - Approved ICIs according to cancer type - iPERCIST. Immune positron emission tomography Response Criteria - Unusual metabolic response patterns

## NMMIEE-26 PSMA (PROSTATE-NOT-SO-SPECIFIC MEMBRANE ANTIGEN) PET: A REVIEW OF BENIGN AND MALIGNANT INCIDENTAL FINDINGS

Vahid Yaghmai, MD, MS (*Abstract Co-Author*) Nothing to Disclose
James Shi, MD (*Abstract Co-Author*) Nothing to Disclose
Maryam Rahmani, MD (*Abstract Co-Author*) Nothing to Disclose
Garrett G. Ward, MD (*Abstract Co-Author*) Nothing to Disclose
Seyedeh Niloufar Rafiei Alavi, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1) Define Prostate-Specific Membrane Antigen (PSMA) and its imaging role, emphasizing its association with prostate cancer and expression in other tissues.2) Discuss PSMA as a transmembrane protein with various cellular roles, highlighting its expression in both normal and neoplastic cells.3) Familiarize radiologists with the knowledge to identify common benign and malignant incidental findings on PSMA PET/CT.4) Introduce evidence-based methods to distinguish between incidental findings and true positive lesions in imaging.

**TABLE OF CONTENTS/OUTLINE**

1. Current Role of PSMA-PET/CT in the management of prostate cancer.2. Overview of the PSMA Protein, its structure, function, and clinical significance 3. Physiologic Uptake Patterns on PET/CT and identifying physiological versus pathological uptake.4. Common Benign Incidental Findings on PSMA-PET/CT 5. Common Non-Prostate Cancer Malignant Findings 6. Evidence-Based Identification Methods: Review the evidence supporting various approaches for accurately identifying incidental findings on PSMA-PET/CT

## NMMIEE-27 MECKEL'S: DELVING INTO THE DIAGNOSTICS OF THE DESOLATE DIVERTICULUM

Mark Ehrhart, MD (*Abstract Co-Author*) Nothing to Disclose
Shana Elman, MD,MA (*Abstract Co-Author*) Nothing to Disclose
R. Travis Clark, MD (*Abstract Co-Author*) Nothing to Disclose
Sara Janos, MD (*Abstract Co-Author*) Nothing to Disclose
Aaron Gambrell, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Meckel's diverticulum is the most common congenital abnormality of the gastrointestinal tract, although only present in approximately 2% of the population. It is important to recognize the different clinical presentations and complications of this anomaly in order to expedite the diagnosis and

treatment for the patient. One of the common diagnostic imaging exams used in the work-up is the Tc-99m pertechnetate Meckel's scan, which will be highlighted in this exhibit, including how to improve the sensitivity of the exam and how to avoid falling for false positives and negatives. This exhibit will show examples of how other diagnostic tools can be used for identification and what tools can be used for troubleshooting to aid in diagnosis, as well as how similar clinical presentations can potentially distract a radiologist or clinical provider from a Meckel's diagnosis. At the end of this review the reader should be able to identify anatomy, recognize various clinical presentations, create a differential diagnosis and appropriately diagnose a Meckel's diverticulum.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction a. Definition/ presentations b. Embryology c. Anatomy/ physiology 2. Imaging findings/ diagnostic troubleshooting a. Nuclear medicine b. Angiography c. CT d. Ultrasound 3. Complications a. GI hemorrhage b. SBO c. Intussusception d. Diverticulitis e. Perforation f. Neoplasm g. Umbilico-ileal fistula h. Hernia- Littre hernia 4. Management/ treatment a. Surgical options b. Prognosis/ outcomes 5. Differential Diagnosis a. IBD b. Ulcers c. Angiodysplasia d. Appendicitis e. Small bowel diverticulitis f. Intussusception look-alike: polyp or lymphoma g. Obstruction look-alike: adhesions or hernias 6. Conclusion

## NMMIEE-28 PRACTICAL INTERPRETATION OF BONE SCINTIGRAPHY: METASTASES, FRACTURES, AND BEYOND

**Awards**
**Certificate of Merit**

Felipe Martinez, MD (*Abstract Co-Author*) Nothing to Disclose
Ming Yang, MD (*Abstract Co-Author*) Nothing to Disclose
Ba D. Nguyen, MD (*Abstract Co-Author*) Nothing to Disclose
Steve S. Huang, MD (*Abstract Co-Author*) Nothing to Disclose
Logan Haug, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To provide a brief overview of the protocols and relevant technical aspects of bone scintigraphy. To facilitate recognition of technical complications that can interfere with correct interpretation of bone scans. To provide a comprehensive list of "Aunt Minnies" that can be recognized on bone scan. To demonstrate characteristic scintigraphic features of benign and malignant bone lesions. To understand patterns of osseous radiotracer uptake and identify soft tissue findings that may contribute to accurate diagnosis of complex syndromes.

**TABLE OF CONTENTS/OUTLINE**

This exhibit has four main components: 1. Procedures/protocols of bone scintigraphy: planar, 3-phase, and SPECT/CT imaging 2. Demonstration of faulty acquisitions with inadequate/suboptimal imaging results: hot glove sign, free Tc-99m pertechnetate, incorrect photopeak, etc. 2. Characteristic and atypical features of metastasis (unifocal, multifocal, sarcomatoid features), fractures (insufficiency fractures, non-accidental trauma) and benign bone lesions (skull suture, enchondroma, infarct, osteoma/osteomatosis in Gardner's syndrome). 3. Scintigraphic osseous and soft tissue findings of metabolic diseases (renal osteodystrophy, brown tumors, calciphylaxis), iatrogenic findings (voriconazole, bisphosphonate, avastin), paraneoplastic syndromes (hypertrophic osteoarthropathy, tumor-induced osteomalacia), and multi-system syndromes (cleidocranial dysplasia, sacral agenesis, sickle cell disease, myelofibrosis, Erdheim-Chester disease, Asherson's syndrome, Mazabraud's syndrome, McCune-Albright syndrome, Mafucci syndrome, Ollier disease, and rhabdomyolysis).

## NMMIEE-29 RADIOPHARMACEUTICAL IMAGING IN THE MANAGEMENT OF CARDIAC SARCOIDOSIS AND AMYLOIDOSIS

Daniel Sehi (*Abstract Co-Author*) Nothing to Disclose
Farrokh Dehdashti, MD (*Abstract Co-Author*) Nothing to Disclose
Robert J. Gropler, MD (*Abstract Co-Author*) Grants, Bayer AG;Consultant, Biomedical Systems;Scientific Adivsor, Amgen Inc;Scientific Advisor, sanofi-aventis Group
Cylen Javidan, MD (*Abstract Co-Author*) Nothing to Disclose
Ashwin Singh S. Parihar, MBBS, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Infiltrative cardiomyopathies involve deposition of abnormal substances within the myocardium leading to progressive deterioration of cardiac function and clinical symptoms of heart failure and arrhythmias. 2. Radiopharmaceutical imaging for cardiac amyloidosis and sarcoidosis provide a non-invasive assessment of disease state and in several cases obviate the requirement of an endomyocardial biopsy, helping directly initiate specific treatment. This exhibit provides a comprehensive overview of the clinical and imaging features of these diseases, including the impact of functional imaging in clinical management.

**TABLE OF CONTENTS/OUTLINE**

1. Common Clinical Presentations and diagnostic algorithms: a. Common clinical presentations. b. Initial diagnostic workup. c. Correlative imaging - Echocardiography, contrast-enhanced MRI. 2. Cardiac Sarcoidosis: a. Patient preparation for FDG PET. b. Imaging patterns on FDG PET and perfusion SPECT, underlying disease mechanisms, implications of imaging findings and imaging pitfalls. c. Clinical role in diagnosis, staging, response assessment and evaluation of suspected recurrence. d. Clinical management of Cardiac Sarcoidosis. 3. Cardiac Amyloidosis: a. Mechanism of radiotracers and Imaging techniques. b. Characteristic patterns on 99mTc-PYP planar and SPECT/CT imaging, including grading of uptake and imaging pitfalls. c. Performance of PYP imaging in specific clinical scenarios, including genetic mutations, type of amyloidosis, solitary cardiac amyloidosis without extra-cardiac involvement. d. Diagnostic accuracy of PYP imaging and its utility for initiating treatment. e. Clinical management of Cardiac Amyloidosis.

## NMMIEE-3 A NOVEL METHOD OF TRAINING TECHNOLOGISTS FOR DOSIMETRIC ANALYSIS SUPPORT IN A PRIVATE RADIOLOGY PRACTICE

Douglas A. Murrey JR, MD (*Abstract Co-Author*) Nothing to Disclose
Mitchell Kennedy (*Abstract Co-Author*) Nothing to Disclose
Michael Durka (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. The use of customized dosimetric software streamlines radiologist workflows. 2. Establishing standardized training materials creates a framework for non-physicians to learn high-quality processing techniques. 3. Utilizing non-physicians is possible to relieve physician workload in processing Y90 Dosimetry

**TABLE OF CONTENTS/OUTLINE**

1. Background/Introduction: - Y90 Radioembolization: an overview of the treatment process 2. Problems with workflows and Y90 delivery in a radiology practice - Time intensive for physicians, etc. 3. Use of Non-Physicians in a Y90 workflow: - Nuclear Medicine and CT Technicians - Challenges and

Benefits. 4. Training Process. 5. Conclusions - Improved efficiency for physicians - Increased practicality of Y90 workflow, leading to increased ability to provide Y90 treatments in private radiology practices,

## NMMIEE-30 USEFULNESS OF PSMA PET/MRI IN TREATED PROSTATE CANCER PATIENTS, OUR INITIAL EXPERIENCE

David Durany Lara (*Abstract Co-Author*) Nothing to Disclose
Eugenia De Lama Salvador, MD (*Abstract Co-Author*) Nothing to Disclose
Eva Maria Merino Serra (*Abstract Co-Author*) Nothing to Disclose

Juan Jose Martin-Marcuartu (*Abstract Co-Author*) Nothing to Disclose
Laura Chavarriaga, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The purpose of our presentation is to evaluate the performance and diagnostic accuracy of PSMA PET/MRI for the evaluation and detection of recurrent prostate cancer in patients treated with surgery or focal strategies, especially after Irreversible Electroporation (IRE) treatment.

### TABLE OF CONTENTS/OUTLINE

Focal therapy (FT) is an emerging treatment option for selected patients with localised prostate cancer (PCa). FT has the potential to achieve oncological control while preserving urinary, sexual and bowel function.IRE induces irreversible permeabilization of the cell membrane, resulting in loss of homeostasis and consequential cell death; with the advantage that preserves tissue structure of the prostate.In recent years, the clinical availability of integrated PET/MRI scanners has made it possible to explore the potential of multimodal, combined anatomical and functional imaging.PSMA PET/MRI has shown potential to use in the planification and early assessment before IRE treatment and follow-up of post-IRE patients and to identify lesions missed by mpMRI. Also, findings in PSMA PET/MRI has changed treatment indications (from focal treatment to systemic). Targeted therapies could be directed by PET/MRI with radiolabelled PSMA because of its ability to detect the most aggressive lesion.PET/MRI is an excellent synergistic imaging modality in the setting of biochemical PCa recurrence, as a tool to both characterize local disease within the prostate and evaluate for metastasis with a single examination.

## NMMIEE-31 BONE SCANS AND THE ORTHOPEDIC SURGERY PATIENT: WHAT RADIOLOGISTS AND CLINICIANS NEED TO KNOW

Brian Nguyen, MD (*Abstract Co-Author*) Nothing to Disclose
Vanessa M. Zayas-Colon, MD (*Abstract Co-Author*) Nothing to Disclose
Tannaz Rajabi (*Abstract Co-Author*) Nothing to Disclose
Vaseem Chengazi, MD (*Abstract Co-Author*) Nothing to Disclose
Wei Li (*Abstract Co-Author*) Nothing to Disclose
John Cerne, MD, BS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Interpreting bone scans of patients with orthopedic hardware is often a challenging topic for residents. We created this exhibit to teach: 1) key bone scan findings in relation to orthopedic hardware; 2) why these findings make sense. Clinicians want to know when there is orthopedic hardware loosening or osteomyelitis. Radiologists need to know that methyl diphosphonate (MDP) adsorbs in proportion to the rates of bone remodeling and that white blood cells (WBCs) migrate to areas of infection. By attaching a radiotracer to MDP or WBCs, a gamma camera can translate radioactivity to pixelation. Accordingly, focal uptake near hardware suggests stress fracture or hardware loosening in the context of remote surgery. Diffuse uptake with increased blood pool suggests hardware loosening vs infection, with the latter being more likely. Normal uptake in the setting of increased blood pool/perfusion suggests soft tissue inflammation vs degenerative arthritis. After reviewing this exhibit, the resident will understand why the imaging patterns make sense and how they can use this information to offer appropriately specific comments on pathology likelihood.

### TABLE OF CONTENTS/OUTLINE

(1) Bone Scans: how they work; what they can show (2) Orthopedic implants in different locations, and the sites of mechanical stress: hips; knees; ankles (3) Cemented vs Non-Cemented Appliances: implications for surgery; implications for imaging; pathophysiological basis (4) Tell Tale Patterns: focal uptake; diffuse uptake; normal uptake (5) Creating a Good Report: patient background; findings; impression (6) Review of Literature: hot off the press; sensitivity and specificity; what does the future hold?

## NMMIEE-32 CURRENT AND EMERGING ROLES OF PET/CT IN THE MANAGEMENT OF MULTIPLE MYELOMA

Asha Kandathil, MD (*Abstract Co-Author*) Nothing to Disclose
Alex Heglin, DO, MS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Whole body FDG PET/CT is indicated in the evaluation of patients with suspected multiple myeloma, for evaluation of total metabolically active disease burden and detection of extramedullary disease. 2. Lab-based multiple myeloma staging methods such as Revised International Staging System (R-ISS) and the Durie-Salmon System show improved assessment of progression-free and overall survival when paired with metabolic activity (SUVmax) from FDG PET/CT scans. 3. The Italian Myeloma Criteria for PET Use (IMPeTUs) interpretation framework has shown accurate stratification of progression free and overall survival via the metabolic characterization of active lesions and may be used for both staging and treatment response assessment. 4. FDG PET/CT is the preferred modality for assessing response to multiple myeloma treatment. 5. Alternative PET agents have shown promising results for multiple myeloma characterization, such as 11C-methionine showing higher sensitivity and accuracy compared to FDG, Ga68-Pentixafor (CXCR4) staging patients higher than FDG, and Cu64-daratumumab showing higher sensitivity and accuracy compared to FDG.

### TABLE OF CONTENTS/OUTLINE

1. Multiple myeloma staging criteria - R-ISS, IMPeTUs, and Durie/Salmon. 2. FDG PET/CT for initial diagnosis, staging and prognostication of multiple myeloma. 3. FDG PET/CT for multiple myeloma treatment response. 4. Alternate PET targets: Ga68-CXCR4, 11C-methionine, 11C-choline

## NMMIEE-33 CHARACTERIZING MUSCLE FDG UPTAKE: AN INDICATOR FOR INFLAMMATORY DISEASES

**Awards**
**Certificate of Merit**

Ryogo Minamimoto, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

FDG uptake on PET/CT has been a valuable indicator in the diagnosis and management of inflammatory disease. This presentation explores the utility of muscle FDG uptake in differentiating between various inflammatory diseases (Dermatomyositis, Cancer-associated myositis, Sarcoidosis, Vascular disease, and Systematic inflammatory disease). Characterization of muscle FDG uptake patterns can enhance diagnostic accuracy, monitor disease progression, and optimize therapeutic interventions for patients with inflammatory diseases.

**TABLE OF CONTENTS/OUTLINE**

1. Dermatomyosis, 2. Cancer-associated myositis (rectal cancer), 3. Muscle involvement in Sarcoidosis, 4. Polyarteritis nodosa (PAN), 5 .Eosinophilic granulomatosis with polyangiitis (EPGA)

## NMMIEE-34 RADIONUCLIDE LYMPHOSCINTIGRAPHY: CASE BASED MULTIMODALITY PICTORIAL REVIEW WITH TEACHING PEARLS

Pokhraj P. Suthar, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Sumeet Virmani, MD, MS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Evaluation and management of extremity edema, lymphatic malformations and leaks, and localization of sentinel lymph nodes for certain cancer patients is challenging for both the patient and the treating physician. Radionuclide lymphoscintigraphy can be effectively used to localize sentinel lymph nodes and prove and/or rule out lymphatic causes of swelling or leak. The purpose of this case-based pictorial exhibit is to highlight the imaging spectrum of various findings of radionuclide lymphoscintigraphy in patients with extremity edema, lymphatic malformations, and leaks, and localization of sentinel lymph nodes. Clinical and other multimodality imaging correlation is provided when available.

**TABLE OF CONTENTS/OUTLINE**

Our case-based multimodality pictorial review (15 cases) includes various patterns seen on both upper and lower-extremity radionuclide lymphangiograms. These include evaluating the number, course, symmetry, and intensity of lymphatic channels; timing related to visualization of draining regional nodes; the number of regional nodes visualized; dermal backflow and its severity; abnormal collaterals as suggested by visualization of popliteal and epitrochlear nodes; leaks and malformations; and protocol with helpful Tips and Pearls during the study. We also highlight its importance in anatomical localization and confirmation of lymphatic leaks and malformations and localizing sentinel lymph nodes in certain cancer patients. Multimodality correlation is provided where available.

## NMMIEE-35 UNDERSTANDING THE ROLE OF IMAGING BEFORE, DURING AND AFTER PSMA PROSTATE CANCER RADIOLIGAND THERAPY

Katelyn Niknam (*Abstract Co-Author*) Nothing to Disclose
Ida Sonni, MD (*Abstract Co-Author*) Nothing to Disclose
Mason Life (*Abstract Co-Author*) Nothing to Disclose
Gholam R. Berenji, MD, MSc (*Presenter*) Research Grant, Siemens AG;Research funded, General Electric Company;Research funded, Lantheus Holdings;Consultant, Canon Medical Systems Corporation

**TEACHING POINTS**

The prostate specific membrane antigen (PSMA) is a cell-surface glycoprotein over-expressed in most clinically significant PCa. PSMA is an ideal target for nuclear medicine theranostics applications in patients with prostate cancer (PCa), and has been widely used for the imaging (PSMA-PET) and therapy (PSMA-radioligand therapy - RLT) of patients with PCa. PSMA-RLT has emerged as a safe and effective treatment for advanced PCa. Imaging plays a crucial role throughout RLT treatment phases. Prior to PSMA-RLT it identifies those patients more likely to respond due to significant expression of the PSMA on their PCa cells. In addition to PSMA-PET, the natural pair for PSMA-RLT theranostics, FDG-PET can be useful in identifying PCa heterogeneity, that was suggested as a possible predictor of treatment response. Immediately after injection of the PSMA-RLT radiopharmaceutical and at subsequent intervals, a SPECT scan can be used to verify the distribution of the radiopharmaceutical in PCa foci, as well as quantify uptake to extrapolate dosimetric information. After completion of PSMA-RLT cycles, PSMA-PET is used to assess tumor response and monitor progression of disease.

**TABLE OF CONTENTS/OUTLINE**

• Introduction to Prostate Cancer Theranostics o Clinical indications o Radiopharmaceuticals o Future directions • PSMA PET/CT prior to PSMA-RLT o Patient eligibility o FDG-PET to assess tumor heterogeneity o Assessment of disease location and extent • Quantitative SPECT after PSMA-RLT o Distribution of PSMA-RLT o Quantification and dosimetry • PSMA PET/CT post-RLT Treatment response monitoring

## NMMIEE-36 TC99M DMSA RENAL CORTICAL SCINTIGRAPHY IN CHILDREN: BEYOND UTI

Marina Easty, FRCR (*Abstract Co-Author*) Nothing to Disclose
Lorenzo Biassoni, MBBS (*Abstract Co-Author*) Nothing to Disclose
Riwa Meshaka, MBChB (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Tc99m-DMSA renal cortical scintigraphy is the test of choice for renal parenchymal scarring following urinary tract infection in children at many centres globally, however its scope of use extends to numerous other indications [Vali et al., 2022]. High quality Tc99m-DMSA renal cortical scintigraphy +/- SPECT can • Characterise location and function of renal parenchyma in congenital anomalies • Evaluate upper and lower moiety differential function separately in duplex systems • Assess functioning renal parenchyma in renovascular hypertension before and after intervention.• Be used alongside low-dose CT to assess complex renal calculi and bilateral Wilms' tumours prior to urological surgery • Provide accurate parenchymal functional information in hydronephrosis, cystic disease, renal transplant, and following traumatic renal injury.

**TABLE OF CONTENTS/OUTLINE**

Role of Tc99m-DMSA scintigraphy, technical aspects, limitations, interpretation pearls and pitfalls, multimodality appearance and clinical correlation in: 1. Congenital renal anomalies: renal ectopia, fusion anomalies, duplex kidney. 2. Cystic renal disease and the nonfunctioning kidney. 3. Hydronephrosis before and after urology surgical intervention 4. Vascular disease including renovascular hypertension and renal vein thrombosis. 5. Complex renal calculi6. Renal parenchymal damage after trauma. 7. Wilms' tumour for nephron-sparing surgery. 8. Renal transplant

## NMMIEE-37 REDISCOVERING QUANTITATIVE LYMPHOSCINTIGRAPHY: AN APPROACH TO THE ASSESSMENT OF LYMPHEDEMA

Juliana Kim (*Abstract Co-Author*) Nothing to Disclose
Orhan K. Oz, MD,PhD (*Abstract Co-Author*) Nothing to Disclose

Jaewon Yang, PhD (*Abstract Co-Author*) Nothing to Disclose
Robert C. Sibley III, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Lymphoscintigraphy (LSG) is the oldest imaging method used to evaluate the lymphatic system. Despite the demonstrated utility of newer techniques including magnetic resonance (MR) lymphangiography, near-infrared imaging, and high-frequency ultrasound, LSG remains the gold standard in the evaluation of lymphedema due to its high sensitivity (96%) and specificity (100%)1. 2. The performance of LSG is highly dependent on the quality of the study protocol and the measurements used to evaluate patients with lymphedema. 3. In this educational exhibit, we provide an illustrated overview of lymphoscintigraphy protocols, reviewing types of radiotracers, exercise interventions, and quantitative measurements, including transport kinetics calculations, which can be used to improve the assessment of patients with primary and secondary lymphedema.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction to lymphedema a. Epidemiology and disease burden b. Diagnosis c. Treatments 2. Comparison of lymphatic imaging methods used to evaluate lymphedema a. Advantages and disadvantages of quantitative lymphoscintigraphy b. MR lymphangiography, near-infrared imaging, and high-frequency ultrasound 3. Review of lymphoscintigraphy protocols a. Radiotracers used b. Exercise interventions c. Timing of imaging d. Quantitative measurements i. Lymph node uptake ii. Clearance rate constant iii. Quantitative asymmetry index iv. Blood appearance rate v. Contrast-to-noise ratio for dermal backflow 4. Challenges and Opportunities a. Clinical applications of quantitative lymphoscintigraphy b. Future directions

## NMMIEE-38 EXPANDING HORIZONS IN BRAIN IMAGING: THE INTEGRAL ROLE OF NUCLEAR MEDICINE AND MRI IN DIAGNOSING AND MANAGING NEUROLOGICAL DISORDERS

Ukihide Tateishi, PhD (*Abstract Co-Author*) Nothing to Disclose
Junichi Tsuchiya, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Akane Ozawa (*Abstract Co-Author*) Nothing to Disclose
Kimiteru Ito, MD (*Abstract Co-Author*) Nothing to Disclose
Jun Oyama (*Abstract Co-Author*) Nothing to Disclose
Tomoki Imokawa, MD (*Abstract Co-Author*) Nothing to Disclose
Kota Yokoyama, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Demonstrate the broad utility of brain perfusion and neuroreceptor SPECT, radionuclide cisternography, FDG, O-gas, amino acid, and Amyloid PET in diagnosing and managing cerebral diseases.2. Illustrate the complementary roles of these nuclear medicine techniques alongside MRI to provide a comprehensive understanding of cerebral pathologies, aiding in accurate diagnosis and effective treatment planning.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction: Importance of Nuclear Medicine in Brain Imaging2. Cerebrovascular Diseases: Utilizing SPECT and PET for assessing cerebrovascular disorders, with a specific focus on their roles in pre-surgical evaluation.3. Epilepsy: Detection of epileptic foci using SPECT and PET to guide surgical and therapeutic interventions.4. Brain Tumors: Application of amino acid PET and FDG PET in differentiating tumor characteristics, crucial for diagnosis and management.5. Psychiatric Disorders: Exploration of cerebral perfusion patterns in psychiatric conditions, enhancing understanding and treatment approaches.6. Inflammatory and Infectious Diseases: PET and SPECT in the diagnosis and management of encephalitis and autoimmune disorders.7. Hydrocephalus and Duropathies: SPECT's role in diagnosing and differentiating cerebrospinal fluid dynamics and related pathologies.8. Neurodegenerative Diseases: Detailed discussion on the diagnostic processes for Alzheimer's disease and other dementias using MRI, SPECT, and PET to differentiate and decide on management strategies.9. Future Perspectives: Discussion on emerging tracers with limited evidence or clinical experience that may become significant in future neuroimaging practices.

## NMMIEE-39 POST-RADICAL PROSTATECTOMY BIOCHEMICAL RECURRENCE PSA, PSMA-PET, AND SALVATION RADIATION THERAPY INTERVAL ON HIGH RISK PATIENT ALL-CAUSE MORTALITY

Johnny Yang, BS, BA (*Abstract Co-Author*) Nothing to Disclose
Vani Vijayakumar, MD (*Abstract Co-Author*) Nothing to Disclose
Jeffrey Roux (*Abstract Co-Author*) Nothing to Disclose
Bryson Brister (*Abstract Co-Author*) Nothing to Disclose
John Hollis Tackett, BS (*Abstract Co-Author*) Nothing to Disclose
Chanukya Cherukuri (*Abstract Co-Author*) Nothing to Disclose
Marjorie Lam (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Discuss biochemical recurrence and treatment failure post-radical prostatectomy for prostate cancer.Assess all-cause mortality risk in salvage radiotherapy before and after PSA failure.Evaluate PSMA imaging intervals in patients with one high-risk factor (ie, pT3/4 or prostatectomy [p] Gleason score 8-10).Highlight the efficacy of 18F-DCFPyL-PET/CT over standard imaging.

**TABLE OF CONTENTS/OUTLINE**

Prostate-specific membrane antigen positron emission tomography, as compared with conventional imaging (bone scan, computed tomography, or magnetic resonance imaging), seems to improve detection of biochemical recurrence in patients with prostate-specific antigen failure (PSA> 0.20 ng/mL) after salvage radical prostatectomy (sRP) for prostate cancer. Its USDA approval was backed by findings from the phase III CONDOR trial, in which 63.9% of men with PSA failure with no definitive evidence of recurrence using standard imaging had a change in management based on the 18F-DCFPyL-PET/CT findings. Prior to sRT, physicians often order a PSMA-PET scan only after PSA > 0.20 ng/mL post-sRT. This timing is chosen because PSMA-PET scans demonstrate optimal sensitivity at PSA > 0.20 ng/mL and because many insurance companies only provide reimbursement if PSA levels exceed a predetermined threshold set by the insurance company. Delaying the initiation of sRP raises concerns for elevated all-cause mortality. To improve outcomes, PSMA-PET scans should be performed within 6 months of reaching PSA failure to prevent delayed treatment while still compliant with insurance policies. This study highlights the efficacy of 18F-DCFPyL-PET/CT in guiding treatment strategies for prostate cancer patients with PSA failure.

## NMMIEE-4 HOW TO REPORT PSMA PET/CT? A REVIEW OF AVAILABLE STANDARDIZED SCORING SYSTEMS

Maryam Rahmani, MD (*Abstract Co-Author*) Nothing to Disclose
Vahid Yaghmai, MD, MS (*Abstract Co-Author*) Nothing to Disclose
James Shi, MD (*Abstract Co-Author*) Nothing to Disclose
Garrett G. Ward, MD (*Abstract Co-Author*) Nothing to Disclose
Seyedeh Niloufar Rafiei Alavi, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1) Explain why standardized reporting is crucial for optimal diagnostic accuracy in PSMA PET/CT2) Familiarize radiologists with all different tools for reporting PSMA-PET/CT results and identify the correct application for each of them3) Describe the two most commonly used PRIMARY score and PSMA-RADS score 4) Compare the performance of different tools for various indications of PSMA PET/CT

**TABLE OF CONTENTS/OUTLINE**

1) Overview of Standardized Reporting Tools for reporting PSMA PET/CT2) Provide a thorough description of the PRIMARY score, supplemented by relevant case examples.3) Explain the PSMA-RADS scoring system with case example studies. 3) Explain the RECIP 1.0, and PPP criteria for treatment response evaluation in PSMA PET/CT 4) A Comparative Review of Scoring Systems, discussing their advantages and disadvantages in different clinical scenarios.

## NMMIEE-40 CUTANEOUS MANIFESTATIONS OF NON-CUTANEOUS MALIGNANCIES ON PET-CT: A HEAD-TO-TOE PICTORIAL REVIEW

Douglas S. Katz, MD (*Abstract Co-Author*) Nothing to Disclose

Aranz Khalilollahi (*Abstract Co-Author*) Nothing to Disclose
Armin Mahabadi (*Abstract Co-Author*) Nothing to Disclose
Anca-Oana Kranz (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

After this review, radiologists/those viewing this exhibit will be able to:• Review the cutaneous and subcutaneous (CSQ) metastatic disease patterns of different internal malignancies.• Understand what to look for in a patient's history.• Be aware of the newer therapies in CSQ and their effects on prognosis.Target audience: Medical students, radiology residents and fellows, and practicing radiologists.

**TABLE OF CONTENTS/OUTLINE**

• Introduction• Head and Neck Malignancies• Thoracic Malignancies• Hepatobiliary Gastrointestinal Malignancies• Genitourinary Malignancies• Lymphoma• Sarcoma• Summary• References

## NMMIEE-41 REVIEW OF BRAIN PET/MRI WITH A FOCUS ON THE APPLICATIONS OF JOINT-RECONSTRUCTION

**Awards**
**Cum Laude**

Matthew S. Breen, MD (*Abstract Co-Author*) Nothing to Disclose
Siddhant Dogra, MD (*Abstract Co-Author*) Nothing to Disclose
Timothy M. Shepherd, MD, PhD (*Abstract Co-Author*) Co-founder, MICroStructure Imaging
Girish M. Fatterpekar, MBBS (*Abstract Co-Author*) Nothing to Disclose
James R. Loftus, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Joint reconstruction is an advanced technique which utilizes information from both the PET and MRI data to improve image reconstruction beyond simple image fusion 2. Advantages of joint reconstruction include superior delineation of activity in cortically-based radiotracers and improved detection of motion 3. Wide applications for joint reconstruction exist across a spectrum of brain PET/MRI techniques which may allow for higher quality image interpretation

**TABLE OF CONTENTS/OUTLINE**

1. Overview of Joint PET-MRI Reconstruction a. Description of technique - not just image fusion b. Advantages and pitfalls 2. Applications of Brain PET/MRI Using Joint Reconstruction a. FDG i. Neurodegenerative diseases ii. Epilepsy iii. Tumor progression versus post-treatment changes b. Amyloid-ligand c. Tau-ligand d. F-DOPA e. FET

## NMMIEE-42 GA68 PSMA PET AND MULTIPARAMETRIC MRI IN RECURRENT GLIOBLASTOMA MULTIFORME: CURRENT INSIGHTS AND FUTURE DIRECTIONS

Liang Wang, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Qiubai Li, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Multimodal Imaging Benefits Highlight the advantages of Ga68 PSMA PET/CT and mpMRI. 2. Radiotracer Selection: Explore the specific roles of Ga68 PSMA in imaging recurrent GBM. 3. Clinical Applications: Illustrate how Ga68 PSMA PET/CT and mpMRI contribute to diagnosis, treatment planning, and monitoring, facilitating personalized therapeutic strategies. 4. Challenges and Future Directions: Address challenges related to standardization, biomarker validation, and the integration of advanced analytical techniques.

**TABLE OF CONTENTS/OUTLINE**

I. Introduction A. Overview of Recurrent GBM B. Rationale for Integrating Ga68 PSMA PET/CT and mpMRI II. Multimodal Imaging Benefits A. Improved Soft Tissue Contrast B. Simultaneous Functional and Anatomical Information C. Potential for Quantitative Analysis III. Radiotracer Selection A. Ga68 PSMA PET for Assessing Tumor Metabolism B. Ga68 PSMA PET/CT and mpMRI for Evaluating Tumor Extent C. Ga68 PSMA PET/CT and mpMRI Markers for Identifying Treatment Resistance IV. Clinical Applications A. Accurate Diagnosis B. Guiding Therapeutic Interventions C. Predicting and Assessing Treatment Response V. Challenges and Future Directions A. Standardization of Imaging Protocols B. Validation of Biomarkers C. Integration of Advanced Analytical Techniques VI. Future Research Directions A. Protocol Optimization B. Conducting Validation Studies and Trials C. Tailoring Personalized Therapeutic Approaches VII. Conclusion A. Summary of Key Findings B. Implications for Clinical Practice C. Potential Enhancements in Patient Care

## NMMIEE-43 IS PSMA/PET REALLY PROSTATE SPECIFIC? AN UPDATE OF NON-PROSTATIC UPTAKE AND EMERGENT ROLE IN OTHER MALIGNANCIES

Patrick Veit-Haibach, MD (*Abstract Co-Author*) Grant, Siemens AG;Speaker, Siemens AG;Travel support, Siemens AG
Roshini Kulanthaivelu, MBBS (*Abstract Co-Author*) Nothing to Disclose

Ur Metser, MD, FRCPC (*Abstract Co-Author*) Consultant, POINT Biopharma Inc
Claudia Ortega Mogilevich, MD (*Abstract Co-Author*) Nothing to Disclose
Andres Kohan, MD (*Abstract Co-Author*) Nothing to Disclose
Vanessa Murad, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. To review the physiological distribution of prostate-specific membrane antigen (PSMA), and potential pitfalls. 2. To present different benign processes showing PSMA uptake with demonstrative examples. 3. To describe malignancies other than prostate cancer that are associated with PSMA uptake, and to review the emerging potential role of PET on their diagnosis and treatment.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction: - What is prostate-specific membrane antigen (PSMA)? 2. Physiological distribution of PSMA and potential pitfalls: Demonstrative cases.3. Benign processes demonstrating PSMA uptake, case-based series: - Benign tumors (E.g. meningioma, solitary fibrous tumor). - Infectious/inflammatory (E.g. pneumonia, proctitis). - Bone remodeling (E.g. fracture, Paget's disease). 4. Other malignancies showing PSMA uptake (E.g. hepatocellular carcinoma, cholangiocarcinoma, breast cancer, colorectal cancer, stomach signet ring carcinoma, adenoid cystic carcinoma, and other salivary gland tumors): - Mechanisms of PSMA uptake. - Updated evidence of PSMA/PET role on diagnosis and treatment.

## NMMIEE-44 ADVANCES IN RADIOPHARMACEUTICAL THERAPY IN NUCLEAR ONCOLOGY: EXPLORING ALPHA RPT OVER BETA RPT

Johnny Yang, BS, BA (*Abstract Co-Author*) Nothing to Disclose
Vani Vijayakumar, MD (*Abstract Co-Author*) Nothing to Disclose
John Hollis Tackett, BS (*Abstract Co-Author*) Nothing to Disclose
Marjorie Lam (*Abstract Co-Author*) Nothing to Disclose
Chanukya Cherukuri (*Abstract Co-Author*) Nothing to Disclose
Nader Pahlevan, BA (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Review the fundamental principles of alpha and beta particles including emission properties of different radionuclides and their applications- Discuss differences in alpha and beta RPT and uses for individualized patient care- Highlight new advancements in RPT and potential side effects

**TABLE OF CONTENTS/OUTLINE**

Radionuclides have a wide variety of uses based on their physical characteristics. An important example is radiopharmaceutical therapy (RPT) which is when a radionuclide is used alone or ligated to a drug, protein, peptide, or monoclonal antibody for the destruction of undesirable cell lines. They are commonly used to treat hyperproliferative cancers and are especially useful in sites like bone and brain that are difficult to reach with conventional external radiotherapy due to the risk of damaging healthy cells. The radionuclides used are primarily beta-particle and alpha-particle emitters. Beta particles average a lower particle energy (PE) and linear energy transfer (LET) with a greater penetrance when compared to alpha particles that tend to have a higher PE and LET with a shorter range. Beta RPT has been available for many years, is very versatile, and is the current gold standard. Yet, new advancements are needed for more resilient cancerous pathologies. Using alpha particles could be an excellent novel therapy as recent clinical trials have shown it to be beneficial in patients where beta RPT has failed. However, some adverse effects have been observed. The approval of alpha particle therapy would broaden treatment options to allow for more individualized patient care.

## NMMIEE-5 FEASIBILITY OF PET ANGIOGRAPHY IN TAKAYASU AORTITIS: CAN IT BE AN ALTERNATIVE TO CT ANGIOGRAPHY?

Yoshifumi Nouno (*Abstract Co-Author*) Nothing to Disclose
Takuji Nanno (*Abstract Co-Author*) Nothing to Disclose
Tetsuya Fukuda, MD, PhD (*Abstract Co-Author*) Research Grant, Canon Medical Systems Corporation;Research Grant, General Electric Company
Midori Fukuyama, MD (*Abstract Co-Author*) Nothing to Disclose
Keizo Murakawa (*Abstract Co-Author*) Nothing to Disclose
Emi Tateishi (*Abstract Co-Author*) Nothing to Disclose
Yusuke Terakawa, RT (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

18F-FDG PET/CT effectively assesses active inflammatory lesions on the aortic wall in Takayasu arteritis (TAK). However, contrast-enhanced CT is still required to evaluate structural changes in the aorta, increasing radiation exposure and the risk of renal dysfunction. A digital PET/CT system equipped with Continuous Bed Motion (CBM) captures the ultra-early dynamic phase of 18F-FDG administration, enabling the acquisition of PET angiography (PET-angio). Previous reports of PET-angio indicated the usage of a higher dose of 18F-FDG than our standard dose of 2MBq/kg. In this study, we adjusted the speed of CBM and achieved PET-angio without increasing the dose of 18F-FDG. The neck-to-pelvis scan using CBM was initiated 20 seconds after injecting 18F-FDG diluted in 20 ml of 0.9% saline solution at a rate of 1 ml/s. Immediately after 18F-FDG administration, 20 ml of 0.9% saline solution was administered at the same rate of 1ml/s for flushing. The detection of radioactivity was insufficient for abdomen-to-pelvis with the fixed CBM speed of 22mm/s, resulting in unclear abdominal arteries. Adjusting the speed to 11mm/s at the level of the L3 vertebra enabled visualization of systemic arteries from the neck to the pelvis. Our combined approach of standard FDG PET/CT and the PET-angio offers clinical utility for monitoring arterial structural changes and active inflammation in TAK patients while minimizing radiation exposure and preventing contrast-induced nephropathy.

**TABLE OF CONTENTS/OUTLINE**

Fig. 1 Comprehensive evaluation in TAK: CTA and PETFig. 2 PET-angio protocol at our center.Fig. 3 Advantages of Adjusting CBM Speed on PET-angioFig. 4 Comparison between CTA and PET-angio.Fig. 5 Clinical benefits of PET-angio

## NMMIEE-6 PET/MRI IN MULTIPLE MYELOMA: POTENTIAL INDICATIONS, TIPS AND TRICKS

Montserrat Cortes (*Abstract Co-Author*) Nothing to Disclose
Jose A. Narvaez, MD (*Abstract Co-Author*) Nothing to Disclose
Karen Perez Alfonso, MD (*Abstract Co-Author*) Nothing to Disclose
Ivan Sanchez Rodriguez (*Abstract Co-Author*) Nothing to Disclose
Itziar Carro (*Abstract Co-Author*) Nothing to Disclose
Javier Hernandez Ganan (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The hybrid PET/MRI techniques combine the morphological information provided by MRI and the metabolic and functional data provided by 18FDG PET imaging. This makes it possible both to detect myeloma infiltration foci in the marrow and to assess prognosis and response to treatment. The objectives

of this review are: - To explain the PET/MRI technique and the protocol to be used. - To explore potential indications in clinical practice. - To assess the similarities and differences of ADC values and FDG uptakes (SUV).

**TABLE OF CONTENTS/OUTLINE**

- PET/MRI technique and protocol. - Diagnostic criteria for multiple myeloma: what the radiologist needs to know. - International Myeloma Working Group (IMWG) imaging recommendations: where would PET/MRI fit in? - Potential indications in clinical practice. - solitary bone plasmacitoma. - multiple myeloma with neurological symptoms or suspected spinal cord or radicular compression. - high-risk smoldering multiple myeloma. - Bone marrow imaging analysis: PET vs DWI sequences. - Tips and tricks for reporting a PET/MRI study.

## NMMIEE-7 STATE OF THE ART OF FUNCTIONAL IMAGING IN MULTIPLE MYELOMA:WB-MRI AND PET-CT

Claudio Cerchione (*Abstract Co-Author*) Nothing to Disclose
Danila Diano (*Abstract Co-Author*) Nothing to Disclose
Davide Bezzi (*Abstract Co-Author*) Nothing to Disclose
Andrea Prochowski Lamurri, MD (*Abstract Co-Author*) Nothing to Disclose
Arrigo Cattabriga (*Abstract Co-Author*) Nothing to Disclose
Alice Rossi, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

According to international guidelines, patients with suspected myeloma should primarily undergo low-dose Whole Body Computed Tomography for diagnostic purposes.To optimize sensitivity and specificity and enable treatment response assessment, Whole Body Magnetic Resonance Imaging (WB-MRI) should include Diffusion Weighted Imaging with Apparent Diffusion Coefficient maps and T1-weighted Dixon sequences with bone marrow Fat Fraction quantification. At baseline WB-MRI shows greater sensitivity for the detecting focal lesions and diffuse bone marrow infiltration pattern than18F-fluorodeoxyglucose Positron Emission Tomography/Computed Tomography (PET-CT), which is considered of choice for evaluating response to treatment and minimal residual disease and imaging of extramedullary disease (EMD). Both WB-MRI and PET-CT findings have been associated with patient's prognosis. Due to tumor heterogeneity and new therapies, the most current research indicates that PET-CT and WB-MRI may play complimentary roles in providing distinct and complementary information.

**TABLE OF CONTENTS/OUTLINE**

1 Introduction. 2 Updated imaging technique standardization: Italian criteria for myeloma for PET-CT use (IMPeTUS Criteria) and WB-MRI Myeloma Response Assessment and Diagnosis System (MY-RADS) guidelines. 3 PET-CT and WB-MRI for staging of myeloma patients. 4 Emerging prognostic factors on PET-CT and WB-MRI. 5 PET-CT and WB-MRI for response assessment and minimal residual disease evaluation. 6 Future perspectives: new radiotracers for PET-CT and PET-MRI. 7 Conclusion. 8 References.

## NMMIEE-8 A GUIDE TO IMAGING BASED $^{177}$LU-PSMA-617 ELIGIBILITY CRITERIA: VISION VS THERAP

Sanaz Behnia, MD (*Abstract Co-Author*) Nothing to Disclose
Delphine L. Chen, MD (*Abstract Co-Author*) Grant, Telix Pharmaceuticals Limited;Speaker, Telix Pharmaceuticals Limited
Amir Iravani, MD (*Abstract Co-Author*) Nothing to Disclose
Alireza Ghodsi, MD (*Abstract Co-Author*) Nothing to Disclose
Ridvan A. Demirci, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Theranostics agents differ from conventional chemotherapy agents by allowing objective pre-treatment eligibility assessment.177Lu-PSMA-617 is an effective and safe treatment for metastatic castration resistant prostate cancer and has been on the focus of theranostics in recent years. Landmark clinical trials, VISON and TheraP, implemented different imaging-based inclusion criteria. Understanding the details of eligibility framework is essential for accurate patient selection. This exhibit aims to provide a guide to imaging-based eligibility criterion.

**TABLE OF CONTENTS/OUTLINE**

1. Understanding the trials: VISION vs TheraP a. VISION trial uses pre-treatment PSMA-PET along with contrast-enhanced CT while TheraP uses pre-treatment PSMA and FDG PET. b. Eligibility criteria set by TheraP led to higher screening failure compared to VISION trial (28% vs 12.6%). c. TheraP trial had higher PSA response rate compared to VISION trial (66% vs 46%). d. FGD-PET as an addition to the PSMA PET, may provide insights about the tumor biology by revealing tumoral heterogeneity. 2. Workflow of imaging-based VISION eligibility and case examples a. =1 PSMA positive lesion of any size in any organ AND b. No PSMA-negative lesions bigger than 2.5 cm in nodes, 1 cm in solid organs and 1 cm in soft tissue components of bone lesions. 3. Workflow of imaging-based TheraP eligibility and case examples a. At least one lesion with PSMA SUVmax =20 AND b. PSMA SUVmax = 10 in all measurable sites AND c. Absence of discordant findings between PSMA and FDG PET

## NMMIEE-9 LIVER LESIONS: THE NUCLEAR OPTION

Benjamin L. Viglianti, MD,PhD (*Abstract Co-Author*) Nothing to Disclose
Daniel J. Wale, DO (*Abstract Co-Author*) Nothing to Disclose
Brett M. Arnkoff, MD (*Abstract Co-Author*) Nothing to Disclose
Miles Lewis (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. It is important for the radiologist to be familiar with the various appearances of liver lesions across common nuclear medicine exams.2. When certain hepatic lesions such as FNH and hemangiomas demonstrate atypical features on CT or MR, nuclear medicine studies can help to confirm the diagnosis.3. Newer PET agents including those targeting somatostatin receptors and PSMA have increased specificity in characterizing hepatic lesions, although there remain pitfalls.

**TABLE OF CONTENTS/OUTLINE**

I. IntroductionII. Gamma Agentsa. Tc99m sulfur colloidi. Focal nodular hyperplasiaii. Miscellaneousb. Tc99m labeled RBC’si. Hemangiomac. Hepatobiliary imagingd. Pseudo-lesionsi. SVC syndromeii. Budd Chiarie. Incidental uptake on other scans - liver lesion on bone scan, sestamibi, etc.III. PET agentsa. FDGi. Infectionii. Metastasesb. DOTATATEc. PSMAIV. Conclusion

## BOMBARDMENT TO BEDSIDE: BEHIND THE SCENES OF NUCLEAR MEDICINE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Prem P. Batchala, MD (*Abstract Co-Author*) Nothing to Disclose
Wayne Dell, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

We recognize that there is limited exposure of radiology trainees to "behind the scenes" events during their 16 week exposure in Nuclear Medicine. However, understanding the events that lead to gamma and PET image production is critical in guiding patient preparation, as well as understanding technologist/patient/public safety, radiotracer biodistribution, and artifacts that influence interpretation. In this exhibit we attempt to highlight important practical steps involved in the most common nuclear medicine exams focused towards radiology trainees.

### TABLE OF CONTENTS/OUTLINE

1. Synthesis of most common radionuclides (99mTc, 18F) and radiopharmaceuticals including QA/QC procedures (e.g. Impurity testing)2. Radiopharmacy, Labeling methods (e.g. 99mTc labeling of RBCs, WBCs, sulfur colloid)3. Transport and receipt of radiopharmaceuticals4. Dose calibrator, radiopharmaceutical administration5. Area surveys, Waste disposal6. Camera (Gamma and PET) QC7. NRC guidelines, Authorized user, written directive

## 18F-FLUOROESTRADIOL (FES) PET IMAGING: INDICATIONS, IMAGING REVIEW AND IMPACT ON CLINICAL MANAGEMENT OF ESTROGEN RECEPTOR POSITIVE BREAST CANCER

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Janice Thai, MD (*Abstract Co-Author*) Nothing to Disclose
Rachel E. Grenier, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1) To review indications and relative indications for 18F-Fluoroestradiol (FES) PET. 2) To demonstrate how FES PET is used to direct clinical management in patients with estrogen receptor (ER) positive breast cancer. 3) To review current limitations of FES PET.

### TABLE OF CONTENTS/OUTLINE

1) Indications for FES PET, including a) Official U.S. Food and Drug administration (FDA) approval, and b) Society of Nuclear Medicine and Molecular Imaging (SNMMI) appropriate use criteria. 2) Mechanism of action and normal biodistribution of FES. 3) Highlight clinical cases in which FES PET was used and how it impacted patient management, specifically: a) Diagnosing progression of metastatic disease in lieu of biopsy; b) Distinguishing between skeletal degenerative change and metastases; c) Diagnosing tumor recurrence that would not have otherwise been identified on diagnostic CT, F18-FDG PET or Tc-99m methylene diphosphonate (MDP) bone scan; and d) Differentiating between post treatment change and tumor recurrence.

### TEACHING POINTS

The objective of this exhibition is:Highlight radiological signs of response in patients with neoplasia after the use of yttrium-90 in different imaging modalities, including magnetic resonance imaging (MRI), computed tomography (CT) and PET-CT;Identify possible adverse effects of local therapy with TARE that are already known and associate them with the success or failure of this therapy;Understanding possible post-treatment changes is essential for correct radiological interpretations during the follow-up of patients undergoing TARE.Provide practical information and pitfalls in the interpretation of radiological manifestations, including radiopharmaceutical response time, differentiation between imaging findings directly related to neoplastic disease and secondary but expected manifestations.

### TABLE OF CONTENTS/OUTLINE

Hepatocellular carcinoma (HCC) is the most common primary liver cancer and the second most common cause of cancer mortality worldwide. This growing incidence has led to the evolution of treatment for HCC and several techniques have emerged, including everything from surgical resection to local ablation, transplantation, transcatheter arterial chemoembolization (TACE), TARE and systemic treatments, in order to reduce morbidity and mortality. Therefore, correct and individualized treatment planning is essential to obtain good results.Among the treatment options, TARE using yttrium-90, also called radioembolization or selective internal radiotherapy, has been gaining prominence and is based on a technique involving nuclear medicine and interventional radiology accepted for the treatment of HCC.

## RADIOLABELED FIBROBLAST ACTIVATION PROTEIN INHIBITOR (FAPI) IN THE INTERSTITIAL LUNG DISEASES (ILD)

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Narges Jokar (*Abstract Co-Author*) Nothing to Disclose
Esmail Jafari (*Abstract Co-Author*) Nothing to Disclose
Mehrzad Bahtouee (*Abstract Co-Author*) Nothing to Disclose
Majid Assadi, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. 68Ga-Fibroblast Activation Protein Inhibitor (FAPI) provides a readout to quantitatively measure the levels of activated fibroblasts in Interstitial Lung Diseases (ILD) with two common histological features, inflammation and fibrosis, regardless of their underlying causes. 2. GGO as a challenging finding on HRCT, raises questions about whether it represents inflammatory changes or interstitial fibrosis. 3. Distinguishing between inflammatory and fibrotic processes is crucial for treatment decisions, therapies focusing on inflammation may not work for patients with dominant fibrosis, while antifibrotic agents may be ineffective for patients with dominant inflammation. 4. FAP imaging is able to differentiate between regions of the lung with active fibrotic remodeling and those without fibrosis.5. The combination of 68Ga-FAPI PET/CT and HRCT yields an additive effect for evaluating ILD-related fibrosis and inflammatory processes over using either modality alone. 6. FAP-positive signals in the entire lung, suggesting different stages of fibrosis. Patients with many FAP-positive cells may be in active fibrosis, while those without may have stable fibrosis.

### TABLE OF CONTENTS/OUTLINE

1. FAPI imaging differentiates inflammatory changes and interstitial fibrosis2. Accurate and precise treatment approach for patients with dominant fibrosis using FAPI imaging3. Giving valuable insights into the complexities associated with ILD using FAPI imaging4. The different scenarios of either inflammation or active fibrosis based on FAPI imaging and HRCT.5. The potential diagnostic value of FAPI imaging in identifying tissue remodeling associated with chronic inflammations throughout the body.

## FIBROBLAST ACTIVATION PROTEIN INHIBITOR (FAPI)- A NEW FRONTIER IN CARDIAC IMAGING

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Narges Jokar (*Abstract Co-Author*) Nothing to Disclose
Esmail Jafari (*Abstract Co-Author*) Nothing to Disclose
Mohammadreza Pourbehi (*Abstract Co-Author*) Nothing to Disclose
Majid Assadi, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

New FAP-targeting PET radiotracers that originally developed for oncologic imaging could serve as a noninvasive method for evaluating the active and fibrosis process process in the early days after myocardial infarction in a patient. Advantages are myocardial imaging with FAPI is Identification of early changes in fibroblast dynamics and profibrotic activity. Identification of subjects at elevated risk of heart failure Identification of patients who may benefit most from specific therapeutic interventions directed against adverse interstitial myocardial fibrosis. Differentiation between active and end-stage disease Monitoring of disease progression and treatment response Enhancing patient care and clinical outcomes Identifying active myofibroblasts would enhance comprehension of their presence in the injured myocardium. Assess the effectiveness of antifibrosis treatments. Offers indirect clues about the extent of fibrogenesis or collagen deposition. Potentially pinpointing a critical time window for preventing fibrosis. FAPI myocardial imaging should be aligned with the advancements in understanding cardiac fibrosis and the development of targeted antifibrotic interventions

### TABLE OF CONTENTS/OUTLINE

1. Uptake distribution of 68Ga-FAPI-46 presumably representing worsening myocardial stiffness2. The FAPI tracer signal contribute to the development of interstitial fibrosis.3.FAPI imaging for assessing the active fibrosis process, which may persist as a chronic condition.4. Potential diagnostic value of FAPI imaging in identifying tissue remodeling throughout the body5. Dual tracers may improve the diagnostic accuracy for characterizing fibroinflammatory processes.

### TEACHING POINTS

Colorectal cancer, the most common gastrointestinal malignancy globally and the third leading cause of cancer-related death, includes rectal cancer, which comprises about one-third of cases. Guidelines recommend MRI for local staging and contrast-enhanced CT for detecting distant metastases. [18F] FDG PET/MRI appears to be a valuable tool for achieving highly precise diagnoses:
- It has been observed that the tumor response to pCRT often involves replacement of viable tumor tissue with fibrosis. Consequently, tumor understaging in this context may stem from the limitations of PET/CT to detect small clusters of residual disease. PET/MRI appears capable of accurately restaging patients following pCRT;
- [18F]FDG PET/MRI could increase the detection rate of potentially metastatic lymph nodes in rectal cancer patients;
- For M staging, [18F]FDG PET/MRI outperformed [18F]FDG PET/CT and CT in detecting metastases in solid organs, whereas it performed worse for lung metastases.

### TABLE OF CONTENTS/OUTLINE

1) T-staging: the capability of [18F]FDG PET/MRI to precisely detect lesions remains intact even in the presence of local fibrosis; 2) N-staging: especially in cases of uncertainty, the combination of [18F]FDG PET/MRI detects hypermetabolic lymph nodes more effectively than MRI alone; 3) M-staging: [18F]PET/MRI provides high soft-tissue contrast, making it useful for examining solid organs such as the liver. Additionally, it can be utilized with specific MRI sequences, such as DWI, as needed.

Yuko Nakamura, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Fuminari Tatsugami, MD (*Abstract Co-Author*) Nothing to Disclose
Mana Ishibashi (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Recently, Deep Learning-based Reconstruction (DLR) for PET imaging has been developed to provide higher signal-to-noise ratio (SNR) images. In the training process of the DLR, the DLR for PET iteratively optimizes filters of its deep convolutional neural network (DCNN) layers to minimize the differences between low-quality images (noisy image) and their paired high-quality images (targets), and the trained DLR can be applied to new data to output new high-quality images. Image quality was significantly improved with DLR-PET compared to conventional PET/CT images. The noise reduction and improved lesion-normal tissue contrast achieved with the DLR-PET may improve lesion detectability and allow more accurate prediction of treatment response. In addition, the PET image quality is maintained with shorter acquisition time or low doses. On the other hand, lesions that appear to have faint or mild FDG uptake on conventional reconstructed PET images may be false-positive due to overall increased uptake on the DLR-PET, so careful interpretation is required.

### TABLE OF CONTENTS/OUTLINE

1. Principle of Deep Learning-based Reconstruction (DRL) for PET imaging 2. Results of our phantom study 3. Clinical case presentation 4. Pitfalls in interpretating the DLR images for PET 5. Future aspects of the DLR for PET imaging

## FLUORESCENT INSIGHTS: A NUCLEAR MEDICINE GUIDE TO MUSCULOSKELETAL INFECTIONS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Harikrishnan Nandakumar, MD (*Abstract Co-Author*) Nothing to Disclose
David J. Lubin, MD (*Abstract Co-Author*) Nothing to Disclose
Sukrita Menon, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Understand the mechanism and common uses of conventional radionuclides utilized for musculoskeletal (MSK) scintigraphic imaging.2. Primary categories of adult MSK infections: Exploring various NM studies in each category which are helpful aids to conventional imaging.3. Review the radionuclide imaging algorithm to assess and choose the best modality optimized for each infection category.4. Explore the utility of hybrid NM techniques in differentiation infection from other pathology in the same region (prosthetic infection vs aseptic prosthetic loosening).5. Fundamental challenges and issues with conventional NM techniques such as false positives/negatives.6. Discuss upcoming developments (new radionuclides and techniques) and their potential role in revolutionizing current understanding of NM studies.

### TABLE OF CONTENTS/OUTLINE

1.Conventional radionuclides and techniques in MSK scintigraphy: Mechanism and clinical indication (Bone Scintigraphy, Ga 67, Labelled leucocyte scintigraphy, In-111, F18-FDG, Ga 68). 2.Primary categories of adult MSK infectionsa. Peripheral Osteomyelitisb. Spondylodiscitisc. Prosthetic Joint Infection 3.Nuclear medicine imaging algorithm for study selection for adult MSK infections. 4.Hybrid NM techniques- SPECT/CT with 99mTc, Ga67, F18 FDG PET/CT, PET/MR 5. Fundamental diagnostic challenges with conventional scintigraphy.6. Future of NM in MSK infections - New techniques and radionuclides. a. Gallium-68-Citrate (68Ga) b. Tc labelled Interleukin-8 c. Sodium Fluoride (18F-NaF) d. Radiolabelled Antibiotics. Novel PET Tracers like 68Ga-NOTA-UBI, 18F-maltohexaose, nanopeptides etc.f. Dynamic whole-body multiparametric PET imaging.

### TEACHING POINTS

Prostate-specific membrane antigen (PSMA) is a membrane protein that is over-expressed in high-risk prostate cancer. PSMA-targeted PET/CT is a valuable tool for detection, staging, and restaging of prostate cancer. However, many non-prostatic malignancies are known to express the PSMA receptor and thus may be seen on PSMA-targeted PET/CT. Knowledge of the biodistribution of PSMA-targeted radiopharmaceuticals and potential false positives is crucial in preventing misdiagnosis and unnecessary treatment. After reviewing this exhibit, radiologists will: 1) Understand normal biodistribution of PSMA as seen on PSMA-targeted PET/CT, 2) Identify causes of uptake that are not due to prostate cancer, and 3) Identify non-prostatic malignancies that express the PSMA receptor and which may have uptake on PSMA-targeted PET/CT.

### TABLE OF CONTENTS/OUTLINE

1. Introduction a. Overview of the PSMA membrane protein b. Overview of PSMA-targeted PET/CT 2. Normal physiologic distribution seen on PSMA-targeted PET/CT a. Lacrimal, salivary glands b. Kidneys c. Liver d. Spleen e. Bowel f. Ganglia (such as celiac and stellate ganglia) g. Normal excretion in urine 3. False positives a. Granulomatous disease b. Bone pathology i. Paget's disease ii. Fibrous dysplasia iii. Healing fractures c. Benign soft tissue lesions i. Schwannoma ii. Meningioma iii. Hemangioma d. Malignant lesions i. Renal cell carcinoma ii. Lymphoma iii. Marjorie Lam (*Abstract Co-Author*) Nothing to Disclose
Chanukya Cherukuri (*Abstract Co-Author*) Nothing to Disclose
John Hollis Tackett, BS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To outline the strengths weaknesses of the eight radionuclides with great potential for use in targeted alpha therapy.To describe potential clinical uses and applications for each of these radionuclides.

### TABLE OF CONTENTS/OUTLINE

Visualization of radionuclide distribution on imaging and the irradiation of malignant cells are two of the primary goals of Nuclear Medicine. An advantageous method of treating malignancies is through targeted radionuclide therapy (TRT), as it delivers highly concentrated doses of radiation directly to tumor cells or to the surrounding microenvironment, while being a minimally invasive procedure. Targeted alpha therapy (TAT) is a form of TRT that focuses on alpha-emitting radionuclides. To provide the most efficacious treatment through TAT, the radionuclide decay pathway, particle emission range, relative biological effectiveness, and physical characteristics (half-life, method of production, radionuclidic purity, etc.) and biochemical characteristics (in-vivo stability, tissue targeting, toxicity, etc.) must be considered and optimized for the chosen radionuclide.Recently, studies have shown that there are eight alpha-emitting radionuclides with the most potential for use in targeted alpha therapy: actinium-225, astatine-211, bismuth-212, bismuth-213, lead-212, radium-223, terbium-149, and thorium-227. This exhibit will discuss these radionuclides in detail, exploring their potential applications in a clinical setting and the advantages and disadvantages for each.

Albert Pons Escoda (*Abstract Co-Author*) Nothing to Disclose
Montserrat Cortes (*Abstract Co-Author*) Nothing to Disclose
Michal Pudis (*Abstract Co-Author*) Nothing to Disclose
Marina Suarez-Pinera (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• The assessment of treatment response in brain tumours and, more specifically, the differentiation between tumour recurrence and treatment related changes (TRC) remains a clinical and neuroimaging challenge. Main neuro-oncology societies (EANO, RANO, SNMMI, EANM) have recommended the use of MR and amino acid PET, both techniques, in this diagnosis. • The new generation of hybrid PET/MR scanners provides a multidisciplinary approach offering additional diagnostic information in a single scan. • The purpose of this exhibit is to evaluate the role of hybrid images in the differential diagnosis of tumour viability versus treatment-related changes.

### TABLE OF CONTENTS/OUTLINE

1. A brief overview of the pathophysiological basis and analysis of [18F]FDOPA PET in brain tumours. 2. Conventional and advanced MRI sequences in neuro-oncology. 3. [18F]FDOPA PET/MRI images of cases from our department and correlation with histopathological findings. 4. Take-home messages.

### TEACHING POINTS

1. Paragangliomas (PGLs) are rare neuroendocrine tumors arising from chromaffin cells along with elevated catecholamines (epinephrine, norepinephrine, and dopamine) and/or their respective metabolites (metanephrine, normetanephrine, and methoxytyramine).2. PGLs are the most hereditary tumor among all endocrine and non-endocrine neoplasms and are currently divided into three clinically relevant genetic clusters (1[a,b], 2, and 3).3. Not only the clinical, biochemical, but functional (molecular) imaging phenotype is dependent upon genetic makeup of these tumors.4. There are 3 specific targets found in PGLs (somatostatin receptor, norepinephrine transporter, and L-type amino acid transporter).5. 68Ga-DOTATATE (targets somatostatin receptor) is the functional imaging phenotype in cluster 1a (SDHx-related) - primary or metastatic PGLs, metastatic sporadic, and head and neck PGLs.6. 18F-FDOPA (targets L-type amino acid transporter) is the functional imaging phenotype in cluster 1b, 2, and primary sporadic pheochromocytoma.7. Selection of targeted radiotherapy (177Lu-DOTATATE or 131I-MIBG) for metastatic patients depend upon uptake on 68Ga-DOTATATE and 123I-MIBG (targets norepinephrine transporter).

### TABLE OF CONTENTS/OUTLINE

1. Definition and location of PGLs including rare locations.2. Genetic cluster classification. 3. Definition of theranostics and various theranostic targets in PGLs.4. Mechanism of action of radiopharmaceuticals.5. Demonstration of functional imaging phenotypes in various clusters and cohorts.6. Algorithm for identifying functional imaging phenotype when genotype is known.7. Application of functional imaging to select between targeted radiotherapies.

### TEACHING POINTS

1. Sarcoid-like reactions, resembling malignancy, require histologic confirmation for accurate diagnosis in post-cancer patients. 2. Histological evaluation is crucial to differentiate sarcoid-like reactions from malignancy. 3. Awareness of these reactions is crucial to prevent misdiagnosis and unwarranted treatment interventions. 4. Utilization of FDG-PET/CT aids in the detection and monitoring of sarcoid-like reactions, guiding clinical management decisions effectively.

### TABLE OF CONTENTS/OUTLINE

I. Introduction A. Background on Sarcoid-like Reactions B. Importance of Accurate Diagnosis in Oncologic Patients II. Radiological-Pathological Correlation A. Imaging Features of Sarcoid-Like Reactions: PET/CT findings highlighting the challenges in diagnosing sarcoid-like reactions and the impact on treatment decisions. Characteristic imaging findings such as lymphadenopathy and pulmonary nodules distinguishing sarcoid-like reactions from malignancy. B. Sarcoid like reaction associated with various treatments such as immunotherapy, targeted therapy, and chemotherapy such as carboplatin. C. Importance of Histological Evaluation: Radiology pathology correlation in cases on sarcoidosis like reaction. D. Clinical Presentation and Diagnostic Challenges III. Conclusion A. Summary of Key Findings B. Recommendations for Clinical Practice C. Future Directions in Research

## PSMA (PROSTATE-NOT-SO-SPECIFIC MEMBRANE ANTIGEN) PET: A REVIEW OF BENIGN AND MALIGNANT INCIDENTAL FINDINGS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Vahid Yaghmai, MD, MS (*Abstract Co-Author*) Nothing to Disclose
James Shi, MD (*Abstract Co-Author*) Nothing to Disclose
Maryam Rahmani, MD (*Abstract Co-Author*) Nothing to Disclose
Garrett G. Ward, MD (*Abstract Co-Author*) Nothing to Disclose
Seyedeh Niloufar Rafiei Alavi, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1) Define Prostate-Specific Membrane Antigen (PSMA) and its imaging role, emphasizing its association with prostate cancer and expression in other tissues.2) Discuss PSMA as a transmembrane protein with various cellular roles, highlighting its expression in both normal and neoplastic cells.3) Familiarize radiologists with the knowledge to identify common benign and malignant incidental findings on PSMA PET/CT.4) Introduce evidence-based methods to distinguish between incidental findings and true positive lesions in imaging.

### TABLE OF CONTENTS/OUTLINE

1. Current Role of PSMA-PET/CT in the management of prostate cancer.2. Overview of the PSMA Protein, its structure, function, and clinical significance 3. Physiologic Uptake Patterns on PET/CT and identifying physiological versus pathological uptake.4. Common Benign Incidental Findings on PSMA-PET/CT 5. Common Non-Prostate Cancer Malignant Findings 6. Evidence-Based Identification Methods: Review the evidence supporting various approaches for accurately identifying incidental findings on PSMA-PET/CT

R. Travis Clark, MD (*Abstract Co-Author*) Nothing to Disclose
Sara Janos, MD (*Abstract Co-Author*) Nothing to Disclose
Aaron Gambrell, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Meckel's diverticulum is the most common congenital abnormality of the gastrointestinal tract, although only present in approximately 2% of the population. It is important to recognize the different clinical presentations and complications of this anomaly in order to expedite the diagnosis and treatment for the patient. One of the common diagnostic imaging exams used in the work-up is the Tc-99m pertechnetate Meckel's scan, which will be highlighted in this exhibit, including how to improve the sensitivity of the exam and how to avoid falling for false positives and negatives. This exhibit will show examples of how other diagnostic tools can be used for identification and what tools can be used for troubleshooting to aid in diagnosis, as well as how similar clinical presentations can potentially distract a radiologist or clinical provider from a Meckel's diagnosis. At the end of this review the reader should be able to identify anatomy, recognize various clinical presentations, create a differential diagnosis and appropriately diagnose a Meckel's diverticulum.

### TABLE OF CONTENTS/OUTLINE

1. Introduction a. Definition/ presentations b. Embryology c. Anatomy/ physiology 2. Imaging findings/ diagnostic troubleshooting a. Nuclear medicine b. Angiography c. CT d. Ultrasound 3. Complications a. GI hemorrhage b. SBO c. Intussusception d. Diverticulitis e. Perforation f. Neoplasm g. Umbilico-ileal fistula h. Hernia- Littre hernia 4. Management/ treatment a. Surgical options b. Prognosis/ outcomes 5. Differential Diagnosis a. IBD b. Ulcers c. Angiodysplasia d. Appendicitis e. Small bowel diverticulitis f. Intussusception look-alike: polyp or lymphoma g. Obstruction look-alike: adhesions or hernias 6. Conclusion

Ba D. Nguyen, MD (*Abstract Co-Author*) Nothing to Disclose
Steve S. Huang, MD (*Abstract Co-Author*) Nothing to Disclose
Logan Haug, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To provide a brief overview of the protocols and relevant technical aspects of bone scintigraphy. To facilitate recognition of technical complications that can interfere with correct interpretation of bone scans. To provide a comprehensive list of “Aunt Minnies” that can be recognized on bone scan. To demonstrate characteristic scintigraphic features of benign and malignant bone lesions. To understand patterns of osseous radiotracer uptake and identify soft tissue findings that may contribute to accurate diagnosis of complex syndromes.

### TABLE OF CONTENTS/OUTLINE

This exhibit has four main components: 1. Procedures/protocols of bone scintigraphy: planar, 3-phase, and SPECT/CT imaging 2. Demonstration of faulty acquisitions with inadequate/suboptimal imaging results: hot glove sign, free Tc-99m pertechnetate, incorrect photopeak, etc. 2. Characteristic and atypical features of metastasis (unifocal, multifocal, sarcomatoid features), fractures (insufficiency fractures, non-accidental trauma) and benign bone lesions (skull suture, enchondroma, infarct, osteoma/osteomatosis in Gardner’s syndrome). 3. Scintigraphic osseous and soft tissue findings of metabolic diseases (renal osteodystrophy, brown tumors, calciphylaxis), iatrogenic findings (voriconazole, bisphosphonate, avastin), paraneoplastic syndromes (hypertrophic osteoarthropathy, tumor-induced osteomalacia), and multi-system syndromes (cleidocranial dysplasia, sacral agenesis, sickle cell disease, myelofibrosis, Erdheim-Chester disease, Asherson's syndrome, Mazabraud's syndrome, McCune-Albright syndrome, Mafucci syndrome, Ollier disease, and rhabdomyolysis).

## RADIOPHARMACEUTICAL IMAGING IN THE MANAGEMENT OF CARDIAC SARCOIDOSIS AND AMYLOIDOSIS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Daniel Sehi (*Abstract Co-Author*) Nothing to Disclose
Farrokh Dehdashti, MD (*Abstract Co-Author*) Nothing to Disclose
Robert J. Gropler, MD (*Abstract Co-Author*) Grants, Bayer AG;Consultant, Biomedical Systems;Scientific Adivsor, Amgen Inc;Scientific Advisor, sanofi-aventis Group
Cylen Javidan, MD (*Abstract Co-Author*) Nothing to Disclose
Ashwin Singh S. Parihar, MBBS, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Infiltrative cardiomyopathies involve deposition of abnormal substances within the myocardium leading to progressive deterioration of cardiac function and clinical symptoms of heart failure and arrhythmias. 2. Radiopharmaceutical imaging for cardiac amyloidosis and sarcoidosis provide a non-invasive assessment of disease state and in several cases obviate the requirement of an endomyocardial biopsy, helping directly initiate specific treatment. This exhibit provides a comprehensive overview of the clinical and imaging features of these diseases, including the impact of functional imaging in clinical management.

### TABLE OF CONTENTS/OUTLINE

1. Common Clinical Presentations and diagnostic algorithms: a. Common clinical presentations. b. Initial diagnostic workup. c. Correlative imaging - Echocardiography, contrast-enhanced MRI. 2. Cardiac Sarcoidosis: a. Patient preparation for FDG PET. b. Imaging patterns on FDG PET and perfusion SPECT, underlying disease mechanisms, implications of imaging findings and imaging pitfalls. c. Clinical role in diagnosis, staging, response assessment and evaluation of suspected recurrence. d. Clinical management of Cardiac Sarcoidosis. 3. Cardiac Amyloidosis: a. Mechanism of radiotracers and Imaging techniques. b. Characteristic patterns on 99mTc-PYP planar and SPECT/CT imaging, including grading of uptake and imaging pitfalls. c. Performance of PYP imaging in specific clinical scenarios, including genetic mutations, type of amyloidosis, solitary cardiac amyloidosis without extra-cardiac involvement. d. Diagnostic accuracy of PYP imaging and its utility for initiating treatment. e. Clinical management of Cardiac Amyloidosis.

## USEFULNESS OF PSMA PET/MRI IN TREATED PROSTATE CANCER PATIENTS, OUR INITIAL EXPERIENCE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

David Durany Lara (*Abstract Co-Author*) Nothing to Disclose
Eugenia De Lama Salvador, MD (*Abstract Co-Author*) Nothing to Disclose
Eva Maria Merino Serra (*Abstract Co-Author*) Nothing to Disclose
Javier Robles Barba, MD (*Abstract Co-Author*) Nothing to Disclose
Juan Jose Martin-Marcuartu (*Abstract Co-Author*) Nothing to Disclose
Laura Chavarriaga, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The purpose of our presentation is to evaluate the performance and diagnostic accuracy of PSMA PET/MRI for the evaluation and detection of recurrent prostate cancer in patients treated with surgery or focal strategies, especially after Irreversible Electroporation (IRE) treatment.

### TABLE OF CONTENTS/OUTLINE

Focal therapy (FT) is an emerging treatment option for selected patients with localised prostate cancer (PCa). FT has the potential to achieve oncological control while preserving urinary, sexual and bowel function.IRE induces irreversible permeabilization of the cell membrane, resulting in loss of homeostasis and consequential cell death; with the advantage that preserves tissue structure of the prostate.In recent years, the clinical availability of integrated PET/MRI scanners has made it possible to explore the potential of multimodal, combined anatomical and functional imaging.PSMA PET/MRI has shown potential to use in the planification and early assessment before IRE treatment and follow-up of post-IRE patients and to identify lesions missed by mpMRI. Also, findings in PSMA PET/MRI has changed treatment indications (from focal treatment to systemic). Targeted therapies could be directed by PET/MRI with radiolabelled PSMA because of its ability to detect the most aggressive lesion.PET/MRI is an excellent synergistic imaging modality in the setting of biochemical PCa recurrence, as a tool to both characterize local disease within the prostate and evaluate for metastasis with a single examination.

Vaseem Chengazi, MD (*Abstract Co-Author*) Nothing to Disclose
Wei Li (*Abstract Co-Author*) Nothing to Disclose
John Cerne, MD, BS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Interpreting bone scans of patients with orthopedic hardware is often a challenging topic for residents. We created this exhibit to teach: 1) key bone scan findings in relation to orthopedic hardware; 2) why these findings make sense. Clinicians want to know when there is orthopedic hardware loosening or osteomyelitis. Radiologists need to know that methyl diphosphonate (MDP) adsorbs in proportion to the rates of bone remodeling and that white blood cells (WBCs) migrate to areas of infection. By attaching a radiotracer to MDP or WBCs, a gamma camera can translate radioactivity to pixelation. Accordingly, focal uptake near hardware suggests stress fracture or hardware loosening in the context of remote surgery. Diffuse uptake with increased blood pool suggests hardware loosening vs infection, with the latter being more likely. Normal uptake in the setting of increased blood pool/perfusion suggests soft tissue inflammation vs degenerative arthritis. After reviewing this exhibit, the resident will understand why the imaging patterns make sense and how they can use this information to offer appropriately specific comments on pathology likelihood.

### TABLE OF CONTENTS/OUTLINE

(1) Bone Scans: how they work; what they can show (2) Orthopedic implants in different locations, and the sites of mechanical stress: hips; knees; ankles (3) Cemented vs Non-Cemented Appliances: implications for surgery; implications for imaging; pathophysiological basis (4) Tell Tale Patterns: focal uptake; diffuse uptake; normal uptake (5) Creating a Good Report: patient background; findings; impression (6) Review of Literature: hot off the press; sensitivity and specificity; what does the future hold?

## CURRENT AND EMERGING ROLES OF PET/CT IN THE MANAGEMENT OF MULTIPLE MYELOMA

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Asha Kandathil, MD (*Abstract Co-Author*) Nothing to Disclose
Alex Heglin, DO, MS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Whole body FDG PET/CT is indicated in the evaluation of patients with suspected multiple myeloma, for evaluation of total metabolically active disease burden and detection of extramedullary disease. 2. Lab-based multiple myeloma staging methods such as Revised International Staging System (R-ISS) and the Durie-Salmon System show improved assessment of progression-free and overall survival when paired with metabolic activity (SUVmax) from FDG PET/CT scans. 3. The Italian Myeloma Criteria for PET Use (IMPeTUs) interpretation framework has shown accurate stratification of progression free and overall survival via the metabolic characterization of active lesions and may be used for both staging and treatment response assessment. 4. FDG PET/CT is the preferred modality for assessing response to multiple myeloma treatment. 5. Alternative PET agents have shown promising results for multiple myeloma characterization, such as 11C-methionine showing higher sensitivity and accuracy compared to FDG, Ga68-Pentixafor (CXCR4) staging patients higher than FDG, and Cu64-daratumumab showing higher sensitivity and accuracy compared to FDG.

### TABLE OF CONTENTS/OUTLINE

1. Multiple myeloma staging criteria - R-ISS, IMPeTUs, and Durie/Salmon. 2. FDG PET/CT for initial diagnosis, staging and prognostication of multiple myeloma. 3. FDG PET/CT for multiple myeloma treatment response. 4. Alternate PET targets: Ga68-CXCR4, 11C-methionine, 11C-choline

## CHARACTERIZING MUSCLE FDG UPTAKE: AN INDICATOR FOR INFLAMMATORY DISEASES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Ryogo Minamimoto, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

FDG uptake on PET/CT has been a valuable indicator in the diagnosis and management of inflammatory disease. This presentation explores the utility of muscle FDG uptake in differentiating between various inflammatory diseases (Dermatomyositis, Cancer-associated myositis, Sarcoidosis, Vascular disease, and Systematic inflammatory disease). Characterization of muscle FDG uptake patterns can enhance diagnostic accuracy, monitor disease progression, and optimize therapeutic interventions for patients with inflammatory diseases.

### TABLE OF CONTENTS/OUTLINE

1. Dermatomyosis, 2. Cancer-associated myositis (rectal cancer), 3. Muscle involvement in Sarcoidosis, 4. Polyarteritis nodosa (PAN), 5 .Eosinophilic granulomatosis with polyangiitis (EPGA)

## RADIONUCLIDE LYMPHOSCINTIGRAPHY: CASE BASED MULTIMODALITY PICTORIAL REVIEW WITH TEACHING PEARLS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Pokhraj P. Suthar, MBBS, MD (*Abstract Co-Author*) Nothing to Disclose
Sumeet Virmani, MD, MS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Evaluation and management of extremity edema, lymphatic malformations and leaks, and localization of sentinel lymph nodes for certain cancer patients is challenging for both the patient and the treating physician. Radionuclide lymphoscintigraphy can be effectively used to localize sentinel lymph nodes and prove and/or rule out lymphatic causes of swelling or leak. The purpose of this case-based pictorial exhibit is to highlight the imaging spectrum of various findings of radionuclide lymphoscintigraphy in patients with extremity edema, lymphatic malformations, and leaks, and localization of sentinel lymph nodes. Clinical and other multimodality imaging correlation is provided when available.

### TABLE OF CONTENTS/OUTLINE

Our case-based multimodality pictorial review (15 cases) includes various patterns seen on both upper and lower-extremity radionuclide lymphangiograms. These include evaluating the number, course, symmetry, and intensity of lymphatic channels; timing related to visualization of draining regional nodes; the number of regional nodes visualized; dermal backflow and its severity; abnormal collaterals as suggested by visualization of popliteal and epitrochlear nodes; leaks and malformations; and protocol with helpful Tips and Pearls during the study. We also highlight its importance in anatomical localization and confirmation of lymphatic leaks and malformations and localizing sentinel lymph nodes in certain cancer patients. Multimodality correlation is provided where available.

### TEACHING POINTS

The prostate specific membrane antigen (PSMA) is a cell-surface glycoprotein over-expressed in most clinically significant PCa. PSMA is an ideal target for nuclear medicine theranostics applications in patients with prostate cancer (PCa), and has been widely used for the imaging (PSMA-PET) and therapy (PSMA-radioligand therapy - RLT) of patients with PCa. PSMA-RLT has emerged as a safe and effective treatment for advanced PCa. Imaging plays a crucial role throughout RLT treatment phases. Prior to PSMA-RLT it identifies those patients more likely to respond due to significant expression of the PSMA on their PCa cells. In addition to PSMA-PET, the natural pair for PSMA-RLT theranostics, FDG-PET can be useful in identifying PCa heterogeneity, that was suggested as a possible predictor of treatment response. Immediately after injection of the PSMA-RLT radiopharmaceutical and at subsequent intervals, a SPECT scan can be used to verify the distribution of the radiopharmaceutical in PCa foci, as well as quantify uptake to extrapolate dosimetric information. After completion of PSMA-RLT cycles, PSMA-PET is used to assess tumor response and monitor progression of disease.

### TABLE OF CONTENTS/OUTLINE

• Introduction to Prostate Cancer Theranostics o Clinical indications o Radiopharmaceuticals o Future directions • PSMA PET/CT prior to PSMA-RLT o Patient eligibility o FDG-PET to assess tumor heterogeneity o Assessment of disease location and extent • Quantitative SPECT after PSMA-RLT o Distribution of PSMA-RLT o Quantification and dosimetry • PSMA PET/CT post-RLT Treatment response monitoring

## TC99M DMSA RENAL CORTICAL SCINTIGRAPHY IN CHILDREN: BEYOND UTI

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Marina Easty, FRCR (*Abstract Co-Author*) Nothing to Disclose
Lorenzo Biassoni, MBBS (*Abstract Co-Author*) Nothing to Disclose
Riwa Meshaka, MBChB (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Tc99m-DMSA renal cortical scintigraphy is the test of choice for renal parenchymal scarring following urinary tract infection in children at many centres globally, however its scope of use extends to numerous other indications [Vali et al., 2022]. High quality Tc99m-DMSA renal cortical scintigraphy +/- SPECT can • Characterise location and function of renal parenchyma in congenital anomalies • Evaluate upper and lower moiety differential function separately in duplex systems • Assess functioning renal parenchyma in renovascular hypertension before and after intervention.• Be used alongside low-dose CT to assess complex renal calculi and bilateral Wilms' tumours prior to urological surgery • Provide accurate parenchymal functional information in hydronephrosis, cystic disease, renal transplant, and following traumatic renal injury.

### TABLE OF CONTENTS/OUTLINE

Role of Tc99m-DMSA scintigraphy, technical aspects, limitations, interpretation pearls and pitfalls, multimodality appearance and clinical correlation in: 1. Congenital renal anomalies: renal ectopia, fusion anomalies, duplex kidney. 2. Cystic renal disease and the nonfunctioning kidney. 3. Hydronephrosis before and after urology surgical intervention 4. Vascular disease including renovascular hypertension and renal vein thrombosis. 5. Complex renal calculi6. Renal parenchymal damage after trauma. 7. Wilms' tumour for nephron-sparing surgery. 8. Renal transplant

## REDISCOVERING QUANTITATIVE LYMPHOSCINTIGRAPHY: AN APPROACH TO THE ASSESSMENT OF LYMPHEDEMA

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Juliana Kim (*Abstract Co-Author*) Nothing to Disclose
Orhan K. Oz, MD,PhD (*Abstract Co-Author*) Nothing to Disclose
Jaewon Yang, PhD (*Abstract Co-Author*) Nothing to Disclose
Robert C. Sibley III, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Lymphoscintigraphy (LSG) is the oldest imaging method used to evaluate the lymphatic system. Despite the demonstrated utility of newer techniques including magnetic resonance (MR) lymphangiography, near-infrared imaging, and high-frequency ultrasound, LSG remains the gold standard in the evaluation of lymphedema due to its high sensitivity (96%) and specificity (100%)1. 2. The performance of LSG is highly dependent on the quality of the study protocol and the measurements used to evaluate patients with lymphedema. 3. In this educational exhibit, we provide an illustrated overview of lymphoscintigraphy protocols, reviewing types of radiotracers, exercise interventions, and quantitative measurements, including transport kinetics calculations, which can be used to improve the assessment of patients with primary and secondary lymphedema.

### TABLE OF CONTENTS/OUTLINE

1. Introduction to lymphedema a. Epidemiology and disease burden b. Diagnosis c. Treatments 2. Comparison of lymphatic imaging methods used to evaluate lymphedema a. Advantages and disadvantages of quantitative lymphoscintigraphy b. MR lymphangiography, near-infrared imaging, and high-frequency ultrasound 3. Review of lymphoscintigraphy protocols a. Radiotracers used b. Exercise interventions c. Timing of imaging d. Quantitative measurements i. Lymph node uptake ii. Clearance rate constant iii. Quantitative asymmetry index iv. Blood appearance rate v. Contrast-to-noise ratio for dermal backflow 4. Challenges and Opportunities a. Clinical applications of quantitative lymphoscintigraphy b. Future directions

Kota Yokoyama, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Demonstrate the broad utility of brain perfusion and neuroreceptor SPECT, radionuclide cisternography, FDG, O-gas, amino acid, and Amyloid PET in diagnosing and managing cerebral diseases.2. Illustrate the complementary roles of these nuclear medicine techniques alongside MRI to provide a comprehensive understanding of cerebral pathologies, aiding in accurate diagnosis and effective treatment planning.

### TABLE OF CONTENTS/OUTLINE

1. Introduction: Importance of Nuclear Medicine in Brain Imaging2. Cerebrovascular Diseases: Utilizing SPECT and PET for assessing cerebrovascular disorders, with a specific focus on their roles in pre-surgical evaluation.3. Epilepsy: Detection of epileptic foci using SPECT and PET to guide surgical and therapeutic interventions.4. Brain Tumors: Application of amino acid PET and FDG PET in differentiating tumor characteristics, crucial for diagnosis and management.5. Psychiatric Disorders: Exploration of cerebral perfusion patterns in psychiatric conditions, enhancing understanding and treatment approaches.6. Inflammatory and Infectious Diseases: PET and SPECT in the diagnosis and management of encephalitis and autoimmune disorders.7. Hydrocephalus and Duropathies: SPECT's role in diagnosing and differentiating cerebrospinal fluid dynamics and related pathologies.8. Neurodegenerative Diseases: Detailed discussion on the diagnostic processes for Alzheimer's disease and other dementias using MRI, SPECT, and PET to differentiate and decide on management strategies.9. Future Perspectives: Discussion on emerging tracers with limited evidence or clinical experience that may become significant in future neuroimaging practices.

## POST-RADICAL PROSTATECTOMY BIOCHEMICAL RECURRENCE PSA, PSMA-PET, AND SALVATION RADIATION THERAPY INTERVAL ON HIGH RISK PATIENT ALL-CAUSE MORTALITY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Johnny Yang, BS, BA (*Abstract Co-Author*) Nothing to Disclose
Vani Vijayakumar, MD (*Abstract Co-Author*) Nothing to Disclose
Jeffrey Roux (*Abstract Co-Author*) Nothing to Disclose
Bryson Brister (*Abstract Co-Author*) Nothing to Disclose
John Hollis Tackett, BS (*Abstract Co-Author*) Nothing to Disclose
Chanukya Cherukuri (*Abstract Co-Author*) Nothing to Disclose
Marjorie Lam (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Discuss biochemical recurrence and treatment failure post-radical prostatectomy for prostate cancer.Assess all-cause mortality risk in salvage radiotherapy before and after PSA failure.Evaluate PSMA imaging intervals in patients with one high-risk factor (ie, pT3/4 or prostatectomy [p] Gleason score 8-10).Highlight the efficacy of 18F-DCFPyL-PET/CT over standard imaging.

### TABLE OF CONTENTS/OUTLINE

Prostate-specific membrane antigen positron emission tomography, as compared with conventional imaging (bone scan, computed tomography, or magnetic resonance imaging), seems to improve detection of biochemical recurrence in patients with prostate-specific antigen failure (PSA> 0.20 ng/mL) after salvage radical prostatectomy (sRP) for prostate cancer. Its USDA approval was backed by findings from the phase III CONDOR trial, in which 63.9% of men with PSA failure with no definitive evidence of recurrence using standard imaging had a change in management based on the 18F-DCFPyL-PET/CT findings. Prior to sRT, physicians often order a PSMA-PET scan only after PSA > 0.20 ng/mL post-sRT. This timing is chosen because PSMA-PET scans demonstrate optimal sensitivity at PSA > 0.20 ng/mL and because many insurance companies only provide reimbursement if PSA levels exceed a predetermined threshold set by the insurance company. Delaying the initiation of sRP raises concerns for elevated all-cause mortality. To improve outcomes, PSMA-PET scans should be performed within 6 months of reaching PSA failure to prevent delayed treatment while still compliant with insurance policies. This study highlights the efficacy of 18F-DCFPyL-PET/CT in guiding treatment strategies for prostate cancer patients with PSA failure.

## HOW TO REPORT PSMA PET/CT? A REVIEW OF AVAILABLE STANDARDIZED SCORING SYSTEMS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Maryam Rahmani, MD (*Abstract Co-Author*) Nothing to Disclose
Vahid Yaghmai, MD, MS (*Abstract Co-Author*) Nothing to Disclose
James Shi, MD (*Abstract Co-Author*) Nothing to Disclose
Garrett G. Ward, MD (*Abstract Co-Author*) Nothing to Disclose
Seyedeh Niloufar Rafiei Alavi, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1) Explain why standardized reporting is crucial for optimal diagnostic accuracy in PSMA PET/CT2) Familiarize radiologists with all different tools for reporting PSMA-PET/CT results and identify the correct application for each of them3) Describe the two most commonly used PRIMARY score and PSMA-RADS score 4) Compare the performance of different tools for various indications of PSMA PET/CT

### TABLE OF CONTENTS/OUTLINE

1) Overview of Standardized Reporting Tools for reporting PSMA PET/CT2) Provide a thorough description of the PRIMARY score, supplemented by relevant case examples.3) Explain the PSMA-RADS scoring system with case example studies. 3) Explain the RECIP 1.0, and PPP criteria for treatment response evaluation in PSMA PET/CT 4) A Comparative Review of Scoring Systems, discussing their advantages and disadvantages in different clinical scenarios.

## REVIEW OF BRAIN PET/MRI WITH A FOCUS ON THE APPLICATIONS OF JOINT-RECONSTRUCTION

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Cum Laude**

Matthew S. Breen, MD (*Abstract Co-Author*) Nothing to Disclose
Siddhant Dogra, MD (*Abstract Co-Author*) Nothing to Disclose
Timothy M. Shepherd, MD, PhD (*Abstract Co-Author*) Co-founder, MICroStructure Imaging
Girish M. Fatterpekar, MBBS (*Abstract Co-Author*) Nothing to Disclose
James R. Loftus, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Joint reconstruction is an advanced technique which utilizes information from both the PET and MRI data to improve image reconstruction beyond simple image fusion 2. Advantages of joint reconstruction include superior delineation of activity in cortically-based radiotracers and improved detection of motion 3. Wide applications for joint reconstruction exist across a spectrum of brain PET/MRI techniques which may allow for higher quality image interpretation

### TABLE OF CONTENTS/OUTLINE

1. Overview of Joint PET-MRI Reconstruction a. Description of technique - not just image fusion b. Advantages and pitfalls 2. Applications of Brain PET/MRI Using Joint Reconstruction a. FDG i. Neurodegenerative diseases ii. Epilepsy iii. Tumor progression versus post-treatment changes b. Amyloid-ligand c. Tau-ligand d. F-DOPA e. FET

## GA68 PSMA PET AND MULTIPARAMETRIC MRI IN RECURRENT GLIOBLASTOMA MULTIFORME: CURRENT INSIGHTS AND FUTURE DIRECTIONS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Liang Wang, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Qiubai Li, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Multimodal Imaging Benefits Highlight the advantages of Ga68 PSMA PET/CT and mpMRI. 2. Radiotracer Selection: Explore the specific roles of Ga68 PSMA in imaging recurrent GBM. 3. Clinical Applications: Illustrate how Ga68 PSMA PET/CT and mpMRI contribute to diagnosis, treatment planning, and monitoring, facilitating personalized therapeutic strategies. 4. Challenges and Future Directions: Address challenges related to standardization, biomarker validation, and the integration of advanced analytical techniques.

### TABLE OF CONTENTS/OUTLINE

I. Introduction A. Overview of Recurrent GBM B. Rationale for Integrating Ga68 PSMA PET/CT and mpMRI II. Multimodal Imaging Benefits A. Improved Soft Tissue Contrast B. Simultaneous Functional and Anatomical Information C. Potential for Quantitative Analysis III. Radiotracer Selection A. Ga68 PSMA PET for Assessing Tumor Metabolism B. Ga68 PSMA PET/CT and mpMRI for Evaluating Tumor Extent C. Ga68 PSMA PET/CT and mpMRI Markers for Identifying Treatment Resistance IV. Clinical Applications A. Accurate Diagnosis B. Guiding Therapeutic Interventions C. Predicting and Assessing Treatment Response V. Challenges and Future Directions A. Standardization of Imaging Protocols B. Validation of Biomarkers C. Integration of Advanced Analytical Techniques VI. Future Research Directions A. Protocol Optimization B. Conducting Validation Studies and Trials C. Tailoring Personalized Therapeutic Approaches VII. Conclusion A. Summary of Key Findings B. Implications for Clinical Practice C. Potential Enhancements in Patient Care

## IS PSMA/PET REALLY PROSTATE SPECIFIC? AN UPDATE OF NON-PROSTATIC UPTAKE AND EMERGENT ROLE IN OTHER MALIGNANCIES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Patrick Veit-Haibach, MD (*Abstract Co-Author*) Grant, Siemens AG;Speaker, Siemens AG;Travel support, Siemens AG
Roshini Kulanthaivelu, MBBS (*Abstract Co-Author*) Nothing to Disclose
Ur Metser, MD, FRCPC (*Abstract Co-Author*) Consultant, POINT Biopharma Inc
Claudia Ortega Mogilevich, MD (*Abstract Co-Author*) Nothing to Disclose
Andres Kohan, MD (*Abstract Co-Author*) Nothing to Disclose
Vanessa Murad, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. To review the physiological distribution of prostate-specific membrane antigen (PSMA), and potential pitfalls. 2. To present different benign processes showing PSMA uptake with demonstrative examples. 3. To describe malignancies other than prostate cancer that are associated with PSMA uptake, and to review the emerging potential role of PET on their diagnosis and treatment.

### TABLE OF CONTENTS/OUTLINE

1. Introduction: - What is prostate-specific membrane antigen (PSMA)? 2. Physiological distribution of PSMA and potential pitfalls: Demonstrative cases.3. Benign processes demonstrating PSMA uptake, case-based series: - Benign tumors (E.g. meningioma, solitary fibrous tumor). - Infectious/inflammatory (E.g. pneumonia, proctitis). - Bone remodeling (E.g. fracture, Paget’s disease). 4. Other malignancies showing PSMA uptake (E.g. hepatocellular carcinoma, cholangiocarcinoma, breast cancer, colorectal cancer, stomach signet ring carcinoma, adenoid cystic carcinoma, and other salivary gland tumors): - Mechanisms of PSMA uptake. - Updated evidence of PSMA/PET role on diagnosis and treatment.

Nader Pahlevan, BA (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Review the fundamental principles of alpha and beta particles including emission properties of different radionuclides and their applications- Discuss differences in alpha and beta RPT and uses for individualized patient care- Highlight new advancements in RPT and potential side effects

### TABLE OF CONTENTS/OUTLINE

Radionuclides have a wide variety of uses based on their physical characteristics. An important example is radiopharmaceutical therapy (RPT) which is when a radionuclide is used alone or ligated to a drug, protein, peptide, or monoclonal antibody for the destruction of undesirable cell lines. They are commonly used to treat hyperproliferative cancers and are especially useful in sites like bone and brain that are difficult to reach with conventional external radiotherapy due to the risk of damaging healthy cells. The radionuclides used are primarily beta-particle and alpha-particle emitters. Beta particles average a lower particle energy (PE) and linear energy transfer (LET) with a greater penetrance when compared to alpha particles that tend to have a higher PE and LET with a shorter range. Beta RPT has been available for many years, is very versatile, and is the current gold standard. Yet, new advancements are needed for more resilient cancerous pathologies. Using alpha particles could be an excellent novel therapy as recent clinical trials have shown it to be beneficial in patients where beta RPT has failed. However, some adverse effects have been observed. The approval of alpha particle therapy would broaden treatment options to allow for more individualized patient care.

Keizo Murakawa (*Abstract Co-Author*) Nothing to Disclose
Emi Tateishi (*Abstract Co-Author*) Nothing to Disclose
Yusuke Terakawa, RT (*Presenter*) Nothing to Disclose

### TEACHING POINTS

18F-FDG PET/CT effectively assesses active inflammatory lesions on the aortic wall in Takayasu arteritis (TAK). However, contrast-enhanced CT is still required to evaluate structural changes in the aorta, increasing radiation exposure and the risk of renal dysfunction. A digital PET/CT system equipped with Continuous Bed Motion (CBM) captures the ultra-early dynamic phase of 18F-FDG administration, enabling the acquisition of PET angiography (PET-angio). Previous reports of PET-angio indicated the usage of a higher dose of 18F-FDG than our standard dose of 2MBq/kg. In this study, we adjusted the speed of CBM and achieved PET-angio without increasing the dose of 18F-FDG. The neck-to-pelvis scan using CBM was initiated 20 seconds after injecting 18F-FDG diluted in 20 ml of 0.9% saline solution at a rate of 1 ml/s. Immediately after 18F-FDG administration, 20 ml of 0.9% saline solution was administered at the same rate of 1ml/s for flushing. The detection of radioactivity was insufficient for abdomen-to-pelvis with the fixed CBM speed of 22mm/s, resulting in unclear abdominal arteries. Adjusting the speed to 11mm/s at the level of the L3 vertebra enabled visualization of systemic arteries from the neck to the pelvis. Our combined approach of standard FDG PET/CT and the PET-angio offers clinical utility for monitoring arterial structural changes and active inflammation in TAK patients while minimizing radiation exposure and preventing contrast-induced nephropathy.

## PET/MRI IN MULTIPLE MYELOMA: POTENTIAL INDICATIONS, TIPS AND TRICKS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Montserrat Cortes (*Abstract Co-Author*) Nothing to Disclose
Jose A. Narvaez, MD (*Abstract Co-Author*) Nothing to Disclose
Karen Perez Alfonso, MD (*Abstract Co-Author*) Nothing to Disclose
Ivan Sanchez Rodriguez (*Abstract Co-Author*) Nothing to Disclose
Itziar Carro (*Abstract Co-Author*) Nothing to Disclose
Javier Hernandez Ganan (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The hybrid PET/MRI techniques combine the morphological information provided by MRI and the metabolic and functional data provided by 18FDG PET imaging. This makes it possible both to detect myeloma infiltration foci in the marrow and to assess prognosis and response to treatment. The objectives of this review are: - To explain the PET/MRI technique and the protocol to be used. - To explore potential indications in clinical practice. - To assess the similarities and differences of ADC values and FDG uptakes (SUV).

### TABLE OF CONTENTS/OUTLINE

- PET/MRI technique and protocol. - Diagnostic criteria for multiple myeloma: what the radiologist needs to know. - International Myeloma Working Group (IMWG) imaging recommendations: where would PET/MRI fit in? - Potential indications in clinical practice. - solitary bone plasmacitoma. - multiple myeloma with neurological symptoms or suspected spinal cord or radicular compression. - high-risk smoldering multiple myeloma. - Bone marrow imaging analysis: PET vs DWI sequences. - Tips and tricks for reporting a PET/MRI study.

## STATE OF THE ART OF FUNCTIONAL IMAGING IN MULTIPLE MYELOMA:WB-MRI AND PET-CT

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Claudio Cerchione (*Abstract Co-Author*) Nothing to Disclose
Danila Diano (*Abstract Co-Author*) Nothing to Disclose
Davide Bezzi (*Abstract Co-Author*) Nothing to Disclose
Andrea Prochowski Lamurri, MD (*Abstract Co-Author*) Nothing to Disclose
Arrigo Cattabriga (*Abstract Co-Author*) Nothing to Disclose
Alice Rossi, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

According to international guidelines, patients with suspected myeloma should primarily undergo low-dose Whole Body Computed Tomography for diagnostic purposes.To optimize sensitivity and specificity and enable treatment response assessment, Whole Body Magnetic Resonance Imaging (WB-MRI) should include Diffusion Weighted Imaging with Apparent Diffusion Coefficient maps and T1-weighted Dixon sequences with bone marrow Fat Fraction quantification. At baseline WB-MRI shows greater sensitivity for the detecting focal lesions and diffuse bone marrow infiltration pattern than18F-fluorodeoxyglucose Positron Emission Tomography/Computed Tomography (PET-CT), which is considered of choice for evaluating response to treatment and minimal residual disease and imaging of extramedullary disease (EMD). Both WB-MRI and PET-CT findings have been associated with patient's prognosis. Due to tumor heterogeneity and new therapies, the most current research indicates that PET-CT and WB-MRI may play complimentary roles in providing distinct and complementary information.

### TABLE OF CONTENTS/OUTLINE

1 Introduction. 2 Updated imaging technique standardization: Italian criteria for myeloma for PET-CT use (IMPeTUS Criteria) and WB-MRI Myeloma Response Assessment and Diagnosis System (MY-RADS) guidelines. 3 PET-CT and WB-MRI for staging of myeloma patients. 4 Emerging prognostic factors on PET-CT and WB-MRI. 5 PET-CT and WB-MRI for response assessment and minimal residual disease evaluation. 6 Future perspectives: new radiotracers for PET-CT and PET-MRI. 7 Conclusion. 8 References.

Amir Iravani, MD (*Abstract Co-Author*) Nothing to Disclose
Alireza Ghodsi, MD (*Abstract Co-Author*) Nothing to Disclose
Ridvan A. Demirci, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Theranostics agents differ from conventional chemotherapy agents by allowing objective pre-treatment eligibility assessment.177Lu-PSMA-617 is an effective and safe treatment for metastatic castration resistant prostate cancer and has been on the focus of theranostics in recent years. Landmark clinical trials, VISON and TheraP, implemented different imaging-based inclusion criteria. Understanding the details of eligibility framework is essential for accurate patient selection. This exhibit aims to provide a guide to imaging-based eligibility criterion.

### TABLE OF CONTENTS/OUTLINE

1. Understanding the trials: VISION vs TheraP a. VISION trial uses pre-treatment PSMA-PET along with contrast-enhanced CT while TheraP uses pre-treatment PSMA and FDG PET. b. Eligibility criteria set by TheraP led to higher screening failure compared to VISION trial (28% vs 12.6%). c. TheraP trial had higher PSA response rate compared to VISION trial (66% vs 46%). d. FGD-PET as an addition to the PSMA PET, may provide insights about the tumor biology by revealing tumoral heterogeneity. 2. Workflow of imaging-based VISION eligibility and case examples a. =1 PSMA positive lesion of any size in any organ AND b. No PSMA-negative lesions bigger than 2.5 cm in nodes, 1 cm in solid organs and 1 cm in soft tissue components of bone lesions. 3. Workflow of imaging-based TheraP eligibility and case examples a. At least one lesion with PSMA SUVmax =20 AND b. PSMA SUVmax = 10 in all measurable sites AND c. Absence of discordant findings between PSMA and FDG PET

Aleena Malik, BSC (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Importance of sustainability in radiology 2. Engaging trainees:- Highlight the significance of involving trainees in sustainability efforts from the beginning of their medical education.- Discuss the potential long-term impact of engaging trainees in sustainability initiatives on their future practice and leadership roles within healthcare organizations. 3. Assessing impact on trainees:- Explore current trainee attitudes and aspirations towards sustainability in radiology departments using national survey.- Describe methods for evaluating the effectiveness of sustainability initiatives on trainees' knowledge, skills, and attitudes.- Discuss the role of feedback mechanisms and continuous improvement processes in refining sustainability education and training programs for trainees.4. Integrating sustainability:- Explore strategies for incorporating sustainability principles into radiology curriculum and training programs based on a needs-assessment.

**TABLE OF CONTENTS/OUTLINE**

I. Introduction- Significance of sustainability in radiology departments.II. Methods- Conducting a needs-based survey among radiology trainees. - Development of a sustainability framework.III. Trainee Engagement and Impact Evaluation- Educational workshops and hands-on training.- Evaluation of the impact on trainees' education and professional development.IV. Discussion- Benefits of integrating sustainability into radiology practice. - Implications for trainees and the broader healthcare system.V. Conclusion

## NPMEE-12 INTRODUCTION TO R FOR RADIOLOGISTS: APPLICATIONS IN RESEARCH, VISUALIZATION, AND PRACTICE MANAGEMENT

Ramtin Hajibeygi (*Abstract Co-Author*) Nothing to Disclose
Long H. Tu, MD (*Abstract Co-Author*) Nothing to Disclose
Kyle Tegtmeyer, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Coding and programming languages are an area with incredible potential value to radiologists across a range of domains, including research, statistics, image analysis and practice management. We seek to introduce radiologists to R, and provide a simple and easy to follow introduction to the R programming language. We review the process of setup and installation, options for integrated development environments (IDEs), and basics of the R language coding and syntax. We additionally seek to demonstrate relevant applications for radiologists, particularly those involved in research or academic endeavors, including statistical applications, data visualization, radiomics and machine learning. We also provide a range of applications relevant to non-academic radiologists, including statistics and modeling for practice management. Lastly, we provide a range of online resources for those interested in learning more above coding in R.

**TABLE OF CONTENTS/OUTLINE**

Topics covered include:- What is R? Introduction to the R programming language- How to download and install R- Review of available Integrated Development Environments (IDEs)- Basics of coding in R- Statistical applications for R- Data visualization with R- Radiomics applications in R- Machine Learning applications in R- Statistics and Data modeling applications for practice management and workflow optimization

## NPMEE-13 REVOLUTIONIZING RADIOLOGY EDUCATION: EXPLORING INNOVATIVE TEACHING METHODS

Omer A. Awan, MD, MPH (*Abstract Co-Author*) Nothing to Disclose
Ozerk Turan (*Abstract Co-Author*) Nothing to Disclose
Izzet Altun, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1- Audience Response Systems (ARS): Utilize ARS to engage learners, assess real-time understanding, and enhance retention through interactive multiple-choice questions. 2- Flipped Classroom Techniques: Implement flipped classroom strategies to encourage independent learning and maximize in-class time for application and synthesis of concepts, simulating real-world diagnostic scenarios.3- Active Learning Strategies: Drawing anatomical structures and scrolling through diagnostic images to stimulate cognitive processing and enhance retention.4- Electronic Media: Videos, educational apps, QR codes, and social media platforms to retain knowledge, promote asynchronous learning, and engage learners outside the traditional classroom setting.

**TABLE OF CONTENTS/OUTLINE**

I. Introduction Technological advancements in radiology educationImportance of active learning approaches over traditional didactic methods II. Audience Response Systems (ARS) A. Definition B. Advantages and Challenges III. Flipped Classroom Techniques A. Concept and Implementation B. Application in Radiology Education C. Benefits and Challenges IV. Active Learning Strategies A. Drawing Anatomy B. Scrollable Images C. Application and Benefits V. Electronic Media A. Videos in Radiology Education B. Educational Apps C. QR Codes and Social Media Platforms VI. Discussion Optimizing use of innovative teaching methodsAddressing challenges and considerations for effective implementation VII. Conclusion

## NPMEE-14 SO YOU WANT TO START A NON-PROFIT: PRIVATE FOUNDATION VS. PUBLIC CHARITY - A GUIDE FOR THE RADIOLOGIST

Long H. Tu, MD (*Abstract Co-Author*) Nothing to Disclose
Caroline Merriam, DO (*Abstract Co-Author*) Nothing to Disclose
Samra Iftikhar, MBBS (*Abstract Co-Author*) Nothing to Disclose
Irene Dixe de Oliveira Santo, MD (*Abstract Co-Author*) Nothing to Disclose
Cristina Fuss, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Danling Chen, MD (*Abstract Co-Author*) Nothing to Disclose
Alexander Kuehne, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

This primer will provide a practical overview of personal foundations and public charities, with a focus on the comparative advantages/disadvantages of each. We discuss additional strategies for each organizational style to reduce the radiologists overall tax burden. We hope this primer serves as both an introduction and inspiration for radiologists who may not have realized the incredible impact they may have via charitable work and help highlight avenues a radiologist may pursue to generate long-lasting, genuine change.Goals of Presentation:-Familiarize the radiologist with the basics of private charitable foundations and public charities (classical 501(c)3 certified non-profits)-Explore the rationale behind the creation of personal philanthropic organizations, contrasted with the drive behind most public charities-Learn about the potential tax benefits/pitfalls, regulatory oversight requirements, of both contrasting the benefits and risks and how they pertain to the radiologist

**TABLE OF CONTENTS/OUTLINE**

-Background:-Overview of the key features of private foundations and public charities-Highlight key differences between Private Foundations and Public Charities including:-Board Structure-Initial Requirements-Tax breaks and benefits-Direct contributions-Stock contributions-Real estate deductions-

Differences in regulatory oversight-Fund disbursement requirements-Contribution Strategy-Focus of organization and funding source:-Funding sources for private foundations vs. public charities-Grant disbursement to other non-profits vs. on the ground operations-Soft benefits of private foundations/public charities:-Networking-Personal fulfillment-Legacy

### TEACHING POINTS

1. To present the environmental impact of radiology in terms of energy consumption, greenhouse gas emissions, and pollution.2. To discuss areas of opportunity and provide solutions on a system-wide, departmental, and individual level.

### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Energy Consumption in Radiology a. CTs and MRIs Energy Usage b. Strategies to Reduce Energy Consumption 3. Environmental Impacts of Radiology a. Cooling systems and Energy Needs b. Addressing Environmental Concerns 4. Artificial Intelligence a. Energy Demands of AI b. Optimization Strategies 5. Environmental Concerns with Gadolinium a. Public Health Implications b. Mitigation Techniques 6. Opportunities for Improvement a. System-wide, Departmental, and Individual Solutions 7. Conclusion

## NPMEE-16 A RESIDENT'S GUIDE TO PHYSICIAN REIMBURSEMENT

William Kirschner (*Abstract Co-Author*) Nothing to Disclose
Sophia R. O'Brien, MD, MEd (*Abstract Co-Author*) Nothing to Disclose
Richard Duszak JR, MD (*Abstract Co-Author*) Advisor, Ethos Medical, Inc;Shareholder, Ethos Medical, Inc
Frank J. Lexa, MD, MBA (*Abstract Co-Author*) Nothing to Disclose
Kari Williams, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The business of medical practice is not one of the six core competencies as defined by the Accreditation Council for Graduate Medical Education (ACGME) [1]. As a result, resident physicians may complete training without adequate knowledge of physician reimbursement and the business of medicine [1,2]. This presentation will provide a brief history of physician reimbursement, define the "Resource-based Relative Value Scale" payment system, translate the relative value unit into physician reimbursement and radiologist reimbursement and explain the physician reimbursement revenue cycle and how it applies to Radiologists.

### TABLE OF CONTENTS/OUTLINE

• Problem statement• Brief history of physician reimbursement o Usual, Customary, Reasonable rateo "Resource based relative value" (RBRVS) o Omnibus Reconciliation Act (1992)o Multiple Procedure Payment Reduction (2006)o Affordable Care Act (2010)• Resource based relative value, Relative value Unit, and Physician reimbursement o Definition and Division of the RVU. § Professional component, technical component, global payment• Conversion Factor• Geographic Practice cost index• Radiologist Reimbursement o Professional component of radiologist worko Technical component is absorbed by entity that owns capital, which may also be the physician.• Radiologist Reimbursement and Revenue Cycle o Define revenue cycle, preauthorization, and accounts receivable.o Explain the workflow from service performed to payment received.

## NPMEE-18 THE WORLD VS. THE MACHINE: BRINGING IMAGING AI TO GLOBAL HEALTH - GOOD ODDS OR BAD BETS?

Subba R. Digumarthy, MD (*Abstract Co-Author*) Consultant, Merck & Co, Inc;Consultant, Pfizer Inc;Consultant, Bristol-Myers Squibb Company;Consultant, Novartis AG;Consultant, F. Hoffmann-La Roche Ltd;Consultant, Polaris;Consultant, Cascadian;Consultant, AbbVie Inc;Consultant, Gradalis, Inc;Consultant, Bayer AG;Consultant, Zai Lab Limited;Consultant, Biengen;Consultant, Riverain Technologies, LLC;Consultant, Resonance Health;Consultant, Annalise-AI Pty Ltd;Research Grant, Lunit Inc;Research Grant, General Electric Company;Research Grant, Qure.ai;Speaker, Siemens AG
Lina Karout, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Imaging access does not equal radiologists' availability in low-income countries (LIC). 2. Understand the landscape of currently available and approved AI applications in the context of thoracic imaging. 3. The differences in rigors of AI approval process in low- and high-income countries. 4. Possible impact of AI in global health in the context of medical imaging.

### TABLE OF CONTENTS/OUTLINE

1. Graphical summary of imaging access and radiologists' availability in the LIC. 2. Case-based illustration of available multi-vendor AI solutions and their applications in thoracic imaging. 3. Differences in how some AI tools are applied in developed and developing countries. 4. Using examples from our global imaging data from multiple countries to highlight the potentials and limitations of AI applications

## NPMEE-19 MONITORING OUR EYES: A LOOK AT COMPUTER VISION SYNDROME

Robert Hill, MD (*Abstract Co-Author*) Nothing to Disclose
Roozbeh Houshyar, MD (*Abstract Co-Author*) Nothing to Disclose
Star Lopez (*Abstract Co-Author*) Nothing to Disclose
James Shi, MD (*Abstract Co-Author*) Nothing to Disclose
Erwin Ho (*Abstract Co-Author*) Nothing to Disclose
Christopher Sahagian (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To review the pathophysiology, epidemiology, risk factors, and treatment modalities for computer vision syndrome.

**TABLE OF CONTENTS/OUTLINE**

Computer Vision Syndrome (CVS) is defined as a constellation of eye and vision symptoms that result from prolonged computer use. Symptoms include dry eyes, eye strain, headache, ocular redness, blurry vision, diplopia, and neck pain, arising due to maladaptive ocular surface, accommodative, and extraocular mechanisms. Many modalities of eye care can be employed to address CVS symptoms. Topical lubricative eyedrops and overnight ointments can rehydrate the ocular surface and create a protective evaporative barrier. Dietary supplements, namely omega-3s and blue light filtering glasses have been shown to improve clinical symptoms. Placement of occlusive punctal plugs preserves natural tears. Warm compresses via steam-chambered goggles or hot towel increase lipid layer thickness and tear film breakup time thereby improving symptoms. The ergonomic design of workstations can ease eye strain using warm, balanced lighting and appropriate monitor positioning. Finally, taking frequent and brief breaks away from screens, as outlined by the 20-20-20 rule, has been shown to improve symptoms without compromising one's duration of computer usage. A thorough understanding of the underlying causes, risk factors, and treatment options will empower radiologists to continue to work longer, more efficiently, and symptom free.

## NPMEE-2 MRI SUSTAINABILITY: UNLOCKING THE POWER OF HEAT RECOVERY IN RADIOLOGY

Daniel J. Margolis, MD (*Abstract Co-Author*) In-kind support, Siemens AG;Consultant, Promaxo, Inc
Akhil Soman (*Abstract Co-Author*) Nothing to Disclose
Filipp Alaverdyan (*Abstract Co-Author*) Nothing to Disclose
Daniel Audette (*Abstract Co-Author*) Nothing to Disclose
Lara Pes (*Abstract Co-Author*) Nothing to Disclose
Akua Amoah, MD, MPH (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

MRI scanners play a crucial role in modern healthcare, but their operation consumes substantial energy and generates significant waste heat.To address this, a heat pump system is a potential solution to capture and repurpose MRI heat for sustainable energy utilization. Heat pumps efficiently transfer heat for heating and cooling functions depending on the direction of heat transfer.Embracing energy conservation in radiology departments holds promise for driving transformative change. Repurposed MRI heat offers a sustainable heating source and contributes to decarbonization efforts within healthcare facilities. Significant energy and heat savings are projected from the integration of heat pumps in the MRI exhaust system, with potentially millions of billions of BTU saved and up to 30% fossil fuel reduction.The question of how cost-effective this project will be cannot be overlooked. Incorporating a heat recovery system into a standard hospital building using a heat pump will cost hundreds of thousands to millions of dollars, but with eventual substantial annual savings.While this may be straightforward to apply for future MRI site designs, integration into existing MRI installation may be challenging and require additional investigation and costs, potentially taking the MRI offline for implementation.

**TABLE OF CONTENTS/OUTLINE**

1. Overview of MRI waste heat 2. Heat pump energy recovery system 3. Potential Benefits 4. Cost Estimate 5. Pitfall

## NPMEE-20 ENHANCING RADIOLOGY PRACTICE THROUGH APPLICATIONS OF QUALITY IMPROVEMENT AND PALLIATIVE CARE IN PATIENT AND FAMILY CENTERED CARE

**Awards**
**Certificate of Merit**

Anna Luisa Kuhn, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Paramesh Karandikar (*Abstract Co-Author*) Nothing to Disclose
Lyle Suh (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Understand Patient and Family-Centered Care (PFCC) principles.2. Understand the history, progress, and relevance of PFCC in radiology.3. Apply the concept of PFCC through practical models and strategies that prioritize quality care.Examples: Patient-oriented communication methods, safety and reporting protocols, cultural competency training, and interdisciplinary collaboration4. Understand PFCC in the context of palliative care in radiology.5. Understand applications of PFCC in the context of quality improvement (QI) initiatives.

**TABLE OF CONTENTS/OUTLINE**

1. Overview(a) Definition and Importance of Patient and Family Centered Care (PFCC); Review Core Principles of PFCC(b) History, Milestones, and Progress of PFCC in Radiology(c) Current challenges and opportunities for improvement2. The Relevance of PFCC in Radiology(a) Quality and value-based care(b) Patient outcomes, satisfaction, and experience(c) Communication3. Implementing PFCC in Radiology Practice(a) Building a culture and evidence-based processes(b) Overcoming Challenges and Barriers (Resistance to change, lack of resources, and competing priorities)4. PFCC and Palliative Care in Radiology Practice5. Quality Improvement for improving PFCC in Radiology6. Future Directions(a) PFCC in Practice, Research, and Training (e.g. Simulations)(b) Innovations and advancements6. Cases(a) Review scenario-based simulation illustrating successful implementation of PFCC in radiology and discuss outcomes and lessons learned

## NPMEE-21 WARREN BUFFET HAS ONE, WHY NOT YOU: THE LOGISTICS, BENEFITS, AND PITFALLS OF A PRIVATE FOUNDATION - AND WHY RADIOLOGISTS ARE WELL-POSITIONED TO START THEIR OWN

Long H. Tu, MD (*Abstract Co-Author*) Nothing to Disclose
Ronald Gathagan, MD (*Abstract Co-Author*) Nothing to Disclose
Irene Dixe de Oliveira Santo, MD (*Abstract Co-Author*) Nothing to Disclose
Caroline Merriam, DO (*Abstract Co-Author*) Nothing to Disclose
Danling Chen, MD (*Abstract Co-Author*) Nothing to Disclose
Cristina Fuss, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Samra Iftikhar, MBBS (*Abstract Co-Author*) Nothing to Disclose
Alexander Kuehne, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

While classically associated with the ultrawealthy, the barrier for entry for creation of a personal charitable foundation is in fact much lower. Current suggested startup funding is between $250,000-$500,000, well within reach of the average practicing radiologist. We believe private foundations are a financial construct that all radiologists should be aware of as a vehicle for social impact and the construction of a meaningful legacy. This presentation will overview private foundations and aim to:-Familiarize the radiologist with the basics of personal/family run private foundations-Explore the rationale behind the creation of private philanthropic organizations-Learn about the potential tax benefits/pitfalls of this process-Increase understanding of the additional regulatory oversight that private foundations undergo-Highlight the reasons a radiologist could be interested in creating a personal foundation including and not limited to: addressing areas of personal/societal interest, global health causes, education, radiology research, etc.

**TABLE OF CONTENTS/OUTLINE**

-Background: Why chose a Private Foundation-Logistics in Setting up:-Certification Process-Initial Requirements-Contribution Strategy-Benefits:-Retention of control-Grant disbursement instead of building an on the ground operation-Networking and Investment-Traditional Focus (Disbursement of funding to various non-profit entities):-Additional Oversight:-Minimum yearly disbursement of funds-Additional investment income excise tax-Self-Dealing restrictions-Excess business holdings-Taxable expenditures-Gold Standard Examples:-Less Than Ideal Examples:

## NPMEE-22 UTILIZING THE SOCIAL ECOLOGICAL MODEL TO EXAMINE DEFICITS IN RECRUITMENT, PROMOTION, AND LEADERSHIP DEVELOPMENT OF WOMEN IN RADIOLOGY

Randy C. Miles, MD, MPH (*Abstract Co-Author*) Nothing to Disclose
Shiva Yagobian, BS (*Abstract Co-Author*) Nothing to Disclose
Efren J. Flores, MD (*Abstract Co-Author*) Speaker, WebMD LLC;Speaker, Consulting Medical Associates, Inc
Amy K. Patel, MD (*Abstract Co-Author*) Medical Advisor, Kheiron Medical Technologies Ltd;Consultant, Hologic, Inc
Franklin Iheanacho, BA (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

•Introduce the socioecological model (SEM) and its levels to explain individual-environment interactions •Examine barriers in recruitment, promotion, and leadership for women via SEM •Address the "leaky pipeline" in academic radiology for women at personal, interpersonal, institutional, community, and policy levels •Review literature on gender disparities in leadership

**TABLE OF CONTENTS/OUTLINE**

1. Socioecological Model (SEM) Introduction 1a. Outline SEM levels: intrapersonal, interpersonal, institutional, community, policy 1b. Explore women underrepresentation in radiology using SEM. 2. Positive Impact of a Diverse Workforce 3. Exploring the gender disparity at each SEM level 3a. Intrapersonal Level I. Recruitment II. Promotion II. Leadership 3b. Interpersonal Level I. Recruitment II. Promotion III. Leadership 3c. Institutional Level I. Recruitment II. Promotion III. Leadership 3d. Community/Policy Level I. Recruitment II. Promotion III. Leadership 4. Sealing the Leaky Pipeline

## NPMEE-23 AN ACADEMIC RADIOLOGIST'S ROADMAP TO SUCCESS: NAVIGATING THE WRITING PROCESS, JOURNALS, CONFERENCES, AND SOCIETY FELLOWSHIPS AND GRANTS

Maad Galal (*Abstract Co-Author*) Nothing to Disclose
Ahmed Kertam (*Abstract Co-Author*) Nothing to Disclose
Long H. Tu, MD (*Abstract Co-Author*) Nothing to Disclose
Quoc-Huy Ly (*Abstract Co-Author*) Nothing to Disclose
Carys Kenny-Howell (*Abstract Co-Author*) Nothing to Disclose
Jeffers Nguyen, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Because research is the currency in academia, it is imperative for aspiring academic radiologists to possess comprehensive skills and knowledge in conducting and disseminating research. However, navigating the layers of academic writing, project management, conference submissions, and journal publications can be overwhelming for novice academics.Through a systematic approach, this primer equips radiologists with the knowledge and skills necessary to excel in academic endeavors, providing guidance on literature review, data analysis, and project management. It also shares a roadmap of major conferences, journals, and grants in radiology and medicine, enhancing visibility within the academic community and facilitating effective dissemination of research findings.

**TABLE OF CONTENTS/OUTLINE**

- Skills, skills, skills: literature review, writing, citation, data analysis, and more- Lifecycle of academic projects: from conceptualization to publication-Road map of major U.S. and international conferences- Reviewer 2: Journals' impact factors, time to first decision, and acceptance rates- Academic societies' grants, fellowships, and awards

## NPMEE-24 AI X DEI: DEVELOPING A MEDICAL STUDENT CURRICULUM ON ARTIFICIAL INTELLIGENCE IN RADIOLOGY AND ITS IMPLICATIONS FOR HEALTH EQUITY

Alexander Lindqwister, MD, MS (*Abstract Co-Author*) Nothing to Disclose
Christopher F. Beaulieu, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Diamanto Rigas, MD (*Abstract Co-Author*) Nothing to Disclose
Zainub Dhanani (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Foundational Understanding in AI-Provide students with a broad foundation in AI technologies in radiology and potential impacts on diverse patient populations2. Bias Awareness and Mitigation-Equip students with the ability to identify and address bias in radiology AI applications, fosteringequitable diagnostic and treatment practices3. Cultural Humility-Emphasize importance of culturally humble AI development in radiology and its role in patient-centered and culturally sensitive care4. Policy and Governance in Radiology AI-Expose students to policy and governance aspects of healthcare AI in radiology, preparing them to advocate for ethical and equitable AI practices in radiology settings5. Emerging Technologies-Explore emerging AI technologies in radiology and implications for the future of radiology, empowering students to stay at the forefront of radiology innovation

**TABLE OF CONTENTS/OUTLINE**

Intro to AI: AI Terminology, Computational Basis of AI, Types of Data, Types of Algorithms/Models, AI for RadiologyAI Pitfalls and Risks: Limitations to AI/ML, Curse of Dimensionality, Validation for AI models, Bias in AI models, Health Equity Issues and Examples, Approaches to Mitigating BiasHuman and Machine Bias in AI Models: Data Curation/Sourcing Bias, Data Annotation and Visualization Bias, Training Dataset Bias, Model and Metric Bias, Inherited Bias, Cognitive Bias, Algorithm Deployment Bias, Evaluation Bias, Complacency in Automation Bias, Statistical Bias, Detection BiasBuilding AI Models: Determining your question, Dataset development, Dataset audits, Training/testing models, Understanding model outputs, Bias audits, Evaluating efficacy and accuracy, Legal Compliance

## NPMEE-25 BRAVING THE AI SURGE-EQUIPPING RADIOLOGY RESIDENCIES FOR TOMORROW'S CHALLENGES

Henrique M. Lee, MD (*Abstract Co-Author*) Nothing to Disclose
Amit Kumar (*Abstract Co-Author*) Nothing to Disclose
Swati Goyal (*Abstract Co-Author*) Nothing to Disclose

Gilberto Szarf, MD, PhD (*Abstract Co-Author*) Speaker, F. Hoffmann-La Roche Ltd;Speaker, Amgen Inc;Speaker, Siemens AG
Vasantha Kumar Venugopal, MD (*Presenter*) Officer, CARPL.AI Inc

**TEACHING POINTS**

1. Deep dive into how AI is currently used in radiology, its capabilities, and its limitations, preparing residents for realistic applications and expectations.2. Emphasizing the importance of recognizing and mitigating biases in AI algorithms, and understanding the ethical implications of automated decision-making.3. Advocating for a balanced educational approach that combines AI tools with traditional hands-on learning to foster a comprehensive skill set.4. Highlighting the need for ongoing education in AI developments, ensuring that residents remain adept as technology evolves.5. Cultivating critical diagnostic skills that complement AI-driven data, ensuring residents can effectively interpret and question AI outputs.

**TABLE OF CONTENTS/OUTLINE**

Overview of AI technologies impacting radiology.Case studies of AI tools improving resident performance and engagementIdentifying and overcoming potential pitfalls such as over-reliance and diminished problem-solving skillsStrategies for teaching ethical considerations and algorithm transparencyEducational Strategies for AI Preparedness -Developing curricula that incorporate AI learning, including simulation-based training and AI-assisted diagnosticsThe role of mentorship and faculty development in an AI-enhanced educational environmentFuture Perspectives and Preparing for Change

## NPMEE-26 THINK LOCAL, ACT GLOBAL: INCORPORATING GLOBAL RADIOLOGY INTO YOUR PRACTICE

Karen Chetcuti, MD, FRCR (*Abstract Co-Author*) Nothing to Disclose
John Phalula, BMBS (*Abstract Co-Author*) Nothing to Disclose
Benjamin Brown, BS (*Abstract Co-Author*) Nothing to Disclose
Katrina A. McGinty, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

After reviewing this presentation, the learner will be able to1. Better understand and describe the disparity in radiology resources worldwide.2. Describe the pros and cons of different methods of involvement in global radiology.3. Understand the role of remote or hybrid involvement in radiology capacity building in low- and middle-income countries as a sustainable and effective means of improving radiology access4. Be prepared to take the next steps to sustainably and seamlessly incorporate global radiology into his/her/their practice

**TABLE OF CONTENTS/OUTLINE**

1. Overview of the need for global radiology2. Discussion of different approaches to global radiology, their strengths and challenges. This will include a discussion of equipment donation, in person visits and virtual support.3. Emphasize the importance of longitudinal projects and capacity building for improving radiology services worldwide.4. Describe hybrid or virtual approaches to global radiology, including current collaborations between an academic medical center in the Southeastern USA and a radiology program in Sub-Saharan Africa. Highlighted projects will include multidisciplinary tumor boards, peer learning conferences between the two residencies, lecture delivery and a supported hands on MRI curriculum. Discussion will focus on program building, program maintenance, measurements of success or failure and the importance of quantifying impact.5. Review topics covered and offer guidance for next steps to incorporate global radiology into one’s professional practice.

## NPMEE-27 METRICS AND INDICES AND SCAMS, OH MY: JOURNAL QUALITY CONSIDERATIONS FOR YOUR QUALITY RADIOLOGY MANUSCRIPT

Thea C. Moran, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. It's hard to efficiently select a journal for manuscript submission with the abundance of journal options in the current open-access landscape. Knowing how to efficiently find, and assess, journals for quality, chance of acceptance, and visibility benefits not just researchers, but patients and the public. 2. Journal metrics must be interpreted in terms of what they're supposed to indicate and their imperfections. 3. Many indices include radiology journals. Journals listed in multiple indices have better visibility but indices' inclusion criteria vary. 4. Megajournals are publishing options for radiology manuscripts; however, they're controversial. It's uncertain what their place will ultimately be in scientific publishing. 5. Predatory journals/publishers are best avoided. Well-known red flags exist. Publishing association directories list publishers who adhere to best practices.

**TABLE OF CONTENTS/OUTLINE**

1. Academic publishing overview. History, kinds of literature, who it affects and how. 2. Journal quality indicators a. Metrics What are they, their meaning(s)/weaknesses. b. Indices What are indices/databases, journal selection criteria, how they help visibility, PubMed/PubMedCentral/Medline, what indices list radiology journals 3. Predatory journals What are they, why are they a problem (for healthcare, authors, society), how to recognize and resources to help avoid 4. Megajournals What are they? Criteria? Controversies. Megajournals that have published radiology manuscripts 5. Personal and electronic means to form a list of potential journals - journal finders, scientific associations, mentors, peers, librarians, journals you review for. 6. Summation/take home points

## NPMEE-28 HOW TO BRING RADIATION SAFETY AND PHYSICS EDUCATION TO LIFE WITH A HANDS-ON FLUOROSCOPY TRAINING

Eduardo Thadeu De Oliveira Correia, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Leonardo K. Bittencourt, MD, PhD (*Abstract Co-Author*) Research Consultant, Canon Medical Systems Corporation
David W. Jordan, PhD (*Abstract Co-Author*) Nothing to Disclose
Lauren Fane, BEng (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Radiation protection and related physics can be taught interactively in an IR suite with simple supplies that medical physics departments have.2. A hands-on fluoroscopy training can demonstrate the distribution of scattered radiation, impact of equipment positioning, and effect of shielding.3. Radiation protection training early-on, before IR rotations can improve resident satisfaction, competence in protecting themselves and patients, and their physics and safety knowledge.

**TABLE OF CONTENTS/OUTLINE**

An interactive radiation protection training can be created with minimal supplies outside of an IR suite with a c-arm: area survey meter, RaySafe X2 with R/F sensor, lead aprons, and acrylic blocks to simulate patients.A hands-on fluoroscopy training can demonstrate radiation safety and physics concepts:1. Distribution of scattered radiation and variation based on size of body region / size of patient imaged and different orientations of the radiation source2. Patient distance from x-ray source impacts patient radiation dose, scatter, and image contrast, because the x-ray beam diverges.3. How much radiation is attenuated by shielding (lead aprons, barriers/boards/walls)This training improved residents' radiation safety knowledge and attitudes in a single-

institution, prospective study.1. Sustained increases in residents' confidence in protecting themselves and comfort in raising concerns to faculty2. Catered to a baseline deficit in concepts that are better demonstrated than discussed3. Increased radiation safety knowledge temporarily. More can be done during procedural rotations to reinforce safety practices and concepts

## NPMEE-29 TRAUMA-INFORMED CARE: SHAPING THE FUTURE OF RADIOLOGY PROCEDURES

**Awards**
**Certificate of Merit**

Janet E. Bailey, MD (*Abstract Co-Author*) Nothing to Disclose
Katherine A. Klein, MD (*Abstract Co-Author*) Nothing to Disclose
Angelica Alexopoulos (*Abstract Co-Author*) Nothing to Disclose
Sydney J. Torres, BS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Review the prevalence of trauma within the patient population and identify types of traumatic experiences patients may have faced.
- Recognize clinical warning signs that indicate a patient may have a history of trauma and identify potential triggers in radiology procedures.
- Explore a universal trauma-informed care approach and its general principles within healthcare, according to the Substance Abuse and Mental Health Services Administration (SAMHSA) and other expert recommendations.
- Provide an actionable framework applicable to clinical practice including before, during, and after procedures to increase patient comfort and patient-centered care within radiology.

### TABLE OF CONTENTS/OUTLINE

- Terminology: What is trauma and trauma-informed care?
- Clinical warning signs that a patient may have a history of trauma
- Potential triggers in radiology
- The Four R's: Definition of a trauma-informed approach
- The key principles of a trauma-informed approach
- A framework for best practices and recommendations to avoid retraumatization in radiology procedures
- Future areas to explore

## NPMEE-3 LLM HANDS-ON: GETTING START OF LLM PROGRAMMING IN PYTHON

Atsushi Teramoto, PhD (*Abstract Co-Author*) Nothing to Disclose
Kippei Isaji (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The emergence and advancement of large language models (LLMs) have made it possible to automate many tasks. These models are integrated into various services, and many users may already have experience interacting with them. However, opportunities to implement publicly available LLMs are limited. The purpose of this exhibit is to teach how to easily implement and fine-tune publicly available LLMs.

### TABLE OF CONTENTS/OUTLINE

Outline: The main teaching points of this exhibit are as follows: 1. LLMs pre-train on vast text data to gain general language knowledge. 2. In recent years, many LLMs have been developed. 3. LLMs have many potential applications in medical settings. TABLE OF CONTENTS: 1. What are LLMs? 2. Use Cases 3. Hands-on Session

## NPMEE-30 PATIENT-REPORTED OUTCOME MEASURES: WHAT THEY ARE, AND HOW THEY CAN BE USED TO IMPROVE PATIENT-CENTRED CARE IN RADIOLOGY

Andrea S. Doria, MD, PhD (*Abstract Co-Author*) Baxalta-Shire (Research Grant), Novo Nordisk (Research Grant), Terry Fox Foundation (Research Grant), PSI Foundation (Research Grant), Society of Pediatric Radiology (Research Grant), Garron Family Cancer Centre (Research Grant)
Rakhshan Kamran (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1) Review the development, validation, and implementation of patient-reported outcome measures (PROMs), which should be the pillar of today's and tomorrow's radiological services to patients. 2) Explore benefits of PROMs to advance patient-centeredness of radiology, along with ethics and future directions.

### TABLE OF CONTENTS/OUTLINE

Radiology should be "patient-centered", but few initiatives exist assessing value creation and patient outcomes in radiology. PROMs can help advance patient-centeredness and value measurement in radiology. This presentation will cover how PROMs can be used in radiology. 1) Introduction to patient-reported outcome measures (PROMs). a) Overview, significance in radiology. b) Capturing patients' perspectives. c) Patient-centred care and demonstrating value of radiology. 2) Development of PROMs. a) Overview and examples of PROMs. b) Importance of patient involvement. 3) Validation of PROMs. a) Methods: validity, reliability, responsiveness. b) Overview of psychometrics. 4) Types of validity. a) Content, criterion, construct. b) Examples of validity assessment. 5) Implementation a) Strategies for PROM implementation. b) Discussion of challenges. 6) Benefits a) Improved communication, monitoring, patient-centred care. b) Research and quality improvement. 7) Case studies. a) Successful cases. b) Real-world experiences. 8) Ethical considerations. a) Confidentiality, consent, cultural sensitivity. b) Risks and limitations. 9) Future directions. a) Emerging trends, technology. b) Research areas, collaboration opportunities. 10) Conclusion a) Summary emphasizing PROMs' importance in improving patient-centred care and demonstrating value in radiology.

## NPMEE-32 ANATOMICALLY ACCURATE AND FLUOROSCOPICALLY VISIBLE 3D-PRINTED SPINAL MODEL FOR LUMBAR PUNCTURE SIMULATION AND TRAINEE EDUCATION

Mina Mousa, MD (*Abstract Co-Author*) Nothing to Disclose
Summer J. Decker, PhD (*Abstract Co-Author*) Nothing to Disclose
Jonathan M. Ford, PhD (*Abstract Co-Author*) Nothing to Disclose
Michael Markovitz, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Impact on Procedural Skills, Confidence and Error Reduction: Improve practical skills through hands-on experience with 3D-printed models to build confidence and reduce errors and complications. 2. Advancements in Simulation-Based Training: Learn about limitations of existing simulations and the need for more anatomically accurate, tactilely realistic, and fluoroscopically visible models. Highlight the design and composition of our 3D-printed lumbar spine model. 3. Standardization of Medical Education and Future Aims: Understand the potential benefits on medical trainee competence and patient safety. Establish a standardized training protocol for residents, fellows, and visiting students with the potential for broader applications in other medical fields and institutions.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction/Background • Need for hands-on medical training and role of 3D printing in addressing this gap; • Challenges and limitations of current training and simulation models; 2. Materials/Methods • Design and printing process of our 3D-printed model; • Material selection for realistic tactile feedback and fluoroscopic contrast visibility; • Implementation in training settings; 3. Results • Initial qualitative feedback; • Observations on usability and authenticity compared to traditional models; 4. Discussion • Impact on trainee competence and confidence; • Implications for patient safety and procedural success; • Considerations for further research and model refinement; 5. Conclusion: • Innovative aspects and potential benefits of the 3D model; • Future steps for controlled efficacy studies; • Potential adaptation for other procedures, medical fields and institutions

## NPMEE-33 BALANCING ACCESS AND ANXIETY: THE CHALLENGES AND OPPORTUNITIES OF IMMEDIATE RESULT RELEASE

Shoichi Maeda (*Abstract Co-Author*) Nothing to Disclose
Eri Ishikawa (*Abstract Co-Author*) Nothing to Disclose
Evgeny Pavlushkov, MD, FRCR (*Abstract Co-Author*) Nothing to Disclose
Jay Starkey, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- The 21st Century Cures Act requires immediate patient access to electronic health information, including radiology reports
- Radiologists must adapt to increased patient communication and shared decision-making
- Proactive guidance and clear reporting can ease patient anxiety about results
- Radiology practices should leverage technology to provide user-friendly patient resources
- Equitable access to health information remains a concern for older and low-income patients

**TABLE OF CONTENTS/OUTLINE**

I. Introduction• 21st Century Cures Act overview• Impact on radiologyII. Current State of Information Blocking in 2024• Implementation successes and challenges• Radiologist experiences and patient feedback• Evolving legal and regulatory landscapeIII. Benefits and Drawbacks of Immediate Result Access• Patient empowerment and shared decision-making• Potential for patient anxiety and confusion• Liability considerations for radiologistsIV. Best Practices for Patient-Centered Radiology• Proactive communication and expectation-setting• Clear, patient-friendly reporting style• Radiologist availability for direct patient questions• Leveraging AI tools for patient educationV. Ensuring Equitable Access• Challenges for older and low-tech-literacy patients• Socioeconomic barriers to portal use and internet access• Strategies for inclusivity and alternative communicationVI. Future Directions and Recommendations• Enhanced EHR interoperability and data sharing• Workflow changes to facilitate patient interaction• Payment models to support radiologist time spent on patient care• Ongoing patient outreach and educationVII. Conclusion

## NPMEE-34 A REVIEW OF THE MEDICAL USE OF ULTRASOUND IN SPACE

Abid Bashir (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To explore space medicine and use of ultrasound in spaceWhy do astronauts use ultrasound in space To diagnose and treatAstronauts training for use of ultrasoundLimitations of using ultrasound in spaceEquipment usedHow can we benefit from use of ultrasound in spaceUltrasound is a well proven diagnostic modality on earth and a versatile diagnostic imaging tool in space, why space applications.Space Applications terrestrial application development ultrasound applications in microgravity. French compact doppler system.

**TABLE OF CONTENTS/OUTLINE**

1. When was ultrasound first recognised as the main imaging tool in space. ?physiology of human body in space and the microgravity induced changes in physiology.2. What training is required to be competent3. What equipment is used4. What are the limitations5. Advanced Diagnostic Ultrasound in Microgravity6. Impact of space ultrasound on science and medicine6. ADUM Study advanced diagnostic ultrasound in microgravity7. WINFOCUS World Interactive Network Focused on Critical Ultrasound (WINFOCUS),NASA,s extreme environment Mission Operation (NEEMO)Future Applications

## NPMEE-35 ENHANCING SPACED REPETITION WITH LARGE LANGUAGE MODELS FOR RADIOLOGY EDUCATION: A PILOT STUDY TO EXPLORE ARTIFICIAL INTELLIGENCE (AI) CAPABILITY, PRACTICALITY AND INTEGRATION

Ryan J. Smith, MD (*Abstract Co-Author*) Nothing to Disclose
Long Nguyen, MD (*Abstract Co-Author*) Nothing to Disclose
Joseph Nenow, MD (*Abstract Co-Author*) Nothing to Disclose
Eric Li, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

-Spaced repetition systems have been acknowledged for improving knowledge retention, competency, and academic performance in medical education. Anki is a flashcard-based software platform, popular among medical trainees, that employs spaced repetition and active recall.-However, limitations exist in spaced repetition learning, including substantial time required for content creation, potential cognitive overload, and lack of customization. Large Language Models (LLMs) present a solution to these challenges by leveraging capabilities such as text summarization and structured data extraction to produce personalized educational content.-This pilot study evaluates the effectiveness of LLMs in enhancing Anki flashcard materials for radiology residents. We used a detailed scoring rubric, aligned with established content creation practices, to assess the ability of LLMs to generate relevant, useful educational materials within a spaced repetition framework.-Our findings explore the practicality and limitations of integrating LLMs into the educational workflows of radiology training, aiming to improve the accuracy, relevance, and customization of learning resources.

**TABLE OF CONTENTS/OUTLINE**

1. Generala. Existing workflows in medical/resident education2. Large Language Models (LLM)a. Third party LLMs (e.g. ChatGPT, Gemini, Llama)b. Role of LLM in medical education3. Pilot Studya. Intent/Designb. Methodologyc. Resultsd. Considerations (e.g. weighted scoring, pilot study scaling, rubric

standardization)4. Integration practicalitya. Conferences/lecturesb. Workstation learningc. Limitations and workarounds5. Implicationsa. Personalized learningb. Future Direction

## NPMEE-36 HARNESSING SOLAR ENERGY - SCIENCE OF LEARNING APPLIED TO RADIOLOGY

Joseph W. Owen, MD (*Abstract Co-Author*) Nothing to Disclose
Katherine Copely, MD (*Abstract Co-Author*) Nothing to Disclose
Fara Y. Shikoh, MD (*Abstract Co-Author*) Nothing to Disclose
James T. Lee, MD (*Abstract Co-Author*) Nothing to Disclose
Andres R. Ayoob, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Although physicians dedicate their lives to learning, most spend little, if any, time understanding the scientific underpinnings of the learning process.As a result, most often rely on personal experience, intuition, opinions, or the latest fad to inform how they learn, frequently leading to ineffective and inefficient practices as well as frustration. This may be particularly detrimental as an ever-expanding body of medical knowledge and rapidly-evolving technologies render the process of life-long learning a necessity for physicians.Fortunately, recent research into the psychological and physiological principles behind learning have led to a number of evidence-based principles proven to enhance the learning process. This has important implications for all - trainees preparing for licensure examination and independent medical practice, practicing radiologists keeping abreast of current knowledge and technologies, and those involved in design and delivery of continuing medical education activities.Understanding these evidence-based learning strategies and how to apply them to radiology education can facilitate knowledge acquisition, promote life-long learning skills, and improve patient outcomes.

### TABLE OF CONTENTS/OUTLINE

Review of how memory works (encoding, storage, and retrieval)Illustration of evidenced-based principles to improve recall: active learning, retrieval practice/testing effect, spaced learning, interleaving, deliberate practice, metacognition, feedback, and real-world applicationsDescription of practical tips to integrate these strategies into daily practice, from trainee education to continuing medical education

## NPMEE-37 ENSURING PATIENT SAFETY: A COMPREHENSIVE APPROACH TO RADIOLOGICAL ERRORS

**Awards**
**Certificate of Merit**

Shoichi Maeda (*Abstract Co-Author*) Nothing to Disclose
Eri Ishikawa (*Abstract Co-Author*) Nothing to Disclose
Evgeny Pavlushkov, MD, FRCR (*Abstract Co-Author*) Nothing to Disclose
Jay Starkey, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Teaching Points:
- Understand the ethical, legal, and safety implications of errors in radiology
- Learn best practices for responding to and mitigating errors
- Encourage a culture of transparency, accountability, and continuous improvement

### TABLE OF CONTENTS/OUTLINE

Table of Contents/Outline:
- Introduction
- Importance of addressing errors in radiology
- Types of errors (interpretation, missed findings, wrong studies, etc.)
- Ethical Considerations
- Duty to disclose errors to patients and referring physicians
- Balancing transparency with patient well-being
- Maintaining trust and integrity in the profession
- Legal Implications
- Potential malpractice liability
- Informed consent and patient communication
- Documentation and reporting requirements
- Patient Safety
- Impact of errors on patient outcomes
- Strategies for error prevention and mitigation
- Implementing safety protocols and checklists
- Responding to Errors
- Immediate actions (communicating with patients, referring physicians, and colleagues)
- Root cause analysis and system improvements
- Emotional support for healthcare professionals involved
- Quality Improvement Initiatives
- Encouraging a culture of safety and transparency
- Empowering radiologists and trainees to identify and report errors
- Collaborative efforts across specialties to enhance patient care
- Conclusion
- Summarize key points and best practices
- Emphasize the importance of a proactive, patient-centered approach to error management

## NPMEE-38 NEXT-GENERATION TB SCREENING: AI-DRIVEN ACTIVE CASE FINDING WITH PORTABLE CHEST RADIOGRAPHS - A RADIOLOGY REVOLUTION OR ROUTINE EVOLUTION?

Abhinav Jain, MD (*Abstract Co-Author*) Nothing to Disclose
Mehvash Haider (*Abstract Co-Author*) Nothing to Disclose
Amit Kumar (*Abstract Co-Author*) Nothing to Disclose
Vasantha Kumar Venugopal, MD (*Presenter*) Officer, CARPL.AI Inc

**TEACHING POINTS**

1. Studies show that AI algorithms can achieve sensitivity and specificity that meet or exceed WHO's Target Product Profile for TB triage tests, significantly outperforming human radiologists in settings with high TB burdens? 2. Portable chest radiographs combined with AI analysis enable rapid on-site TB screening reducing the delay from screening to diagnosis3. AI algorithms have been shown to reduce the number of Xpert tests required by 50% while maintaining a sensitivity above 90% 4. The STOP TB Partnership highlights AI-powered CAD's role across diverse settings, with case studies from India, Pakistan, Cambodia, Vietnam, Uganda, and Nigeria illustrating varied implementation challenges and successes.5. ACF Metrics Effective ACF is measured by specific metrics, e.g., in India: screening 10% of the population, testing 4.75% of those, diagnosing 5% of those tested, aiming for an NNS (Number Needed to Screen) below 1,538

**TABLE OF CONTENTS/OUTLINE**

Introduction to AI in TB Screening - Overview of the integration of AI with portable chest radiography in enhancing TB detection.Global Case Studies - Insights from Northeast Nigeria, implementations in Indonesia and India.Evaluation of AI in Screening Programs - Discussion on the evaluation of AI technologies in TB screening, including studies from the STOP TB Partnership and WHO guidelines on the use of AI in detecting TB from chest X-rays.Challenges and Ethical Considerations - Consideration of potential biases in AI algorithms, and the ethical implications of widespread AI deployment in healthcare.Conclusion Impact of AI-driven portable chest radiography in TB active case finding.

## NPMEE-39 THEORY OF CONSTRAINTS IN RADIOLOGY

Danilo Sirias (*Abstract Co-Author*) Nothing to Disclose
James V. Rawson, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

There are many approaches to process improvement. Common approaches used in Radiology include Lean and the Plan Do Study/Check Act cycle. The Theory of Constraints was described by Eli Goldratt in The Goal in 1984 taking an operations management approach to flow. The premise is that in any complex system, there are only a few rate limiting steps. Improvement efforts on a step, which is not rate limiting to the over flow in the organization, will increase throughput at that individual step. However, those gains will simple queue up at the constraint, so there will be no system level improvement in flow. A constraint can be a piece of equipment, personal or even a policy. For example, in Radiology, backlogs for outpatient appointments point to a constraint. A constraint is often an expensive, hard to duplicate resource. In the past in Radiology, this was often the equipment and could be approached by optimizing utilization of the equipment. In today’s world of radiology staff shortages, the staff may be the constraint. In this exhibit, we review how to optimize the constraint to improve throughput in Radiology.Teaching Points • In any complex system, there are only a few rate limiting steps/constraints. • An hour of time lost at a bottleneck is an hour lost for the system. • An hour saved at a non-bottle-neck does not improve throughput. • Buffers can be used to protect the constraint and increase utilization of the constraint (throughout).

**TABLE OF CONTENTS/OUTLINE**

I. Theory of Constraints defined II. Constraints and Rate Limiting Steps III. Five Focusing Steps IV. Improving Throughput V. Financial vs Flow Accounting VI. Next steps for Radiology

## NPMEE-4 TOWARDS GREENER IMAGING: EVALUATING SUSTAINABILITY IN TECHNOLOGY PROCUREMENT

Laura Mosteiro, MD (*Abstract Co-Author*) Nothing to Disclose
MARIA AMPARO VILLAVERDE GOMEZ, MD (*Abstract Co-Author*) Nothing to Disclose
Cristina Enjamio, PhD, MEng (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The modernisation of advanced technological equipment in our healthcare systems requires a holistic approach to procurement that takes into account the evolving challenges posed by climate change, together with technological advances and sustainability imperatives. In a public health service environment, technology procurement requires strategic planning that integrates service needs, clinical and organisational objectives, financial resources and sustainability criteria.This publication aims to critically assess the adequacy of equipment procurement criteria set out in national or regional plans, with a two-pronged approach:1. The breadth and depth of incorporation of renewal or endowment criteria associated with the life cycle of equipment, covering maintenance, operating and environmental costs. This includes the deliberate consideration of end-of-life disposal processes to mitigate environmental impact and advance sustainability goals.2. 2. The effectiveness of the implementation or subsequent monitoring of these criteria, ensuring compliance with established sustainability benchmarks and expectations, thereby promoting responsible financing.Ultimately, this study aims to provide insights into the strategic integration of objective sustainability criteria into technology procurement decisions.

**TABLE OF CONTENTS/OUTLINE**

1. Context and introduction2. Objectives3. Methodology 4. Results5. Discussion and conclusions

## NPMEE-40 ORGANIZATIONAL RESILIENCE IN RADIOLOGY

Omar Msto Hussain Nasser, MD (*Abstract Co-Author*) Nothing to Disclose
Bettina Siewert, MD (*Abstract Co-Author*) Editor, Wolters Kluwer nv;Reviewer, Wolters Kluwer nv
James V. Rawson, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Even before the COVID-19 pandemic there was much discussion about resilience. This was usually discussed in the content of burnout and focused on the resilience of the individual. More recent literature in radiology looks at the leadership and system drivers of burnout shifting some of the responsibility for burnout off of the individual. In the recent revision of the Malcolm Baldrige National Quality Award criteria, one of the frameshifts was to look for evidence of organizational resilience. We review the concepts of individual and organizational resilience and look at key performance indicators that Radiology practices can assess to identify opportunities to improve organizational resilience. Teaching points • In addition to individual resilience, organizations can be resilient. • Organizational resilience is not the sum of the resilience of the individuals in the organization. • Other organizational processes contribute to the ability to survive or even thrive/transform when faced with shock, disasters and crisis. • Key performance indicators/metrics with benchmarks and trends over time can be used by Radiology practices and hospitals to identify where there is opportunity to improve their organizational resilience.

**TABLE OF CONTENTS/OUTLINE**

I. Burnout and Moral Injury II. Individual Resilience III. Multifactorial approach to Burnout IV. Organizational Resilience V. Measure of Organizational resilience VI. Opportunities for Radiology

## NPMEE-41 COOKING UP ULTRASOUND PHANTOMS: A HOW-TO GUIDE

Logan M. Ryals, BS (*Abstract Co-Author*) Nothing to Disclose
Nader Pahlevan, BA (*Abstract Co-Author*) Nothing to Disclose
Thomas Powell (*Abstract Co-Author*) Nothing to Disclose
Charlotte Taylor, MD (*Abstract Co-Author*) Nothing to Disclose
Clinton Case (*Abstract Co-Author*) Nothing to Disclose
Chanukya Cherukuri (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Relay the importance of using US phantoms in teaching residents, medical students, and radiologists how to perform US-guided procedures.Provide step-by-step instructions for the creation of home-made US phantoms which may be used for demonstrations.

**TABLE OF CONTENTS/OUTLINE**

Ultrasound (US) is vital in diagnosing and treating disease, so providing quality US instruction to radiology residents to build proficiency and confidence in performing US-guided procedures is important. US phantoms are often employed to teach the basics of thyroid biopsy, breast biopsy, intravascular access, etc. Additionally, the use of US phantoms has enhanced student outreach, allowing for increased engagement within student-run interest groups. However, purchasing high quality US phantoms from a commercial vendor is often costly, and they must be replaced over time due to wear and tear. An alternative is to create "homemade" US phantoms using gelatin and other household materials. There is no standard recipe for creating homemade phantoms, and few step-by-step resources exist for radiology educators to create high-quality phantoms. Three types of phantoms will be discussed: a 3-layer amniocentesis/paracentesis abdominal phantom, a vessel phantom, and a breast biopsy phantom. A resource for creating breast biopsy and vascular access phantoms will be beneficial given that the ACGME will soon require breast biopsy and vascular access procedural competency for radiology residency graduation. In addition to providing instructions for creating US phantoms, demonstrations will be outlined, including probe placement, basics of scanning and probe types, US-guided fine needle aspiration, and student interest group activities.

## NPMEE-42 AN ULTRA SOUND IDEA: A SINGLE CENTER EXPERIENCE OF LONGITUDINAL, INTEGRATED POINT-OF-CARE ULTRASOUND CURRICULUM IN UNDERGRADUATE MEDICAL EDUCATION

Roozbeh Houshyar, MD (*Abstract Co-Author*) Nothing to Disclose
Sohrab Kharabaf, BS (*Abstract Co-Author*) Nothing to Disclose
Monica Gerges (*Abstract Co-Author*) Nothing to Disclose
Christopher Sahagian (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Detail a single center longitudinal, integrated point-of-care ultrasound (POCUS) curriculum in undergraduate medical education, with sampled scanned cases and subjective feedback from student participants.Underscore benefits of such a curriculum, including health equity.

**TABLE OF CONTENTS/OUTLINE**

Our institution provides every medical student a handheld POCUS device, Butterfly iQ (made by Butterfly Network, Inc. based in Guilford, CT), which is used in concert with courses. Preclinical students complete biweekly teaching sessions and assessments that cover technical skills, clinical correlates, and image-guided procedures of all organ systems. Artificial intelligence-driven live teaching tools within Butterfly iQ guide students to obtain high quality scans. A supplementary ultrasound (US) scanning elective is also offered. Students on rotations complete select US views to demonstrate competence. Impact of this curricular program is gauged with subjective metrics. Many studies show that early exposure to POCUS training enhances anatomic knowledge and diagnostic skill. Data gathered by our institution reveals students felt more confident and demonstrated improved objective competence in obtaining US views after completing just one US elective session. Mastering such skills benefits a clinician's career, facilitating quicker, more accurate diagnoses. Handheld POCUS empowers students to improve health disparities. Our institution's novel approach to providing its medical students a longitudinal POCUS curriculum may serve as a best-practice guideline for other institutions seeking to enhance anatomic understanding, clinical skills, technological literacy, and health equity.

## NPMEE-43 CREATING AN INCLUSIVE IMAGING DEPARTMENT - SUPPORTING NEURODIVERGENT PATIENTS ON THE IMAGING JOURNEY

Magda Coetzee (*Abstract Co-Author*) Nothing to Disclose
Michelle Phillips (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Neurodiversity is an umbrella term for the different conditions that describe variations in the way human brains process information. The challenges faced by those with neurodiverse conditions can make attending imaging departments and undergoing examinations difficult. We have a duty of care to all patients; it is important to increase awareness of neurodiversity and offer practical advice to radiography professionals to improve their skills and offer an inclusive service.

**TABLE OF CONTENTS/OUTLINE**

The poster explains the challenges faced by neurodivergent patients - examples include executive function challenges, communication problems and issues with sensory overload. Further challenges are broken down by specific modality such as the intimate nature of mammography and the noise, confined space and necessary stillness of the Magnetic Resonance Imaging (MRI) scanner. This is followed by practical advice to ensure a better more understanding imaging service. Including - Working on the principle that everyone is to be treated with respect and no one is to be assumed to be unintelligent or incapable. Listen to your patients, use simple and direct language and give time for replies. Offer various methods of communication. Allow patients to see, touch and/or hear the equipment prior to their examination. The poster covers challenges adhering to the advice above but concludes with benefits of providing a service which is as accessible and smooth to as many as possible.

## NPMEE-44 ETHICS OF CARE IN RADIOLOGY: A PRIMER FOR EVERYDAY PRACTICE

Juliana M. Bueno, MD (*Abstract Co-Author*) Nothing to Disclose
Emily Lin (*Abstract Co-Author*) Nothing to Disclose
Kaelin Cockrell, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

There is a misconception that medical ethics is less relevant to radiology due to the limited direct patient-physician interaction. However, radiologists face ethical dilemmas during their daily workflow, which are difficult to recognize as they involve technology, systems, and stakeholders beyond patients themselves. Lack of awareness of radiology specific ethical challenges is a barrier to quality clinical care. This exhibit illustrates radiology-specific ethical dilemmas through case-based examples to increase awareness and provide support to solving these everyday challenges.Teaching points: 1) Recognizing the key ethical principles that govern clinical care allows us to recognize situations at risk of ethical violation. 2) Awareness and knowledge of the

challenges that spring from each of the ethical principles is paramount. 3) The ethical challenges faced in diagnostic radiology are complex as they involve components of the system that are beyond the patients themselves. 4) A systematic approach to ethical problem-solving is necessary for the practice of radiology

**TABLE OF CONTENTS/OUTLINE**

1. Refresher on key clinical ethical principles: a) Beneficence b) Nonmaleficence c) Autonomy d) Justice 2. Commonly encountered clinical scenarios: a) Appropriate use of imaging and follow up. b) Communicating critical results. c) Immediate availability of reports to patients (21st Century Cures Act mandate). d) Deciding relevant incidental findings to report. e) Addressing diagnostic misses or misdiagnosis. f) Imaging in incarcerated and refugee populations. 3) Conclusions: a) Ethical problem-solving tools. b) Future directions when facing ethical dilemmas

## NPMEE-5 ENGAGING AND INSPIRING THE NEXT GENERATION OF RADIOLOGISTS

Mina S. Makary, MD (*Abstract Co-Author*) Nothing to Disclose
Farbod Fazlollahi, BS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Setting Clear Expectations Articulate daily reciprocal expectations, including objectives and the student's role on the team. Example: Residents outline study types, software, and focus areas for the day.
- Explaining Diagnostic Reasoning and Processes Residents should verbalize their thought process and diagnostic reasoning as they navigate studies. Example: Explaining the choice of slices and views in a CT scan.
- Engaging and Assessing the Student Continuously ask students for their observations and reasoning to assess understanding and promote active learning. Example: "What do you see here? Why do you think that?"
- Providing Real-Time Feedback and Further Learning Offer immediate feedback and recommend resources for further learning based on daily performance. Example: Provide specific feedback and suggest relevant articles or modules.
- Challenging the Student to Predict and Interpret Encourage students to predict findings from clinical indications and interpret images independently. Example: Discuss expectations before revealing MRI results.

**TABLE OF CONTENTS/OUTLINE**

- Problem Statement
- The Need for Effective Engagement in Radiology Education
- Setting Clear Reciprocal Expectations
- Explaining Diagnostic Processes
- Engaging and Assessing the Student
- Challenging the Student to Interpret
- Summary and Wrap Up

## NPMEE-6 COMPASSIONATE COMMUNICATION: ELEVATING SKILLS FOR CONVEYING BAD NEWS IN BREAST IMAGING

**Awards**
**Certificate of Merit**

Janice Thai, MD (*Abstract Co-Author*) Nothing to Disclose
Rachel E. Grenier, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1) Highlight the importance of training and education in delivering bad news in breast imaging. 2) Review step by step process for delivering bad news in breast imaging. 3) Review array of patient emotional responses, and tips for recognizing and responding empathically.

**TABLE OF CONTENTS/OUTLINE**

1) Emphasize the importance of delivering bad news effectively in medicine, within the context of a patient care model. 2) Define the breast radiologist's specific objectives in delivering bad news to patients. 3) Demonstrate a step-by-step process for delivering bad news. 4) Review spectrum of emotional responses to bad news so that the breast radiologist can be better prepared to respond and meet the patient where they are at. 5) Emphasize importance of patient diversity: cultural, socioeconomic, ethnic, and physical. 6) Highlight the importance of personal reflection in improving communication style, especially when starting out as a breast radiologist. 7) Provide specific case examples/scenarios to demonstrate the nuance and dynamism of delivering bad news to patients in breast imaging.

## NPMEE-7 RADIOLOGISTS FOR THE PUBLIC GOOD: A GUIDE TO NON-PROFIT ORGANIZATIONS IN RADIOLOGY AND HOW TO GET INVOLVED

Cristina Fuss, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Irene Dixe de Oliveira Santo, MD (*Abstract Co-Author*) Nothing to Disclose
Long H. Tu, MD (*Abstract Co-Author*) Nothing to Disclose
Danling Chen, MD (*Abstract Co-Author*) Nothing to Disclose
Caroline Merriam, DO (*Abstract Co-Author*) Nothing to Disclose
Joseph Kim, MD (*Abstract Co-Author*) Nothing to Disclose
Alexander Kuehne, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

• Develop an understanding of the different types of non-profit work in radiology and available to radiologists• Understand the differing types of charitable/non-profit organizations in radiology, which can be grouped into four major areas: standalone charitable organizations, professional societies, charitable arms of for-profit organizations, and educational (e.g., Road2IR)• Foster an understanding of the various ways to get involved with charitable organizations within the field of radiology, at any level of time commitmentThere are several well-recognized and longstanding charitable organizations in medicine, such as Doctors without Borders, The Red Cross, and UNICEF. Non-profit/charitable work in radiology specifically is newer and has truly only accelerated over the past two decades. Digital imaging technology has fostered a revolution in imaging-related care and has offered novel means of broaden access. The possibilities for philanthropic work within our field are growing exponentially. The purpose of this overview is to raise awareness of, and provide opportunities for individuals who desire to become involved with non-profit work in the field of radiology.

**TABLE OF CONTENTS/OUTLINE**

-Background:-Standalone Charitable Organizations:-RAD-AID-Radiologists without Borders-UNITSUSA-Project CURE-Societal Charitable Arms:-RSNA, ASER, ARRS, etc-Charitable efforts of For Profit Organizations:-VRAD first read initiative-Educational:-Road2IR

## NPMEE-8 PRECISION PROTOTYPES: THE EVOLUTION OF PATIENT-SPECIFIC MODELS IN RADIOLOGY

Mina S. Makary, MD (*Abstract Co-Author*) Nothing to Disclose
Farbod Fazlollahi, BS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Imaging Data Basics: CT and MRI imaging data is used to produce detailed anatomical cross-sections that are then processed by software to help distinguish different tissues.
- Conversion Process: 2D cross-sectional data is stacked to construct a 3D volume, then converted to a mesh structure for 3D printing, then divided into sections to be printed accurately one layer at a time
- Software Tools: A variety of commercially available software such as 3D Slicer, OsiriX, and Materialise Mimics are used for image processing, segmentation, and mesh generation.
- Clinical Applications: 3D printed models can be used to enhance preoperative planning, surgical navigation, and implant design, as well as for diagnosis, research and teaching. Important considerations for wider applicability in the clinical space include accuracy, quality assurance, and regulatory compliance.

**TABLE OF CONTENTS/OUTLINE**

- Problem Statement
- Introduction to CT and MRI Imaging Data
- Converting Imaging Data to 3D Printable Files
- Image Segmentation Techniques
- Software Tools for 3D Model Generation
- Clinical Applications of 3D Printing
- Quality Assurance and Regulatory Considerations
- Future Directions in 3D Printing
- Summary and Conclusion

## NPMEE-9 RADIOLOGY MYTH BUSTERS - FILTERING FACT FROM FICTION

**Awards**
**Cum Laude**

Lindsay S. DeWeese, PHD (*Abstract Co-Author*) Nothing to Disclose
Nadine Mallak, MD (*Abstract Co-Author*) Nothing to Disclose
Dennis Barbon, MD (*Abstract Co-Author*) Nothing to Disclose
Alice W. Fung, MD (*Abstract Co-Author*) Nothing to Disclose
Lindsay N. Douglas, PhD (*Abstract Co-Author*) Nothing to Disclose
Anna Mench (*Abstract Co-Author*) Nothing to Disclose
Catherine Meyer, PhD (*Abstract Co-Author*) Nothing to Disclose
Laszlo Szidonya, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Review strongly held beliefs in Radiology, their origins, and supporting or disproving data.2. Present evidence-based, patient-friendly discussion points to better inform patients and non-radiology colleagues.

**TABLE OF CONTENTS/OUTLINE**

The discussion of each myth will include data from which the myth arose, data supporting a new perspective, and takeaways to help educate patients and non-radiologists.1. Myth #1: Effective dose is useful for individual patient dose and risk assessment.2. Myth #2: Ultrasound is the only safe imaging for pregnant patients.3. Myth #3: Imaging exams that utilize the lowest dose are always better.4. Myth #4: Patient shielding should be used whenever possible.5. Myth #5: Patients should always be isolated after radionuclide exams and therapies.6. Myth #6: Patients with renal dysfunction should avoid iodinated IV contrast or be given a lower dose of contrast.7. Myth #7: Iodine and shellfish allergies are contraindications to iodinated IV contrast administration.8. Myth #8: Spleen biopsy is contraindicated due to risk of bleeding.9. Myth #9: Gadolinium deposition is associated with long-term health problems.10. Myth #10: INR is always a useful assessment for bleeding risk.

## WHO YOU GONNA CALL? GHOST (ARTIFACT) BUSTERS! REVIEWING THE ROLE OF MEDICAL PHYSICISTS IN OPTIMIZING RADIOLOGY DEPARTMENT FUNCTION AND IMAGING QUALITY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Anthony Roscoe, BSc, MSc (*Abstract Co-Author*) Nothing to Disclose
Matthew S. Hartman, MD (*Abstract Co-Author*) Nothing to Disclose
Margaret E. Blackwood, MS (*Abstract Co-Author*) Nothing to Disclose
Nicholas Arconti, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

· Medical physicists play a critical role in ensuring departmental compliance with state and federal regulations, as well as maintaining accreditation· Physicists' expertise in image artifact troubleshooting and causative analysis serves to optimize quality assurance and improve patient outcomes· Constructing optimal imaging protocols requires medical physics expertise to ensure dose optimization· Collaboration between radiologists and medical physicists can inform departmental technology/device acquisition· As teachers, medical physicists can offer robust graduate and continuing medical education to trainee and attending radiologists

### TABLE OF CONTENTS/OUTLINE

· An overview of our medical physicists' roles and responsibilities in maintaining departmental compliance with regulatory statutes and accreditation standards· Interesting cases within our department of imaging artifacts that were successfully diagnosed and resolved using medical physics expertise· A review of specific institutional imaging protocols (e.g. low-dose chest computed tomography) which depend on dose optimization· Several examples of recent instances of radiology-medical physics collaboration in deciding on optimal device and software acquisitions· An overview of our medical physicists' functioning as educators, including examples of radiation safety demonstrations and cases of directly educating patients with concerns about radiation exposure

## FRAMEWORK FOR ENGAGING TRAINEES IN SUSTAINABILITY INITIATIVES USING A NATIONAL SURVEY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Charlotte J. Yong-Hing, MD, FRCPC (*Abstract Co-Author*) Nothing to Disclose
Sonali Sharma, BSc (*Abstract Co-Author*) Nothing to Disclose
Jimin Lee (*Abstract Co-Author*) Nothing to Disclose
Maura J. Brown, MD (*Abstract Co-Author*) Synthesis Health Inc - research collaboration, no financial relationship at this time ( Nov 2022).
Aleena Malik, BSC (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Importance of sustainability in radiology 2. Engaging trainees:- Highlight the significance of involving trainees in sustainability efforts from the beginning of their medical education.- Discuss the potential long-term impact of engaging trainees in sustainability initiatives on their future practice and leadership roles within healthcare organizations. 3. Assessing impact on trainees:- Explore current trainee attitudes and aspirations towards sustainability in radiology departments using national survey.- Describe methods for evaluating the effectiveness of sustainability initiatives on trainees' knowledge, skills, and attitudes.- Discuss the role of feedback mechanisms and continuous improvement processes in refining sustainability education and training programs for trainees.4. Integrating sustainability:- Explore strategies for incorporating sustainability principles into radiology curriculum and training programs based on a needs-assessment.

### TABLE OF CONTENTS/OUTLINE

I. Introduction- Significance of sustainability in radiology departments.II. Methods- Conducting a needs-based survey among radiology trainees. - Development of a sustainability framework.III. Trainee Engagement and Impact Evaluation- Educational workshops and hands-on training.- Evaluation of the impact on trainees' education and professional development.IV. Discussion- Benefits of integrating sustainability into radiology practice. - Implications for trainees and the broader healthcare system.V. Conclusion

## INTRODUCTION TO R FOR RADIOLOGISTS: APPLICATIONS IN RESEARCH, VISUALIZATION, AND PRACTICE MANAGEMENT

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Ramtin Hajibeygi (*Abstract Co-Author*) Nothing to Disclose
Long H. Tu, MD (*Abstract Co-Author*) Nothing to Disclose
Kyle Tegtmeyer, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Coding and programming languages are an area with incredible potential value to radiologists across a range of domains, including research, statistics, image analysis and practice management. We seek to introduce radiologists to R, and provide a simple and easy to follow introduction to the R programming language. We review the process of setup and installation, options for integrated development environments (IDEs), and basics of the R language coding and syntax. We additionally seek to demonstrate relevant applications for radiologists, particularly those involved in research or academic endeavors, including statistical applications, data visualization, radiomics and machine learning. We also provide a range of applications relevant to non-academic radiologists, including statistics and modeling for practice management. Lastly, we provide a range of online resources for those interested in learning more above coding in R.

### TABLE OF CONTENTS/OUTLINE

Topics covered include:- What is R? Introduction to the R programming language- How to download and install R- Review of available Integrated Development Environments (IDEs)- Basics of coding in R- Statistical applications for R- Data visualization with R- Radiomics applications in R- Machine Learning applications in R- Statistics and Data modeling applications for practice management and workflow optimization

## SO YOU WANT TO START A NON-PROFIT: PRIVATE FOUNDATION VS. PUBLIC CHARITY - A GUIDE FOR THE RADIOLOGIST

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Long H. Tu, MD (*Abstract Co-Author*) Nothing to Disclose
Caroline Merriam, DO (*Abstract Co-Author*) Nothing to Disclose
Samra Iftikhar, MBBS (*Abstract Co-Author*) Nothing to Disclose
Irene Dixe de Oliveira Santo, MD (*Abstract Co-Author*) Nothing to Disclose
Cristina Fuss, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Danling Chen, MD (*Abstract Co-Author*) Nothing to Disclose
Alexander Kuehne, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

This primer will provide a practical overview of personal foundations and public charities, with a focus on the comparative advantages/disadvantages of each. We discuss additional strategies for each organizational style to reduce the radiologists overall tax burden. We hope this primer serves as both an introduction and inspiration for radiologists who may not have realized the incredible impact they may have via charitable work and help highlight avenues a radiologist may pursue to generate long-lasting, genuine change.Goals of Presentation:-Familiarize the radiologist with the basics of private charitable foundations and public charities (classical 501(c)3 certified non-profits)-Explore the rationale behind the creation of personal philanthropic organizations, contrasted with the drive behind most public charities-Learn about the potential tax benefits/pitfalls, regulatory oversight requirements, of both contrasting the benefits and risks and how they pertain to the radiologist

### TABLE OF CONTENTS/OUTLINE

-Background:-Overview of the key features of private foundations and public charities-Highlight key differences between Private Foundations and Public Charities including:-Board Structure-Initial Requirements-Tax breaks and benefits-Direct contributions-Stock contributions-Real estate deductions-Differences in regulatory oversight-Fund disbursement requirements-Contribution Strategy-Focus of organization and funding source:-Funding sources for private foundations vs. public charities-Grant disbursement to other non-profits vs. on the ground operations-Soft benefits of private foundations/public charities:-Networking-Personal fulfillment-Legacy

### TEACHING POINTS

1. To present the environmental impact of radiology in terms of energy consumption, greenhouse gas emissions, and pollution.2. To discuss areas of opportunity and provide solutions on a system-wide, departmental, and individual level.

### TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Energy Consumption in Radiology a. CTs and MRIs Energy Usage b. Strategies to Reduce Energy Consumption 3. Environmental Impacts of Radiology a. Cooling systems and Energy Needs b. Addressing Environmental Concerns 4. Artificial Intelligence a. Energy Demands of AI b. Optimization Strategies 5. Environmental Concerns with Gadolinium a. Public Health Implications b. Mitigation Techniques 6. Opportunities for Improvement a. System-wide, Departmental, and Individual Solutions 7. Conclusion

## A RESIDENT'S GUIDE TO PHYSICIAN REIMBURSEMENT

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

William Kirschner (*Abstract Co-Author*) Nothing to Disclose
Sophia R. O'Brien, MD, MEd (*Abstract Co-Author*) Nothing to Disclose
Richard Duszak JR, MD (*Abstract Co-Author*) Advisor, Ethos Medical, Inc;Shareholder, Ethos Medical, Inc
Frank J. Lexa, MD, MBA (*Abstract Co-Author*) Nothing to Disclose
Kari Williams, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The business of medical practice is not one of the six core competencies as defined by the Accreditation Council for Graduate Medical Education (ACGME) [1]. As a result, resident physicians may complete training without adequate knowledge of physician reimbursement and the business of medicine [1,2]. This presentation will provide a brief history of physician reimbursement, define the "Resource-based Relative Value Scale" payment system, translate the relative value unit into physician reimbursement and radiologist reimbursement and explain the physician reimbursement revenue cycle and how it applies to Radiologists.

### TABLE OF CONTENTS/OUTLINE

• Problem statement• Brief history of physician reimbursement o Usual, Customary, Reasonable rateo "Resource based relative value" (RBRVS) o Omnibus Reconciliation Act (1992)o Multiple Procedure Payment Reduction (2006)o Affordable Care Act (2010)• Resource based relative value, Relative value Unit, and Physician reimbursement o Definition and Division of the RVU. § Professional component, technical component, global payment• Conversion Factor• Geographic Practice cost index• Radiologist Reimbursement o Professional component of radiologist worko Technical component is absorbed by entity that owns capital, which may also be the physician.• Radiologist Reimbursement and Revenue Cycle o Define revenue cycle, preauthorization, and accounts receivable.o Explain the workflow from service performed to payment received.

## THE WORLD VS. THE MACHINE: BRINGING IMAGING AI TO GLOBAL HEALTH - GOOD ODDS OR BAD BETS?

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Subba R. Digumarthy, MD (*Abstract Co-Author*) Consultant, Merck & Co, Inc;Consultant, Pfizer Inc;Consultant, Bristol-Myers Squibb Company;Consultant, Novartis AG;Consultant, F. Hoffmann-La Roche Ltd;Consultant, Polaris;Consultant, Cascadian;Consultant, AbbVie Inc;Consultant, Gradalis, Inc;Consultant, Bayer AG;Consultant, Zai Lab Limited;Consultant, Biengen;Consultant, Riverain Technologies, LLC;Consultant, Resonance Health;Consultant, Annalise-AI Pty Ltd;Research Grant, Lunit Inc;Research Grant, General Electric Company;Research Grant, Qure.ai;Speaker, Siemens AG
Lina Karout, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Imaging access does not equal radiologists' availability in low-income countries (LIC). 2. Understand the landscape of currently available and approved AI applications in the context of thoracic imaging. 3. The differences in rigors of AI approval process in low- and high-income countries. 4. Possible impact of AI in global health in the context of medical imaging.

### TABLE OF CONTENTS/OUTLINE

1. Graphical summary of imaging access and radiologists' availability in the LIC. 2. Case-based illustration of available multi-vendor AI solutions and their applications in thoracic imaging. 3. Differences in how some AI tools are applied in developed and developing countries. 4. Using examples from our global imaging data from multiple countries to highlight the potentials and limitations of AI applications

## MONITORING OUR EYES: A LOOK AT COMPUTER VISION SYNDROME

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Robert Hill, MD (*Abstract Co-Author*) Nothing to Disclose
Roozbeh Houshyar, MD (*Abstract Co-Author*) Nothing to Disclose
Star Lopez (*Abstract Co-Author*) Nothing to Disclose
James Shi, MD (*Abstract Co-Author*) Nothing to Disclose
Erwin Ho (*Abstract Co-Author*) Nothing to Disclose
Christopher Sahagian (*Presenter*) Nothing to Disclose

### TEACHING POINTS

To review the pathophysiology, epidemiology, risk factors, and treatment modalities for computer vision syndrome.

### TABLE OF CONTENTS/OUTLINE

Computer Vision Syndrome (CVS) is defined as a constellation of eye and vision symptoms that result from prolonged computer use. Symptoms include dry eyes, eye strain, headache, ocular redness, blurry vision, diplopia, and neck pain, arising due to maladaptive ocular surface, accommodative, and extraocular mechanisms. Many modalities of eye care can be employed to address CVS symptoms. Topical lubricative eyedrops and overnight ointments can rehydrate the ocular surface and create a protective evaporative barrier. Dietary supplements, namely omega-3s and blue light filtering glasses have been shown to improve clinical symptoms. Placement of occlusive punctal plugs preserves natural tears. Warm compresses via steam-chambered goggles or hot towel increase lipid layer thickness and tear film breakup time thereby improving symptoms. The ergonomic design of workstations can ease eye strain using warm, balanced lighting and appropriate monitor positioning. Finally, taking frequent and brief breaks away from screens, as outlined by the 20-20-20 rule, has been shown to improve symptoms without compromising one’s duration of computer usage. A thorough understanding of the underlying causes, risk factors, and treatment options will empower radiologists to continue to work longer, more efficiently, and symptom free.

## MRI SUSTAINABILITY: UNLOCKING THE POWER OF HEAT RECOVERY IN RADIOLOGY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Daniel J. Margolis, MD (*Abstract Co-Author*) In-kind support, Siemens AG;Consultant, Promaxo, Inc
Akhil Soman (*Abstract Co-Author*) Nothing to Disclose
Filipp Alaverdyan (*Abstract Co-Author*) Nothing to Disclose
Daniel Audette (*Abstract Co-Author*) Nothing to Disclose
Lara Pes (*Abstract Co-Author*) Nothing to Disclose
Akua Amoah, MD, MPH (*Presenter*) Nothing to Disclose

### TEACHING POINTS

MRI scanners play a crucial role in modern healthcare, but their operation consumes substantial energy and generates significant waste heat.To address this, a heat pump system is a potential solution to capture and repurpose MRI heat for sustainable energy utilization. Heat pumps efficiently transfer heat for heating and cooling functions depending on the direction of heat transfer.Embracing energy conservation in radiology departments holds promise for driving transformative change. Repurposed MRI heat offers a sustainable heating source and contributes to decarbonization efforts within healthcare facilities. Significant energy and heat savings are projected from the integration of heat pumps in the MRI exhaust system, with potentially millions of billions of BTU saved and up to 30% fossil fuel reduction.The question of how cost-effective this project will be cannot be overlooked. Incorporating a heat recovery system into a standard hospital building using a heat pump will cost hundreds of thousands to millions of dollars, but with eventual substantial annual savings.While this may be straightforward to apply for future MRI site designs, integration into existing MRI installation may be challenging and require additional investigation and costs, potentially taking the MRI offline for implementation.

### TABLE OF CONTENTS/OUTLINE

1. Overview of MRI waste heat 2. Heat pump energy recovery system 3. Potential Benefits 4. Cost Estimate 5. Pitfall

## ENHANCING RADIOLOGY PRACTICE THROUGH APPLICATIONS OF QUALITY IMPROVEMENT AND PALLIATIVE CARE IN PATIENT AND FAMILY CENTERED CARE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Anna Luisa Kuhn, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Paramesh Karandikar (*Abstract Co-Author*) Nothing to Disclose
Lyle Suh (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Understand Patient and Family-Centered Care (PFCC) principles.2. Understand the history, progress, and relevance of PFCC in radiology.3. Apply the concept of PFCC through practical models and strategies that prioritize quality care.Examples: Patient-oriented communication methods, safety and reporting protocols, cultural competency training, and interdisciplinary collaboration4. Understand PFCC in the context of palliative care in radiology.5. Understand applications of PFCC in the context of quality improvement (QI) initiatives.

### TABLE OF CONTENTS/OUTLINE

1. Overview(a) Definition and Importance of Patient and Family Centered Care (PFCC); Review Core Principles of PFCC(b) History, Milestones, and Progress of PFCC in Radiology(c) Current challenges and opportunities for improvement2. The Relevance of PFCC in Radiology(a) Quality and value-based care(b) Patient outcomes, satisfaction, and experience(c) Communication3. Implementing PFCC in Radiology Practice(a) Building a culture and evidence-based processes(b) Overcoming Challenges and Barriers (Resistance to change, lack of resources, and competing priorities)4. PFCC and Palliative Care in Radiology Practice5. Quality Improvement for improving PFCC in Radiology6. Future Directions(a) PFCC in Practice, Research, and Training (e.g. Simulations)(b) Innovations and advancements6. Cases(a) Review scenario-based simulation illustrating successful implementation of PFCC in radiology and discuss outcomes and lessons learned

## WARREN BUFFET HAS ONE, WHY NOT YOU: THE LOGISTICS, BENEFITS, AND PITFALLS OF A PRIVATE FOUNDATION - AND WHY RADIOLOGISTS ARE WELL-POSITIONED TO START THEIR OWN

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Long H. Tu, MD (*Abstract Co-Author*) Nothing to Disclose
Ronald Gathagan, MD (*Abstract Co-Author*) Nothing to Disclose
Irene Dixe de Oliveira Santo, MD (*Abstract Co-Author*) Nothing to Disclose
Caroline Merriam, DO (*Abstract Co-Author*) Nothing to Disclose
Danling Chen, MD (*Abstract Co-Author*) Nothing to Disclose
Cristina Fuss, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Samra Iftikhar, MBBS (*Abstract Co-Author*) Nothing to Disclose
Alexander Kuehne, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

While classically associated with the ultrawealthy, the barrier for entry for creation of a personal charitable foundation is in fact much lower. Current suggested startup funding is between $250,000-$500,000, well within reach of the average practicing radiologist. We believe private foundations are a financial construct that all radiologists should be aware of as a vehicle for social impact and the construction of a meaningful legacy. This presentation will overview private foundations and aim to:-Familiarize the radiologist with the basics of personal/family run private foundations-Explore the rationale behind the creation of private philanthropic organizations-Learn about the potential tax benefits/pitfalls of this process-Increase understanding of the additional regulatory oversight that private foundations undergo-Highlight the reasons a radiologist could be interested in creating a personal foundation including and not limited to: addressing areas of personal/societal interest, global health causes, education, radiology research, etc.

### TABLE OF CONTENTS/OUTLINE

-Background: Why chose a Private Foundation-Logistics in Setting up:-Certification Process-Initial Requirements-Contribution Strategy-Benefits:-Retention of control-Grant disbursement instead of building an on the ground operation-Networking and Investment-Traditional Focus (Disbursement of funding to various non-profit entities):-Additional Oversight:-Minimum yearly disbursement of funds-Additional investment income excise tax-Self-Dealing restrictions-Excess business holdings-Taxable expenditures-Gold Standard Examples:-Less Than Ideal Examples:

## UTILIZING THE SOCIAL ECOLOGICAL MODEL TO EXAMINE DEFICITS IN RECRUITMENT, PROMOTION, AND LEADERSHIP DEVELOPMENT OF WOMEN IN RADIOLOGY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Randy C. Miles, MD, MPH (*Abstract Co-Author*) Nothing to Disclose
Shiva Yagobian, BS (*Abstract Co-Author*) Nothing to Disclose
Efren J. Flores, MD (*Abstract Co-Author*) Speaker, WebMD LLC;Speaker, Consulting Medical Associates, Inc
Amy K. Patel, MD (*Abstract Co-Author*) Medical Advisor, Kheiron Medical Technologies Ltd;Consultant, Hologic, Inc
Franklin Iheanacho, BA (*Presenter*) Nothing to Disclose

### TEACHING POINTS

•Introduce the socioecological model (SEM) and its levels to explain individual-environment interactions •Examine barriers in recruitment, promotion, and leadership for women via SEM •Address the "leaky pipeline" in academic radiology for women at personal, interpersonal, institutional, community, and policy levels •Review literature on gender disparities in leadership

### TABLE OF CONTENTS/OUTLINE

1. Socioecological Model (SEM) Introduction 1a. Outline SEM levels: intrapersonal, interpersonal, institutional, community, policy 1b. Explore women underrepresentation in radiology using SEM. 2. Positive Impact of a Diverse Workforce 3. Exploring the gender disparity at each SEM level 3a. Intrapersonal Level I. Recruitment II. Promotion II. Leadership 3b. Interpersonal Level I. Recruitment II. Promotion III. Leadership 3c. Institutional Level I. Recruitment II. Promotion III. Leadership 3d. Community/Policy Level I. Recruitment II. Promotion III. Leadership 4. Sealing the Leaky Pipeline

## AN ACADEMIC RADIOLOGIST'S ROADMAP TO SUCCESS: NAVIGATING THE WRITING PROCESS, JOURNALS, CONFERENCES, AND SOCIETY FELLOWSHIPS AND GRANTS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Maad Galal (*Abstract Co-Author*) Nothing to Disclose
Ahmed Kertam (*Abstract Co-Author*) Nothing to Disclose
Long H. Tu, MD (*Abstract Co-Author*) Nothing to Disclose
Quoc-Huy Ly (*Abstract Co-Author*) Nothing to Disclose
Carys Kenny-Howell (*Abstract Co-Author*) Nothing to Disclose
Jeffers Nguyen, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Because research is the currency in academia, it is imperative for aspiring academic radiologists to possess comprehensive skills and knowledge in conducting and disseminating research. However, navigating the layers of academic writing, project management, conference submissions, and journal publications can be overwhelming for novice academics.Through a systematic approach, this primer equips radiologists with the knowledge and skills necessary to excel in academic endeavors, providing guidance on literature review, data analysis, and project management. It also shares a roadmap of major conferences, journals, and grants in radiology and medicine, enhancing visibility within the academic community and facilitating effective dissemination of research findings.

### TABLE OF CONTENTS/OUTLINE

- Skills, skills, skills: literature review, writing, citation, data analysis, and more- Lifecycle of academic projects: from conceptualization to publication- Road map of major U.S. and international conferences- Reviewer 2: Journals' impact factors, time to first decision, and acceptance rates- Academic societies' grants, fellowships, and awards

## AI X DEI: DEVELOPING A MEDICAL STUDENT CURRICULUM ON ARTIFICIAL INTELLIGENCE IN RADIOLOGY AND ITS IMPLICATIONS FOR HEALTH EQUITY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Alexander Lindqwister, MD, MS (*Abstract Co-Author*) Nothing to Disclose
Christopher F. Beaulieu, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Diamanto Rigas, MD (*Abstract Co-Author*) Nothing to Disclose
Zainub Dhanani (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Foundational Understanding in AI-Provide students with a broad foundation in AI technologies in radiology and potential impacts on diverse patient populations2. Bias Awareness and Mitigation-Equip students with the ability to identify and address bias in radiology AI applications, fosteringequitable diagnostic and treatment practices3. Cultural Humility-Emphasize importance of culturally humble AI development in radiology and its role in patient-centered and culturally sensitive care4. Policy and Governance in Radiology AI-Expose students to policy and governance aspects of healthcare AI in radiology, preparing them to advocate for ethical and equitable AI practices in radiology settings5. Emerging Technologies-Explore emerging AI technologies in radiology and implications for the future of radiology, empowering students to stay at the forefront of radiology innovation

### TABLE OF CONTENTS/OUTLINE

Intro to AI: AI Terminology, Computational Basis of AI, Types of Data, Types of Algorithms/Models, AI for RadiologyAI Pitfalls and Risks: Limitations to AI/ML, Curse of Dimensionality, Validation for AI models, Bias in AI models, Health Equity Issues and Examples, Approaches to Mitigating BiasHuman and Machine Bias in AI Models: Data Curation/Sourcing Bias, Data Annotation and Visualization Bias, Training Dataset Bias, Model and Metric Bias, Inherited Bias, Cognitive Bias, Algorithm Deployment Bias, Evaluation Bias, Complacency in Automation Bias, Statistical Bias, Detection BiasBuilding AI Models: Determining your question, Dataset development, Dataset audits, Training/testing models, Understanding model outputs, Bias audits, Evaluating efficacy and accuracy, Legal Compliance

## BRAVING THE AI SURGE-EQUIPPING RADIOLOGY RESIDENCIES FOR TOMORROW'S CHALLENGES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Henrique M. Lee, MD (*Abstract Co-Author*) Nothing to Disclose
Amit Kumar (*Abstract Co-Author*) Nothing to Disclose
Swati Goyal (*Abstract Co-Author*) Nothing to Disclose
Gilberto Szarf, MD, PhD (*Abstract Co-Author*) Speaker, F. Hoffmann-La Roche Ltd;Speaker, Amgen Inc;Speaker, Siemens AG
Vasantha Kumar Venugopal, MD (*Presenter*) Officer, CARPL.AI Inc

### TEACHING POINTS

1. Deep dive into how AI is currently used in radiology, its capabilities, and its limitations, preparing residents for realistic applications and expectations.2. Emphasizing the importance of recognizing and mitigating biases in AI algorithms, and understanding the ethical implications of automated decision-making.3. Advocating for a balanced educational approach that combines AI tools with traditional hands-on learning to foster a comprehensive skill set.4. Highlighting the need for ongoing education in AI developments, ensuring that residents remain adept as technology evolves.5. Cultivating critical diagnostic skills that complement AI-driven data, ensuring residents can effectively interpret and question AI outputs.

### TABLE OF CONTENTS/OUTLINE

Overview of AI technologies impacting radiology.Case studies of AI tools improving resident performance and engagementIdentifying and overcoming potential pitfalls such as over-reliance and diminished problem-solving skillsStrategies for teaching ethical considerations and algorithm transparencyEducational Strategies for AI Preparedness -Developing curricula that incorporate AI learning, including simulation-based training and AI-assisted diagnosticsThe role of mentorship and faculty development in an AI-enhanced educational environmentFuture Perspectives and Preparing for Change

## THINK LOCAL, ACT GLOBAL: INCORPORATING GLOBAL RADIOLOGY INTO YOUR PRACTICE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Karen Chetcuti, MD, FRCR (*Abstract Co-Author*) Nothing to Disclose
John Phalula, BMBS (*Abstract Co-Author*) Nothing to Disclose
Benjamin Brown, BS (*Abstract Co-Author*) Nothing to Disclose
Katrina A. McGinty, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

After reviewing this presentation, the learner will be able to1. Better understand and describe the disparity in radiology resources worldwide.2. Describe the pros and cons of different methods of involvement in global radiology.3. Understand the role of remote or hybrid involvement in radiology capacity building in low- and middle-income countries as a sustainable and effective means of improving radiology access4. Be prepared to take the next steps to sustainably and seamlessly incorporate global radiology into his/her/their practice

### TABLE OF CONTENTS/OUTLINE

1. Overview of the need for global radiology2. Discussion of different approaches to global radiology, their strengths and challenges. This will include a discussion of equipment donation, in person visits and virtual support.3. Emphasize the importance of longitudinal projects and capacity building for improving radiology services worldwide.4. Describe hybrid or virtual approaches to global radiology, including current collaborations between an academic medical center in the Southeastern USA and a radiology program in Sub-Saharan Africa. Highlighted projects will include multidisciplinary tumor boards, peer learning conferences between the two residencies, lecture delivery and a supported hands on MRI curriculum. Discussion will focus on program building, program maintenance, measurements of success or failure and the importance of quantifying impact.5. Review topics covered and offer guidance for next steps to incorporate global radiology into one’s professional practice.

## METRICS AND INDICES AND SCAMS, OH MY: JOURNAL QUALITY CONSIDERATIONS FOR YOUR QUALITY RADIOLOGY MANUSCRIPT

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Thea C. Moran, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. It's hard to efficiently select a journal for manuscript submission with the abundance of journal options in the current open-access landscape. Knowing how to efficiently find, and assess, journals for quality, chance of acceptance, and visibility benefits not just researchers, but patients and the public. 2. Journal metrics must be interpreted in terms of what they're supposed to indicate and their imperfections. 3. Many indices include radiology journals. Journals listed in multiple indices have better visibility but indices' inclusion criteria vary. 4. Megajournals are publishing options for radiology manuscripts; however, they're controversial. It's uncertain what their place will ultimately be in scientific publishing. 5. Predatory journals/publishers are best avoided. Well-known red flags exist. Publishing association directories list publishers who adhere to best practices.

### TABLE OF CONTENTS/OUTLINE

1. Academic publishing overview. History, kinds of literature, who it affects and how. 2. Journal quality indicators a. Metrics What are they, their meaning(s)/weaknesses. b. Indices What are indices/databases, journal selection criteria, how they help visibility, PubMed/PubMedCentral/Medline, what indices list radiology journals 3. Predatory journals What are they, why are they a problem (for healthcare, authors, society), how to recognize and resources to help avoid 4. Megajournals What are they? Criteria? Controversies. Megajournals that have published radiology manuscripts 5. Personal and electronic means to form a list of potential journals - journal finders, scientific associations, mentors, peers, librarians, journals you review for. 6. Summation/take home points

## HOW TO BRING RADIATION SAFETY AND PHYSICS EDUCATION TO LIFE WITH A HANDS-ON FLUOROSCOPY TRAINING

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Eduardo Thadeu De Oliveira Correia, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Leonardo K. Bittencourt, MD, PhD (*Abstract Co-Author*) Research Consultant, Canon Medical Systems Corporation
David W. Jordan, PhD (*Abstract Co-Author*) Nothing to Disclose
Lauren Fane, BEng (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Radiation protection and related physics can be taught interactively in an IR suite with simple supplies that medical physics departments have.2. A hands-on fluoroscopy training can demonstrate the distribution of scattered radiation, impact of equipment positioning, and effect of shielding.3. Radiation protection training early-on, before IR rotations can improve resident satisfaction, competence in protecting themselves and patients, and their physics and safety knowledge.

### TABLE OF CONTENTS/OUTLINE

An interactive radiation protection training can be created with minimal supplies outside of an IR suite with a c-arm: area survey meter, RaySafe X2 with R/F sensor, lead aprons, and acrylic blocks to simulate patients.A hands-on fluoroscopy training can demonstrate radiation safety and physics concepts:1. Distribution of scattered radiation and variation based on size of body region / size of patient imaged and different orientations of the radiation source2. Patient distance from x-ray source impacts patient radiation dose, scatter, and image contrast, because the x-ray beam diverges.3. How much radiation is attenuated by shielding (lead aprons, barriers/boards/walls)This training improved residents' radiation safety knowledge and attitudes in a single-institution, prospective study.1. Sustained increases in residents’ confidence in protecting themselves and comfort in raising concerns to faculty2. Catered to a baseline deficit in concepts that are better demonstrated than discussed3. Increased radiation safety knowledge temporarily. More can be done during procedural rotations to reinforce safety practices and concepts

## TRAUMA-INFORMED CARE: SHAPING THE FUTURE OF RADIOLOGY PROCEDURES

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Janet E. Bailey, MD (*Abstract Co-Author*) Nothing to Disclose
Katherine A. Klein, MD (*Abstract Co-Author*) Nothing to Disclose
Angelica Alexopoulos (*Abstract Co-Author*) Nothing to Disclose
Sydney J. Torres, BS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Review the prevalence of trauma within the patient population and identify types of traumatic experiences patients may have faced.
- Recognize clinical warning signs that indicate a patient may have a history of trauma and identify potential triggers in radiology procedures.
- Explore a universal trauma-informed care approach and its general principles within healthcare, according to the Substance Abuse and Mental Health Services Administration (SAMHSA) and other expert recommendations.
- Provide an actionable framework applicable to clinical practice including before, during, and after procedures to increase patient comfort and patient-centered care within radiology.

### TABLE OF CONTENTS/OUTLINE

- Terminology: What is trauma and trauma-informed care?
- Clinical warning signs that a patient may have a history of trauma
- Potential triggers in radiology
- The Four R's: Definition of a trauma-informed approach
- The key principles of a trauma-informed approach
- A framework for best practices and recommendations to avoid retraumatization in radiology procedures
- Future areas to explore

## LLM HANDS-ON: GETTING START OF LLM PROGRAMMING IN PYTHON

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Atsushi Teramoto, PhD (*Abstract Co-Author*) Nothing to Disclose
Kippei Isaji (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The emergence and advancement of large language models (LLMs) have made it possible to automate many tasks. These models are integrated into various services, and many users may already have experience interacting with them. However, opportunities to implement publicly available LLMs are limited. The purpose of this exhibit is to teach how to easily implement and fine-tune publicly available LLMs.

### TABLE OF CONTENTS/OUTLINE

Outline: The main teaching points of this exhibit are as follows: 1. LLMs pre-train on vast text data to gain general language knowledge. 2. In recent years, many LLMs have been developed. 3. LLMs have many potential applications in medical settings. TABLE OF CONTENTS: 1. What are LLMs? 2. Use Cases 3. Hands-on Session

## PATIENT-REPORTED OUTCOME MEASURES: WHAT THEY ARE, AND HOW THEY CAN BE USED TO IMPROVE PATIENT-CENTRED CARE IN RADIOLOGY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Andrea S. Doria, MD, PhD (*Abstract Co-Author*) Baxalta-Shire (Research Grant), Novo Nordisk (Research Grant), Terry Fox Foundation (Research Grant), PSI Foundation (Research Grant), Society of Pediatric Radiology (Research Grant), Garron Family Cancer Centre (Research Grant)
Rakhshan Kamran (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1) Review the development, validation, and implementation of patient-reported outcome measures (PROMs), which should be the pillar of today’s and tomorrow’s radiological services to patients. 2) Explore benefits of PROMs to advance patient-centeredness of radiology, along with ethics and future directions.

### TABLE OF CONTENTS/OUTLINE

Radiology should be “patient-centered”, but few initiatives exist assessing value creation and patient outcomes in radiology. PROMs can help advance patient-centeredness and value measurement in radiology. This presentation will cover how PROMs can be used in radiology. 1) Introduction to patient-reported outcome measures (PROMs). a) Overview, significance in radiology. b) Capturing patients' perspectives. c) Patient-centred care and demonstrating value of radiology. 2) Development of PROMs. a) Overview and examples of PROMs. b) Importance of patient involvement. 3) Validation of PROMs. a) Methods: validity, reliability, responsiveness. b) Overview of psychometrics. 4) Types of validity. a) Content, criterion, construct. b) Examples of validity assessment. 5) Implementation a) Strategies for PROM implementation. b) Discussion of challenges. 6) Benefits a) Improved communication, monitoring, patient-centred care. b) Research and quality improvement. 7) Case studies. a) Successful cases. b) Real-world experiences. 8) Ethical considerations. a) Confidentiality, consent, cultural sensitivity. b) Risks and limitations. 9) Future directions. a) Emerging trends, technology. b) Research areas, collaboration opportunities. 10) Conclusion a) Summary emphasizing PROMs' importance in improving patient-centred care and demonstrating value in radiology.

## ANATOMICALLY ACCURATE AND FLUOROSCOPICALLY VISIBLE 3D-PRINTED SPINAL MODEL FOR LUMBAR PUNCTURE SIMULATION AND TRAINEE EDUCATION

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Mina Mousa, MD (*Abstract Co-Author*) Nothing to Disclose
Summer J. Decker, PhD (*Abstract Co-Author*) Nothing to Disclose
Jonathan M. Ford, PhD (*Abstract Co-Author*) Nothing to Disclose
Michael Markovitz, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Impact on Procedural Skills, Confidence and Error Reduction: Improve practical skills through hands-on experience with 3D-printed models to build confidence and reduce errors and complications. 2. Advancements in Simulation-Based Training: Learn about limitations of existing simulations and the need for more anatomically accurate, tactilely realistic, and fluoroscopically visible models. Highlight the design and composition of our 3D-printed lumbar spine model. 3. Standardization of Medical Education and Future Aims: Understand the potential benefits on medical trainee competence and patient safety. Establish a standardized training protocol for residents, fellows, and visiting students with the potential for broader applications in other medical fields and institutions.

### TABLE OF CONTENTS/OUTLINE

1. Introduction/Background • Need for hands-on medical training and role of 3D printing in addressing this gap; • Challenges and limitations of current training and simulation models; 2. Materials/Methods • Design and printing process of our 3D-printed model; • Material selection for realistic tactile feedback and fluoroscopic contrast visibility; • Implementation in training settings; 3. Results • Initial qualitative feedback; • Observations on usability and authenticity compared to traditional models; 4. Discussion • Impact on trainee competence and confidence; • Implications for patient safety and procedural success; • Considerations for further research and model refinement; 5. Conclusion: • Innovative aspects and potential benefits of the 3D model; • Future steps for controlled efficacy studies; • Potential adaptation for other procedures, medical fields and institutions

## BALANCING ACCESS AND ANXIETY: THE CHALLENGES AND OPPORTUNITIES OF IMMEDIATE RESULT RELEASE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Shoichi Maeda (*Abstract Co-Author*) Nothing to Disclose
Eri Ishikawa (*Abstract Co-Author*) Nothing to Disclose
Evgeny Pavlushkov, MD, FRCR (*Abstract Co-Author*) Nothing to Disclose
Jay Starkey, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- The 21st Century Cures Act requires immediate patient access to electronic health information, including radiology reports
- Radiologists must adapt to increased patient communication and shared decision-making
- Proactive guidance and clear reporting can ease patient anxiety about results
- Radiology practices should leverage technology to provide user-friendly patient resources
- Equitable access to health information remains a concern for older and low-income patients

### TABLE OF CONTENTS/OUTLINE

I. Introduction• 21st Century Cures Act overview• Impact on radiologyII. Current State of Information Blocking in 2024• Implementation successes and challenges• Radiologist experiences and patient feedback• Evolving legal and regulatory landscapeIII. Benefits and Drawbacks of Immediate Result Access• Patient empowerment and shared decision-making• Potential for patient anxiety and confusion• Liability considerations for radiologistsIV. Best Practices for Patient-Centered Radiology• Proactive communication and expectation-setting• Clear, patient-friendly reporting style• Radiologist availability for direct patient questions• Leveraging AI tools for patient educationV. Ensuring Equitable Access• Challenges for older and low-tech-literacy patients• Socioeconomic barriers to portal use and internet access• Strategies for inclusivity and alternative communicationVI. Future Directions and Recommendations• Enhanced EHR interoperability and data sharing• Workflow changes to facilitate patient interaction• Payment models to support radiologist time spent on patient care• Ongoing patient outreach and educationVII. Conclusion

## ENHANCING SPACED REPETITION WITH LARGE LANGUAGE MODELS FOR RADIOLOGY EDUCATION: A PILOT STUDY TO EXPLORE ARTIFICIAL INTELLIGENCE (AI) CAPABILITY, PRACTICALITY AND INTEGRATION

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Ryan J. Smith, MD (*Abstract Co-Author*) Nothing to Disclose
Long Nguyen, MD (*Abstract Co-Author*) Nothing to Disclose
Joseph Nenow, MD (*Abstract Co-Author*) Nothing to Disclose
Eric Li, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

-Spaced repetition systems have been acknowledged for improving knowledge retention, competency, and academic performance in medical education. Anki is a flashcard-based software platform, popular among medical trainees, that employs spaced repetition and active recall.-However, limitations exist in spaced repetition learning, including substantial time required for content creation, potential cognitive overload, and lack of customization. Large Language Models (LLMs) present a solution to these challenges by leveraging capabilities such as text summarization and structured data extraction to produce personalized educational content.-This pilot study evaluates the effectiveness of LLMs in enhancing Anki flashcard materials for radiology residents. We used a detailed scoring rubric, aligned with established content creation practices, to assess the ability of LLMs to generate relevant, useful educational materials within a spaced repetition framework.-Our findings explore the practicality and limitations of integrating LLMs into the educational workflows of radiology training, aiming to improve the accuracy, relevance, and customization of learning resources.

### TABLE OF CONTENTS/OUTLINE

1. Generala. Existing workflows in medical/resident education2. Large Language Models (LLM)a. Third party LLMs (e.g. ChatGPT, Gemini, Llama)b. Role of LLM in medical education3. Pilot Studya. Intent/Designb. Methodologyc. Resultsd. Considerations (e.g. weighted scoring, pilot study scaling, rubric standardization)4. Integration practicalitya. Conferences/lecturesb. Workstation learningc. Limitations and workarounds5. Implicationsa. Personalized learningb. Future Direction

## HARNESSING SOLAR ENERGY - SCIENCE OF LEARNING APPLIED TO RADIOLOGY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Joseph W. Owen, MD (*Abstract Co-Author*) Nothing to Disclose
Katherine Copely, MD (*Abstract Co-Author*) Nothing to Disclose
Fara Y. Shikoh, MD (*Abstract Co-Author*) Nothing to Disclose
James T. Lee, MD (*Abstract Co-Author*) Nothing to Disclose
Andres R. Ayoob, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Although physicians dedicate their lives to learning, most spend little, if any, time understanding the scientific underpinnings of the learning process.As a result, most often rely on personal experience, intuition, opinions, or the latest fad to inform how they learn, frequently leading to ineffective and inefficient practices as well as frustration. This may be particularly detrimental as an ever-expanding body of medical knowledge and rapidly-evolving technologies render the process of life-long learning a necessity for physicians.Fortunately, recent research into the psychological and physiological principles behind learning have led to a number of evidence-based principles proven to enhance the learning process. This has important implications for all - trainees preparing for licensure examination and independent medical practice, practicing radiologists keeping abreast of current knowledge and technologies, and those involved in design and delivery of continuing medical education activities.Understanding these evidence-based learning strategies and how to apply them to radiology education can facilitate knowledge acquisition, promote life-long learning skills, and improve patient outcomes.

### TABLE OF CONTENTS/OUTLINE

Review of how memory works (encoding, storage, and retrieval)Illustration of evidenced-based principles to improve recall: active learning, retrieval practice/testing effect, spaced learning, interleaving, deliberate practice, metacognition, feedback, and real-world applicationsDescription of practical tips to integrate these strategies into daily practice, from trainee education to continuing medical education

## ENSURING PATIENT SAFETY: A COMPREHENSIVE APPROACH TO RADIOLOGICAL ERRORS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Shoichi Maeda (*Abstract Co-Author*) Nothing to Disclose
Eri Ishikawa (*Abstract Co-Author*) Nothing to Disclose
Evgeny Pavlushkov, MD, FRCR (*Abstract Co-Author*) Nothing to Disclose
Jay Starkey, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Teaching Points:
- Understand the ethical, legal, and safety implications of errors in radiology
- Learn best practices for responding to and mitigating errors
- Encourage a culture of transparency, accountability, and continuous improvement

### TABLE OF CONTENTS/OUTLINE

Table of Contents/Outline:
- Introduction
- Importance of addressing errors in radiology
- Types of errors (interpretation, missed findings, wrong studies, etc.)
- Ethical Considerations
- Duty to disclose errors to patients and referring physicians
- Balancing transparency with patient well-being
- Maintaining trust and integrity in the profession
- Legal Implications
- Potential malpractice liability
- Informed consent and patient communication
- Documentation and reporting requirements
- Patient Safety
- Impact of errors on patient outcomes
- Strategies for error prevention and mitigation
- Implementing safety protocols and checklists
- Responding to Errors
- Immediate actions (communicating with patients, referring physicians, and colleagues)
- Root cause analysis and system improvements
- Emotional support for healthcare professionals involved
- Quality Improvement Initiatives
- Encouraging a culture of safety and transparency
- Empowering radiologists and trainees to identify and report errors
- Collaborative efforts across specialties to enhance patient care
- Conclusion
- Summarize key points and best practices
- Emphasize the importance of a proactive, patient-centered approach to error management

# Abstract Archives of the RSNA, 2024

NPMEE-38

## NEXT-GENERATION TB SCREENING: AI-DRIVEN ACTIVE CASE FINDING WITH PORTABLE CHEST RADIOGRAPHS - A RADIOLOGY REVOLUTION OR ROUTINE EVOLUTION?

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Abhinav Jain, MD (*Abstract Co-Author*) Nothing to Disclose
Mehvash Haider (*Abstract Co-Author*) Nothing to Disclose
Amit Kumar (*Abstract Co-Author*) Nothing to Disclose
Vasantha Kumar Venugopal, MD (*Presenter*) Officer, CARPL.AI Inc

### TEACHING POINTS

1. Studies show that AI algorithms can achieve sensitivity and specificity that meet or exceed WHO's Target Product Profile for TB triage tests, significantly outperforming human radiologists in settings with high TB burdens? 2. Portable chest radiographs combined with AI analysis enable rapid on-site TB screening reducing the delay from screening to diagnosis3. AI algorithms have been shown to reduce the number of Xpert tests required by 50% while maintaining a sensitivity above 90% 4. The STOP TB Partnership highlights AI-powered CAD's role across diverse settings, with case studies from India, Pakistan, Cambodia, Vietnam, Uganda, and Nigeria illustrating varied implementation challenges and successes.5. ACF Metrics Effective ACF is measured by specific metrics, e.g., in India: screening 10% of the population, testing 4.75% of those, diagnosing 5% of those tested, aiming for an NNS (Number Needed to Screen) below 1,538

### TABLE OF CONTENTS/OUTLINE

Introduction to AI in TB Screening - Overview of the integration of AI with portable chest radiography in enhancing TB detection.Global Case Studies - Insights from Northeast Nigeria, implementations in Indonesia and India.Evaluation of AI in Screening Programs - Discussion on the evaluation of AI technologies in TB screening, including studies from the STOP TB Partnership and WHO guidelines on the use of AI in detecting TB from chest X-rays.Challenges and Ethical Considerations - Consideration of potential biases in AI algorithms, and the ethical implications of widespread AI deployment in healthcare.Conclusion Impact of AI-driven portable chest radiography in TB active case finding.

NPMEE-39

## THEORY OF CONSTRAINTS IN RADIOLOGY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Danilo Sirias (*Abstract Co-Author*) Nothing to Disclose
James V. Rawson, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

There are many approaches to process improvement. Common approaches used in Radiology include Lean and the Plan Do Study/Check Act cycle. The Theory of Constraints was described by Eli Goldratt in The Goal in 1984 taking an operations management approach to flow. The premise is that in any complex system, there are only a few rate limiting steps. Improvement efforts on a step, which is not rate limiting to the over flow in the organization, will increase throughput at that individual step. However, those gains will simple queue up at the constraint, so there will be no system level improvement in flow. A constraint can be a piece of equipment, personal or even a policy. For example, in Radiology, backlogs for outpatient appointments point to a constraint. A constraint is often an expensive, hard to duplicate resource. In the past in Radiology, this was often the equipment and could be approached by optimizing utilization of the equipment. In today's world of radiology staff shortages, the staff may be the constraint. In this exhibit, we review how to optimize the constraint to improve throughput in Radiology.Teaching Points • In any complex system, there are only a few rate limiting steps/constraints. • An hour of time lost at a bottleneck is an hour lost for the system. • An hour saved at a non-bottle-neck does not improve throughput. • Buffers can be used to protect the constraint and increase utilization of the constraint (throughout).

### TABLE OF CONTENTS/OUTLINE

I. Theory of Constraints defined II. Constraints and Rate Limiting Steps III. Five Focusing Steps IV. Improving Throughput V. Financial vs Flow Accounting VI. Next steps for Radiology

## TOWARDS GREENER IMAGING: EVALUATING SUSTAINABILITY IN TECHNOLOGY PROCUREMENT

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Laura Mosteiro, MD (*Abstract Co-Author*) Nothing to Disclose
MARIA AMPARO VILLAVERDE GOMEZ, MD (*Abstract Co-Author*) Nothing to Disclose
Cristina Enjamio, PhD, MEng (*Presenter*) Nothing to Disclose

### TEACHING POINTS

The modernisation of advanced technological equipment in our healthcare systems requires a holistic approach to procurement that takes into account the evolving challenges posed by climate change, together with technological advances and sustainability imperatives. In a public health service environment, technology procurement requires strategic planning that integrates service needs, clinical and organisational objectives, financial resources and sustainability criteria.This publication aims to critically assess the adequacy of equipment procurement criteria set out in national or regional plans, with a two-pronged approach:1. The breadth and depth of incorporation of renewal or endowment criteria associated with the life cycle of equipment, covering maintenance, operating and environmental costs. This includes the deliberate consideration of end-of-life disposal processes to mitigate environmental impact and advance sustainability goals.2. 2. The effectiveness of the implementation or subsequent monitoring of these criteria, ensuring compliance with established sustainability benchmarks and expectations, thereby promoting responsible financing.Ultimately, this study aims to provide insights into the strategic integration of objective sustainability criteria into technology procurement decisions.

### TABLE OF CONTENTS/OUTLINE

1. Context and introduction2. Objectives3. Methodology 4. Results5. Discussion and conclusions

## ORGANIZATIONAL RESILIENCE IN RADIOLOGY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Omar Msto Hussain Nasser, MD (*Abstract Co-Author*) Nothing to Disclose
Bettina Siewert, MD (*Abstract Co-Author*) Editor, Wolters Kluwer nv;Reviewer, Wolters Kluwer nv
James V. Rawson, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Even before the COVID-19 pandemic there was much discussion about resilience. This was usually discussed in the content of burnout and focused on the resilience of the individual. More recent literature in radiology looks at the leadership and system drivers of burnout shifting some of the responsibility for burnout off of the individual. In the recent revision of the Malcolm Baldrige National Quality Award criteria, one of the frameshifts was to look for evidence of organizational resilience. We review the concepts of individual and organizational resilience and look at key performance indicators that Radiology practices can assess to identify opportunities to improve organizational resilience. Teaching points • In addition to individual resilience, organizations can be resilient. • Organizational resilience is not the sum of the resilience of the individuals in the organization. • Other organizational processes contribute to the ability to survive or even thrive/transform when faced with shock, disasters and crisis. • Key performance indicators/metrics with benchmarks and trends over time can be used by Radiology practices and hospitals to identify where there is opportunity to improve their organizational resilience.

### TABLE OF CONTENTS/OUTLINE

I. Burnout and Moral Injury II. Individual Resilience III. Multifactorial approach to Burnout IV. Organizational Resilience V. Measure of Organizational resilience VI. Opportunities for Radiology

## COOKING UP ULTRASOUND PHANTOMS: A HOW-TO GUIDE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Logan M. Ryals, BS (*Abstract Co-Author*) Nothing to Disclose
Nader Pahlevan, BA (*Abstract Co-Author*) Nothing to Disclose
Thomas Powell (*Abstract Co-Author*) Nothing to Disclose
Charlotte Taylor, MD (*Abstract Co-Author*) Nothing to Disclose
Clinton Case (*Abstract Co-Author*) Nothing to Disclose
Chanukya Cherukuri (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Relay the importance of using US phantoms in teaching residents, medical students, and radiologists how to perform US-guided procedures.Provide step-by-step instructions for the creation of home-made US phantoms which may be used for demonstrations.

### TABLE OF CONTENTS/OUTLINE

Ultrasound (US) is vital in diagnosing and treating disease, so providing quality US instruction to radiology residents to build proficiency and confidence in performing US-guided procedures is important. US phantoms are often employed to teach the basics of thyroid biopsy, breast biopsy, intravascular access, etc. Additionally, the use of US phantoms has enhanced student outreach, allowing for increased engagement within student-run interest groups. However, purchasing high quality US phantoms from a commercial vendor is often costly, and they must be replaced over time due to wear and tear. An alternative is to create "homemade" US phantoms using gelatin and other household materials. There is no standard recipe for creating homemade phantoms, and few step-by-step resources exist for radiology educators to create high-quality phantoms. Three types of phantoms will be discussed: a 3-layer amniocentesis/paracentesis abdominal phantom, a vessel phantom, and a breast biopsy phantom. A resource for creating breast biopsy and vascular access phantoms will be beneficial given that the ACGME will soon require breast biopsy and vascular access procedural competency for radiology residency graduation. In addition to providing instructions for creating US phantoms, demonstrations will be outlined, including probe placement, basics of scanning and probe types, US-guided fine needle aspiration, and student interest group activities.

## AN ULTRA SOUND IDEA: A SINGLE CENTER EXPERIENCE OF LONGITUDINAL, INTEGRATED POINT-OF-CARE ULTRASOUND CURRICULUM IN UNDERGRADUATE MEDICAL EDUCATION

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Roozbeh Houshyar, MD (*Abstract Co-Author*) Nothing to Disclose
Sohrab Kharabaf, BS (*Abstract Co-Author*) Nothing to Disclose
Monica Gerges (*Abstract Co-Author*) Nothing to Disclose
Christopher Sahagian (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Detail a single center longitudinal, integrated point-of-care ultrasound (POCUS) curriculum in undergraduate medical education, with sampled scanned cases and subjective feedback from student participants.Underscore benefits of such a curriculum, including health equity.

### TABLE OF CONTENTS/OUTLINE

Our institution provides every medical student a handheld POCUS device, Butterfly iQ (made by Butterfly Network, Inc. based in Guilford, CT), which is used in concert with courses. Preclinical students complete biweekly teaching sessions and assessments that cover technical skills, clinical correlates, and image-guided procedures of all organ systems. Artificial intelligence-driven live teaching tools within Butterfly iQ guide students to obtain high quality scans. A supplementary ultrasound (US) scanning elective is also offered. Students on rotations complete select US views to demonstrate competence. Impact of this curricular program is gauged with subjective metrics. Many studies show that early exposure to POCUS training enhances anatomic knowledge and diagnostic skill. Data gathered by our institution reveals students felt more confident and demonstrated improved objective competence in obtaining US views after completing just one US elective session. Mastering such skills benefits a clinician’s career, facilitating quicker, more accurate diagnoses. Handheld POCUS empowers students to improve health disparities. Our institution’s novel approach to providing its medical students a longitudinal POCUS curriculum may serve as a best-practice guideline for other institutions seeking to enhance anatomic understanding, clinical skills, technological literacy, and health equity.

## CREATING AN INCLUSIVE IMAGING DEPARTMENT - SUPPORTING NEURODIVERGENT PATIENTS ON THE IMAGING JOURNEY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Magda Coetzee (*Abstract Co-Author*) Nothing to Disclose
Michelle Phillips (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Neurodiversity is an umbrella term for the different conditions that describe variations in the way human brains process information. The challenges faced by those with neurodiverse conditions can make attending imaging departments and undergoing examinations difficult. We have a duty of care to all patients; it is important to increase awareness of neurodiversity and offer practical advice to radiography professionals to improve their skills and offer an inclusive service.

### TABLE OF CONTENTS/OUTLINE

The poster explains the challenges faced by neurodivergent patients - examples include executive function challenges, communication problems and issues with sensory overload. Further challenges are broken down by specific modality such as the intimate nature of mammography and the noise, confined space and necessary stillness of the Magnetic Resonance Imaging (MRI) scanner. This is followed by practical advice to ensure a better more understanding imaging service. Including - Working on the principle that everyone is to be treated with respect and no one is to be assumed to be unintelligent or incapable. Listen to your patients, use simple and direct language and give time for replies. Offer various methods of communication. Allow patients to see, touch and/or hear the equipment prior to their examination. The poster covers challenges adhering to the advice above but concludes with benefits of providing a service which is as accessible and smooth to as many as possible.

## ETHICS OF CARE IN RADIOLOGY: A PRIMER FOR EVERYDAY PRACTICE

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Juliana M. Bueno, MD (*Abstract Co-Author*) Nothing to Disclose
Emily Lin (*Abstract Co-Author*) Nothing to Disclose
Kaelin Cockrell, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

There is a misconception that medical ethics is less relevant to radiology due to the limited direct patient-physician interaction. However, radiologists face ethical dilemmas during their daily workflow, which are difficult to recognize as they involve technology, systems, and stakeholders beyond patients themselves. Lack of awareness of radiology specific ethical challenges is a barrier to quality clinical care. This exhibit illustrates radiology-specific ethical dilemmas through case-based examples to increase awareness and provide support to solving these everyday challenges.Teaching points: 1) Recognizing the key ethical principles that govern clinical care allows us to recognize situations at risk of ethical violation. 2) Awareness and knowledge of the challenges that spring from each of the ethical principles is paramount. 3) The ethical challenges faced in diagnostic radiology are complex as they involve components of the system that are beyond the patients themselves. 4) A systematic approach to ethical problem-solving is necessary for the practice of radiology

### TABLE OF CONTENTS/OUTLINE

1. Refresher on key clinical ethical principles: a) Beneficence b) Nonmaleficence c) Autonomy d) Justice 2. Commonly encountered clinical scenarios: a) Appropriate use of imaging and follow up. b) Communicating critical results. c) Immediate availability of reports to patients (21st Century Cures Act mandate). d) Deciding relevant incidental findings to report. e) Addressing diagnostic misses or misdiagnosis. f) Imaging in incarcerated and refugee populations. 3) Conclusions: a) Ethical problem-solving tools. b) Future directions when facing ethical dilemmas

## ENGAGING AND INSPIRING THE NEXT GENERATION OF RADIOLOGISTS

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Mina S. Makary, MD (*Abstract Co-Author*) Nothing to Disclose
Farbod Fazlollahi, BS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Setting Clear Expectations Articulate daily reciprocal expectations, including objectives and the student's role on the team. Example: Residents outline study types, software, and focus areas for the day.
- Explaining Diagnostic Reasoning and Processes Residents should verbalize their thought process and diagnostic reasoning as they navigate studies. Example: Explaining the choice of slices and views in a CT scan.
- Engaging and Assessing the Student Continuously ask students for their observations and reasoning to assess understanding and promote active learning. Example: "What do you see here? Why do you think that?"
- Providing Real-Time Feedback and Further Learning Offer immediate feedback and recommend resources for further learning based on daily performance. Example: Provide specific feedback and suggest relevant articles or modules.
- Challenging the Student to Predict and Interpret Encourage students to predict findings from clinical indications and interpret images independently. Example: Discuss expectations before revealing MRI results.

## COMPASSIONATE COMMUNICATION: ELEVATING SKILLS FOR CONVEYING BAD NEWS IN BREAST IMAGING

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

**Awards**
**Certificate of Merit**

Janice Thai, MD (*Abstract Co-Author*) Nothing to Disclose
Rachel E. Grenier, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1) Highlight the importance of training and education in delivering bad news in breast imaging. 2) Review step by step process for delivering bad news in breast imaging. 3) Review array of patient emotional responses, and tips for recognizing and responding empathically.

### TABLE OF CONTENTS/OUTLINE

1) Emphasize the importance of delivering bad news effectively in medicine, within the context of a patient care model. 2) Define the breast radiologist's specific objectives in delivering bad news to patients. 3) Demonstrate a step-by-step process for delivering bad news. 4) Review spectrum of emotional responses to bad news so that the breast radiologist can be better prepared to respond and meet the patient where they are at. 5) Emphasize importance of patient diversity: cultural, socioeconomic, ethnic, and physical. 6) Highlight the importance of personal reflection in improving communication style, especially when starting out as a breast radiologist. 7) Provide specific case examples/scenarios to demonstrate the nuance and dynamism of delivering bad news to patients in breast imaging.

Joseph Kim, MD (*Abstract Co-Author*) Nothing to Disclose
Alexander Kuehne, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

• Develop an understanding of the different types of non-profit work in radiology and available to radiologists• Understand the differing types of charitable/non-profit organizations in radiology, which can be grouped into four major areas: standalone charitable organizations, professional societies, charitable arms of for-profit organizations, and educational (e.g., Road2IR)• Foster an understanding of the various ways to get involved with charitable organizations within the field of radiology, at any level of time commitmentThere are several well-recognized and longstanding charitable organizations in medicine, such as Doctors without Borders, The Red Cross, and UNICEF. Non-profit/charitable work in radiology specifically is newer and has truly only accelerated over the past two decades. Digital imaging technology has fostered a revolution in imaging-related care and has offered novel means of broaden access. The possibilities for philanthropic work within our field are growing exponentially. The purpose of this overview is to raise awareness of, and provide opportunities for individuals who desire to become involved with non-profit work in the field of radiology.

### TABLE OF CONTENTS/OUTLINE

-Background:-Standalone Charitable Organizations:-RAD-AID-Radiologists without Borders-UNITSUSA-Project CURE-Societal Charitable Arms:-RSNA, ASER, ARRS, etc-Charitable efforts of For Profit Organizations:-VRAD first read initiative-Educational:-Road2IR

## PRECISION PROTOTYPES: THE EVOLUTION OF PATIENT-SPECIFIC MODELS IN RADIOLOGY

Sunday, Dec. 1 9:00AM - 6:00PM Room: LEARNING CENTER

Mina S. Makary, MD (*Abstract Co-Author*) Nothing to Disclose
Farbod Fazlollahi, BS (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- Imaging Data Basics: CT and MRI imaging data is used to produce detailed anatomical cross-sections that are then processed by software to help distinguish different tissues.
- Conversion Process: 2D cross-sectional data is stacked to construct a 3D volume, then converted to a mesh structure for 3D printing, then divided into sections to be printed accurately one layer at a time
- Software Tools: A variety of commercially available software such as 3D Slicer, OsiriX, and Materialise Mimics are used for image processing, segmentation, and mesh generation.
- Clinical Applications: 3D printed models can be used to enhance preoperative planning, surgical navigation, and implant design, as well as for diagnosis, research and teaching. Important considerations for wider applicability in the clinical space include accuracy, quality assurance, and regulatory compliance.

### TEACHING POINTS

1. Review strongly held beliefs in Radiology, their origins, and supporting or disproving data.2. Present evidence-based, patient-friendly discussion points to better inform patients and non-radiology colleagues.

### TABLE OF CONTENTS/OUTLINE

The discussion of each myth will include data from which the myth arose, data supporting a new perspective, and takeaways to help educate patients and non-radiologists.1. Myth #1: Effective dose is useful for individual patient dose and risk assessment.2. Myth #2: Ultrasound is the only safe imaging for pregnant patients.3. Myth #3: Imaging exams that utilize the lowest dose are always better.4. Myth #4: Patient shielding should be used whenever possible.5. Myth #5: Patients should always be isolated after radionuclide exams and therapies.6. Myth #6: Patients with renal dysfunction should avoid iodinated IV contrast or be given a lower dose of contrast.7. Myth #7: Iodine and shellfish allergies are contraindications to iodinated IV contrast administration.8. Myth #8: Spleen biopsy is contraindicated due to risk of bleeding.9. Myth #9: Gadolinium deposition is associated with long-term health problems.10. Myth #10: INR is always a useful assessment for bleeding risk.

Richard A. Bronen, MD (*Abstract Co-Author*) Nothing to Disclose
Justin Sindoni, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Discuss temporal lobe plus epilepsy (TLE+) and its importance2. Review pertinent anatomy of TLE+ (e.g., connections to the insula, thalamus, olfactory, and cingulate)3. Review cases of pathologies of TLE+ structures involved in refractory epilepsyBackground: Temporal lobe epilepsy is the most common type of epilepsy and accounts for about half of all cases of focal epilepsy. Over the last few decades, it has been recognized that epilepsy may be the result of "network" changes in the brain rather than from a focal abnormality influencing an "epileptogenic zone." Temporal lobe plus epilepsy (TLE+) is a term coined to discuss the network of extratemporal structures involved in refractory temporal lobe epilepsy, including the insula, thalamus, olfactory connections, and cingulate. In this exhibit we will discuss the anatomy and connections of the structures involved in TLE+ in the context what is important for the radiologist to know and evaluate. We will review imaging of both normal anatomy and cases illustrating pathology in patients with TLE+. The ultimate goal is to assist the radiologist in providing optimal care in the diagnosis and successful treatment of epilepsy, particularly with helping targeting for recent therapies such and neuromodulation and laser ablation treatments.

### TABLE OF CONTENTS/OUTLINE

1. Introduction2. Discussion of structures and connections of TLE+ (e.g. the insula, thalamus, olfactory connections, and cingulate)3. Imaging evaluation of normal TLE+ structures4. Case examples of pathology involving TLE+ structures5. Summarize TLE+ and future directions for the radiologist's role in the multidisciplinary approach to epilepsy treatment

Maria Lucia Brun, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

- To recognize and differentiate between cases of stroke and differential considerations based on imaging findings.- To recognize specific imaging patterns and signs associated to common and uncommon stroke mimics on imaging.- To understand the importance of accurate differentiation for timely and appropriate patient management.

### TABLE OF CONTENTS/OUTLINE

Mimics account for nearly half of all hospital admissions for suspected strokes. Stroke mimics may present as functional disorders or may be symptomatic of underlying neurological or medical conditions. A significant number of patients continue to receive thrombolysis unnecessarily, resulting in inherent risks and avoidable costs. Thus, accurate diagnosis is of utmost importance. A non-contrast CT scan alone is often insufficient for diagnosis, and multimodal CT or MRI scans are typically required.Imaging Pattern-Based Approach Through Cases:- Segmental gray and white matter: Stroke, Seizures, Migraine, HSV encephalitis, Venous thrombosis, TGA, Hypoglycemia, Tumor, MELAS- Cortical and deep gray matter: HII, Hepatic encephalopathy, CJD, Wernicke's encephalopathy.- Deep gray matter: Stroke, HII, CO poisoning, extrapontine myelinolysis, CJD, Nonketotic Hyperglycemia, Venous thrombosis, Wernicke's.- White matter: CADASIL, Susac's, demyelination, metronidazole and methotrexate toxicity, Heroin.- Watershed zones: Stroke, RCVS, PRES, Moya-Moya, Hyperperfusion syndrome.- Scattered Foci: Fat emboli, DAI Embolic infarcts, Mets.- Corpus Callosum: CLOCCs, Seizures, Marchiafava-Bignami. <!--EndFragment-->

## NREE-101 SPONTANEOUS INTRACRANIAL HYPOTENSION - AN EASY GUIDE

Beatriz Alba Perez, MD (*Abstract Co-Author*) Nothing to Disclose
Juan V. Quintana Perez, MD (*Abstract Co-Author*) Nothing to Disclose
Ana M. Vera-Carmona, MD (*Abstract Co-Author*) Nothing to Disclose

Martiel M. Manrique Zegarra, BMedSc (*Abstract Co-Author*) Nothing to Disclose
Alba Fernandez-Rodriguez, MD (*Abstract Co-Author*) Nothing to Disclose
Ines Pecharroman, PhD (*Abstract Co-Author*) Nothing to Disclose
Noelia Bravo Alcobendas, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

After reviewing this exhibit, the reader should: - Understand the pathophysiology of spontaneous intracranial hypotension and be able to explain and correlate it with the imaging findings. - Properly describe the findings in the studies performed to patients affected by this condition. - Learn the MRI sequences that are most useful for detecting the different findings leading to disease diagnosis and to identifying underlying causes, being aware of the differential diagnosis suggested by each of the described findings. - Be familiar with the complex diagnostic and therapeutic process of the disease: recognizing situations warranting a high clinical suspicion for this condition, determining appropriate screening tests, identifying circumstances in which invasive procedures are needed for further evaluation, and customizing treatment approaches for individual scenarios.

**TABLE OF CONTENTS/OUTLINE**

-Introduction - Clinical presentation - Differential diagnosis - Causes - Work-up algorithm - Diagnostic imaging : initial approach o Brain MRI o Spine MRI - Diagnostic imaging : investigating the etiology o CT-Myelography o Non invasive MR-Myelography o Fluoro-Myelography - Treatment o Conservative treatment o Targeted treatment - Conclusions

## NREE-102 PRIMARY CENTRAL NERVOUS SYSTEM LYMPHOMA: IMAGING AND FEATURES AND DIFFERENTIAL DIAGNOSIS

Diogo G. Correa, MD (*Abstract Co-Author*) Nothing to Disclose
Lara Mori, MD (*Abstract Co-Author*) Nothing to Disclose
Gabriela A. Ribas, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Imaging Modalities: Teach about the imaging modalities commonly used in diagnosing PCNSL.
- Typical Imaging Features: Highlight the typical imaging features of PCNSL on MRI and CT scans.
- Differential Diagnosis: Emphasize the importance of considering differential diagnoses when evaluating imaging findings suggestive of PCNSL in immunocompetent and immunocompromised patients.
- Key Differentiating Factors: Teach about the key differentiating factors between PCNSL and other brain lesions on imaging.
- Advanced Imaging Techniques: Introduce advanced imaging techniques such as diffusion-weighted imaging (DWI), perfusion-weighted imaging (PWI), and magnetic resonance spectroscopy (MRS), which may aid in differentiating PCNSL from other brain lesions based on specific metabolic and hemodynamic features.

**TABLE OF CONTENTS/OUTLINE**

Introduction to PCNSL: Definition and incidence and clinical presentation. Histophatological analysis: Overview of WHO classification diffuse large B-cell lymphoma (DLBCL) and other lymphoid neoplasms in the CNS. Role of Imaging in PCNSL Diagnosis: Importance of MRI in PCNSL diagnosis, clinical applicability and data provided by MRI. Imaging Features of PCNSL: Tumor metabolism, water molecule diffusion, cell density and blood-brain barrier permeability. Differential Diagnosis of PCNSL: Importance of distinguishing differential diagnoses, defining biopsy location. Atypical Forms of PCNSL: Extra-axial PCNSL, intravascular lymphoma, lymphomatosis Cerebri and skull lymphoma. Conclusion: Radiologist role is to contributed to the PCNSL diagnosis, treatment planning, and patient care.

## NREE-103 UNTANGLING THE LUMBOSACRAL PLEXUS MRI: SEARCH PATTERNS, PATHOLOGIES AND DIAGNOSTIC INSIGHTS

**Awards**
**Certificate of Merit**

Claudia F. Kirsch, MD (*Abstract Co-Author*) Consultant, Informa PLC;Royalties, Informa PLC
Jeffers Nguyen, MD (*Abstract Co-Author*) Nothing to Disclose
Long H. Tu, MD (*Abstract Co-Author*) Nothing to Disclose
Christopher J. Hamilton, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The lumbosacral plexus is a complex network of nerves formed by the ventral rami of the lumbar and sacral spine, with end branches innervating the pelvic sidewall and lower limbs. Despite its clinical significance, lumbosacral plexus MRI examinations are infrequently performed, and instances of imaged pathologies are even rarer. Consequently, radiologists may lack the exposure and expertise needed to effectively evaluate these examinations.Our objective is two-fold: 1) to delve into the anatomy and present cases illustrating key findings of lumbosacral plexus pathologies that we have drawn from the past 25 years at our academic tertiary center showcasing a wide range of etiologies, including neoplastic, infectious, inflammatory and traumatic causes; and 2) to highlight the key MRI sequences and demonstrate our search pattern while providing a step-by-step framework to assist in the interpretation of this uncommonly performed exam.

**TABLE OF CONTENTS/OUTLINE**

1.Review the anatomy of the lumbosacral plexus2.Identify the indications for MRI evaluation of the lumbosacral plexus in clinical practice3.Familiarize with the MRI techniques and sequences utilized for optimizing the imaging of the lumbosacral plexus4.Develop a systematic search pattern and highlight key elements that should be documented in every radiologist’s report5.Discuss and illustrate various pathologies affecting the lumbosacral plexus, including neoplastic, infectious/inflammatory, traumatic and degenerative etiologies

## NREE-104 IRON RIM LESIONS AND CENTRAL VEIN SIGN ON 3T SWI: WHAT RADIOLOGISTS SHOULD KNOW IN THE DIAGNOSIS OF MULTIPLE SCLEROSIS

Masayuki Maeda, MD (*Abstract Co-Author*) Nothing to Disclose
Seiya Kishi (*Abstract Co-Author*) Nothing to Disclose
Ryota Kogue, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Fumine Tanaka (*Abstract Co-Author*) Nothing to Disclose
Hajime Sakuma, MD, PhD (*Abstract Co-Author*) Research Grant, Eisai Co, Ltd;Research Grant, FUJIFILM Holdings Corporation;Research Grant, Guerbet

SA;
Maki Umino, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Iron rim lesions (IRLs) and central vein sign (CVS) on SWI have been reported to be useful for the diagnosis and monitoring of multiple sclerosis (MS). Here we demonstrate the importance of these findings regarding diagnosis and clinical relevance in MS patients. We aimed to1) Understand what IRLs indicate in MS pathology. 2) Learn about the pathology of CVS, which shows inflammation-dependent remodeling of blood vessel walls (lumen enlargement and collagen deposition). 3) Learn how specific IRLs and CVS are for MS lesions and what the differential diagnosis is. 4) Learn the relationship between IRLs and other MRI findings/clinical findings.

**TABLE OF CONTENTS/OUTLINE**

1. Pathology of IRLs: IRLs represent a rim of iron-laden macrophages/microglial cells at the lesion edge (i.e., chronic active lesion). 2. Diagnostic value of IRLs and CVS: IRLs are unique to MS except for Susac syndrome. CVS is unique to MS except for Behēet's disease. 3. IRLs and other MR findings: ring enhancement and hypointense ADC rim may predict progression from acute to IRL. 4. Combination of IRLs and CVS: a great impact on the prediction of clinically isolated syndrome patients' conversion to definite MS. 5. Clinical relevance of IRLs: IRLs may serve as a marker of persistent low-level inflammation in adjuvant therapy targeting insidious clinical decline.

## NREE-105 IDENTIFICATION AND CLINICAL SIGNIFICANCE OF PLAQUE ULCERATIONS

Luca Saba, MD (*Abstract Co-Author*) Nothing to Disclose
Brett Cucchiara (*Abstract Co-Author*) Nothing to Disclose
Jae W. Song, MD, MS (*Abstract Co-Author*) Nothing to Disclose
David Yang (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. We provide criteria for defining plaque ulcerations based on image modality.2. We correlate the anatomy of a plaque ulceration to its appearance on imaging and clarify the concept of an ulceration as a crater in plaque rather than an outpouching of the blood vessel wall.3. We describe the stages of how plaque develops and ulcerations form.4. We review the literature on the significance of plaque ulcerations and high risk with stroke and cardiac events.5. We provide examples of common image interpretation pitfalls that may mimic plaque ulcerations, including faint plaque calcifications, carotid webs, and intimal flaps from arterial dissections.

**TABLE OF CONTENTS/OUTLINE**

1. Identification of plaque ulceration. (a) Criteria for defining plaque ulceration in the vascular beds. (b) Classification of carotid artery ulceration types. (c) Anatomy of plaque ulceration and imaging appearances.2. Mechanism and pathophysiology of plaque ulceration.3. Clinical significance of plaque ulcerations in the aorta, coronary arteries, carotid arteries, and intracranial arteries. (a) Prevalence. (b) Histology. (c) Clinical associations with stroke or cardiac events. (d) Multimodality image examples on ultrasound/echocardiograms, CTAs, and MRAs.4. Image interpretation pitfalls of identifying plaque ulcerations. (a) Example of focal calcification. (b) Example of carotid web versus dissection

## NREE-106 SUMMER IS COMING - DECODING THE ARBOVIRUS IMPRINTS IN NEUROIMAGING

Tomas Freddi, MD (*Abstract Co-Author*) Nothing to Disclose
Laura C. Magalhaes, MD (*Abstract Co-Author*) Nothing to Disclose
Pedro N. Castro, MD (*Abstract Co-Author*) Nothing to Disclose
Roberto Q. Santos, MD (*Abstract Co-Author*) Nothing to Disclose
Diogo G. Correa, MD (*Abstract Co-Author*) Nothing to Disclose
Elissandra M. Lima, MD (*Abstract Co-Author*) Nothing to Disclose
Celso Hygino, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To elucidate the neuroradiological manifestations of arbovirus infections, emphasizing characteristic imaging features across different modalities. To enhance understanding of the pathophysiological impact of arboviruses in the CNS, facilitating early diagnosis and effective intervention. To discuss the evolution of imaging in tracking the progression and support treatment response of arbovirus infections, highlighting their pivotal role in clinical decision-making.

**TABLE OF CONTENTS/OUTLINE**

1. Overview of arboviruses, focusing on physiopathology and clinical findinds. 2. Epidemiology of arboviruses, focusing on those that frequently cause neurological manifestations 3. Discussion on the physiopathology of CNS invasion and typical progression. 4. Radiological signatures of dengue fever, West Nile virus, Chikungunya, Japanese Encephalitis, Saint Louis Encephalitis, and Zika, including cortical lesions, white matter changes, spinal cord findings, neural root involvement, and hemorrhagic presentations. 5. Associated complications: post Yellow-Fever Vaccination lesions, Guillain-Barré Syndrome. 6. Discuss the diagnosis challenges, using a combination of imaging features, clinical correlation, and laboratory confirmation. 7. Overview of current support treatments and prevention available for arbovirus infections and the role of neuroradiology in monitoring treatment efficacy and neurologic recovery. Implications of imaging findings on therapeutic decisions, particularly in severe cases requiring aggressive treatment. 8. Take-home messages: summary of the critical contributions of imaging to understanding, diagnosing, and managing arbovirus infections in the CNS.

## NREE-107 EPIDEMIC ECHOES OF THE TROPICAL TWISTER: NEURORADIOLOGICAL FEATURES OF CHIKUNGUNYA VIRUS

**Awards**
**Certificate of Merit**

Elissandra M. Lima, MD (*Abstract Co-Author*) Nothing to Disclose
Diogo G. Correa, MD (*Abstract Co-Author*) Nothing to Disclose
Roberto Q. Santos, MD (*Abstract Co-Author*) Nothing to Disclose
Tomas Freddi, MD (*Abstract Co-Author*) Nothing to Disclose
Pedro N. Castro, MD (*Abstract Co-Author*) Nothing to Disclose
Laura C. Magalhaes, MD (*Abstract Co-Author*) Nothing to Disclose
Celso Hygino, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To illuminate the neuroradiological manifestations associated with Chikungunya virus (CHIKV) infections in adults, emphasizing specific imaging features that aid in diagnosis. To delineate the clinical relevance of these imaging findings, enhancing the understanding of CNS involvement. To advocate for integrating neuroradiological evidence with clinical diagnostics to optimize the prevention and management of CHIKV.

**TABLE OF CONTENTS/OUTLINE**

1.Brief overview of Chikungunya virus, including virology, transmission, and global epidemiology. 2.Discuss typical clinical presentations, focusing on neurological symptoms that prompt neuroradiological evaluation. 3.Comprehensive review of neuroradiological findings in CHIKV-infected patients, detailed descriptions of patterns observed in MRI and CT, including encephalitis, myelitis, and perinatal mother-to-child transmission. 4.Description of the spectrum of neurological complications associated with CHIKV, ranging from mild headache and vertigo to more severe complications like Guillain-Barré syndrome and acute disseminated encephalomyelitis. 5. Typical and atypical radiological features, such as meningeal enhancement, cerebral and spinal cord involvement, acute disseminated encephalomyelitis-like lesions, and Guillain-Barré syndrome. 6.Discussion on the role of imaging in differentiating CHIKV neurological manifestations from those caused by other arboviruses. 7.Prevention and discussion on the role of neuroradiology in monitoring treatment efficacy and neurological recovery. 8.Recap the significance of neuroradiological approaches in diagnosing and managing Chikungunya's neurological manifestations.

## NREE-108 OUTLINING THE SPINAL CORD: TOPOGRAPHIC APPROACH TO SPINAL CORD ABNORMALITIES

Roberto Q. Santos, MD (*Abstract Co-Author*) Nothing to Disclose
Laura C. Magalhaes, MD (*Abstract Co-Author*) Nothing to Disclose
Pedro N. Castro, MD (*Abstract Co-Author*) Nothing to Disclose
Diogo G. Correa, MD (*Abstract Co-Author*) Nothing to Disclose
Elissandra M. Lima, MD (*Abstract Co-Author*) Nothing to Disclose
Celso Hygino, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To elucidate the benefits of topographic approach in imaging and classification of spinal cord lesions, enhancing diagnostic precision and therapeutic targeting.To showcase the integration of neuroimaging, clinical and laboratory data, with topographic lesions mapping to provide a comprehensive overview of lesion features. To better understand how topographic data can inform prognosis and guide rehabilitation strategies, improving outcomes.

**TABLE OF CONTENTS/OUTLINE**

1.Introduction to topographic approach of spinal cord lesions, emphasizing the value of detailed anatomical and functional mapping. 2.Classification system based on topographic data that categorizes injuries by segments of the spine, adjacent structures and specific neural elements affected. 3.Imaging the spinal lesions, including epidural abscess, lymphoma, angiomyolipoma, cytomegalovirus, syphilis, schistosomiasis, CIDP, melanoma, Guillain-Barré syndrome, post-vaccination myelitis, chemical radiculitis, sarcoidosis, subacute combined degeneration, copper deficiency, HIV, ADEM, NMOSD, tuberculosis, fungus, vasculitis, CLIPPERS, viral encephalitis, spinal cord ischemia, COVID myelitis. 6. Gadolinium enhancement patterns of the spinal cord diseases. 7.Examine how specific topographic features correlate with patient prognosis, potential for recovery and risk of complications. 8.Discuss how topographic information can guide surgical interventions, the choice of rehabilitation techniques, and the development of targeted therapies. 9. summary of the pivotal role that topographic mapping plays in transforming the landscape of spinal cord injury diagnosis and management.

## NREE-109 CHARACTERISTIC ANATOMIC LOCATION OF SYMMETRIC DWI HYPERINTENSE LESIONS: FROM INSIDE TO OUTSIDE

Kazufumi Kikuchi, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Osamu Togao, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Kousei Ishigami, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Koji Yamashita, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. To review what type of diseases could involve the inner or outer brain 2. To learn how DWI provides a greater contrast between lesions and surrounding normal structures than other sequences 3. To list differential diagnoses based on disease-specific location, shape, and clinical information

**TABLE OF CONTENTS/OUTLINE**

1) Innermost: Wernicke encephalopathy, osmotic demyelination, artery of Percheron infarction, and Leigh encephalopathy 2) Corpus callosum+ and Hippocampi: Cytotoxic lesions of the corpus callosum (CLOCCs), 5-FU induced encephalopathy, metronidazole-induced encephalopathy, autoimmune encephalitis, and human herpesvirus 6 (HHV-6) encephalitis 3) Pyramidal tracts, basal nuclei, and thalami CLCN2-related leukoencephalopathy, adrenomyeloneuropathy, hypomyelination of early myelinating structures (HEMS), vigabatrin-associated brain abnormalities, and hemolytic uremic syndrome 4) White matter Influenza encephalopathy, adrenoleukodystrophy, hereditary diffuse leukodystrophy with spheroids (HDLS), adult-onset autosomal dominant leukodystrophy, acute encephalopathy with biphasic seizures and late reduced diffusion (AESD), and neuronal intranuclear inclusion disease 5) Cortices and outside skull: Creutzfeldt-Jakob Disease, Gerstmann-Straussler-Scheinker disease, hypoxic-ischemic encephalopathy, and relapsing polychondritis

## NREE-11 ATYPICAL CEREBRAL VENOUS THROMBOSIS: 'THE EYES SEE WHAT THE MIND KNOWS' :EXPANDING THE PHENOTYPIC SPECTRUM OF CEREBRAL VENOUS THROMBOSIS

**Awards**
**Cum Laude**

Sabha Ahmed, MBBS, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

I. llustrate the normal Intracranial Superficial andDeep Venous Anatomy.2. Illustrate the common findings of Cerebral Venous Sinus Thrombosis.3. Illustrate the tell tales of Cortical Vein Thrombosis.4. Illustrate with examples the rare phenotypic manifestations of atypical Cerebral Venous Thrombosis(CVT).5. Highlight the importance of ruling out atypical CVT in day-to-day reporting and avoid overcalling these manifestations as either Demyelinating or Neoplastic conditions.

**TABLE OF CONTENTS/OUTLINE**

Table of contentsOutline of normal intracranial superficial and deep venous systemOutline of the draining venous territories of the intracranial venous systemCommon imaging phenotypes of dural sinus , cortical and deep venous thrombosisCase based illustration of atypical cerebral venous thromboses - Schematic depiction of the the afflicted veinsHighlight the common misdiagnoses in day to day reporting of this condition

## NREE-110 THROUGH THE SKULL: EXPLORING TRANSCALVARIAL LESIONS

Andrea S. Costacurta, MD (*Abstract Co-Author*) Nothing to Disclose
Angelo D. Correa, MD (*Abstract Co-Author*) Nothing to Disclose

Luis A. Quevedo (*Abstract Co-Author*) Nothing to Disclose
Luiza A. Nahoum, MD (*Abstract Co-Author*) Nothing to Disclose
Paula Castro, MD (*Abstract Co-Author*) Nothing to Disclose
Luiza Ambrozino, MD (*Abstract Co-Author*) Nothing to Disclose

Virginia R. Simonini, MD (*Abstract Co-Author*) Nothing to Disclose
Clara Fiorot, MD (*Abstract Co-Author*) Nothing to Disclose
Marina Da Silva, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Adriana M. Melo, MBA, MD (*Abstract Co-Author*) Nothing to Disclose
Nina Ventura, MD (*Abstract Co-Author*) Nothing to Disclose
Pedro A. Gama Carpentieri Primo, MD (*Abstract Co-Author*) Nothing to Disclose
Glenda Peres (*Abstract Co-Author*) Nothing to Disclose
Ferdinand D. Cabrera Filho, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The intricate anatomical structures comprising the scalp, skull, and dura mater serve as potential loci for lesions capable of traversing multiple compartments. The purpose of this educational exhibit is to explore the various facets of transcalvarial lesions, including their clinical and imaging characteristics, in order to equip radiologists with the tools necessary to significantly narrow the spectrum of potential diagnoses.

**TABLE OF CONTENTS/OUTLINE**

1. Definition of a transcalvarial lesion.2. Overview of the anatomical structures that compose the scalp, cranial vault, and dura mater.3. Discussion of the main differential diagnosis: Meningioma, Lymphoma, Metastasis and Plasmacytoma.4. Patterns of calvarial invasion on CT.5. Miscellaneous: Demonstration of rare lesions that can manifest as transcalvarial masses: CNS Tuberculosis, Solitary Fibrous Tumor and Dermatofibrosarcoma Protuberans.

## NREE-111 PERIOPERATIVE AND POSTOPERATIVE COMPLICATIONS OF ENDOSCOPIC ENDONASAL APPROACH SURGERIES OF THE ANTERIOR SKULLBASE: A CASE-BASED REVIEW

**Awards**
**Certificate of Merit**

Marion A. Hughes, MD, JD (*Abstract Co-Author*) Nothing to Disclose
Barton F. Branstetter IV, MD (*Abstract Co-Author*) Nothing to Disclose
William E. Rothfus, MD (*Abstract Co-Author*) Nothing to Disclose
Katie S. Traylor, DO (*Abstract Co-Author*) Nothing to Disclose
Keerthi Arani, MD (*Abstract Co-Author*) Nothing to Disclose
Gloria Joo, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. The endoscopic endonasal approach (EEA) is a surgical technique that allows for direct access to a variety of tumors centered at the anterior skullbase. By operating through the nose and paranasal sinuses, EEA minimizes brain retraction, and manipulation of neurovascular structures that occur with transfacial and transcranial approaches.2. Knowledge of conventional pre-operative skullbase anatomy and typical postoperative appearance of nasoseptal flap reconstruction on CT and MRI is crucial to assess for possible complications of EEA.3. The most common type of complication is flap failure, which can manifest radiologically as CSF leak from flap migration/dehiscence, flap necrosis, and infection. Other less common complications involve injury to the internal carotid artery (ICA) and other adjacent skullbase structures. These complications can be evaluated with skullbase CT and MRI, cisternograms, and cerebral angiograms.

**TABLE OF CONTENTS/OUTLINE**

1. Overview of the endoscopic endonasal approach: general technique and comparison of EEA to transfacial/transcranial approaches.2. Normal postoperative findings on CT and MRI: intact nasoseptal flap and fat graft.3. Postoperative Complications on Imaging A. Flap: flap migration with brain herniation, CSF leak, flap necrosis with infection. B. Vascular: ICA dissections, pseudoaneurysms, cavernous sinus thrombosis, air embolism to intracranial vessels.

## NREE-112 THE ART OF MISMATCH: A DIAGNOSTIC KEY IN CNS TUMOR IMAGING

Roy Riascos, MD, MBA (*Abstract Co-Author*) Nothing to Disclose
Carlos H. Torres, MD, FRCPC (*Abstract Co-Author*) Nothing to Disclose
Andres F. Rodriguez, MD (*Abstract Co-Author*) Nothing to Disclose
Paulo C. Puac Polanco, MD, MSc (*Abstract Co-Author*) Nothing to Disclose
Maria Lucia Brun, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1.To improve the ability to recognize and interpret various types of mismatches in CNS tumor imaging, leading to more accurate diagnoses. 2.To foster a deeper comprehension of the different scenarios where mismatch patterns can be valuable in the diagnostic process of CNS neoplasms. 3. To emphasize the importance of interdisciplinary collaboration in the initial approach of brain tumors and their evaluation after treatment.

**TABLE OF CONTENTS/OUTLINE**

In the realm of CNS neoplasm diagnosis, the emergence of mismatch scenarios offers a compelling dimension to the diagnostic process.The nuanced interplay between clinical presentations, diverse imaging modalities, and difficulties/limitations of imaging techniques unveils challenges for an accurate diagnosis where different types of mismatches can be found. The ability to recognize and interpret these deviations from the expected unlocks precision in diagnosing CNS neoplasms, ultimately leading to better patient care and outcomes.Outline: 1. Clinico-radiological mismatch: Pseudoprogression. Pseudo response. 2. Imaging-imaging mismatch: T2/FLAIR mismatch. Advanced-basic imaging mismatch. Mistmatch within imaging features. 3. Imaging-technique mismatch. 4. Imaging-surgical findings mismatch: Imaging. Conclusion: Understanding the pivotal role of mismatch scenarios in the diagnostic process of CNS neoplasms is key. We must emphasize the importance of interdisciplinary collaboration.

## NREE-113 MAPPING THE MAZE: NEUROIMAGING INSIGHTS INTO IMMUNOCOMPROMISED PATIENTS

**Awards**
**Certificate of Merit**

Faisal A. Alsugair, MD,FRCPC (*Abstract Co-Author*) Nothing to Disclose
Paulo C. Puac Polanco, MD, MSc (*Abstract Co-Author*) Nothing to Disclose
Azza Reda, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

• Immunocompromised patients represent a vulnerable group that can be affected by numerous neurological conditions.• The impairment of the body's immune system in this population can alter their ability to prevent diseases, particularly infections.• Other less common complications can be seen in immunocompromised patients, such as infection-induced neoplasms, paradoxical inflammatory reactions to treatment, or metabolic conditions. . There are several primary immune deficiencies and a wide number of secondary causes that include advanced age, metabolic conditions, infection (e.g., HIV), malnutrition, and chronic disorders such as diabetes and systemic lupus erythematosus

**TABLE OF CONTENTS/OUTLINE**

Approach for diagnosing Complications in Immunocompromised patientsA. Opportunistic infectionsB. Treatment-related complicationsC. NeoplasmsD. Miscellaneous A. Opportunistic infections- Toxoplasmosis- Fungal infections: Candida albicans, Cryptococcal meningoencephalitis, Cryptococcosis Gelatinous pseudocysts, choroid plexitis, Invasive fungal sinusitis- Viral infections: Ramsay-Hunt syndrome, herpes zoster virus, Herpes zoster ophthalmicus- Nocardia- CD8 encephalitis B. Treatment-related complications- PML- PML-IRIS C. Neoplasms- EBV-induced 1ry CNS Lymphoma - Miscellaneous- Vasculitis- Infarction

## NREE-114 CONTRAST-INDUCED ENCEPHALOPATHY: AN UNDERESTIMATED COMPLICATION AFTER ENDOVASCULAR PROCEDURES?

Salome Bosshart, MD (*Abstract Co-Author*) Nothing to Disclose
Rosario Pascarella, MD (*Abstract Co-Author*) Nothing to Disclose
Maria Luisa Zedde, MD (*Abstract Co-Author*) Nothing to Disclose
Nathalie Nierobisch (*Abstract Co-Author*) Nothing to Disclose
Nicolin Hainc (*Abstract Co-Author*) Nothing to Disclose
Alexander Stebner, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

I) Pathophysiology, epidemiology, and clinical presentation II) Typical radiographical signs of Contrast-Induced Encephalopathy (CIE) on CT and MRI. III) Distinguishing CIE from other differential diagnoses/frequent post-endovascular procedures complications.

**TABLE OF CONTENTS/OUTLINE**

What is CIE? It is a rare sporadic condition of neurotoxicity after intravascular administration of iodine contrast. It evolves rapidly and causes temporary neurological deficits/seizures shortly after contrast administration, sometimes within hours. Patients usually recover within days without residual findings on imaging, but cases of incomplete remission with permanent deficits and rarely death have been reported. It is assumed that the breakdown of the blood-brain barrier with contrast-leakage causes altered excitability and thus neuronal dysfunction. Typical imaging findings? Cortical and sulcal hyperdensities on CT not corresponding to blood but contrast agent and vasogenic edema resulting in mass effect. These findings typically resolve completely within hours to days on follow-up imaging. Pearls, pitfalls, and differential diagnoses: Is it blood or contrast? - Dual-Energy CT is a useful tool to differentiate iodine from blood! Is the swelling a sign of stroke progression? - Sometimes you will need CTA to exclude residual or recurrent vessel occlusions, or MRI to look for diffusion restriction in acute stroke patients and FLAIR/T1w/SWI for blood, as iodine contrast should not be visible on MRI! Am I missing something? - Time will tell: After excluding acute conditions like subarachnoid hemorrhage and acute ischemic stroke, CIE will resolve typically quickly with conservative supportive treatment.

## NREE-115 PICTORIAL REVIEW OF INTRAVENTRICULAR BRAIN TUMORS IN ADULTS AND CHILDREN - A PRIMER FOR RESIDENTS AND FELLOWS

Laiz Godoy, MD (*Abstract Co-Author*) Nothing to Disclose
Otavio Augusto Ferreira Dalla Pria, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Intraventricular brain tumors encompass myriad presentations in both clinical symptomology and radiological findings and frequently represent a challenge for the radiologist since multiple imaging features overlap among these tumors. Nevertheless, they account for a relevant incidence in our daily practice regardless of being an experienced neuroradiologist or a junior resident taking calls. Given their importance, a constant review of these entities is mandatory to succeed in general or neuroradiology. Moreover, this exhibit aims: 1. To review the literature concerning adult and children's intraventricular brain tumors; 2. To describe multi-modality imaging findings helpful in narrowing the differentials and relevant clinical presentations based on location, age, sex, etc. 3. To depict cases of typical and atypical supra and infratentorial intraventricular brain tumors in adults and children.

**TABLE OF CONTENTS/OUTLINE**

1. Concise exposition delineating the embryology, anatomical configuration, and physiological attributes pertinent to the ventricular system; 2. Illustration of diverse cases featuring intraventricular cerebral neoplasms, including but not limited to ependymoma, subependymoma, central neurocytoma, subependymal giant cell tumor, choroid plexus neoplasm, meningiomas, juxtaposed with a comprehensive examination of potential differentials such as colloid cysts, atypical teratoid/rhabdoid tumors, and other pathologies. Furthermore, incorporation of cases initially presumed to originate intrinsically but ultimately diagnosed within the extraventricular ambit due to semblant radiological manifestations; 3. Conclusion and take-home messages, 4. References

## NREE-116 UNRAVELING THE UNUSUAL: A CASE REVIEW OF UNIQUE TRIGGERS FOR TRANSIENT ISCHEMIC ATTACKS (TIAS)

Mansi N. Jantre III, MBBS, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Transient Ischemic Attacks (TIAs) are often precipitated by conventional risk factors such as hypertension, diabetes, or hypercholesterolemia. However, there exists a subset of cases where atypical triggers play a significant role. This review examines the radiological features and diagnostic challenges associated with these unusual triggers for TIAs. Through a series of case studies and imaging modalities including CT, MRI, and angiography, we elucidate the role of radiology in understanding these atypical triggers is crucial for accurate diagnosis, timely intervention, and improved patient outcomes.

**TABLE OF CONTENTS/OUTLINE**

-Introduction - Case: Parapharyngeal abscess with secondary involvement of carotid sheath- Case; Stylocarotid syndrome in Eagles syndrome-Case: Subclavian steel syndrome-Case; ICA pseudoanuysm triggering TIA and Horners syndrome-Case; Floating unstable plaque in ICA

## NREE-117 WHEN TO WORRY ABOUT INTRACRANIAL CALCIFICATIONS: OVERVIEW ON CT

Guilherme C. Martins, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Calcifications within the brain parenchyma or vasculature are typical finding in all ages, present in the radiologist's daily routine. They can be age-related or pathological with a wide spectrum of presentations. Even with the introduction of Magnetic Resonance Imaging (MRI), non-contrast computerized tomography (NCCT) scan is the choice for detection and characterization. They can be classified into patterns with related terminology, ranging from dots, lines, stippled, blush, gyriform to conglomerates, as well as divided into pathological subtypes: vascular, genetic, infectious, inflammatory or neoplastic diseases. Pathological conditions can be linked to the radiological phenotype, taking into account anatomical location, distribution, dimensions and morphology, in association with clinical history and age. When identified in the appropriate clinical setting, the characteristic features allow the radiologist to facilitate the differential diagnosis and avoid practical errors.

### TABLE OF CONTENTS/OUTLINE

Optimizing the approach based on the radiological patterns, dividing them with related terminology and pathological subtypes thru a summary facilitates diagnosis, understanding and clinical management.

## NREE-118 DON'T BE VEIN: INTRACRANIAL VENOUS PATHOLOGY - A PRIMER FOR THE RADIOLOGIST

Ashok Srinivasan, MD (*Abstract Co-Author*) Nothing to Disclose
Grant E. MacKinnon, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. Understanding typical intracranial venous anatomy and common variants is essential to develop an effective search pattern and avoid misinterpretation, a common pitfall for the training radiologist.2. Recognizing patterns of venous thrombosis and hemorrhage will aid in rapid diagnosis and the potential need for additional imaging.3. Identifying venous malformations helps guide patient management and avoid unnecessary workup.

### TABLE OF CONTENTS/OUTLINE

I. Typical intracranial venous anatomy a) Unique features of intracranial veinsII. Common intracranial venous variants a) High riding jugular bulb b) Jugular diverticulum c) Jugular dehiscenceIII. Venous thrombosis a) Risk Factors b) Venous territories i) Dural venous sinus thrombosis ii) Deep venous thrombosis iii) Superficial venous thrombosis c) Imaging features signs d) Complications i) Infarction ii) Dural arteriovenous fistula e) Mimics i) Hypoplastic/stenotic transverse sinus ii) Arachnoid granulations iii) PolycythemiaIV. Venous hemorrhage a) Venous epidural hematoma i) Common subtypes (1) Anterior temporal (2) Vertex (3) Clival b) Germinal matrix hemorrhage i) Risk Factors ii) Grading c) Perimesencephalic (nonaneurysmal) subarachnoid hemorrhageV. Venous malformations a) Cavernous malformation b) Developmental venous anomaly c) Capillary telangiectasia d) Sinus pericranii

## NREE-119 BRAIN MRI PROTOCOLS: A USER GUIDE

Matthew F. Glasser, MD,PhD (*Abstract Co-Author*) Nothing to Disclose
Robert C. McKinstry III, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Arash Nazeri, MD (*Abstract Co-Author*) Nothing to Disclose
Michelle Wegscheid, MD,PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Brain MRI protocols can be overwhelming for trainees. A foundational understanding of the physical principles of brain MR sequences is important for effective clinical deployment and accurate diagnostic interpretation. Furthermore, understanding MR parameters as customizable variables will inform patient and pathology-specific protocol optimization. The purpose of this exhibit is to: 1) Discuss the basic physics principles underlying sources of tissue contrast and image quality. 2) Provide an overview of acquisition methods, pulse sequences, and acceleration techniques commonly used in brain MR protocols. 3) Illustrate clinical applications and limitations of MR parameters through case examples. 4) Detail an approach to optimizing MR protocols for patient needs and pathology-specific questions.

### TABLE OF CONTENTS/OUTLINE

Tissue contrast: i) Sources of contrast: T1, T2, T2*, ? (susceptibility), PD, fat/water content, magnetization transfer, motion, ii) Weighting vs. quantitative mapping, iii) Fat saturation methodsImage quality spatial resolution, SNR, CNR, image fidelity, artifactsImage acquisition methods: i) Read-out: cartesian vs. non-cartesian k-space sampling, 2D vs. 3D, EPI, ii) Common pulse sequences: spin echo, gradient echo, SSFP, inversion recovery, DWI, perfusion, BOLD, flow sensitive, iii) Acceleration techniques: multi-coil parallel imaging (GRAPPA/SENSE, CAIPIRINHA and wave-CAIPI), simultaneous multi-slice, k-t acceleration methods for dynamic imaging, compressed sensing, deep learning methods, geometry factor (g-factor), iv) Reduced FOV (e.g., ZOOMit)Hardware: magnetic field strength, radiofrequency coils, gradient strength and slew rate, b0 and b1 shimming

## NREE-120 HYPOPHYSITIS: RADIOLOGICAL FINDINGS AND CLINICAL CHARACTERISTICS

Alex Rovira-Canellas, MD (*Abstract Co-Author*) Scientific Advisory Board, Novartis AG;Speaker, Novartis AG;Scientific Advisory Board, Groupe Sanofi;Speaker, Groupe Sanofi;Scientific Advisory Board, SyntheticMR AB;Scientific Advisory Board, TensorMedical;Scientific Advisory Board, F. **TEACHING POINTS**

Hypophysitis is an inflammation of the pituitary gland and a rare cause of hypopituitarism. It can be primary (autoimmune or idiopathic) or secondary to sellar, suprasellar, and parasellar lesions, systemic diseases, or drugs. The most common primary hypophysitis is lymphocytic. Regardless of the etiology, patients with hypophysitis present symptoms and signs caused by inflammation that can lead to hypopituitarism with or without diabetes insipidus, and/or symptoms related to mass effect on the pituitary stalk, hypothalamus, or optic chiasm. The diagnosis relies on clinical, laboratory, and radiological findings. MRI with contrast is the preferred imaging modality, often necessitating follow-up studies to discern changes aiding in differentiation from pituitary adenomas. Treatment primarily entails hormonal replacement, with glucocorticoids reserved for cases presenting with compressive symptoms. Surgical intervention is seldom warranted.

**TABLE OF CONTENTS/OUTLINE**

1. Hypophysitis is recognized as a rare inflammatory condition affecting the pituitary gland.2. Lymphocytic hypophysitis is the most prevalent form of primary hypophysitis.3. Diagnosis of hypophysitis can be challenging, but MRI plays a crucial role in confirming the diagnosis and preventing misinterpretation that might lead to unnecessary surgical interventions.4. Treatment strategies primarily involve hormone replacement therapy and the use of high-dose glucocorticoids to alleviate mass effect and manage symptoms effectively.

## NREE-121 SUBTLE IMAGING FINDINGS LEADING TO NOT-SO SUBTLE PRESENTATIONS -PEARLS AND PITFALLS OF EASY-TO-MISS EPILEPTOGENIC ETIOLOGIES

Mehmet E. Adin, MD (*Abstract Co-Author*) Nothing to Disclose
Richard A. Bronen, MD (*Abstract Co-Author*) Nothing to Disclose
Long H. Tu, MD (*Abstract Co-Author*) Nothing to Disclose
Samra Iftikhar, MBBS (*Abstract Co-Author*) Nothing to Disclose
Alexander Kuehne, MD (*Abstract Co-Author*) Nothing to Disclose
Irene Dixe de Oliveira Santo, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

• Review the most common, uncommon, and easily missed causes of epilepsy.• Discuss types of seizures, MRI epilepsy protocol and sequences.• Describe the most important pearls, pitfalls, and causes of misses that the radiologist should know regarding each of the conditions described.

**TABLE OF CONTENTS/OUTLINE**

1. Prevalence and causes of epilepsy.2. Types of seizures: simple partial, complex partial, and generalized.3. Indications for imaging in adults and children with epilepsy.4. Imaging findings of the multiple etiologies with cases from our institution.5. Common misses and pitfalls.6. Pearls and systematic approach to increase the sensitivity of the radiologist to these conditions and improve detection of even the most subtle findings, including:a. Important information to review in the patient's chart.b. Useful imaging modalities including but not limited to MRI, CT, and nuclear medicine.c. MRI technique recommendations.d. Vital MRI sequences according to suspected etiology and patient's agee. Appropriate level and windowing.

## NREE-122 IMAGING PATTERNS OF SKULL BASE LESIONS ON CT/MR AND THEIR MIMICS: A SIMPLIFIED SYSTEMATIC APPROACH TO ANALYZE COMPLEX SKULL BASE LESIONS AND NARROW YOUR DIFFERENTIALS

Rita G. Bhatia, MD (*Abstract Co-Author*) Nothing to Disclose
Natalya Nagornaya, MD (*Abstract Co-Author*) Nothing to Disclose
Julieta Aristizabal Baron, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Review pertinent anatomy of the skull base. 2. Provide a simple systematic approach and review the differential diagnosis of benign and malignant lesions of the skull base and common "pseudolesions" based on anatomic subdivisions, characteristic imaging features and patterns of growth allowing radiologists to narrow down the differential diagnosis. 3. Review specific roles and use of different imaging modalities for accurate diagnosis, localization, and staging when appropriate of most common skull base lesions.4. Highlight key points in the imaging findings that should be included in the radiology report as critical information for the pre-operative planning. 5. Highlight key imaging features of most common "pseudolesions" to help differentiate them from their potential pathologic mimics or "true lesions" and to avoid unnecessary biopsies and treatment.

**TABLE OF CONTENTS/OUTLINE**

1. Pseudolesions, normal variants, and developmental anomalies: fibrous dysplasia, arrested pneumatization of the sphenoid sinus, juvenile ossifying fibroma, aneurysmal bone cyst, petrous apex cephalocele, dermoid cyst, white epidermoid cyst, neuroenteric cyst and ecchordosis physaliphora. 2. Expansile benign skull lesions: lateral sphenoid meningocele, allergic fungal sinusitis, mucocele, and cholesterol granuloma. 3. Central skull base tumors: giant cell tumor, spindle cell hemangioma, clival chordoma, invasive pituitary adenoma, and plasmacytoma. 4. Petro-clival lesions: chordoma and chondrosarcoma. 5. Vascular lesion and mimics: petrous Internal carotid artery aneurysm, carotid canal sympathetic plexus schwannoma, and cavernous sinus capillary hemangioma.

## NREE-123 CENTRAL NERVOUS SYSTEM (CNS) COMPLICATIONS IN LEUKEMIA -A COMPREHENSIVE MRI APPROACH TO DIAGNOSIS AND MANAGEMENT

**Awards**
**Certificate of Merit**

Mariko Kurokawa, MD (*Abstract Co-Author*) Nothing to Disclose
Noriko Doki (*Abstract Co-Author*) Nothing to Disclose
Yasunobu Takaki (*Abstract Co-Author*) Nothing to Disclose
Koichiro Mori (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- CNS complications in leukemia are diverse and can significantly impact patient outcomes.
- MRI plays a crucial role in the early diagnosis and management of CNS lesions in leukemia patients.
- Recognizing characteristic MRI findings can help differentiate various CNS complications and guide appropriate treatment.

**TABLE OF CONTENTS/OUTLINE**

• Introduction
- Overview of CNS complications in leukemia

- Importance of MRI in diagnosis and management • Malignancy
- CNS infiltration and recurrence
- Post-transplant lymphoproliferative disorders • Infections
- Viral, bacterial, fungal and other infections • Cerebrovascular events
- Hemorrhage and thrombosis • Drug (and/or Radiotherapy)- related neurotoxicity
- Chemotherapy and radiotherapy-induced complications • Immune-mediated neurotoxicity
- CAR T-cell therapy and associated neurotoxicity syndromes • Conclusion
- Significance of a comprehensive MRI approach in leukemia patients

## NREE-124 METAL ARTIFACT REDUCTION IN CT ANGIOGRAPHY USING PHOTON-COUNTING DETECTOR CT

Toshihide Itoh, PhD (*Abstract Co-Author*) Employee, Siemens AG
Kazuhisa Matsumoto (*Abstract Co-Author*) Nothing to Disclose

Nobuo Kitera, RT, MSc (*Abstract Co-Author*) Nothing to Disclose
Masahiro Nakashima, MD, PhD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Photon-counting detector (PCD) CT provides CT angiography (CTA) with higher spatial resolution and less noise than energy-integrating detector (EID) CT. Metals, such as clips, coils, stents, and liquid embolic materials, used during neurosurgery or endovascular surgery cause beam-hardening artifacts, which strongly degrade images. To settle this issue, we should optimize the reconstruction techniques including field-of-view (FOV), matrix size, kernel setting, use of iterative reconstruction (IR) and metal artifact reduction algorithms (MAR). PCD-CT also provides the retrospective use of virtual monoenergetic imaging. This presentation covers the advantages and pitfalls of PCD-CT over EID-CT, and discusses the causes and types of metal artifacts, and various reconstruction techniques. We also demonstrate latest advances in PCD-CT with case-based reviews.

### TABLE OF CONTENTS/OUTLINE

1. Principles and advantages of PCD-CT, and image quality of CTA using PCD-CT. 2. Overview of artifacts in general and explanation of the mechanisms and types of metal artifacts. 3. Reconstruction techniques to reduce metal artifacts. 4. Case-based review of cases in which reconstruction techniques to reduce metal artifacts were useful. 5. Discussion for utilities of PCD-CT for metal artifact reduction with advantages, disadvantages, and pitfalls.

## NREE-125 CLINICAL APPLICATIONS OF TECHNIQUES TO REDUCE GEOMETRIC DISTORTION AND SUSCEPTIBILITY ARTIFACT IN DIFFUSION-WEIGHTED MRI

### TEACHING POINTS

Diffusion-weighted imaging (DWI) is an essential MRI technique for assessing neurological disorders. Single-shot echo-planar imaging (SS-EPI) is the most widely used DWI technique; however, EPI-based DWI techniques are prone to susceptibility artifacts in areas of B0 field inhomogeneity. Therefore, many DWI techniques have been developed to overcome distortion caused by magnetic susceptibility. The aims of this presentation are (1) to introduce DWI techniques for distortion correction, (2) to realize the improvement of distortion in clinical cases, and (3) to discuss their clinical application. Furthermore, (4) techniques to reduce acquisition time, making these technologies more clinically useful, will also be presented.

### TABLE OF CONTENTS/OUTLINE

1. History and techniques of distortion correction in DWI.2. Clinical applications: We demonstrate examples of DWIs with distortion correction. The discussion will be categorized into the following two types of DWI techniques.(a) The methods to reduce distortions in EPI-based DWI, including Reverse encoding Distortion Correction (RDC) -DWI, etc. (b) The methods to reduce distortions using fast spin echo (FSE), including TGSE-BLADE DWI (2D turbo gradient- and spin-echo diffusion-weighted imaging with non-Cartesian BLADE trajectory), etc. 3. The techniques to reduce acquisition time for clinical applications: Specifically, they are parallel imaging, simultaneous multi-slice acceleration technique, and noise reduction technique. Noise reduction techniques include Deep Learning Reconstruction (DLR) techniques.

## NREE-126 TRACTOGRAPHY 101: A GUIDE TO SEGMENTATION

Karla D. Fuentes Badillo, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Axon fibers, the fundamental components of neural communication, are classified into three main groups: commissural fibers, association fibers, and projection fibers. This classification is crucial for understanding the complex network of the brain. Projection fibers: white matter tracts that connect the cortex with other areas in the CNS. They may be efferent (motor) or afferent tracts (sensory), e.g., corticospinal tract, anterior thalamic radiations. Association fibers: connect different areas in the same hemisphere. There are two types of association fibers: long-range and U-fibers (short-range), e.g.,

arcuate fasciculus, inferior fronto-occipital fasciculi, cingulum (limbic system fibers), uncinate fasciculus. Commissural fibers: a type of white matter tract that crosses the midline, connecting the same cortical area in opposite hemispheres (right-left hemispheric connections), e.g., forceps minor and major. Three diffusion tensor imaging techniques in common use are the fractional anisotropy map, the principal diffusion direction map, and fiber-tracking maps. Axonal tracts are commonly mapped using a deterministic method called FACT (fiber assignment by continuous tracking). In this method, the user selects "seed voxels" in a particular area of the brain, and automated software computes fiber trajectories in and out of that area.

**TABLE OF CONTENTS/OUTLINE**

Introduction Basics Tractography Inferior Longitudinal Fasciculus (ILF) Inferior Fronto-Occipital Fasciculus (IFO) Arcuate Fasciculus (AF) Uncinate Fasciculus (UF) (forceps major, FMA) (forceps minor, FMI) Cingulum (CBT, CBD) Fornix (FX) Corticospinal Tract (CST) Anterior Thalamic Radiations (ATR) Conclusion

## NREE-127 MIND'S MAELSTROM: CURRENTS OF INTENSITY AND DENSITY SWIRLING THE INTRACRANIAL HEMORRHAGES ETIOLOGIES

**TEACHING POINTS**

To categorize the diverse etiologies of intracranial hemorrhage (ICH) and elucidate their radiological hallmarks.To explore the latest advancements in methodologies and imaging technologies for accurately pinpointing the causes of ICH.To highlight the critical role of radiological findings in guiding therapeutic strategies and prognostication for patients with ICH.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction: an overview of intracranial hemorrhage. 2. Etiologies of Intracranial Hemorrhage: the prevalent and less common primary and secondary causes of ICH, such as hypertension, cerebral amyloid angiopathy, aneurysms, arteriovenous malformations, cavernous malformations, trauma, coagulopathies, tumors, vasculitis, and venous sinus thrombosis. 3. Radiological Identification of ICH Etiologies: the roles of CT, MRI, and digital subtraction angiography (DSA) in discerning the origin of the hemorrhage and the age of the clot. How imaging features, like the location and pattern of hemorrhage and associated findings, can indicate specific etiologies. ICH classification systems, including Fisher grading for subarachnoid hemorrhage, Zabramski classification for cavernous malformations, and Boston criteria for cerebral amyloid angiopathy. 4. Radiology-Guided Management and Therapeutic Approaches: how radiological findings, including the spot and swirl signs, influence active ICH management strategies, including surgical interventions. 5. Advancements in Imaging Techniques and Future Directions: recent technological innovations in radiology that improve the detection and characterization of ICH. 6. Take-home Messages.

## NREE-128 RADIOGRAPHIC INSIGHTS: SHAPING NUANCED ANATOMY - A JOURNEY THROUGH ORBITAL MYSTERIES & EYE DISEASE ENIGMAS

**TEACHING POINTS**

The orbit is a sophisticated anatomical area encompassing vital structures such as the eye globe, optic nerve, and extraocular muscles. Thus, the precise interpretation of orbital imaging findings necessitates a comprehensive understanding of its complex anatomy and the interrelationships among these structures. The specific objectives are as follows: To delineate the orbital anatomy and highlight the critical anatomical relationships for clinical practice. To showcase the primary imaging findings associated with orbital disorders, tailored to the anatomical specifics of each compartment. To present the detailed orbital anatomy and its interconnected structure, ensuring accurate interpretation of imaging results.

**TABLE OF CONTENTS/OUTLINE**

1. Overview of Imaging Modalities, Protocols, Pitfalls, Principles, and Techniques Specific to Orbital Imaging. 2. Bony Landmarks and Foramina Within the Orbit. 3. Anatomy and Functional Aspects of the Orbital Septum. 4. Detailed Examination of the Eye Globe: Anatomy, Function, and Imaging Assessments of Disorders. 5. The Optic Nerve and Sheath: Detailed MRI Characteristics and Associated Pathologies. 6. Diagnostic Imaging of Extraocular Muscles: Anatomy and Pathological Conditions. 7. Structural and Functional Analysis of Intraconal and Extraconal Spaces: Tools for Diagnostic Imaging of Related Disorders. 8. Assessment of the Nasolacrimal Apparatus. 9. Pathological Conditions Specific to Orbital Compartments: Infections, Tumors, and Inflammatory Diseases. 10. Clinical and Surgical Perspectives: Presentation and Management Strategies for Orbital Disorders, Including Surgical Techniques. 11. Take-Home Messages.

## NREE-129 CLOCK REWIND IN STROKE STRIDE: STRETCHING TIME'S BOUNDS IN BRAIN SALVAGE

Vitor A. Soares, MD (*Abstract Co-Author*) Nothing to Disclose
Raquel Bezerra, MD (*Abstract Co-Author*) Nothing to Disclose

Pedro N. Castro, MD (*Abstract Co-Author*) Nothing to Disclose
Gabriela A. Ribas, MD (*Abstract Co-Author*) Nothing to Disclose
Laura C. Magalhaes, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The primary objective of this abstract is to delve into the evolving landscape of stroke management, emphasizing the extended window for treatment beyond the traditionally accepted timeframe. It aims to shed light on the latest neuroradiological advancements and clinical trials that support this paradigm shift. Key objectives include: To analyze the impact of recent research on extending the treatment window for ischemic stroke, including the implications for radiological practices. To evaluate the role of conventional and advanced imaging techniques in identifying patients who can benefit from treatment in the extended window phase. To discuss integrating radiological innovations into clinical guidelines, focusing on time to treat and the potential for improved recovery rates.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction: historical context of the "golden hour" in stroke treatment and its limitations. 2. Pivotal studies (ex: DAWN, DEFUSE 3) that challenge the traditional treatment window, extending the time frame for eligible thrombectomy patients. 3. "Brain window" vs. "time window" — how patient-specific factors influence treatment eligibility. 4. How MRI and CT perfusion techniques have become instrumental in identifying salvageable brain tissue beyond the conventional treatment window. 5. Radiological Innovations and Clinical Trials: Overview of ongoing clinical trials exploring the limits of stroke intervention timings, including thrombectomy and intravenous thrombolysis. 6. Future Directions: The potential for further expanding the treatment window with continuous advancements in the imaging diagnosis assessment. 7. Take-home messages.

## NREE-13 THE NOVEL DUAL INJECTION CONE BEAM CT FOR ASSESSMENT OF THE ANGIOARCHITECTURE OF INTRACRANIAL DURAL ARTERIOVENOUS FISTULAS

Yoichi Morofuji, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Understanding the complex dural arteriovenous fistula (dAVF) anatomy, especially in identifying the feeders and shunt patterns in relation to the affected sinus and cortical veins, is crucial for determining treatment approaches and predicting clinical outcomes and possible complications. We developed dual injection cone beam computed tomography (CBCT) that enabled the simultaneous identification of feeders, fistulous points, and drainers.

**TABLE OF CONTENTS/OUTLINE**

Our dual injection CBCT is a novel imaging modality for assessing the angioarchitecture of dAVFs. Although 3D-DSA reveals the morphological anatomy, all vessels are depicted uniformly, making it difficult to recognize feeders, fistulous points, and drainers. In contrast, in dual injection CBCT, the presence of diluted contrast media in the drainers and undiluted contrast medium in the feeders not only makes it easier to recognize the feeders and drainers but also enables detailed evaluation of the fistulous point. Identifying fistulous points and shunt patterns is crucial for determining the treatment approaches and avoiding possible complications. Cross-sectional imaging in dual injection CBCT can provide superior information on small arterial feeders and fistulous points compared to other modalities, such as 3D-DSA, CTA, and MRI, because the gradation of the contrast media in dual injection CBCT clearly demonstrates feeders and drainers. To the best of our knowledge, our dual injection CBCT is the first report to provide the images to distinguish the feeders, fistulous points, and drainers of shunt diseases simultaneously.

## NREE-130 RIVERS OF RISK: BRAIN HIGH-FLOW VASCULAR MALFORMATIONS THROUGH RADIOLOGIC RAPIDS

Elissandra M. Lima, MD (*Abstract Co-Author*) Nothing to Disclose

Pedro N. Castro, MD (*Abstract Co-Author*) Nothing to Disclose
Gabriela A. Ribas, MD (*Abstract Co-Author*) Nothing to Disclose
Laura C. Magalhaes, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To explore the intricate landscape of high-flow vascular malformations within the brain, emphasizing the crucial role of radiologic imaging in their diagnosis, classification, and treatment planning. To provide a detailed overview of the types and characteristics of high-flow vascular malformations in the brain. To highlight the advancements in imaging techniques that have transformed the detection, understanding, and intervention strategies for these conditions. To explore the multidisciplinary approach to managing high-flow vascular malformations, focusing on integrating radiologic findings into arteriographic therapeutic decisions.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction. 2. Classifying brain high-flow vascular malformations: arteriovenous malformations and cerebral proliferative angiopathy, their grading systems, risks, differentiation, and the implications for treatment. Overview of dural arteriovenous fistulas, including classification based on location, venous drainage patterns, and associated risks. Pial arteriovenous fistulae: epidemiology, radiographic features, complications, therapeutics, and prognosis. 3. Imaging: CT angiography, MRI angiography, 4D flow MRI, and digital subtraction angiography. 4. Challenges in imaging diagnosis: differentiating between various types of vascular malformations. The role of imaging in assessing the risks of bleeding and neurological deficits. 5. Treatment planning and radiologic guidance: endovascular treatment, surgery, and radiosurgery. 7. Clinical outcomes: the predictive value of imaging findings. 8. Take-home messages.

## NREE-132 MYSTERIES BENEATH THE MIND'S DOME: ILLUMINATING CONGENITAL MALFORMATIONS OF THE POSTERIOR FOSSA

**Awards**

Elissandra M. Lima, MD (*Abstract Co-Author*) Nothing to Disclose
Caio Tasso d. Rego (*Abstract Co-Author*) Nothing to Disclose
Maysa R. Oliveira, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The primary aim of this abstract is to dissect the intricate world of congenital malformations of the posterior fossa, emphasizing the groundbreaking role of radiological imaging in their diagnosis, classification, and management. This exploration intends to: Illuminate the diverse spectrum of congenital malformations within the posterior fossa, highlighting their clinical relevance and challenges in diagnosis. Detail the advancements in radiological techniques that have revolutionized the detection and understanding of these malformations. Foster a comprehensive approach to managing these conditions, leveraging imaging findings to guide therapeutic decisions and predict outcomes.

**TABLE OF CONTENTS/OUTLINE**

1. Overview of the posterior fossa's anatomy and its critical role in neurological function. 2. Introduction to the complexity of congenital malformations in this region and their impact on patient morbidity and mortality. 3. Comparative analysis of CT, MRI, and ultrasonography in the context of prenatal and postnatal imaging. 4. MRI protocol. 5. Classification of common malformations, including Dandy-Walker malformation, Chiari malformations, and arachnoid cysts, along with rarer entities like rhombencephalosynapsis and pontocerebellar hypoplasia. 6. Embryological origins and potential genetic underpinnings of these conditions. 7. Exploration of how the extent and nature of malformations as seen on imaging correlate with neurological outcomes. 8. Potential areas for future research, like genetic markers and their imaging correlates. 9. Take-home messages.

## NREE-133 CAROTID WEB: IMAGING FEATURES AND ENDOVASCULAR MANAGEMENT

Yeray Aguilar Tejedor (*Abstract Co-Author*) Nothing to Disclose
Alejandro Santana Hernandez, MD (*Abstract Co-Author*) Nothing to Disclose
Cristina Candelaria Linares Bello, MD (*Abstract Co-Author*) Nothing to Disclose
Ernesto Santana, MD (*Abstract Co-Author*) Nothing to Disclose
Carmen Rodriguez Fuentes, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To remember the craniocervical vascular anatomy. To describe the physiopathology of the carotid web and the different imaging findings. To explain the endovascular management in the treatment (stenting).

**TABLE OF CONTENTS/OUTLINE**

Carotid web is a rare and under-recognized cause of stroke, especially in young patients with a high recurrence rate. It presents as a linear membrane that extends from the posterior aspect of the carotid bulb or internal carotid artery into the lumen, and is considered an atypical form of fibromuscular dysplasia. This entity predisposes to thrombus formation due to blood stasis and platelet activation. A complete clinical history and physical examination are crucial for its diagnosis. Digital subtraction angiography is the gold standard diagnosis procedure. Endovascular procedures, such as stenting, plays an important role in its management.

## NREE-134 IMAGING REVIEW AND CLINICAL MANIFESTATIONS OF LACUNAR STROKE SYNDROMES

Maria Lucia Brun, MD (*Abstract Co-Author*) Nothing to Disclose
Thurl Cledera, MD (*Abstract Co-Author*) Nothing to Disclose
Stacey Danica L. Gosiaco, MD (*Abstract Co-Author*) Nothing to Disclose
Randall S. Teh, MD (*Abstract Co-Author*) Nothing to Disclose
Kevin Ryan T. Yu, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Lacunar stroke syndromes represent a distinct subset of ischemic strokes, characterized by small subcortical infarcts resulting from occlusion of deep penetrating arteries. Difficulty may be encountered on imaging due to their small size unless there is a high index of suspicion. Correlation with the clinical presentation and imaging findings is paramount to diagnosis. The objectives of this exhibits are: 1) Understand the intricate relationship between neuroanatomy, vascular pathology, and clinical manifestations, 2) Recognize imaging features and patterns of lacunar stroke syndromes, 3) Develop a clinical approach to detecting infarct in acute brain imaging

**TABLE OF CONTENTS/OUTLINE**

IntroductionA. Definitions and NeuroanatomyB. Mechanism of Lacunar InfarctionC. Clinical PresentationD. Imaging ConsiderationClassic Lacunar SyndromesA. Pure Motor HemiparesisB. Ataxic HemiparesisC. Pure Sensory StrokeD. Sensorimotor StrokeE. Dysarthria-Clumsy Hand SyndromeAtypical Lacunar SyndromesA. Internuclear OpthalmoplegiaB. Isolated DysarthriaC. Hemichorac/HemiballismusD. Isolated Gaze PalsyE. Paramedian Thalamic SyndromeConclusion

## NREE-135 ALTERED VISUALIZATION OF DEEP MEDULLARY VEINS IN VARIOUS INTRACRANIAL DISORDERS: A STUDY OF SWI

**Awards**
**Certificate of Merit**

Eun Ja Lee, MD, PhD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

To understand the physics of susceptibility-weighted MR imaging (SWI) and the venous anatomy on SWI.To investigate the fine anatomic structure of medullary veins of cerebral white matter on SWI.To describe various intracranial disorders in which the medullary veins play a major role in disease development.To assess the clinical significance of altered visualization of deep medullary veins in various intracranial disorders

**TABLE OF CONTENTS/OUTLINE**

1. General overview of SWI, including assessment of venous hemodynamics 2. Understanding the overall venous anatomy and anatomic structure of medullary veins in the cerebral hemisphere 3. Exploring the fine radiologic anatomy of the medullary veins using SWI. 4. Discussion of disorders related to altered visualization of deep medullary veins 1) changes of deep medullary veins in patients with acute and subacute ischemic stroke 2) changes of deep medullary veins in patients with moyamoya disease 3) changes of deep medullary veins in patients with cerebral venous sinus thrombosis - major

dural sinuses / cortical veins / deep veins4) changes of deep medullary veins in vascular anomaly or malformation - developmental venous anomaly / Sturge Weber syndrome / dural arteriovenous fistula 5) hemorrhagic disorders related to deep medullary veins - diffuse vascular injury due to trauma / deep medullary vein engorgement or thrombosis in neonates 6) changes of deep medullary veins in cerebral small vessel disease 7) changes of deep medullary veins in cognitive impairment 8) changes of deep medullary veins in patients with brain death 9) post-operative changes of deep medullary veins 10) others 5. Summary and conclusion

## NREE-136 LOOK TO THE BUBBLE - NEURORADIOLOGICAL ASPECTS OF INTRACRANIAL CYSTIC LESIONS

### TEACHING POINTS

Cysts are often seen in brain imaging. Distinguishing between these cysts based solely on imaging findings can be difficult due to their varied presentations. A location-based approach and specific imaging features can help in making a more precise diagnosis.1) To review imaging findings of brain cystic lesions.2) Recognize the different types of brain cystic lesions, categorized on the basis of their causes and localization.3) A practical approach to interpreting these conditions systematizing the evaluation based on main neurologic imaging findings and clinical features.4) Formulate a differential diagnosis for a cystic-appearing lesion in the central nervous system, considering its location or site of origin and imaging features.

### TABLE OF CONTENTS/OUTLINE

1) Introduction.2) Localization of brain cystic lesions: Extra-axial x Intra-axial.3) Cystic lesions and other neurological imaging findings tips.4) Visual systematization of different types of cystic lesions.5) Main differential diagnosis for a cystic-appearing lesion.6) Take home messages.

## NREE-137 NEUROLOGICAL COMPLICATIONS OF VARICELLA ZOSTER VIRUS: COMPREHENSIVE UPDATE AND REVIEW OF CLINICAL AND IMAGING FEATURES

**Awards**
**Certificate of Merit**

Takashi Katsube (*Abstract Co-Author*) Nothing to Disclose
Takeshi Yoshizako, MD (*Abstract Co-Author*) Nothing to Disclose
Yasushi Kaji, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Aiko Gobara, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Varicella zoster virus (VZV) infection causes several neurological complications, which can be severe because VZV reactivation is associated with a compromised immune system. Diagnosis of VZV is difficult in the absence of a characteristic rash, but is important because of the need for early antiviral therapy. MRI is a non-invasive diagnostic tool that can help reveal the neurological complications of VZV disease. Here, we review the neurological complications of VZV and discuss their diagnosis, differential diagnosis and validated imaging modalities.1. To provide a clinical and radiological review of the central nervous system (CNS) and peripheral nervous system (PNS) complications of VZV infection.2. To provide an anatomical and pathological review of the mechanisms by which CNS and PNS complications of VZV infection occur and spread, and to correlate these with imaging findings.3. To describe effective methods for the detection of neurological complications of VZV infection by imaging.

### TABLE OF CONTENTS/OUTLINE

A. Epidemiology and clinical features of neurological complications in VZVB. Radiological review of CNS and PNS complications of reactivated VZV and differential diagnosis of each 1. Meningoencephalitis 2. Cranial nerve palsies 3. Vasculopathy 4. Myelitis 5. Other neurological complications such as optic neuritis and perineuritisC. Effective Conventional MR imaging of brain, spinal cord, and peripheral nerve lesionsD. Advanced MR imaging methods for neurological complication detectionGd 3D-FLAIR, vessel wall imaging, 3D MR neurography

## NREE-138 NAVIGATING THE MAZE: MULTIMODAL IMAGING AND TECHNIQUES FOR DIAGNOSING ALZHEIMER'S DISEASE AND RELATED MEMORY DISORDERS

### TEACHING POINTS

1. Understand imaging criteria for Alzheimer’s Disease using MRI, SPECT, and PET.2. Recognize differential diagnosis importance in memory disorders via case reviews.3.Learn to apply visual and statistical analysis tools for accurate clinical diagnosis.

### TABLE OF CONTENTS/OUTLINE

1. Imaging Techniques- Role of imaging in memory disorders, focusing on Alzheimer's Disease.- MRI: Identifying key and progressive AD signs.- PET/SPECT: Using metabolic, amyloid, and tau imaging for AD.- Statistical tools for objective assessment.2. Case Studies- Typical imaging features in advanced AD.- Early AD signs and nuclear medicine's role.- Differential diagnosis via MRI: Vascular dementia, Creutzfeldt-Jakob Disease, Neuronal Intranuclear Inclusion Disease, fragile X-associated tremor/ataxia syndrome, Hereditary diffuse leukoencephalopathy with spheroids, Cerebral Autosomal Dominant Arteriopathy with Subcortical Infarcts and Leukoencephalopathy, Primary progressive multiple sclerosis, HIV encephalopathies, delayed hypoxic

encephalopathies, Intravascular Large B cell Lymphoma, Neuropsychiatric SLE.- Differential diagnosis via nuclear medicine: Frontotemporal lobe dementia, Dementia with Lewy bodies, Corticobasal syndromes.3. Future DirectionsOverview of advanced imaging techniques in dementia research.

### NREE-139 JOURNEY INTO THE CRANIOVERTEBRAL JUNCTION: NAVIGATING THE CRANIOCERVICAL INSTABILITY WITH DYNAMIC CT AND MRI

Gaurav Pradhan (*Abstract Co-Author*) Nothing to Disclose
Jyoti Kumar, MD (*Abstract Co-Author*) Nothing to Disclose
Mohammad Shoaib, MBBS,MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

1. Understanding CCI Dive into the clinical significance of craniocervical instability (CCI), exploring its impact on patient's lives and the urgency of early detection to mitigate adverse outcomes. 2. Technical Mastery Familiarise with the intricacies of dynamic MRI and CT imaging, uncovering tips and tricks to optimize image quality and overcome common challenges. 3. Quantitative Parameters Demystified Decode the significance of key quantitative parameters for CCI assessment, mastering measurement techniques and understanding their diagnostic and therapeutic implications. 4. Real-Life Application Embark on real-life adventures through case studies, and offer valuable insights for diagnosis and treatment.

#### TABLE OF CONTENTS/OUTLINE

I. Let's Get Started! A. What's the Big Deal with Craniocervical Instability (CCI)? B. Why Dynamic Imaging Holds the KeyII. Tech Talk: Getting the Perfect ShotProtocols for dynamic MRI and CT acquisition.III. Crunching Numbers: Your CCI Cheat Sheet A. Meet the Superheroes: Atlantodens Interval, Grab Oakes measurement, Clivoaxial angle, and More B. How These Numbers Solve Mysteries in CCIIV. Case Files: Stories from the Trenches From Ligamentous Laxity to the Perils of Compression: Real-Life CCI DramaV. Speak Radiology: From Reports to Conversations A. Putting Quantitative Parameters into Words That Make Sense B. Tips for Communicating Like a Pro with CliniciansVI. Tricky Trails: Avoiding Pitfalls in CCI Diagnosis A. Navigating the Treacherous Terrain of Inconclusive Measurements B. How to Stay on Course When the Diagnostic Maze Gets Tough

illustration about the concept of R2 starexplain basic physics of IVIM Imaging includingRadiofrequency Excitation and RelaxationT2 Relaxation and Decay R2 Valuesexplain the clinical Significance of R2 MRImention advantages and Challengesexplain 7T MRI and Enhanced R2 Imaging

### NREE-141 FOUND BY MORE THAN A STROKE OF LUCK: A REVIEW OF IMAGING MANIFESTATIONS AND RISK FACTORS FOR INCIDENTAL, PREVIOUSLY UNKNOWN CEREBRAL INFARCTS ON CT IMAGING

Long H. Tu, MD (*Abstract Co-Author*) Nothing to Disclose
Alexander Kuehne, MD (*Abstract Co-Author*) Nothing to Disclose
Saeed Rahmani (*Abstract Co-Author*) Nothing to Disclose
Carys Kenny-Howell (*Abstract Co-Author*) Nothing to Disclose
Danling Chen, MD (*Presenter*) Nothing to Disclose

#### TEACHING POINTS

An estimated 9 to 13% of strokes are not diagnosed upon initial clinical presentation, with many infarcts detected as incidental chronic findings on CT head imaging later performed for unrelated purposes.-To understand the clinical implications and potential changes in management that an occur when previously unknown strokes are seen on brain imaging.-To become familiar with the radiographic manifestations and imaging findings of incidental prior strokes.-To recognize the risk factors for missed or delayed stroke diagnosis, including unusual clinical symptomatology and patient characteristics which place specific subgroups at increased risk

**TABLE OF CONTENTS/OUTLINE**

-Overview of the prevalence and clinical impact of missed or delayed diagnosis of stroke-Discuss the clinical implications of identifying previously unknown, even chronic strokes on primary and secondary prevention strategies to prevent stroke-related complications-CT head imaging features of incidental chronic stroke, including: infarct location (cortical vs subcortical), infarct size, vascular territory, and evolution in appearance over time-Recognizing stroke and non-stroke causes encephalomalacia (postsurgical changes, trauma, infection, congenital disorders, variant neurologic anatomy, and imaging artifact)-Identification of risk factors for missed or delayed stroke diagnosis (Non-traditional clinical signs and symptoms of stroke, Patient demographic factors, Hospital visit characteristics)

## NREE-142 BENEATH THE SURFACE: UNVEILING SPLIT CORD MALFORMATIONS THROUGH IMAGING

Surjith Vattoth, MD, FRCR (*Abstract Co-Author*) Nothing to Disclose
Akram Alwarqi, MD (*Abstract Co-Author*) Nothing to Disclose

**TEACHING POINTS**

1. Review embryonic pathogenesis of split cord malformation (SCM)2. Review types of SCM and their imaging features and clinical significance.3. Review associations of SCM and pertinent imaging findings

**TABLE OF CONTENTS/OUTLINE**

- Overview of SCM and clinical presentation
- Embryonic pathogenesis of SCM
- Types of SCM (Pang's classification) and imaging characteristicsa. Type 1b. Type 2
- Common associations of SCMa. Segmentation and fusion anomaliesb. Tethered cordc. Syringomyeliad. Scoliosis/Kyphoscoliosise. Meningomyelocelef. Spinal Lipoma
- Imaging recommendations, pearls and pitfalls

## NREE-143 THALAMIC INFARCTS: CLINICAL PRESENTATION WITH REVIEW OF ANATOMY AND VASCULAR SUPPLY OF RELEVANT THALAMIC NUCLEI

Rishi K. Gosalia, MD (*Abstract Co-Author*) Nothing to Disclose
Liam M. O'Neill, MD (*Abstract Co-Author*) Nothing to Disclose
Patrick Taggart, DO (*Abstract Co-Author*) Nothing to Disclose
Tamim Sultani, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Most common cause of unilateral thalamic infarcts is microvascular disease with less common causes to include large vessel arterial plaque disease and embolic infarcts. Microvascular disease related thalamic infarcts usually occur in the ventrolateral territory while large vessel plaque infarcts involve the posteromedial territories. Bilateral thalamic infarct etiology includes artery of Percheron occlusion, top of basilar artery occlusion and deep venous sinus thrombus.

**TABLE OF CONTENTS/OUTLINE**

The exhibit is formatted as 2 clinical cases. The first case is an 86-year-old female who presented with abnormal sensation in the corner of mouth and ipsilateral hand and foot found to have an acute infarct in the contralateral thalamus within the VPM/VPL nuclei consistent with Cheiro-Oral Pedal Syndrome. The second patient is a 47-year-old male who presented with numbness and pain in left forehead, maxilla, neck, chest and thigh with stabbing headache behind the eyes. This patient was also found to have an acute lacunar infarct within the VPL nucleus of the right thalamus and was diagnosed with thalamic pain syndrome. The affected thalamic nuclei in these cases are the ventral posteromedial (VPM) and ventral posterolateral nuclei (VPL). Infarcts in this region of the thalamus can present with myriad of symptoms including sensorimotor deficits with sudden onset and severe symptoms. Sensory loss and decreased levels of consciousness are also commonly seen in VPM/VPL thalamic nuclei infarcts. These regions of the thalamus are predominately supplied by paramedian or thalamic perforators from P1 and P2 segments of the PCA. The VPL nucleus is supplied by the posterior choroidal artery, a branch of the P2 segment PCA.

## NREE-15 THE MERGE OF BONES: DELVING INTO SYNOSTOSIS

Leandro T. Lucato, MD (*Abstract Co-Author*) Nothing to Disclose
Douglas M. Nunes (*Abstract Co-Author*) Nothing to Disclose
Claudia D. Leite, MD, PhD (*Abstract Co-Author*) Nothing to Disclose
Thiago Luiz P. Scoppetta, MD (*Abstract Co-Author*) Nothing to Disclose
Diego C. Fragoso (*Abstract Co-Author*) Nothing to Disclose
Carlos Jorge da Silva, PhD, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The development of the face and skull is orchestrated by a complex three-dimensional morphogenetic process involving hundreds of genes controlling a coordinated pattern of tissue proliferation, and differentiation from different embryological origins.Imaging characteristics allow differentiation between positional plagiocephaly and that resulting from craniosynostosis.Tomographic studies with 3D reconstruction are the gold standard for imaging in the diagnosis and classification of craniosynostoses for potential surgical planning, as they allow for great detail of the bone structure.MRI studies provide a better assessment of the brain parenchyma, especially in patients with syndromic craniosynostoses, where other findings may be present.In some cases, imaging markers allow for the diagnosis of a specific disease or at least a group of diseases.

**TABLE OF CONTENTS/OUTLINE**

IntroductionTo review (1) normal suture anatomy and (2) pattern of suture closureGenetic and Pathophysiological PerspectivesTo depict genetic and embryology of cranial suturesImagingTo discuss the main imaging modalities, including their strengths and weaknessTo guide radiologists in the differentiation between positional plagiocephaly from true synostosisTo demonstrate the imaging spectrum of craniosynostosis, involving single versus multiple suture fusionTo identify the main imaging markers that enable a confident diagnosis of a specific disease or a group of related diseasesTo highlight potential associated abnormalities

## NREE-16 COMPARATIVE EVALUATION OF HABENULAR VOLUME AND IRON CONTENT USING MANUAL AND NORMALIZED SEGMENTATION TECHNIQUES IN STAGE SEQUENCES

E. Mark Haacke, PhD (*Abstract Co-Author*) Research Grant, Biogen Idec Inc ;President, Magnetic Resonance Innovations, Inc
Lei Zhang (*Abstract Co-Author*) Nothing to Disclose
Yueluan Jiang (*Abstract Co-Author*) Nothing to Disclose
Bingyang Bian (*Abstract Co-Author*) Nothing to Disclose
Xingchen Pan (*Abstract Co-Author*) Nothing to Disclose
TAO LI (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Using different segmentation methods to study the intergroup differences in the volume and iron content of the habenula between patients with first episode depression (FED) and control group. All subjects underwent STAGE sequence magnetic resonance imaging (MRI). Volume measurement included two methods, the first involved manual segmentation using ITK-SNAP (Figure 1), and the second used a habenular brain template created from a high-resolution, high-contrast template comprised of a total of 990 brain scans, followed by post-processing with FSL software to obtain the volume of the habenula (Figure 2). Due to poor matching of QSM to the MNI 152 space, iron content was measured only through manually segmented brain templates in the QSM sequence.There were no differences in gender or age between patients with FED and the control group ($p > .05$) (Table 1). Using manual segmentation, there were no differences in volume or iron content of the bilateral habenula between FED patients and the control group ($p > .05$). However, standardized segmentation of the habenula showed intergroup differences, with a larger habenula volume in FED patients ($p < .05$). Furthermore, we compared the results of manual segmentation and standardized segmentation, finding intergroup differences in the right habenula ($p < .05$) (Table 2).The above results indicate that manual segmentation involves a certain level of subjectivity, while standardized segmentation is more sensitive in detecting intergroup differences. This suggests the need for applying more refined segmentation techniques in this field to achieve superior segmentation results in the future.

### TEACHING POINTS

To illustrate the anatomical landmarks of the conus medullaris, filum terminale and cauda equina.To show the spectrum of pathologies affecting these structures using a case-based approach.To review the various pathological processes and their imaging features, based on magnetic resonance imaging (MRI).Provide differential diagnosis of lesions according to congenital, inflammatory/ infectious/ demyelinating auto-immune, neoplastic and vascular etiologies.

### TABLE OF CONTENTS/OUTLINE

The conus medullaris represents the tapered terminus of the spinal cord, is a vital anatomical landmark in diagnostic radiology. The filum terminale is a small thin filament of connective tissue that extends inferiorly from the apex of the conus medullaris to the sacrum. Cauda equina is the collective term given to nerve roots distal to the conus medullaris, which occupy the lumbar cistern. A thorough grasp of its anatomy, common anatomical variations, and the diagnostic challenges associated with lesions in this area is crucial for radiologists. This pictorial essay provides a detailed review of the anatomy as well as the broad differential diagnosis of lesions located in these topographies. Differential diagnoses were addressed by etiology and divided into the following groups: congenital, vascular, inflammatory/ infectious, neoplastic and miscellaneous.MRI is the method of choice for evaluating these lesions, as it provides better tissue and contrast resolution in the analysis. The knowledge of the anatomy and imaging patterns of lesions located in these areas is crucial for radiologists to be able to narrow the differential diagnosis, guiding a more efficient therapeutic approach to patients.

## NREE-18 IMAGING FOLLOW-UP OF THE LONG-TERM THERAPEUTIC MECHANISM OF VERMICULITE NANOSHEETS ON ISCHEMIC STROKE

Feng Lishuai (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Intraventricular injected vermiculite (VMT) enter into brain parenchyma through damaged cerebrospinal fluid brain barrier.VMT were swallowed by microglia and then reduced the release of proinflammatory factor by microglia through regulating upstream signaling pathways.VMT also improved survival rate of neuron and the integrity of BBB after ischemic stroke, reduced the "no-reflow" after reperfusion.All these protective effects of VMT is demonstrated by MRI and ultrasound super-resolution imaging technology.

### TABLE OF CONTENTS/OUTLINE

Ischemic stroke is a common neurological disorder and a major cause of permanent disability in patients. So far, few therapeutic drugs that can treat neurological damage in stroke. Therefore, protecting nerves and promoting neural function recovery remain an urgent research area. In this study, we adopted the method of intraventricular injection of VMT nanosheets. By comparing the areas of abnormal diffusion weighted imaging (DWI) signals with VMT nanosheets entering the brain, and using techniques such as biological transmission electron microscopy and immunofluorescence, we elucidated the passive targeted delivery characteristics of VMT nanosheets at different time points after stroke. Furthermore, the multi-target protective effects and prognosis of VMT nanosheets on neurons, glial cells, and cerebral blood vessels after stroke were explored through motor and cognitive-behavioral studies, MRI, ultrasound super-resolution in vivo imaging techniques, and brain tissue samples validation. These results demonstrated the enormous potential of VMT nanosheets in the application of ischemic stroke.

## NREE-19 THESE GO TO ELEVEN: SERIOUS SPINAL TAP COMPLICATIONS YOU SHOULD KNOW ABOUT

**Awards**
**Certificate of Merit**

Alvaro Jose de la Iglesia Salas, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

This exhibit intends• To acquaint the reader with the most crucial intracranial and spinal complications after lumbar puncture (LP) through a series of cases in a multimodality fashion.• To discuss the significance of dura-arachnoid enhancement after LP.• To review the technique, risk factors, and contraindications for LP.The main teaching points are• LP is a generally safe diagnostic and therapeutic procedure.• The rate of severe complications is low, but radiologists may encounter some in their careers. Familiarization with these adverse effects will grant a timely and correct diagnosis.• Chief risk factors are traumatic or non-sterile technique, bleeding diathesis, raised intracranial pressure, and challenging anatomy.• CT and MRI should be scrutinized for signs of intracranial and spinal hemorrhage, cerebrospinal fluid leak, intracranial hypotension, herniation, and dural sinus thrombosis.• Meningitis, abscess, arachnoiditis, epidermoid cyst, and foreign body constitute more unusual sequelae to be mindful of.• Diffuse dura-arachnoid enhancement should likely not be a concern for delaying LP since it is not prevalent without intracranial hypotension, strongly advising to exclude other causes first when present.

### TABLE OF CONTENTS/OUTLINE

• Introduction: relevant anatomy, LP technique, general indications.• General contraindications and risk factors for complications following LP.• LP complications: spinal and intracranial hemorrhage, cerebrospinal fluid leak, intracranial hypotension, cerebral and cerebellar herniation, dural sinus thrombosis, arachnoiditis, meningeal infection, abscess, epidermoid cyst, foreign body.• Dura-arachnoid enhancement after LP.• Conclusion.

## NREE-2 SPETZLER MARTIN TAKE THE WHEEL! STEERING CLEAR FROM BRAIN TRAFFIC JAMS: AVM REVIEW

Amanda P. Marrero-Gonzalez, MD (*Abstract Co-Author*) Nothing to Disclose
Jorge Machicote, MD, MSc (*Abstract Co-Author*) Nothing to Disclose
Kevin Hornedo, BS (*Abstract Co-Author*) Nothing to Disclose
Claudia Muns, MD (*Abstract Co-Author*) Nothing to Disclose
Alejandra Cardona Del Valle, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Review the grading of Arteriovenous Malformations (AVMs) as defined by the Spetzler-Martin classification. Provide anatomical diagrams of Grade I-V of AVMs. Contribute case examples with pathognomonic imaging findings of grade I-V AVMs on CT, MRI, and angiography studies. Define the possible complications of AVMs and their corresponding management. Provide a self-assessment tool for the classification of AVMs as defined by the Spetzler Martin classification.

### TABLE OF CONTENTS/OUTLINE

Educational Objectives Introduction. Arteriovenous Malformations (AVMs) Spetzler-Martin classification - Grade I-V Anatomical Diagrams, CT, MRI, and Angiography Imaging Findings and Treatment Options. Complications of AVMs. Self-assessment with multiple cases in quiz format. Conclusion. Brain AVMs are vascular lesions characterized by a connection between feeding arteries and a draining venous network without an intervening capillary bed. Clinically, AVMs can exhibit variable initial presentations and may result in serious outcomes such as intracranial hemorrhages, seizures, neurological deficits, and death. While diagnosis is made through different imaging modalities, management is mostly surgical. Thus, understanding AVM structure and location becomes relevant for planning appropriate interventions and anticipating potential complications. This exhibit will review the grading of AVMs as defined by the Spetzler-Martin classification using a pictorial depiction of lesions along with their appearance on various imaging modalities such as MRI, CT, and angiography. We will also discuss complications associated with AVMs, and address the role of radiology in guiding treatment decisions.

## NREE-20 CLINICAL NEUROIMAGING IMPLICATIONS OF 7-TESLA MRI

Sadaf Afif (*Presenter*) Nothing to Disclose

### TEACHING POINTS

1. 7-Tesla MRI (7T) offers high spatial and contrast resolution with a superior signal-to-noise ratio (SNR) and contrast-to-noise ratio (CNR) than conventional field strengths, enhancing clinical application by improving the detection and characterization of both normal and abnormal structures. This exhibit showcases clinical advantages of 7T. 2. High spatial and contrast resolution plays a role in imaging for trigeminal neuralgia, where 7T MRI has the potential to improve diagnosis associated with pathologies like masses, local vascular alterations, and microstructural changes. 3. The anatomy of the skull base poses a challenge for imaging of skull base tumors. 7T could play a crucial role in enhancing comprehensive preoperative tumor assessment, vital for precise surgical planning for achieving adequate tumor resection and minimizing morbidity. 4. 7T enhances noninvasive diagnosis of focal epileptogenic lesions and associated microstructural features with precise trigger point detection in patients with nondiagnostic conventional field studies which expedites targeted treatment planning. 5. The identification of cortical lesions, white matter plaques, and characterization of imaging biomarkers such as central vein sign in Multiple Sclerosis could be significantly enhanced by 7T, addressing challenges often seen with conventional MRI. 6. 7T may play a promising role in the diagnosis and follow-up of Alzheimer’s disease by better elucidating structural changes and accompanying pathologies such as cerebral microbleeds with superior resolution.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction 2. Trigeminal Neuralgia 3. Skull Base Tumors 4. Epilepsy 5. Multiple Sclerosis 6. Alzheimer's Disease

## NREE-21 TEMPORAL LOBE EPILEPSY WITH A FOCUS ON UNDERLYING ANATOMY: A PRIMER FOR THE RADIOLOGIST

**Awards**
**Certificate of Merit**

Aline Herlopian (*Abstract Co-Author*) Nothing to Disclose
Chong Zhou, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Review pertinent anatomy of the limbic system underlying temporal lobe epilepsy (ex. hippocampus, fornix, parahippocampal gyrus, cingulate).2. Review potential limbic anatomy variants that may be mistaken for pathology.3. Review cases of pathologies associated with temporal lobe epilepsy.Abstract: Temporal lobe epilepsy (TLE) is the most common type of epilepsy and accounts for about half of all cases of focal epilepsy. Diagnosis of epilepsy related radiological abnormalities often depends on identification of subtle imaging features involving the temporal lobe or limbic structures which can precipitate temporal lobe seizures. Accurate interpretation can be prone to error because unlike other neurological diseases such as tumors and demyelinating lesions, abnormalities in TLE may not involve significant MRI signal changes or distortion of brain anatomy. Additional normal individual differences in sulcal and gyral positioning and anatomy pose additional challenges. This exhibit will review normal anatomy, variant anatomy that may be confused with pathology, and pathologies that should be identified in the initial evaluation for TLE. We will review the concept of the limbic network and its functions and connections. Ultimately, this exhibit will serve as a primer for practicing radiologists in assessing complex and less recognized findings in medically refractory TLE.

**TABLE OF CONTENTS/OUTLINE**

1. Introduction2. Background - Seizure workup with clinical context3. Normal anatomy of structures involved in temporal lobe epilepsy4. Examples of pathology involving limbic structures with clinical cases Summary of search pattern for TE seizure evaluation

## NREE-24 ARTERIAL SPIN LABELING ASSESSMENT OF CEREBRAL ARTERIOVENOUS FISTULAE AND MALFORMATIONS

Noorbakhsh, MD,MPH (*Abstract Co-Author*) Nothing to Disclose
Divya S. Bolar, MD,PhD (*Abstract Co-Author*) Nothing to Disclose
Usha Trivedi, MD, BS (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Arterial spin labeling (ASL) is a noninvasive MRI technique that magnetically labels blood for use as an endogenous tracer for to assess cerebral perfusion. ASL is exquisitely sensitive for detecting arteriovenous fistulae (AVF) and arteriovenous malformations (AVM) via arterialized signal in the venous system and/or nidus. ASL can identify subtle AV shunt lesions and provides valuable insight into the progression or resolution of these lesions on follow-up imaging. However, mimics of AV shunt lesions on ASL, such as jugular venous reflux and venous thrombosis, can confound interpretation and warrant additional imaging for confirmation. This educational exhibit showcases the utility of ASL for diagnosing and assessing AVF and AVM and provides examples of mimics of which the neuroradiologist should be aware.

**TABLE OF CONTENTS/OUTLINE**

1. Vascular Shunt Lesions - Review of arteriovenous malformations (AVM) and arteriovenous fistulae (AVF) 2. Current Methods of Assessing Shunt Lesions - Imaging methods to evaluate AVM and AVF 3. Discussion of Arterial Spin Labeling (ASL) - Review on acquisition and interpretation of ASL in the setting of AV shunting - Comparison of ASL with other techniques to assess shunt lesions 4. Cases of AVM with ASL - Examples of large and small AVMs 5. Cases of AVF with ASL - Examples of carotid cavernous fistula - Examples of dural arteriovenous fistula 6. ASL to Assess Follow up Studies - Progression and improvement of AVF and AVM on ASL 7. Pitfalls of ASL - Mimics of arterialized signal, including jugular venous reflux and venous sinus thrombosis 8. Summary of ASL and its utility for evaluating AVM and AVF

## NREE-25 5 STEPS ASSESSMENT OF ACUTE STROKE

Eduarda Bezerra Cirne, MD (*Abstract Co-Author*) Nothing to Disclose
Yasmin Fernandes De Aquino, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Review the anatomy of the medulla oblongata, its specific structures, connections with other parts of the central nervous system, and main functions. Detail in step-by-step how and which weighted magnetic resonance imaging (MRI) sequences contribute to the identification of the main pathologies that affect the medulla oblongata. Demonstrate the importance of accurate diagnosis of bulbar pathologies for planning surgical and therapeutic interventions, and adequate monitoring of the disease in order to avoid further neurological damage.

**TABLE OF CONTENTS/OUTLINE**

The medulla oblongata is a small segment of the brain stem that contains structures fundamental to life, such as the vital autonomous cardiovascular and respiratory centers that control heart rate, blood pressure, and breathing. Although isolated bulbar injuries are rare, late diagnosis and inadequate treatment can lead to disability or death. In this context, magnetic resonance imaging (MRI) plays a central role in accurate and early diagnosis, and it is essential for radiologists to have in-depth knowledge and a focused look at image findings to identify anatomical structures, recognize pathological changes, differentiate similar conditions and correlate radiological findings with clinical symptoms. The step-by-step analysis of the medulla oblongata using magnetic resonance allows the optimization of analytical reasoning in the evaluation, helping to obtain a detailed understanding of the changes expected in each disease, contributing to an accurate diagnosis and, consequently, an adequate treatment that obtain the best clinical outcomes.

## NREE-27 TARGETED NEUROSURGICAL INTERVENTIONS: THE ROLE OF NEUROIMAGING IN LITT, DBS, AND HIFU

Evgeny Pavlushkov, MD, FRCR (*Abstract Co-Author*) Nothing to Disclose
Jay Starkey, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Explore new neurosurgical techniques and their applications
- Understand the role of neuroimaging in pre-and post-operative settings

- Discuss the anatomy and targets for LITT, DBS, and HIFU procedures
- Highlight the importance of neuroimaging in guiding and evaluating these treatments

**TABLE OF CONTENTS/OUTLINE**

- Introduction
- Laser Interstitial Thermal Therapy (LITT)
- Principles and mechanisms
- Indications and targeted pathologies
- Pre-operative imaging: planning and target identification
- Intra-operative imaging: real-time monitoring and guidance
- Post-operative imaging: assessing treatment response and complications
- Deep Brain Stimulation (DBS)
- Overview of DBS
- Targets for DBS:
- Ventral Intermediate Nucleus (VIM) for essential tremor
- Globus Pallidus internus (GPi) for dystonia and Parkinson's disease
- Subthalamic Nucleus (STN) for Parkinson's disease
- Pre-operative imaging: anatomical and functional mapping
- Intra-operative imaging: electrode placement and verification
- Post-operative imaging: evaluating lead position and stimulation effects
- High-Intensity Focused Ultrasound (HIFU)
- Principles and mechanisms of action
- Applications in neurosurgery, focusing on the VIM for essential tremor
- Pre-operative imaging: target localization and treatment planning
- Intra-operative imaging: real-time monitoring and guidance
- Post-operative imaging: assessing treatment efficacy
- Integration of Advanced Imaging Techniques
- The role of functional MRI, diffusion tensor imaging, and tractography
- Advances in intra-operative imaging: MRI-guided neurosurgery
- Future Directions and Challenges
- Emerging applications of LITT, DBS, and HIFU
- Potential limitations and risks
- Conclusion

## NREE-28 TEMPORAL LOBE ENCEPHALOCELES ASSOCIATED EPILEPSY - SUBTLE LESIONS YOU DO NOT WANT TO MISS

Richard A. Bronen, MD (*Abstract Co-Author*) Nothing to Disclose
Derek Nitz, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Temporal Lobe Encephaloceles Associated Epilepsy - Subtle Lesions You Do Not Want to Miss Temporal Lobe Encephaloceles (TLenc) are herniations of brain parenchyma through dural defects in the middle cranial fossa and have been identified as a cause of medically refractory epilepsy. Identification of these lesions is imperative because surgical resection can be curative. However, there are challenges to the diagnosis of TLenc, which include lack of awareness of the lesion (particularly prior to 2015) and subtle findings on MR and CT imaging. TLenc are often small, isointense to brain tissue, and difficult to distinguish from normal TL undulations or adjacent subjacent extracranial tissue, particularly if thin high resolution imaging protocols are not utilized. At the conclusion of this exhibit, the learner will be able to do the following: Describe TLenc and their clinical significance. Will be aware of the current imaging protocol to optimize the detection of TLenc. Highlight key imaging features to identify TLenc. Identify typical and subtle cases of TLenc.

**TABLE OF CONTENTS/OUTLINE**

Background of TLenc: Define TLenc. Discuss clinical significance. Review current management of TLenc. Review pitfalls in the diagnosis of TLenc on imaging. Review recommended imaging protocol: Review HARNESS MRI imaging protocol. Discuss optimal sequences and view for identification of TLenc. Discuss key imaging features to identify TLenc. Review cases of typical and subtle TLenc.

## NREE-29 HAEMATOLYMPHOID TUMORS OF THE CENTRAL NERVOUS SYSTEM: A PERSPECTIVE BEYOND LYMPHOMA

**TEACHING POINTS**

; Review the subdivision of these tumors according to 2021 World Health Organization Classification of Tumours (WHO CNS5). ; Emphasize the main characteristics that distinguish primary and secondary lymphomas. ; Illustrate the different subtypes of histiocytic tumors and their radiological features.

**TABLE OF CONTENTS/OUTLINE**

● Introduction. ● Illustrate the origin of lymphocytic and histiocytic cells. ● Subdivision of these tumors according to 2021 World Health Organization Classification of Tumours (WHO CNS5). ● General considerations on lymphomas. ○ Diffuse primary lymphoma of large cells B.○ Secondary lymphoma. ○ Immunodeficiency-associated lymphoma.■ AIDS-related lymphoma.■ Post-transplant lymphoproliferative disorder (PTLD). ○ Intravascular large B-cell lymphoma (intravascular lymphomatosis). ○ Lymphomatoid granulomatosis. ● General considerations on histiocytic tumors. ● Langerhans cell histiocytosis.○ Langerhans cell histiocytosis.○ Hypothalamic-pituitary axis involvement.○ Neurodegenerative involvement. ● Non-Langerhans histiocytic tumors.○ Rosai-Dorfman disease.○ Erdheim-Chester disease.

## NREE-3 CONGENITAL CRANIOFACIAL ANOMALIES: A PICTORIAL REVIEW

Lauren J. Ehrlich, MD (*Abstract Co-Author*) Nothing to Disclose
Namita Bhagat, MD (*Abstract Co-Author*) Nothing to Disclose
Gaurav Cheraya, MD (*Abstract Co-Author*) Nothing to Disclose
Jordan Hughes, MD (*Abstract Co-Author*) Nothing to Disclose
Anisa A. Chowdhary, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Craniofacial malformations can be either isolated or part of a defined genetic syndrome. Early diagnosis of these malformations has vital clinical significance because some may present as acute emergencies in the postnatal period, whereas others may require long-term treatment. Some may also be associated with brain anomalies. The diagnostic value of three-dimensional reconstructed images by computed tomography (3D-CT) is particularly high in individuals with complex craniofacial deformities, and in patients with congenital malformations. 3D-CT imaging is the method of choice for understanding the pathologic morphology of the patients and in the preparation for craniofacial surgery.

### TABLE OF CONTENTS/OUTLINE

Introduction: Craniofacial malformation is one of the most commonly encountered birth defects in the prenatal and postnatal periods. Facial cleft cleft lip (CL) with or without cleft palate (CP), is the most common congenital craniofacial malformation. Craniofacial syndromes commonly associated with craniosynostis include Apert syndrome, Crouzon syndrome, and Pfeiffer syndrome, which are secondary to mutations of fibroblast growth factor receptor (FGFR). Purpose: The purpose of this study is to assess the clinical and CT imaging patterns of Craniofacial syndromes with correlating the abnormalities such as bone abnormalities of the face, cranium and the skull base.

## NREE-30 CHRONIC SUBDURAL HEMATOMA: ADVANCED IMAGING OF THE MEMBRANES AND THE ROLE OF MIDDLE MENINGEAL ARTERY EMBOLIZATION

Uttam Bodanapally, MBBS (*Abstract Co-Author*) Speakers Bureau, Siemens AG;Travel support, Siemens AG;Research support, Siemens AG
Dheeraj Gandhi, MBBS, MD (*Abstract Co-Author*) Research Grant, Stryker CorporationResearch Grant, Medtronic plc
Athanasios Pavlou, MD (*Presenter*) Nothing to Disclose

### TEACHING POINTS

Chronic subdural hematoma (cSDH) is a complex immunological and angiogenic process that is initiated by minor trauma to the dural membranes. Based on hematoma morphology, cSDHs are classified on unenhanced CT scans for triage and treatment. Certain hematoma morphologies benefit from membrane imaging by either contrast enhanced MRI or contrast enhanced dual energy CT (DECT) that provides valuable information to guide further management. With increasing accessibility and significant shorter scan time, DECT not only provides an excellent means for the depiction and grading of membranes, but also provides functional information by estimating the amount of iodine exudation through the immature capillaries present in the membranes. Conventional surgical management of cSDH can quickly decompress the hematoma but recurrence and complication rates are high. Middle meningeal artery embolization (MMAE) can restrict arterial supply to the membranes to induce necrosis, target neo-vasculature and the cycle of inflammation which are thought to be responsible for propagation and postoperative recurrence. In addition, MMAE can also be potentially used as a standalone method to induce resorption and resolution without surgical evacuation.

### TABLE OF CONTENTS/OUTLINE

Epidemiology and health care burden. Pathophysiology as it pertains to advanced imaging methods. Role of CT imaging with emphasis on dual energy techniques for membrane imaging. Use of advanced imaging to guide surgical management with or without adjunct middle meningeal artery embolization. Discussion of the utility of sole middle meningeal artery embolization. Future prospects in the diagnosis and treatment of chronic subdural hematomas

## NREE-31 JOIN THE BRIGHTER SIDE OF THE FORCE: HOW 7-TESLA MRI CAN HELP TO ASSESS CASES IN NEUROIMAGING

### TEACHING POINTS

- Overview clinical indications for 7-T MRI in neuroimaging, highlighting its superior detail over lower field MRIs.- Demonstrate the improved diagnostic capabilities of 7-T MRI for complex neurological conditions.- Address challenges in clinical application of 7-T MRI and propose solutions for integration into clinical practice.

### TABLE OF CONTENTS/OUTLINE

1. Introduction1.1. Evolution of MRI technology and introduction of 7-T MRI in neuroimaging.2. Additional benefits of 7-T MRI2.1. Brain tumors2.2. Radiotherapy planning2.3. Multiple sclerosis and demyelinating diseases2.4. Intracranial MRA and vessel imaging2.5. Movement disorders and deep brain stimulation2.6. Pituitary pathology2.7. Epilepsy focal lesions2.8. MR Spectroscopy for metabolic disorders3. Challenges and Solutions3.1. Technical, operational, and safety challenges of 7-T MRI and strategies for clinical adoption.4. Conclusions and Take Notes

## NREE-32 BEYOND THE BASICS OF PREOPERATIVE SPINE IMAGING: WHAT ARE THE FINDINGS THAT CHANGE MANAGEMENT?

Carol P. Geer, MD (*Abstract Co-Author*) Nothing to Disclose
Edwin A. Stevens, MD (*Abstract Co-Author*) Nothing to Disclose
Scott D. Wuertzer, MD, MS (*Abstract Co-Author*) Nothing to Disclose
Caroline Wilson, MD (*Abstract Co-Author*) Nothing to Disclose
Jessica Hinaman, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

1. Review cross-sectional spine imaging, highlighting the importance of CT for assessing fracture morphology and MRI for evaluating soft tissue injuries. 2. Describe additional, often overlooked, findings and anatomic considerations in the cervical, thoracic, and lumbar spine that affect patient management and should be included in all radiology reports. 3. Review these findings through a case-based approach with CT and MRI examples.

**TABLE OF CONTENTS/OUTLINE**

Review of Basics. Fracture morphology - value of CT. Soft tissue injury - value of MRI. Cervical Spine. Traumatic - Traumatic disc herniation. Extent of ligamentous injury. Integrity of the transverse ligament. Discoligamentous competency at C2/C3. Angulation of odontoid. Extent of fracture with underlying diffuse idiopathic skeletal hyperostosis or ankylosing spondylitis. Non-traumatic - Soft foraminal disc herniation or disc-osteophyte complex. Ossification of posterior longitudinal ligament. Alignment. Anatomic Consideration - location of vertebral artery position relative to C2 pars. Thoracic and Lumbar Spine. Traumatic - Traumatic disc herniation. Extent of ligamentous injury. Extent of fracture with underlying DISH or AS. Non-traumatic - Location of disc herniation. Etiology of post-surgical stenosis (recurrent disc, osteophyte, or scar). Prior decompressive surgery. Anatomic Consideration - location of iliac vein bifurcation complex to L4/L5 and L5/S1.

## NREE-33 UNRAVELING THE MIDLINE: SELLAR AND PARASELLAR LESIONS FROM A RADIOLOGIST'S PERSPECTIVE

Fernanda V. Pereira, MD (*Abstract Co-Author*) Nothing to Disclose
Caio Silveira, MD (*Abstract Co-Author*) Nothing to Disclose
Gustavo Yamada, MD (*Abstract Co-Author*) Nothing to Disclose
Fabiano Reis (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

There is a myriad of sellar and parasellar lesions, and they are not uncommon. They are found especially in the pediatric population, accounting for approximately 10% of all pediatric intracranial tumors, and thus represent a routine diagnostic challenge for the radiologist. This educational exhibit aims to: review the normal anatomy and embryology of the midline of the brain, especially the pituitary gland, the suprasellar cistern and the hypothalamus; summarize the imaging characteristics of the sellar region on CT and MRI; review pituitary adenomas and their main mimicking entities, differential diagnoses and common pitfalls through a set of illustrative clinical cases.

**TABLE OF CONTENTS/OUTLINE**

(1) Introduction; (2) Anatomy and embryology of the brain midline (sella turcica and pituitary gland, parasellar region, suprasellar cistern and hypothalamus); (3) Case-based review of pituitary adenomas, and its main mimickers and differential diagnoses: pituitary carcinoma, granular cell tumor of the neurohypophysis, meningioma, pituitary metastasis, intrasellar plasmacytoma, pituitary apoplexy, aneurysms, pilocytic hypothalamic/chiasmatic astrocytoma, craniopharyngioma, sellar xanthogranuloma, hypothalamic hamartoma, clivus chordoma, sarcoidosis, surgical manipulation, carotid-cavernous fistula, epidermoid cyst; (4) Final remarks and take-home messages.

## NREE-34 IDENTIFYING AND CHARACTERIZING NON-STENOTIC POTENTIAL ARTERIOGENIC SOURCES OF EMBOLI IN PATIENTS WITH EMBOLIC STROKE OF UNDETERMINED SOURCE

Maoxue Wang, MD (*Abstract Co-Author*) Nothing to Disclose

Tamara Hernandes Ricci, MD (*Abstract Co-Author*) Nothing to Disclose
Nathalia C. Santos, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

The purposes of this exhibit are:- Review the main neuroimaging patterns of MOGAD through clinical cases.- Discuss and describe the imaging features at the heterogeneous phenotypes in MOGAD patients, focusing in MRI findings, such as optic neuritis, transverse myelitis, supratentorial and infratentorial involvement.

**TABLE OF CONTENTS/OUTLINE**

1. Imaging patterns of MOGAD disorder with epidemiological features in adult and pediatric population.- Neuroimaging patterns such as supratentorial and infratentorial involvement, optic neuritis and transverse myelitis. 2. Supratentorial and infratentorial most common imaging patterns in MOGAD patients illustrated by clinical cases.- Supratentorial involvement showed by clinical cases with heterogenous imaging patterns such as acute disseminated encephalomyelitis (ADEM), flair-hyperintense lesions in anti-MOG associated encephalitis with seizures (FLAMES) and other patterns.- Infratentorial involvement in MOGAD illustrated by a clinical case 3. The overlap of the imaging and neurological patterns of ADEM and FLAMES- Clinical case illustrating the alternance of ADEM and FLAMES imaging patterns 4. Transverse Myelitis in MOGAD patients.- Clinical cases showing the spinal cord involvement in MOGAD disease. 5. Optic neuritis imaging pattern in MOGAD- Imaging pattern of MOGAD optic neuritis and the differences of the optic nerve involvement in the most common differential diagnosis.

## NREE-39 NON-NEOPLASTIC INTRACRANIAL CYSTIC LESIONS: IMAGING FINDINGS AND PRACTICAL APPROACH OF THE DIFFERENTIAL DIAGNOSES

Diego Dias, MD (*Abstract Co-Author*) Nothing to Disclose
Marnya Wellysa Leite Tavares, MD (*Abstract Co-Author*) Nothing to Disclose
Maria Sabrina Medeiros Olimpio, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- The normal brain is not perfectly symmetrical.- Brain asymmetries are characterized by enlargement or atrophy of all or part of a cerebral hemisphere.- They can be physiological or non-physiological (congenital or acquired).

**TABLE OF CONTENTS/OUTLINE**

Brain asymmetry has been observed for over a century in humans in terms of structure, function, and behavior and is characterized by enlargement or atrophy of all or part of a cerebral hemisphere. They can be physiological or non-physiological (congenital or acquired). Physiological asymmetries reflect evolutionary, hereditary, developmental, experiential, and pathological factors. The specialization of the left hemisphere for language was one of the earliest observations of brain asymmetry. Among the most prominent observations of brain asymmetry are the right frontal and left occipital petalia (when one of the lobes protrudes towards the contralateral side, leaving impressions on the inner surface of the skull). Other common physiological asymmetries include gyral-sulcal patterns, distribution of grey and white matter and ventricular asymmetry. On the other hand, various diseases, whether congenital or acquired, present disproportion between one cerebral hemisphere or lobe and the other. A pratical approach to assessment, considering the dimensions of the affected hemisphere (enlarged or reduced), the size of the lateral ventricles on the diseased side, and the pattern of involvement between the cerebral lobes, can help narrow down the list of differential diagnoses.

## NREE-40 BOTTOMS UP: EXPLORING CAUDAL REGRESSION SYNDROME THROUGH RADIOLOGY

Vanessa C. Chacon, MD (*Abstract Co-Author*) Nothing to Disclose
Beatriz M. Navarro Estrada, MD (*Abstract Co-Author*) Nothing to Disclose
Berali Del Espiritu Santo Padilla, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

• Caudal Regression Syndrome (CRS) is a rare genetic disorder characterized by total or partial agenesis of the lower vertebral, sacral, and thoracolumbar spine.• The clinical presentation of CRS varies based on the extent of malformations, common features include a short intergluteal cleft, foot deformities, and lower extremity muscular atrophy. Neurological deficits correlate with the level of vertebral anomaly, while gastrointestinal and genitourinary abnormalities pose significant diagnostic challenges.• Antenatal ultrasound is sensitive for detecting hypoplasia of the lower extremities and sacral or lumbosacral agenesis.• Fetal MRI confirms the diagnosis and assesses the level of the terminal medullary cone. Postnatally, imaging modalities like ultrasonography, bone survey, CT scan, and MRI are utilized for confirmation and detailed assessment.• CRS is divided into two subgroups: Group 1, characterized by high agenesis with cord termination above the lower border of L1, while Group 2, features low agenesis below L1, and often presents a low-lying conus, predisposing to progressive neurological deterioration.• Additionally, Renhaw's classification categorizes sacral agenesis into four types, providing insights into the anatomical variations seen in CRS.

Javier M. Romero, MD (*Abstract Co-Author*) Stockholder, TMA Precision Medicine
Arash Kamali, MD (*Abstract Co-Author*) Nothing to Disclose
David E. Timaran Montenegro, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

• Demonstrate the role of black blood MR imaging (BB-MRI) in detecting and interpreting arterial wall diseases in intracranial vessels. • Depict the clinical applications and pitfalls of BB-MRI in neurovascular diagnosis. • Provide insights into the pathology beyond luminal abnormalities, enabling the differentiation of causes of stenosis, such as intracranial atherosclerotic disease, vasculitis, and reversible cerebral vasoconstriction syndrome, through

BB-MRI. • Highlight interpretive pitfalls, including artifacts from slow flow, enhancing veins mimicking arterial wall enhancement, and vasa vasorum enhancement mimicking vasculitis.

**TABLE OF CONTENTS/OUTLINE**

Atherosclerosis: Clear visualization of vessel walls and enabling precise assessment of atherosclerotic plaque morphology and burden. Vasculitis: concentric vessel wall thickening and enhancement. Notably, the "tram track sign," observed as a hyperintense line with hypointense rims, is a hallmark of vasculitic involvement. Dissection: intramural hematoma as a characteristic imaging finding in dissection, along with the eventual visualization of mural thrombus. Moyamoya Disease: Characteristic terminal intracranial internal carotid artery stenosis without enhancement. Intracranial Saccular Aneurysms: Stability of aneurysms can be predicted by absence of enhancement in the vessel wall. Vasospasm: Narrowing of vessel lumen without enhancement. Reversible Cerebral Vasoconstriction Syndrome (RCVS): Mild enhancement or no enhancement with thickened vessel walls. Giant Cell Arteritis: Helps in determining where to perform a biopsy on the temporal artery and predicting biopsy results.

## NREE-42 THE POSTOPERATIVE SELLA: WHAT IS THE RADIOLOGIST ROLE?

Angelo D. Correa, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

Postoperative evaluation of the sella turcica is a major challenge, even for experienced neuroradiologists. The objective of this presentation is to promote a review on the topic and propose solutions for the standardized evaluation of these exams, with the aim of increasing the precision and confidence of radiologists when faced with them.

**TABLE OF CONTENTS/OUTLINE**

- It is necessary to know the characteristics of pre-operative exams and how the surgical procedure was performed.- An examination with the appropriate technique must be performed, focusing on T2 and post-contrast T1-weighted sequences. Performing a dynamic sequence and post-contrast T1 3D fast spin echo sequences may be useful.- Careful evaluation of these studies should initially look for postoperative complications, such as bleeding, ischemia and CSF leak.- The assessment of residual lesion and progression must be carried out with caution, always using all available comparative exams, to identify slow growth.- Some post-treatment expected changes should also be observed, such as insinuation of the supra sellar cistern and herniation of the optic chiasm.

## NREE-43 CORTICAL BRAIN LESIONS: FACTS AND FEATURES

Alan I. Araujo, MD (*Abstract Co-Author*) Nothing to Disclose

Nathalia C. Santos, MD (*Presenter*) Nothing to Disclose

**TEACHING POINTS**

- Review the main imaging patterns of the differential diagnosis of cortical lesions - Discuss the essential imaging findings, such as leptomeningeal enhancement, cortical thickening, distribution features, and also the use of additional MRI sequences in the differential diagnosis of the cortical lesions- Illustrate the MRI imaging findings of each disorder through clinical cases, highlighting the key points, and discussing clinical and epidemiological features- Suggest a flowchart of the practical approach of cortical lesions

**TABLE OF CONTENTS/OUTLINE**

● The main imaging findings in the cortical lesions approach ● The use of additional MRI sequences ● Differential Diagnosis of Cortical Lesions○ Inflammatory Disorders: Multiple sclerosis; Myelin oligodendrocyte glycoprotein antibody-associated disease (MOGAD); Behçet disease Autoimmune encephalitis.○ Infectious Disorders: Tuberculosis; Syphilis; Herpes encephalitis; Creutzfeldt Jakob.○ Vascular Disorders: Infarction; Hypoxic ischemic brain injury.○ Neoplastic Disorders ○ Toxic and Metabolic Disorders: Wernicke's encephalopathy; Hyperammonemia; Hepatic encephalopathy; Marchiafava-Bignami; Osmotic demyelination syndrome; Wilson disease; Mitochondrial encephalomyopathy with lactic acidosis and stroke-like episodes (MELAS).○ Developmental Disorders: Focal cortical dysplasia; Heterotopia.○ Phakomatosis: Tuberous sclerosis; Sturge Weber.○ Neurodegenerative Disorders: Amyotrophic lateral sclerosis; Frontotemporal lobe dementia. ● Flowchart of the practical approach of cortical lesions

## NREE-44 HIDING IN THE CORNER: A SIMPLIFIED APPROACH TO CEREBELLOPONTINE ANGLE LESIONS
